Ver. 673. In these eleven verses he teaches, that what he has been saying of animals, holds good in all other things, which consist likewise of certain kinds of atoms, disposed in a proper manner; and though in all things are contained some seeds that are common to all things, yet certain other seeds are mixed with them that are proper to each thing in particular, and these are the cause of the different intervals, motions, sises, connections, &c. from whence proceeds the difference and variety of things. He concludes excellently well; that notwithstanding the difference of the seeds, yet if the intervals, motions, &c. were not different likewise, the heavens, the seas, the earth, in a word, all things would be confusedly mingled with one another.

Ver. 684. Cicero is mistaken to say, that the Epicureans ascribed no quality whatever to their atoms. "Isti autem," says he, "ex corpusculis non colore, non qualitate aliqua, quam ποιοῦνται Græci vocant, non censu præditi, sed concurrentibus temere atque casu mundum esse perfectum," &c. lib. ii. de Natura Deorum. Epicurus himself writes the contrary in the epistle to Herodotus: Καὶ μὲν καὶ τὰς ἀτόμους νομισίω μηδεμίαν ποιοῦντα τῶν φαινόμενων προσφύεσθαι, πλὴν χήματος καὶ βάρους τὸ μίγνυς, καὶ ὅσα ἐξ ἀνάγκης χήματος συμφωνῇ εἶσι. Ποιοῦντες γὰρ ἄλλαι οἶον χεῶμα τι, τὸ διεμοῖναι, παρὰ τὸν θῆσιν τῶν ἀτόμων μετὰ ἀλλήλους, δια καὶ ταῖς ἀτόμοις ἐκ ἐνυπάρχουσι. Lucretius asserts the same opinion, and first in these nine verses teaches that they have no colours; and that there is no need of white seeds to make a white compound body, nor of black to make a black, &c.

Ver. 691. He means that the atoms have no colours whatever, either any like, or any unlike those that we discover on the surfaces of all concrete bodies.

Ver. 693. Lucretius was aware that he should find it very difficult to persuade many to believe, that there are no colours in the seeds, and consequently not in the compounds. For most men are so carried away by prejudice, that they will not believe that they can perceive any corporeal thing, that is not coloured; and therefore they cannot suffer that the seeds, which cannot be conceived by the mind as colourless, should be obtruded upon them as such. He therefore briefly, in these nine verses, obviates these prepossessions; and says, even men who are born blind perceive and know things by touching them, though they never saw their colours. Nor does all the perception of things set and go away with the sun. Even in the thickest darkness we perceive no less the things we touch, than those we handle at noon-day, and in the clearest light.

Ver. 702. In these eight verses Lucretius proves, in the first place, that the seeds of things are not coloured, because all colour is liable to change; but the seeds of things are immutable; otherwise all things would fall into nothing. Epicurus in the epistle to Herodotus. Παιδὸς πᾶσιν ἁτόμοις ἐνυπάρχουσα καὶ ἴδια μὴ μεταβάλλει, ὥς αἱ ἁτόμοι μηδὲν μεταβάλλουσι· ἐπεὶ δὲ τὸ ὑπομένειν ἐν τῶν διαλήσει τῶν συγκρίσεων στείρον τι ἀδιάλυτον, ὃ τὰς μεταβολὰς ἔκ ἐς τὸ μὴ ἐν ποιήσαντο· αἱ δὲ ποιήσεις ἔκ ἐνυπάρχουσαι σὲ μὴ ἴδιαι, οἷον χρώματι, τι θερμοῦς, ἐν τῷ μεταβάλλοντι ἔκ ὧσπερ ἐκείναι καταλείπονται, ἀλλ' ἐξ ὧν τῷ σώματος ἀπόλλονται. From whence Lucretius asserts, that if colour were intrinsically in the seeds, the seeds would be mutable: for all colour is mutable.

Ver. 710. Secondly, He teaches in these sixteen verses, that the atoms are not imbued with any colours, and that it would be to no purpose for any man to pretend they are, since there is no necessity they should be so; for allow them a variety of figures, and from the different order, site and disposition of them, colours will proceed; for example, the sea is of a cerulean colour, but grows white by the agitation of the waves. Thus too the seeds, which disposed in one manner, look blue when they are placed in another order, may put on and exhibit a white. But if a blue colour were innate, and naturally in the seeds, no position or agitation whatever could make those principles white.

Ver. 720. Ovid. Metam. xi. ver. 499. speaking of a tempestuous sea:

—cum fulvas ex imo vertit arenas,
Concolor est illis; Stygia modo nigrior unda:
Sternitur interdum, spumisque sonantibus albet.

When yellow sands are sifted from below,
The glitt'ring billows give a golden show:
And when the fouler bottom spews the black,
The Stygian dye the tainted waters take:
Then frothy white appear the flatted seas,
And change their colour, changing their disease.

Dryd.

Ver. 726. But some perhaps will allege that the water of the sea is composed of various coloured atoms, from whence proceeds that change of colours in the waves, now cerulean, now white, in like manner as a square is composed of two or four triangles included in it; which triangles within themselves have other figures. But the poet, in these twelve verses, tells us this is not the case; for in the square you may see the dissimilar figures, without or exterior to which it is a square, that is to say, you may see the figures, which the square has and contains within it; but you can see nothing like this in the water of the sea, that is, you can see no mixed and different colours. And, therefore, the objection that some perhaps might make, that white things do not proceed from white seeds, nor black from black; but white from black, and on the contrary, black from white, &c. is of no weight whatever.

This is the interpretation which Faber gives to this passage.

Ver. 738. In these five verses, he proves the former objection to be of no weight whatever. For bodies of a different figure may conspire into another different figure, as triangles into a square: but there is no reason therefore to conclude the like of colours; for different colours can never compose one simple colour.

Ver. 743. He urges this yet farther, in these six verses, and asserts, that they who pretend that one simple colour may be made of seeds of several colours, forsake the former opinion, and overthrow the only reason of their own. For they insist upon coloured seeds, that white bodies may proceed from white seeds, and black from black: but if either a black or a white colour should proceed from various coloured principles, the whole reason of the argument they before insisted on is lost. Then he adds, that a white colour (and the same may be said of any other colour) will sooner proceed from seeds that have no colour at all, than from seeds imbued with a black or any other colour. Thus I explain this passage, which none of the interpreters hitherto have rightly understood: and it may be observed, that the whole series of the disputation confirms this interpretation.

Ver. 749. In these fifteen verses, Lucretius concludes, that the atoms are colourless, because colour is nothing but light refracted in a body, or reflected from the surface of an opacous body. The poet says nothing of refracted light; but if you put to your eyes a prism, or common three-cornered piece of glass, you will find that the rays of light, that suffer a double refraction, present several colours to the sight. But he observes, that the feathers about a pigeon's neck, or in peacocks tails, as the rays of light strike directly or obliquely upon them, put on and diffuse now a yellow, now a green, now a flame, and several other colours. And hence he argues, that in dark places, where no rays of light enter, and out of which none are reflected, there is no such thing as colours; and therefore that colours, which appear in things when the light returns, are produced from the light itself, according to the dispositions the things have to receive, reflect, refract, and convey it to the eyes. Therefore since seeds never come into the light, or reflect any rays, they are altogether colourless, as much as if they were concealed and buried in utter darkness. Epicurus, in the second book against Theophrastus says: ἔκ εἶναι τὰ χρώματα συμφῶν τοῖς σώμασιν, ἀλλὰ γίνεσθαι κατὰ ποίους τινὰς ταῖς εἰς, καὶ θέσεις πρὸς τὴν ὄψιν. And again: ἔκ οἶδω ὅπως δεῖ τὰ ἐν σκοτεινῇ ὕλῃ φῆσαι χρώματα ἔχειν. Plutarchus advers. Colorem.

The dispute about colours is altogether difficult: and various are the opinions concerning the cause and reason of colour. Epicurus and Democritus, as Diogen. Laert. lib. x. says, were of opinion, that colour is not actually in any thing; but the other philosophers asserted it to be really in things, yet with this difference, the

the Pythagoreans did not distinguish colour from the surface of bodies, nor the Stoics from the first figurations of matter, nor the Peripatetics from the perspicuous bound of matter. Empedocles alone held colour to be a certain effluence from bodies, and Plato would have it to be a certain flame. This will help us to explain more clearly the opinion of Epicurus, who, as Plutarch says, taught that colours are not inherent in bodies, and a part of them, but are produced according to certain orders and positions of the light. Moreover, that by the word bodies, he did not mean the atoms, but the things and bodies of the things composed of them, as the same Plutarch witnesses. Therefore I interpret his colours not inhering to be colours not engendered with, or innate in things. For Epicurus held, that in the outmost parts of things, or the surfaces of bodies, there is such a disposition and order of the atoms, of which the things are composed, as makes them exhibit and show forth certain colours, when the light comes to them; and that they emit out of themselves certain atoms, which constituting the image of the thing seen, strike the ball of the eye in such a manner, order, and disposition, that by certain strokes of the light, they are the cause that the things are seen in the eye itself. Nor would he allow any colour to be in his atoms, but taught that colours proceed from the various orders and positions of the atoms, when the light comes to them. Thus too Lucretius says, ver. 753. that there can be no colour in the dark; and, according to this doctrine, Virgil sings, *Æneid* vi. ver. 271.

—ubi cælum condidit umbra
Jupiter, et rebus nox abstulit atra colorem.

This was the opinion of that philosopher. But the most probable opinion is, that colour is a certain power in bodies of affecting our organs after such or such a manner, whereby such or such a perception is excited and produced in the mind. This power is put into action by the intermediation of the rays of light, and consequently colour is but light reflected and modified; for when the rays of light are withdrawn, no colours are perceptible. Colour so far depends on the object seen, that, according to the different disposition, connection, and situation of the parts of bodies, the different reflections of the rays of light are produced; therefore, if the disposition of the object be altered, the colour likewise will vary, because the rays will not then be reflected in the same manner as they were before. Thus crystal, when broken into small pieces, loses its perspicuous transparency, and becomes bright; and wood, though before white, grows black with burning. Besides, what reasons could be given for the various colours in clouds, which are sometimes red, sometimes white; and to what can we attribute the gaudy diversity of colours in the rainbow, but to the different modifications of the rays of light, according to the variations of the figures and motions of the particles of such bodies? Neither can any one justly deny these to

be colours, since colour is only such a power as is described above; nor ought it to be alleged, that because some colours are transitory and not permanent, they ought not really to be called colours, or at least, not without the addition of spurious: for it might with equal reason be asserted, that the short duration of the cause destroys the effect. Thus, a child that dies as soon as born, would not deserve the name; and the greenness of leaves might be said to be no colour, because they so soon fade and wither. If this were allowed, there would be no colours in the world; for there are not any that are everlasting. The opinion of Aristotle and his followers concerning colour is unsatisfactory, for they define it thus: A second quality, sensible to the sight, and produced from the tempering of the first qualities: But this definition leaves us still in the dark; for the question still remains, What this quality is? How it is produced? From what? When? Others define colour thus: "Perspicui extremitas in corpore determinatio, seu extremitas perspicui determinati." And the opinion of Plato, which I mentioned above, deserves to be transcribed at large. The passage is in his *Timæus*, p. 342. Edit. Lamartianæ, and contained in these words: *Τέταρτον δὲ λοιπὸν ἔστι γένος ἡμῖν αἰσθητικόν, ὃ διγίγεται χεῖρ, συχρὰ ἐν αὐτῷ ποικίλματα κίχνη- μίον ἃ ζυμπάσῃα μὲν χρώας ἐκάλεισιν φλόγα τῶν σωμάτων ἐκείτων ἀπορρέουσιν, ὅψαι σύμμιξα μόρια ἔχουσιν πρὸς αἰσθῆσιν* where, in express words, he calls colours flames, that is, light continually flowing from bodies. Moreover, if it be inquired how one object comes to be yellow, another green, a third red, &c. the answer is, That colours being only the mixture of light with darkness in the surface of opacous bodies, yellow, for example, is the mixture of light with a little darkness, blue with a little more, red with more yet; so that, as we said before, colours are nothing but light variously reflected and shadowed. Pindar, *Ode* vi. elegantly attributes to flowers, *παμπροφύεις ἀκτῖνας*, purple beams: And Cowley had something like this in his mind, when he said:

It casts a dusky gloom o'er all the flowers,
And with full beams their mingled light devours.
David. 2.

And in his Hymn to the Light he is entirely of this opinion:

All the world's bravery that delights our eyes,
Is but thy sev'ral liveries:
Thou the rich die on them bestow'st;
Thy pencil paints this landskip as thou go'st.
A crimson garment in the rose thou wear'st;
A crown of studded gold thou bear'st:
The virgin lilies in their white,
Are clad but with the lawn of almost naked light.
The violet, spring's little infant, stands
Girt in thy purple swaddling bands:
On the fair tulip thou dost doat;
Thou cloth'st it with a gay and particolour'd coat.
Having given this short account of the several opinions concerning the cause of colour, I will

only add, that colours are generally divided into two sorts, simple and compound. The simple are only the extremes, white and black, to which some add yellow, blue, and red, which they call middle colours, as being of a middle constitution between white and black. The compound colours are those that are formed by the mixture of some of the simples; for example, the cinericean or ash-colour is a compofure of white and black; the gold colour, of yellow and red; the purple, of red and blue; the green, of yellow and blue; the livid, of red, yellow, and blue, &c. All which colours vary, according to the different mixture of falts with fulphurs, earth, &c. and where, the "caput mortuum" more or less abounds, there the mixture turns to a colour more or less dark, &c.

But to return to our author: Epicurus farther taught, that all things are not disposed and ordered in a like manner, so as to exhibit the like colours, when the light comes to them; but that one thing has a different disposition from another, which is the reason that it exhibits a different colour; as pipes utter several and different sounds, when they receive the breath of him that plays upon them; or as different plants that have no flowers, yet put forth different flowers, according as they have different heat or moisture; moreover, since it is manifest that the same thing changes and varies its colours according to the different degrees of light or shade, as it happens in the feathers of pigeons. Epicurus, therefore, for this reason, believed, that none of those different colours can be assumed or put on, so as to be said to be in the things themselves; and therefore that no colour is inherent in bodies.

Ver. 764. Another argument is contained in these seven verses. In the perception of every colour, the pupil or light of the eye is struck. But it receives one sort of stroke when a white, another when a black, or any other colour offers itself to it. But what need have seeds of colours, that they may in various manners affect and strike the eye? Allow only that these principles are of different figures, and disposed besides in different manners, and from thence will arise various images, by which they will variously strike the eyes, and stir up different motions in the organs. For sight, according to Epicurus, is made *διὰ τῆς εἰκῆς ἀδρόλων ἐς τὴν ὀφθαλμοῦ ἰμωσίωσις*. And from this doctrine of his, we may gather, that he held each of the senses to be a certain touch, and that all sensation is made by the incursion of the image out of the object into the organ of the sense, which is struck by it; but this image is nothing else but the atoms themselves, which come upon the sense in a different manner, according to their different position, order, figure, &c. Thus sight is made, when the atoms come from the object seen into the pupil of the eye, and move, and affect it according to their different position, order, figure, &c. But since the perception of that image is different, according to the different motions or qualities of the atoms; hence it is that the strokes which the apple of the eye receives,

come to be different; and this is the reason it perceives different colours. But Aristotle taught, that the cause of sight proceeds from the quality of the things seen, which quality discovers and makes manifest its power, and lays it open to the sense of sight. Plato and the Stoics are of another opinion, nor do they agree among themselves. See A. Gell. lib. v. c. 15.

Ver. 771. In these six verses, he adds another argument, taken partly from the confession of those against whom he disputes, and partly from the constancy of the colours that appear in the different kinds of things. They, says he, who imagine that seeds have colours, do not ascribe any certain colours to any certain figures, nor affirm that seeds of such a figure are of such a colour: for instance, they do not pretend that all quadrangular seeds are black, nor that the round are white, the triangular blue, &c. Whence then proceeds this constancy of colour in some kinds of things? Why are all crows black? Why all swans white? We should certainly see both swans and crows of various colours, if the seeds of which they are composed were stained with various dyes.

Ver. 777. In these eight verses, he argues yet farther, and says: Divide any coloured body, and the smaller the particles are made, the weaker grow the colours; nay, they will at length be quite lost, and vanish away even while the particles still remain visible to the eye. We are therefore much in the wrong to expect colour in the principles of things, which we cannot find in the minutest parts of bodies.

Ver. 785. In these ten verses, he presses hard on his adversaries. All men grant, says he, that the bodies which the nostrils cannot smell, are inodorous, and that they which the ear cannot hear have no sound. Then why must it not be granted, in like manner, that the bodies which the eyes cannot perceive, are void of colours? For the senses are the sole judges of the qualities of things, nor ought we to believe that any quality can belong to a body which the senses do not ascribe to it. And since there are bodies that want some certain qualities, why may not the atoms in like manner want colour, sensibility, cold, dryness, &c.

Ver. 795. Enough of colours. He now demonstrates, in these twenty verses, that the atoms are destitute of all other qualities likewise, as smell, cold, heat, sound, humidity, taste, softness, flexibility, rareness, &c. To prove which he brings three arguments: First, If you allow smell to the atoms, you will confound all things: the most delightful fragrantcy of the seeds must be lost by the intervening of the unfavoury stench of other seeds; and as when artists compose essences of rich perfumes, unless they make use of inodorous oil, that has no scent at all, the oil will corrupt their sweetest odours; we may conclude the same likewise of taste, sound, heat, cold, &c. The seeds cannot be divided, and therefore cannot exhale either odours, or sound, or heat, or taste, or cold, which consist of particles that are

emitted and flow from bodies. Third, If you ascribe to atoms, softness, flexibility, rareness, brittleness, &c. you will at the same time make them mutable, therefore obnoxious to dissolution, and consequently all things must fall into nothing.

Thus we allow that Lucretius has convincingly performed his design of freeing his atoms from all sensible qualities: and indeed he is of late seconded by so many experiments of the late philosopher Boyle, that it is now past all doubt. And if we can believe our senses, we must forsake forms and qualities, and allow what we formerly called such to be only phantasms arising from the stroke of external bodies on our organs.

Ver. 815. Having proved that the seeds of things are void of heat, cold, smell, taste, colour, and all other sensible qualities, and having asserted, that hot, cold, savoury, odorous, &c. things are nevertheless made of them, he now undertakes a greater task, and teaches, that things of sense can spring from senseless seeds, and that there is no need of any superior principle to matter, but a fit combination of atoms can think, will, and remember. To prove this, he appeals first to experience: Worms, says he, are bred from a rotten dunghill, in which it would be in vain to search for any life or sense. This argument is contained in nine verses.

Ver. 820. Thus bees too are produced from the bowels of a suffocated and putrified heifer, as Virgil says, Georg. iv. and Ovid. xv. Metam. & Fast. i.

— fervent examina putri
De bove; mille animas una necata dedit.

And Diodorus Siculus, in the beginning of his first books, says, That in the country about Thebes, at certain seasons of the year, large mice, that devoured every thing, were bred out of the clods of the earth. Athenæus, in his eighth book, chap. 2. reports, that in Pæonia and Dardanium (now called Bulgaria), there rained down so many frogs from heaven (that is, perhaps they were suddenly produced after great showers), that they filled all the public ways, and swarmed even in the private houses, insomuch that their domestic furniture was covered with them; that they found them even in the very pots where they boiled their meat; and that, what with the trouble of the living, and stench of the dead ones, the inhabitants were forced at length to forsake their country. And Pliny, in his eighth book, ch. 29. reports, that a whole city in Gallia, and another in Afric, were driven away, the first by frogs, the other by locusts, which had been bred in like manner. And many examples of this kind might be collected in profane histories, not to mention those we find in the sacred writers. Ovid describes this production of animals from the putrid and fermenting slime of the river Nile:

Sic ubi deseruit madidos septemfluvius agros
Nilus, et antiquo sua flumina reddidit alveo,

Æthereoque recens exarsit sydere limus;
Plurima cultores versis animalia glebis
Inveniunt; et in his quædam modo cæpta sub
Nascendi spatium: quædam imperfecta, suisque
Trunca vident numeris: et eodem in corpore

Altera pars vivit, rudis est pars altera tellus.
Metam. lib. i. v. 422.

Which Dryden thus interprets:

Thus when the Nile from Pharian fields is fled,
And seeks with ebbing tides his ancient bed:
The fat manure with heav'nly fire is warm'd,
And crusted creatures as in wombs are form'd:
These, when they turn the glebe the peasants find,
Some rude and yet unfinish'd in their kind:
Short of their limbs, a lame imperfect birth,
One half alive, and one of lifeless earth.

Ver. 824. Neither does he, to confirm this assertion, propose an example only in the generation of worms and animals, but in those already generated. Thus, in these twelve verses he tells us, that the food that is taken into the body of animals, from inanimate, as it was before, becomes animated. Beasts and birds, which are things of sense, are nourished with insensible food, as grass, leaves, &c. Mankind feeds upon birds and beasts; and thus men are at length composed of the insensible particles of grass, leaves, &c. He then illustrates this opinion with a very proper similitude. Dry wood is resolved into fire and flame; but insensible nourishment is not more different from living and sensible flesh, than dull wood from clear and shining fire and flame. And as from the wood must be extricated some particles, which by stirring up, and disentangling themselves from their former position, and then disposing themselves in a new order, may be endowed with that new power of shining and warming: so from the meat must be separated the spirituous particles, which, by being extracted in a certain manner, and disposed in a new, may obtain this energy of sensibility. For the procreation of sense, or of a sensible thing from insensible principles, is owing to the certain and peculiar magnitude, figure, position, order and motion of those principles.

Ver. 836. But lest experience itself should be thought to contradict the arguments he has brought from experience, he owns in these twenty verses, that he cannot deny that wood, stone, and earth mixed together, do sometimes remain insensible; otherwise we should see living houses, and sensible towers. He therefore confesses, that insensible things, unless they have a certain figure and magnitude, unless they be agitated in a due motion, and disposed in a certain order, never compose sensible things. But let all things necessary and requisite be allowed them, and then an animal will be produced from the most insensible of all things. For let wood putrify, or earth grow rotten with constant showers, and you will soon behold a numerous train of animals spring from that putrified wood and rotten earth.

Ver. 856. These five verses contain another argument to this effect. If the principles of which

sense consists be sensible, they must consequently be soft; because no hard or solid body is capable of sense; and if they are soft, they must be corruptible likewise; for unless they are solids, they may be divided, and therefore lose their nature. But the principles of things, as is before declared, ought to persevere and remain uncorrupted. Thus the philosopher Gassendus rightly explains this passage; but the grammarian Lambinus gives it a different interpretation; more agreeable to the rules of grammar, than to the doctrine of Lucretius. Moreover, this argument is chiefly designed against Plato and Anaxagoras: the first of whom held that all things are animated and sensible: the latter, that all things are in all things in such a manner that the insensible parts of things are mixed with the sensible. Thus both they and their followers held, that sensibles proceed from sensibles.

Ver. 861. In these fifteen verses, he proposes another argument. Let us suppose, says he, with Plato and Anaxagoras, that these sensible, as they will have them to be, and consequently soft principles of things, can be eternal, and not subject to dissolution; yet they cannot be said to be sensible; neither as parts, because separated parts have no sense; for each part requires a union with the other parts to make it capable of sense: and without a vital consent and accord of the parts, there is no sense whatever; nor as wholes, because they then would be a certain kind of animals, and therefore mortal and corruptible, which contradicts the supposition.

Ver. 875. He goes on, in these five verses; because, says he, though they be admitted both as animals, and as immortal too, yet not an animal, at least like any of those we now see, would, or could be generated, that is to say, of its own, or combined into one species; but only a heap or crowd of various animalcules. Thus Gassendus: but Faber gives it another interpretation. Let it be granted, says he, that the principles are sensible; and since you will have so, not corruptible neither. What after all could be produced of them? Certainly nothing but animals: no tree, no metal, &c.

Ver. 880. In these eight verses, he derides those who assert, that atoms are indeed endowed with sense, but not with that which appears afterwards in the animals that are made of those atoms: to which he subjoins another argument, like that which he alleged above, at v. 820. Birds, says he, are made of eggs, and worms of rotten earth; but, who ever yet pretended that the eggs were sensible, or the putrid clods alive?

Ver. 888. But some perhaps will say, that the principles of things are indeed insensible, but that by the power and virtue of the thing that generates, those principles are changed into sensibles, and enjoy sense before they combine into an animal. To this Lucretius answers, in these fifteen verses, that the principles, separately taken, are altogether incapable of change; and that the sense of no animal can be produced before the animal itself be perfect, because sense requires

such a consent and agreement of vital motions, as we should in vain expect in the principles of things, which fly confusedly scattered up and down in the air, the earth, the water, and fire. Here the poet seems to hint at those philosophers, who taught that all things are made of the four elements.

Ver. 903. The poet pursues his subject; and, in these ten verses, appeals once more to the truth of experience. For, says he, a violent stroke which only dissolves the texture and connection of the little bodies of which the animal consists, takes away all manner of sense; the animal is stunned, the soul is dissipated; and its particles being dispelled through the pores and issues of the body, death inevitably ensues.

Ver. 913. In these ten verses, he declares, that if the stroke be something weaker, all things may be restored to their former state, after some small discomposure of the little bodies; the disposition to vital motion still having the upper hand; and not being quite broken and dissolved. Thus the stunned senses revive afresh, the animal returns from the very gates of death, and recovers its former convalescency.

Ver. 923. In the next place, he proves, in these ten verses, that the seeds of pleasure and pain are therefore void of all sense; because, as pain proceeds from the violent expulsion of the seeds out of the state in which they are; so pleasure arises from the restoring of them into the same state again. But the principles of things are simple; nor can their parts be driven from the state in which they are, nor restored into the same state again. And, thus since the atoms are incapable of being affected with pleasure or with pain, they must be destitute of all sense.

Ver. 934. In these twenty-three verses, he compels his adversaries to mere absurdities. For, if things, because they are sensible, must be made of sensibles likewise, that is to say, like things of like; men, for example, must, of necessity, consist of principles, which even themselves laugh, weep, discourse, and reason concerning the mixture and composition of things, and even of their own selves, and inquire into what principles they are made of; for men laugh, weep, discourse, and reason. But if laughing, weeping, and wise things can be composed of principles that neither laugh, weep, nor are wise, why should not sensible things proceed from principles that are wholly insensible? He also urges another absurdity: for if you assent that laughing, weeping, &c. things proceed from laughing, weeping, &c. principles, even those seeds must be composed of others that are like them, and they again of others: and thus the progression would be infinite, and never at an end.

Ver. 937. I have already observed, book i. ver. 925, that these two verses are in the third book of Cowley's *Davidis*.

Ver. 955. He concludes, in these thirty-two verses, this long disputation concerning the production of sensible things: he recapitulates his former arguments, urges them yet more home,

weight, on which the other conjuncts depend. For motion, concurrence, and stroke, are a consequence of weight. The two events are their site, and order, on which the other events likewise depend: for the intervals and connections depend on the site and position of the atoms; and the ways, places, or regions, on their order. Moreover, Lucretius will have all the qualities of concrete things to proceed from all the conjuncts and events of the atoms; though Epicurus seems to acknowledge but three of them to be necessary: Figure, site, and order; as may be seen in Laetius, lib. x. Empiricus adv. Phys. lib. ii. and Lactantius, lib. iii. cap. 17. And as to the manner how all the qualities of concrete bodies proceed from these three last conjuncts and events of the atoms, you may consult P. Gassendus, l. 10. in Laert. pag. 218. & 317. where all those matters are at large explained.

Ver. 989. The seeds being now rightly prepared, and instructed with motion, he requires a work of them, than which nothing is greater, nothing more prudent, nothing more noble.

He builds with them other earths, other suns, other stars, and in a word, innumerable worlds in the infinite void. He owns this opinion to be new and incredible, but will not have it therefore rejected: And would his Memmius be attentive to his arguments, and weigh the matter seriously, it would daily appear less and less strange and wonderful; for many things seem indeed astonishing for a while, to which when men are once accustomed, they no longer suspect the truth of them *ἀλλὰ μὲν τὸ Κόσμοι ἀπειροὶ εἰσὶ οἷοι* *ἐμοὶ τῆς αἰτίας, οἷα τ' ἀνόμοιοι*; says Epicurus to Herodotus.

Here the translator has totally omitted the four following verses of his author:

*Quærit enim ratione animus, cum summa loci sit
Infinita foris hæc extra mœnia mundi;
Quid sit ibi porro, quò prospicere usque velit mens,
Atque animi jactus liber quo per volet ipse.*

And indeed the interpreters vary in opinion concerning them; some retain them absolutely, others as positively reject them. In my opinion, they are neither absurd nor useless: for they explain the argument of the subsequent disputation; and the meaning of them is this: For I ask, says Lucretius, since without the walls of this world, these visible heavens, there is an infinite space, what is contained in that space, into which the mind is desirous to look, and by its own strength can freely consider without any hindrance or obstruction. This is the interpretation our translator himself gives this passage in the Latin edition of Lucretius.

Ver. 1006. If you will give credit to Epicurus, it is certain, that there is an infinite void; and that an infinity of seeds are flying up and down in it; but all those seeds did not combine into one body to compose this world of ours: Why then should we not believe, that in other parts of the infinite space, some atoms compose other frames, very like, or unlike this world which we inhabit

and behold: especially since the same nature reigns every where, and exercises the same power in all the parts of the infinite void. This argument is contained in nineteen verses. Epicurus himself writes thus to Herodotus: *αἱ τὴ γὰρ ἀτόμοι ὅσαι φέρονται τὸ πόρρω ταύτη, τὴ ἀλλήλοι· ἀλλὰ εἰς ἀπερὶασίαν κόσμων ἀπείρων συναρχονται· ὃ γὰρ κατηνάονται αἱ τοῦτοι ἀτόμοι (ἐξ ὧν ἂν γένοιτο ὁ κόσμος οὗτος, ἢ ἐξ ὧν ἂν ποιηθείη ἄλλος) ὥτ' εἰς ἓνα, (so Niebomius reads it) ὥτ' εἰς πεπερασμένους, ὥτ' ὅσοι τοῦτοι ὥδ' ὅσοι διάφοροι τῶν, ὥς ἂν τὸ ἐμπόδιζον ἐστὶ πρὸς τὴν ἀπειρίαν τῶν κόσμων.*

Ver. 1025. In these nine verses, he argues farther to this purpose. When all things that are requisite for the production of any thing are ready and at hand, why should not that thing be produced? But there is a sufficient store of matter, a place besides very proper; nor is there wanting that strength and power of nature, which composed this world of ours, of atoms that met fortuitously, and combined and joined together: Why then should not the same nature join together other matter likewise, which is prepared for her, and obedient to her; and produce other heavens, other earths, other seas, men, animals, &c. in other places of the infinite void? Metrodorus, an intimate friend of Epicurus, has comprised this and the preceding argument in these words: *ἀτοπον εἶναι ἐν μεγάλῳ πεδίῳ ἓνα τὰχὺν γινέσθαι, καὶ ἓνα κόσμον ἐν τῇ ἀπείρῳ· ὅτι δὲ ἀπειροὶ καὶ τὸ πλῆθος δῆλον ἐν τῇ ἀπείρῳ τὰ αἰτία εἶναι· εἰ γὰρ ὁ μὲν κόσμος πεπερασμένος, τὰ δὲ αἰτία πάντα ἀπειρα ἐξ ὧν ὅδε ὁ κόσμος γέγονεν, ἀνάγκη ἀπειροὺς εἶναι, ὅτε γὰρ τὰ πάντα γέγονεν αἰτία, ἐκὲν καὶ τὰ ἀπολείεσθαι.* Plutarchus de Placit. Philosoph. lib. i. cap. 5.

Ver. 1034. Lastly, He proposes his third argument in these ten verses. Consider all created things, you will find in each kind a numerous train of like animals, which are called individuals: as in the human kind, men; in the brute, beasts, &c. Will you then pretend that there is only one sun and one earth; since the sun, the earth, the heavens, &c. are alike subject to perish, as are the other compound bodies. For according to the doctrine of those philosophers, against whom Lucretius here disputes, the reason why the several kinds of animals contain many of each kind is, because the individuals die.

Thus our poet ends his arguments to prove the plurality of worlds. But Epicurus and Lucretius were not the only men who held an infinite number of worlds. For, to say nothing of Plutarch, who, in the first de Placit. Philosoph. says expressly, there are many worlds: nor of Heraclitus, who, together with the Stoics, held an innumerability of worlds successively, as they call it, that is to say, that the worlds were renewed and made out of one another: nor of Heraclides, who, as well as the Pythagoreans, believed all the stars that glitter in the heavens, and light this globe of ours, to be so many other worlds: not to mention, I say, any of these, it is certain, from the testimony of Stobæus, Eclog. Phys. lib. ix. that Anaximander, Anaximenes, Archelaus, Xenophanes, Diogenes, Leucippus, admitted an in-

finite number of worlds. To these we may likewise add Anaxarchus, who, as Plutarch says, drew tears from Alexander the Great, by telling him, that the number of worlds was infinite. Democritus and Epicurus spoke aloud, that there were infinite worlds: And their disciple Metrodorus too was of the same opinion, and said, that it is no less absurd to imagine that there is but one world in the infinite universe, than it would be to affirm, that but one blade of corn is growing in a vast, spacious, and fruitful plain: as Plutarch witnesses in the place above cited. Thales indeed affirmed there is but one world, and that it was created by God. Empedocles too taught the same doctrine; but then he held it to consist of a very small particle of the universe. Yet why may there not be an actual multiplicity, though not an infinity of worlds: let us content ourselves with the belief of a possibility that there may be more than we know, or are aware of: For indefinite is not infinite; man may not find the term, and yet a term there may be. Let us only modestly remember to reserve the infinite, which the divines term *essentia*, that the speculation may be the safer. The rational and acute Bruno has travelled far on this argument, and strives to evince that there is a plurality of worlds: and for my part, so long as the considerations of these things rather adds to, and heightens the adoration of that infinite power of the great God, who, even by the author of the epistle to the Hebrews, is more than once only said to have created the worlds, Heb. i. 2. and xi. 3. I cannot see why we should censure such as have favoured and promoted these doctrines and opinions: among whom, besides the ancients before mentioned, are many of our late and best astronomers, as Kepler, Tycho Brahe, Galileo, Des Cartes, Gassendus, Hevelius, and divers others of extraordinary note and reputation: Yet we need not be obstinate, or too dogmatical, "*adeo nefas existimandum est ea scrutari, quæ deus voluit esse celata,*" says Lactantius in his treatise de Origine Erroris. And whether or no there be more worlds than one, God only knows, who is both *intus* and *foris*; not as *in loco* but as being "*ens infinitum, principiumque, cui omne innititur ens.*" I will therefore conclude this infinitely confounding and incomprehensible subject with these very pertinent words of Pliny, who, speaking of the globe of this vast universe, says: "*Furor est, profecto furor est egredi ex eo, et tanquam ejus cuncte plane jam sint nota, ire scrutari extra: quasi verò mensuram ullius rei possit agere qui sui nesciat, aut mens hominis videre quæ mundus ipse non capiat.*" Nat. Hist. lib. ii. cap. i. It is a madness, indeed a mere madness, to go beyond the limits of this world, and to be perpetually seeking without it; as if we had already attained a perfect knowledge of the things that are within it: For how can he, who knows not his own, take the exact dimensions of any thing else: or how should the wit of any man pretend to perceive those things, which the very world itself cannot comprehend or contain?

Ver. 1644. In these fifteen verses, Lucretius, after his usual manner, takes occasion from the foregoing positions, to fall foul upon Providence: He has before given peace and quiet to his gods; because nothing can be happy that has any thing to do: But let us now suppose, says he, that this blessed and happy Deity can be disturbed and vexed with business or the care of any thing: yet what strength, what power is sufficient to preside over, and to govern an infinite number of worlds, of suns, of earths, &c.? For to rule an infinite number of worlds, is too great an office to be administered with ease, even by a god who would be always busy, and allow himself no rest at all. Thus our impious poet treats that puny god, whom he feigned to be like man; and at length he concludes the whole with a scoff that atheists commonly advance, and which indeed is of more weight than this argument against Providence. Epicurus writes to the same purpose to Pythocles: *Καὶ μὲν ἐν τοῖς μισαῖροις φόβον, καὶ τροπὴν, καὶ ἐκλείψιν, καὶ ἀναβολὴν, καὶ δύσιν, καὶ τὰ σύστοιχα τῶν τοις, μήτε λείψανός τις νομίζειν χρῆναι δέσσειν, μήτε διατάτοντος ἢ διατάξαντος, καὶ ἕνα τὴν πᾶσαν μακαριότητα ἔχοντος, μετὰ ἀφθαρσίας ὃ γὰρ συμφέρονσι πραγμάτων, καὶ φροντίδεις, καὶ χάριτες μακαριόντι, ἄλλα ἀσθενείᾳ καὶ φόβῳ, καὶ προσδήσει τῶν πλησίων.*

Thus we see that Lucretius was so inveterate an enemy to the Divine Providence and Omnipotence, that he could not comprehend what Virgil not long after him visibly saw and believed, when in his 4th Georg. verse 221. he said,

—Deum namque ire per omnes
Terrasque, tractusque maris, cælumque profundum, &c.

But the doctrine of Epicurus would not suffer our poet to believe, that the nature of our gods was sufficiently powerful to govern the affairs of the universe; and therefore he held, that all things arrive by accident, and that chance is the supreme disposer and governor of all. Plutarch tells us, that he embraced this opinion, having observed, "*Malis esse bonè, et bonis male:*" i. e. to use the words of St. Ambrose, "*Improbos abundare bonis, et bonos egere:*" That the wicked abound in good things, and that the good are in want. An impious belief, which even Cicero himself condemns in the first book of the Nature of the Gods, where he says: "*Sunt philosophi, et fuerunt, qui omnino nullam habere censerent humanarum rerum procuracionem Deos. Quorum si vera est sententia, quæ potest esse pietas, quæ religio? Hæc enim omnia pure et caste tribuenda Deorum numini ita sunt, si animadvertuntur ab his, et si est aliquid a Diis immortalibus hominum generi tributum. Sin autem Dii neque possunt nos juvare, neque volunt, nec curant omnino, nec, quod agamus, animadvertunt, nec est, quod ab his ad hominum vitam permanere possit, quid est, quod ullos Diis immortalibus cultus, honores, preces adhibeamus? In specie autem fictæ simulationis, sicut reliquæ virtutes, ita pietas inesse non potest, cum qua simul et sanctitatem et religionem tolli necesse est.*"

Quibus sublatis perturbatio vitæ sequitur et magna confusio: atque haud scio an pietas adversus Deos sublata, fides etiam et societas humani generis, et una excellentissima virtus justitiæ tollatur."

Ver. 1049. "Proh sancta Deum tranquilla pectora pace!" says Lucretius. And Epicurus is observed by Dionysius, bishop of Alexandria, to fill his books with oaths and adjurations: "Ὁρκας δὲ καὶ ὀρκίσματα μυρίαις τοῖς ἑαυτοῦ βιβλίοις ἀγλίζει, θμύνει τε σαυικῶς μὰ Δία, καὶ νῆ Δία ἑξορκῶν τὰς ἐνληχανόνας, καὶ πρὸς ὧς διαλέγοιτο, πρὸς τῶν Θεῶν." Eusebius, Prep. lib. 14. cap. 27. He asserts many oaths and adjurations in his books, swearing often, and adjuring his readers by Jupiter and all the gods. And we may find Lucretius too sometimes of this humour, as appears by this passage, and some others, that may be observed here and there in this poem.

Ver. 1059. Having built an infinite number of worlds, and affirmed them to be mortal like animals, he now, in these twelve verses, asserts, that they are nourished, increase, and sometimes diminish, and at length die away. For the infinite universe supplies seeds, which the world receives, and they duly joining with it, it becomes more strong and vigorous: when it emits, and parts with as many seeds as it receives, then it stints its growth, and stays at a stand, that is, neither increases nor decreases: but when more seeds fly away from the world than it receives, and are duly conjoined to its mass, then it waxes feeble, decays by degrees, and draws to an end.

This was the opinion of Epicurus, and he grounded this belief on these reasons: I. Because the world was once made, and had its beginning in time: as Cicero says, 1. de Nat. Deor. II. Because he held the world to be of a like nature with animals. III. Because each individual part of this world consists of bodies that are born and die. IV. Because there is a continual war between all the parts that compose this whole, which are always contending with one another, and which contention must of necessity weaken, and will at length occasion the destruction of the whole frame. V. Because he would not allow any thing in nature to be not born, incorruptible and eternal, except these three things, the atoms, the void, and the τὸ πᾶν ALL, or the universe. But these opinions of his concerning his infinite worlds, or the decay of this, depending on his absurd, fortuitous concurrence, must of necessity have the same fate, and fall with it. Besides, we may bid any man, who is fond of these opinions, look on the face of the world, as it is painted in histories down from the Trojan wars, (for I press not more ancient, infallible records), about which time society first began, and he will see it look as young now, as it did then, and that its vigour is still as great.

However, some of the fathers of the Christian church have not dissented from this opinion: especially not St. Cyprian, who writes to Demetrianus in these words: "Scire debes jam mundum non illis viribus stare, quibus prius steterat: nec vigore ac robore eo esse, quo ante prævalebat.

Hæc, etiam nobis tacentibus, et nulla descripturis sanctis prædicationibusque divinis documenta præbentibus, mundus ipse jam loquitur, et occasum sui rerum labentium probatione testatur. Non hyeme nutriendis feminibus tanta imbrium copia est: non frugibus æstate torrendis solita flagrantia est: nec sic verna temperie sata læta sunt; nec adeo arboreis sætibus autumnò sæcunda sunt: Minus de effossis et fatigatis fontibus eruntur marmorum crusta: minus auri et argenti opes fuggerunt: exhausta jam metalla, et pauperes venæ breviantur in dies singulos: Decrescit in arvis agricola: in mari nauta: miles in castris: innocentia in foro: justitia in judicio: in amicitia concordia: in artibus peritia: in moribus disciplina. Minuatur necesse est, quidque sine jam proxima in occidua, et in extrema devertit."

Ver. 1067. Ovid. Metam. xv. ver. 214. says to the same purpose with Lucretius.

Nostra quoque ipsorum semper, requique sine ulla,

Corpora vertuntur: nec quod fuimusve, sumusve, Cras erimus. — — —

Which Dryden thus renders:

Thus even our bodies daily change receive;
Some part of what was theirs before they leave:
Nor are to-day what yesterday they were:
Nor the whole same to-morrow will appear.

Ver. 1071. Having asserted that his worlds grow sometimes bigger, sometimes less, he explains in these twenty-seven verses the whole reason of the growth and decay of animals, and affirms that the same reason holds good in other things likewise. Now animals grow, because in the first part of their life, more nourishment is converted into their substance, than departs, and is lost from it: in the middle part of their life, when they are grown to maturity, as much only is converted into the substance, as goes away from it: then the age of the animal is at a stand; that is to say, the animal neither grows nor decreases; but in its declining age, more flies away from its substance, than is converted into it. Thus the animal increases and wastes away: but how it comes to pass, that in the first part of life more is received and conjoined, in the middle part as much, and in the last less, the poet does not think fit to inquire: And indeed the reason of that is concealed, and to my knowledge ever will be so from atheism.

Ver. 1074. Thus Cicero, in the second book de Nat. Deor. describes the manner by which the food is distributed into all the parts of the body. It is first, says he, received into the mouth to be chewed and ground to pieces by the teeth; when it is thus chewed, it is conveyed through the meat-pipe into the stomach, to be concocted; when it is there concocted, it is carried first to the liver, then to the heart, and is distributed from thence by the veins into all other parts and members of the body: and by this means and manner it is, that the whole animal grows, and is nourished.

Ver. 1081. Virg. Georg. 3. v. 66.

Optima quæque dies miseris mortalibus ævi
Prima fugit: subeunt morbi, tritisque senectus;
Et labor, & duræ rapit inclementia mortis.

In youth alone unhappy mortals live;
But ah! the mighty bliss is fugitive:
Discolour'd sickness, anxious labours come,
And age, and death's inexorable doom. *Dryd.*

Ver. 1098. He concludes in these thirty verses, that the world grows old in the same manner as animals do; that is to say, that the conduits and passages in the world, which answer to the veins in animals, being impaired and weakened by the continual blows they meet with from external bodies, receive with great difficulty the matter that flows down out of the infinite void, and is proper to support and repair the world. And this mighty frame is extended so far and wide, that it parts with more matter out of its substance, than it receives afresh from the void; and, therefore, must of necessity diminish, grow feeble, and decay. The earth, as Epicurus held, produced formerly of her own accord, all kinds of animals, fruits, trees, &c. but we now find by experience, that she is past her teeming time; and, therefore, it cannot be denied but she now grows old.

Ver. 1105. I affirm, says the poet, that all these things did proceed from the earth: for animals were not let down from heaven, as the asserters of Providence pretend, by that chain, which none but one Homer ever saw: nor were they born of the sea, or from the waves that insult the shores. But that very earth, which at this day feeds and nourishes all kinds of things, is the very same earth that formerly brought them forth.

Ver. 1108. Homer feigned that all things were let down from heaven to earth by a golden chain. Yet, if we may take Plato's word for it, Homer meant only the sun, and shows that to be a chain of gold; because, while the sun rolls round the universe and enlightens it, all things are safely preserved, and live and flourish, as well as those that are among the gods, as in our earthly abodes. But if the sun should stand still, and cease from his revolution, as if he were bound in chains, all things must of necessity perish. Macrobius on the dream of Scipio, will have that chain of Homer to be an uninterrupted connection of causes, that bind themselves together by mutual bands, even from the Supreme God to the last dregs of matter. "Cumque omnia continuis successionibus se sequantur, degenerantia per ordinem ad imum meandi; inveniatur pressius intuenti à summo Deo usque ad ultimam rerum sæcem una mutuis se vinculis religans, & nusquam interrupta connexio: & hæc est Homeri carena aurere, quam pendere de cælo in terras Deum jussisse commemorat." Macrobius in Somn. Scip. lib. i. cap. 44.

Ver. 1111. Thus too Ovid, Metamorph. i. ver. 101.

Ipsa quoque, immunis rastroque intacta, nec ullis
Saucia vomeribus, per se dabat omnia Tellus.

And v. 107.

Ver erat æternum, placidique tepentibus auris
Mulcebant Zephyri natos sine semine flores.
Mox etiam fruges tellus inarata ferebat,
Nec renovatus ager gravidis caneat aristis.
Flumina jam lactis, jam flumina Nectaris ibant,
Flavaque de viridi stillabant ilice mella.

The teeming earth, yet guiltless of the plough,
And unprovok'd did fruitful stores allow.
The flow'rs unsown, in fields and meadows reign'd,
And western winds immortal spring maintain'd.
In foll'wing years the bearded corn ensu'd
From earth unask'd, nor was that earth renew'd
From veins of valleys milk and nectar broke,
And honey sweated through the pores of oak.

Dryd.

To which I subjoin these incomparable verses of the same poet, in his translation of the fourth eclogue of Virgil:

Unlabour'd harvests did the fields adorn,
And cluster'd grapes then blush'd on ev'ry thorn:
The knotted oak did show'rs of honey weep,
And through the matted grass the liquid gold did creep.

Ver. 1115. The earth is become so barren, that though we provoke her by constant tillage, even till we weary our oxen, and wear out our peasants with continual labour, yet the ungrateful soil deludes the hopes of the tiller, and produces not the crop he had reason to expect from his toil and industry. An evident and convincing proof, that the earth is now grown old and worn out to that degree, that she can no longer bring forth as she did in her youthful years.

Ver. 1121. The poet has subjoined to the argument taken from the doctrine of Epicurus, the poetical fable of the Golden Age. But being jealous that men would ascribe the fertility of the earth in those days to the benevolence of the Deity, and to the bounty and goodness of the gods to the pious men of that age, he scoffs at that opinion, and despises their ignorance, who do not yet know that the earth is grown feeble and barren with old age.

Ver. 1123. Because in the beginning of the world, men had nothing to do but to worship the gods: since the earth then produced the fruits of its own accord, and they had no need to employ their time in tilling it.

ANIMADVERSION,

BY WAY OF RECAPITULATION, ON THE SECOND BOOK OF LUCRETIVS.

IN this book are deposited all the treasures of Epicurus; of no great value indeed; yet many of the ancients were continually pillaging them, till at length Tully entirely rifled and laid them waste. Lucretius with great labour strove to renew and establish them again; but has met with the suc-

cess he deserved: for it has fared with the doctrine of Epicurus, as with a child of a sickly race; though you cram it with the most nourishing and healthful food, it will at best be puny and infirm.

From v. 68. to v. 82. the poet teaches, that there is motion, nor do we disown it. And that the motion of all things proceeds from the motion of the principles; and this too we grant. But when, v. 84. he ascribes weight to the seeds, and asserts that to be the cause of their motion, he is too indulgent to himself and his atoms. Who can grant weight to all matter, and the same weight to bodies of the same bulk? Sense and certain experience cry out against it. But Epicurus had observed, that stones, wood, in short, all things that are contained within the bounds of this world tend downwards; and, therefore, believed that all things had descended from all eternity; which opinion, whoever embraces, will indeed be "nitidissimus de grege Epicuri Philosophus." He may as reasonably pretend, that the wheels, springs, or any other of the members and parts of an engine, will do the same thing separately, which they perform jointly. But, let us even grant this too. He presents us in the next place with infinite atoms, tending downwards through an infinite void by just degrees, and with equal velocity. In the immensity of the longitudes, latitudes, and altitudes, an infinity of innumerable atoms are flying to and fro: and these atoms overtaking, and laying hold of one another in the interjected void, cling and join together, and thus compose all the forms and figures of things. But how came they to overtake and catch hold of one another, since they all move with equal swiftness? To this he answers, v. 210. and says, they decline a little, even the least that can be. But even this declination is feigned at pleasure; for, as Cicero says, 2 de Finib. "Ait declinare Atomos sine causa, quo nihil turpius est Physico: & illum motum naturalem omnium ponderum, è regione inferiorem locum petentium, sine causa eripuit atomis: Nec tamen id, cujus causa hæc fing erat, affectus est: nam siue omnes Atomæ declinabunt, nullæ unquam cohærescent; siue aliæ declinabunt, aliæ suo motu recte ferentur: primum erit hoc quasi provincias Atomis dare, quæ recte, quæ oblique ferantur." For he says that the atoms decline, without alleging any reason for their declination, than which nothing is more unbecoming of a natural philosopher. And without any reason likewise he has taken from the atoms that natural motion of all weights, that tend in a direct line to a lower place. Nor after all has he gained the point, for the sake of which he invented all this; for either all the atoms will decline, none will ever stick together; or some will decline while others move, as they naturally ought in a right line. And this is, in a manner, to prescribe to atoms their proper offices, and to enjoin some to descend in a direct line, others obliquely.

Lucretius himself is aware of this difficulty, v. 216. where he is so far from solving it, that he rather yields and submits to its strength. But, v. 240. he starts another difficulty, by the help of

which he endeavours to extricate himself from the former: or like the cuttle-fish, throws out clouds of darkness and obscurity, that it may be more difficult to find and take him. For he asserts, that without this declination of the seeds, no reason can be given for the freedom of will which we perceive in all animals. But the same Cicero in the first book of the Nature of the Gods, answers him thus: "Hoc persæpe facitis, Epicurei, ut cum aliquid non verisimile dicatis, & reprehensionem effugere velitis; efferatis aliquid quod omnino ne fieri possit: at satius fuerit illud ipsum, de quo ambigebatur, concedere, quam tam impudenter resistere; velit Epicurus, cum videret, si Atomæ ferrentur in locum inferiorem suo pte pondere, nihil fore in nostra potestate, quod esset, earum motus certus & necessarius: invenit quo modo necessitatem effugeret, quod viz. Democritum fugerat: Ait Atomum, cum pondere & gravitate directo deorsum feratur, declinare paulum. Hoc dicere turpius est, quam illud, quod vult, non posse defendere." The custom of you Epicureans is this; when you assert any thing that is improbable to be true, and are desirous to avoid reprehension, you advance something that is wholly impossible to be done; but you would act more ingenuously, if you granted the matter in doubt; rather than insisted so obstinately on your own opinions, like Epicurus, who, when he saw that if the atoms were moved downwards by their own weight, nothing would be in our power, because their motion would be certain and necessary, found a way which Democritus never thought of, to avoid this necessity; and said, that an atom, though by its own weight and heaviness it be carried directly downwards, yet declines a little. To say this is more weak and dishonourable than not being able to make good what he asserted. And in his book, De Fato, Cicero likewise says: "Epicurus uno tempore, res duas suscipit inenodabiles; unam, ut sine causa fiat aliquid, ex quo existet, ut de nihilo quippiam fiat; quod nec ipsi, nec cuiquam Physico placet; alteram, ut cum duo Individua per Inanitatem ferantur, alterum è regione moveatur, alterum declinet." Epicurus takes upon him at once to make good two things, for either of which no reason can be given: one, that any thing can be done without a cause; from whence it will follow, that any thing can be made of nothing; which neither himself nor any natural philosopher will allow: the other, that when two indivisible bodies are moved through the void, one of them should descend in a straight line, the other by declination. And, in the same book he goes yet farther; and says, "Quæ ergo nova causa in natura est, quæ declinat Atomum? aut num sortiuntur inter se, quæ declinet, quæ non? aut cur minimo declinet intervallo, majore non? aut cur declinet uno Minimo, non declinet duobus aut tribus? Optare hoc quidem est, non disputare; nam neque extrinsecus impulsam Atomum loco moveri & declinare dicit, neque in illo Inani, per quod feratur Atomus, quidquam fuisse causæ, cur ea non è regione ferretur, nec in ipsa Atomo mutationis aliquid factum est, quamobrem naturalem

fui ponderis motum non teneret. Ita cum attulisset Epicurus nullam causam, quæ istam Declinationem efficeret, tamen aliquid sibi dicere videtur, quam id dicat, quod omnium mentes aspernentur & respuant." What new cause is there then in nature that can make an atom decline? Or have they cast lots among themselves which shall decline, and which not? Or, why does an atom decline the least interval of space, and not a greater? Or, why does it decline one least, and not two or three? This is to choose what he will say, not to dispute: for he neither says, that an atom declines in its motion, by reason of any outward impulse, nor that in the void through which the atom is moved, there is any cause why it does not descend in a direct line; nor, lastly, that any change is made in the atom itself that may oblige it not to keep and observe the natural motion of its own weight. Thus, though Epicurus alleges no cause of that declination, yet he seems to himself to say something, even when he says that which the understanding and reason of all men despise and reject. And thus Cicero has laid waste the gardens of Epicurus, and overthrown all that philosophy that attacked even Providence itself.

But Lucretius is more successful in that long disputation, from v. 319. to v. 547. concerning the variety of the figures of his atoms: and likewise in that of the seeds of different figures that enter into the contexture of every compound body, which begins at v. 547. and ends at 683. He also adorns his arguments with fables properly introduced and applied, and supports his assertions with several strong and convincing reasons.

Nor will any adversary of the Epicurean philosophy ever be able to evade those arguments, by which, from v. 684. to v. 988. he demonstrates, that his atoms are void of colour, smell, heat, in a word, of every quality, and of all manner of sense. I confess he does not rightly explain the origin of sense, but he proves, that the sense of animals is not due to sensible seeds, which was his chief design in this book, with a sharpness of wit and strength of judgment, even worthy of Lucretius himself.

At length, from v. 989. to v. 1059. he builds

innumerable worlds: and this too might have been granted, if he had assigned any proper architect for so great a work. "Sed quis credit ex Atomorum Concurfione fortuita hujus Mundi pulcherrimum ornatum esse perfectum? An cum machinatione quadam aliquid moveri videmus, ut Sphæram, ut Horas, ut alia permulta, non dubitamus quin sint opera illa rationis? Cum autem impetum Cœli cum admirabili celeritate moveri, vertique videamus, constantissime conficientem vicissitudines anniversarias cum summa salute & conversatione rerum omnium, dubitamus quin ea non solum ratione fiant, sed etiam excellenti quadam divinaque ratione? Quod si Mundos efficere potest Concurfus Atomorum, cur Porticum, cur Templum, cur Domum non potest, quæ sunt minus operosa, & multo quidem facilia." Cicero, de Nat. Deor. lib. 2. Who can believe that this most beautiful frame of the world was produced and perfected by a fortuitous concourse of atoms? When we see any thing move, as it were by art and skill, as the spheres, the seasons, and many other things, do we doubt whether they are the works of reason? When we see with what wonderful celerity the sun is moved and whirled around, and how he causes the annual changes and vicissitudes to the utmost benefit and preservation of all things, do we doubt that all these things are not the work of reason, nay, of an excellent and divine reason too? And if a concourse of atoms can make worlds, why can it not make a portico, a temple, or a house, which requires less skill and labour, and are much more easy to make? Thus Cicero, that most grateful champion of Providence.

Lastly, from v. 1060. to the end of this book, the reader may behold innumerable worlds born daily, and dying every day, and bless his own good fortune, that he remains safe and unhurt in the midst of so many and so great ruins and devastations. Meanwhile, he cannot but smile to see some infant sucking worlds, and others grown feeble and doddered with age; now dying with hunger, now choked up with fat. For nothing is more certain, than that Lucretius always loses himself when he falls foul upon Providence.

PREFACE TO THE READER.

THIS is that book of Lucretius, which, above all the rest, ought to be read with most judgment and discretion. For, since it is in this that the poet endeavours to prove the soul to be of a corporeal nature, it may fall out that some will too credulously yield themselves up to his arguments; while others, persuaded that such a doctrine, right or wrong, ought to be condemned without mercy, will voluntarily deprive themselves of reading so excellent a book. Lest this should happen, it will not be amiss to put them in mind that many of the ancients were of opinion, that spirits are to be

reckoned in the number of corporeal things. Among those was not only Porphyrius, in his admirable *Περὶ ψυχῆς καὶ ἀποχρῆς*; but Plotinus and Jamblichus; and of us Christians, Tertullian, Basil, and Augustin, not to mention the more modern. Now, if these ancients were not condemned for following this belief concerning spirits, I think there is no reason that we should be so much offended at Lucretius's opinion of corporeal souls. Hitherto is nothing but what you may read without being scandalized at it. And would to God Lucretius had stopped here: For others have as-

serted the immortality of the soul, which, nevertheless, they believed to be of the same nature with spirits; however, they reserved to it its own right, or what the bounty of God has bestowed upon it. But our author, when he has shown the soul of a man to be a corporeal substance, strenuously and obstinately asserts, that it is impossible but that it must likewise be subject to death and dissolution; and that the generality of men being astonished, cast down, and overawed by the tyranny of religion, are horribly mistaken, to believe, that *Æternas nigra pœnas in morte timendum.*

Lucret.

they have any reason to dread eternal torments after death. Thus you see the rocks and shelves that you ought to avoid and fly from and you will do well to compare this doctrine of the Epicurean sect with the arguments of the Platonists, who asserted the immortality of the soul: but much better, if laying aside the disputations and controversies of this wavering and uncertain philosophy, you apply yourself directly to him, who has demonstrated, that the Parent and Father of all things is **GOD OF THE LIVING, BUT NOT OF THE DEAD.** Another thing, reader, you ought continually to have before your eyes, which is this: Be our souls spiritual, or if you will, corporeal: yet we ought not much to trouble our heads about these arguments of Lucretius, since being Christians, as we are, we verily and unfeignedly believe, that the time will come that this brute and senseless mass of the body, which the soul now informs and guides, when after a

course of years it is turned into corruption and dust, and then scattered and dispersed away, will, nevertheless, at length unite again; and being thus collected and got together out of water, air, and earth, will remain and persevere for an endless succession of ages. Let Lucretius then prove, if he will, the nature of the soul to be corporeal, and therefore liable to death; he will advance nothing that will startle a true Christian; since we believe the future resurrection and immortality of the body, upon surer grounds than any arguments of vulgar physiology, and of chemistry itself (for that wonderful experiment, of which Quercetanus and others make mention, concludes nothing for the resurrection of the body), though they are equally, nay, more difficult to prove and believe. Let me add one thing more. The treatise of Tertullian, which is intitled *De Anima*, will assist you very much in the right understanding of this book: if you read it, you will peruse the most excellent work of that great man. To conclude, If in this book, or in any other of my writings, the false opinions of Lucretius have dropped from me, either through haste or inadvertency, I desire it may be remembered that I am the actor, not the poet; and that I here unsay and recant all things of that nature which may have slipped from me by either of those means. Nor, indeed, is my course of life such, that when my soul comes to be separated from my body, I should willingly expect that end which nature has ordained for the brute animals that perish. Farewell.

TANAQUIL FABER.

BOOK III.

THE ARGUMENT.

THE poet flatters himself, that, in the two former books, he has fully and rightly explained the nature, and the properties of his atoms. In the four remaining books, he applies himself very attentively to describe the effects which those atoms produce. And first, as he had reason to do, he brings upon the stage the parts of the mind, and of the soul: And this is the subject of the disputation of all this book, which he begins, I. With the praise of Epicurus, whom, from ver. 1. to ver. 92, he extols for having been the first who taught, that this world, and all things in it, were not made by the Deity, but by a fortuitous concurrence of atoms; and for delivering, by that doctrine, the minds of men from the fear of the gods, of death, and of punishments after death. II. Having by way of preface, said this of Epicurus, he teaches, from ver. 92. to ver. 133, that the mind and the soul are a part of man, in like manner as the feet, the hands, the arms, the head, and the other members; and not a vital habit of the whole body, or an accord and consent of all the parts of the body, which some of the ancient philosophers called harmony. But that he may dispute distinctly, and without confusion, because he uses promiscuously the words mind and soul, he teaches, III. from ver. 133. to ver. 160. that the mind and the soul are but one thing; but that the mind is the chief part, and resides in the heart, because fear, joy, and all the other passions, which obey and depend on the mind, discover themselves there, while the soul, in which the locomotive faculty is solely placed, being diffused through the whole body, is moved as the mind pleases. IV. Then, from ver. 161. to 177, he endeavours to demonstrate, that the nature of the mind and soul is corporeal, because the mind touches the soul, and moves it, and the soul touches the body: but where there is no body there can be no touch. V. From ver. 178. to 307, he teaches, that this corporeal mind is composed of atoms extremely subtle, minute, and round. And particularly that this mind consists of heat, wind, or vapour, and air, and of another thing, which consisting of the seeds the most subtle, the most minute, and the most subject to motion, is the principal and original cause of

TRANS. II.

E c

sense. But how the heat, the wind, the air, and this fourth, nameless thing, are mingled, or what proportion of each makes up the composition, he ingenuously confesses he cannot tell. VI. From ver. 308. to 331, he asserts, that the soul and body are so united together, that they cannot be separated without the destruction of both of them. And, VII. from ver. 333. to 353, he asserts, that not only the mind, but the body too has perception, or rather the whole animal, composed of body and soul. VIII. After this, from ver. 353. to 396, he refutes the opinion of Democritus, who taught that the respective parts of the soul are fitted and joined to the respective parts of the body. And having affirmed before that the mind is the most excellent part of the whole compound, he now farther asserts, that the life and preservation of the animal depends more on the mind than on the soul. IX. From ver. 396. to 809, he endeavours to prove, by six and twenty arguments, that minds and souls are born with the bodies, and die with them, and, by the way, derides the transmigration of Pythagoras. X. In the next place, from ver. 810. to 836, he teaches, that death is nothing, because the soul, being mortal, has nothing to fear after death; nay, that if it be granted that the soul is immortal, as Plato held, yet death still is nothing, since the separated soul would not remember that she had ever been before. XI. Then to ver. 874, he laughs at the vain anxiety of men concerning their sepulture and thence, to ver. 915, proves that death is not an ill, because the dead want not those good things which the living enjoy, but are exempted from those calamities which afflict and torment us wretches that are alive. XII. That even life itself is not a thing very desirable, because it has nothing new to give us, but always the same manish pleasures, till at length we loathe them, to ver. 976. XIII. But lest the fables, which the poets feign of hell and of future punishments, should fright us, he explains those fables, and shows, that they are verified upon earth; that we feel those torments while we are living, and have no reason to dread them after we are dead, to ver. 1026. XIV. Lastly, To the end of this book, he puts us in mind, that it is both foolish and absurd to bemoan ourselves that we must die, since the wisest of men, and the most potent princes and emperors, have been forced to submit to the inevitable power of death. And he teaches, that men lead unquiet and anxious lives, because they avoid the thoughts and contemplation of death, and are foolishly fond of that life which they must one day lose, which can supply them with no new delights, and is exposed to innumerable dangers and afflictions. And that, after all, by the longest life to which they can attain, they save not one moment from the length of death, which is as much eternal to them who die to-day, as to those who died many ages ago.

THEE who hast light from 'midst thick darkness
brought,
And first life's benefits and pleasures taught;
Thee, chiefest glory of the Grecian state,
I strictly trace, willing to imitate,
Not contradict: For how can larks oppose
The vig'rous swan? They are unequal foes:
Or how can tender kids, with feeble force,
Contend in racing with the noble horse?
Thou, parent of philosophy, hast shown
The way to truth by precepts of thy own. 10
For, as from sweetest flow'rs the lab'ring bee
Extracts her precious sweets, great soul! from
thee
We all our golden sentences derive;
Golden, and fit eternally to live.
For when I hear thy mighty reasons prove,
This world was made without the pow'rs above,
All fears and terrors waste, and fly apace;
Through parted heav'ns, I see the mighty space,
The rise of things, the gods, and happy seats,
Which storm, or vi'lent tempest never bears, 20
Nor snow invades, but with the purest air,
And gaudy light diffus'd look gay and fair:
There bounteous nature makes supplies for ease,
There minds enjoy uninterrupted peace:
But that which senseless we so grossly fear,
No hell, no sulph'rous lakes, no pools appear:
And through the earth I can distinctly view,
What underneath the busy atoms do.
From thoughts like these I mighty pleasure find,
And silently admire thy strength of mind, 30

By whose one single force to curious eyes,
All naked and expos'd whole nature lies.
Since then I've taught what seeds of bodies are,
And how they move, what different shapes they
wear,
And how from these, all beings first may spring:
Next of the mind, and of the soul I'll sing;
And chase that dread of hell, those idle fears,
That spoil our lives with jealousies and cares,
Disturb our joys with dread of pains beneath,
And sully them with the black fear of death. 40
For though some talk they should less fear to
Than live in a disease, or infamy: [die,
That they know well, the soul consists in blood,
And our philosophy can do no good:
Observe, they talk thus rather out of love
To empty praise, than what they say, approve:
For these same men, to chains, or banishment
Condemned; to gallies, or to prison sent;
Though infamous by horrid crimes they're grown,
Yet still to endure, and patiently live on: 50
Nay more, where'er these boasting wretches
come,
They sacrifice black sheep on every tomb,
To please the manes; and of all the rout,
When cares and dangers press, grow most devout.
Therefore to know mens souls, and what they
are,
View them beset with dangers, and with care.
For then their words will with their thoughts
agree,
And, all the mask pull'd off, show what they be.

Besides, all blind ambition, and fierce lust
Of avarice, those parents of unjust,
Which make men plunge through sins, and vex
each hour

With cares and pains, to climb to wealth and
pow'r,

This shame, these great disturbers of our breath,
Are chiefly nourish'd by the fear of death:

For infamy, contempt, and poverty,

All seem so near the gates of death to lie,

That while by senseless fears, men frighted strive
As far remov'd, as possible, to live:

By civil wars endeavour to get more;

And, doubling murders, double their vast store;

Laugh o'er their brother's graves, and tim'rous
guests 71

All hate, and dread their nearest kinsmans feasts.

From the same cause the meagre envious rise,

And look on other's wealth with troubled eyes;

Complaints they make, and passion'tly repine,

That some with pow'r, and some with honour
shine;

While they lie mean, and low, and without fame;

And thus they die for statues and a name.

When some this dread strikes deep, ev'n life they
hate; 79

And their own hands prevent the stroke of fate:

Yet still are ignorant that this vain fear

Breeds all their trouble, jealousy, and care;

Makes men unkind, unchaste, and break their
trust;

In short, destroys whate'er is good and just.

So some their parents, and their country sell,

To free themselves from death, and following hell.

For we by day, as boys by night, do fear

Shadows, as vain and senseless as those are.

Wherefore that darkness that o'erspreads our souls,

What can disperse, but those eternal rules, 90

Which from firm premises true reason draws,

And a deep insight into nature's laws.

First then, the mind in which the reason lies,

Is part of man; as hands, and feet, and eyes

Are part of animals: though some have taught,

And ev'n philosophers, that sense and thought

Do no partic'lar feat, no part controul,

But are a vital habit of the whole;

In Greek call'd harmony; and that from thence

Flows all our reason, life, and thought, and
sense; 100

But 'tis no part: so health and strength belong

To man; but are no parts of him that's strong.

But this is false. —————

For often when these vis'ble members smart,

Brisk joys still seated in some unseen part:

And so o' th' contrary, when minds oppress'd,

Sink under cares, their bodies are at rest.

So often, when the hand or foot complains,

The head is vigorous, and free from pains.

Besides, when charms of sleep have clos'd our
eyes, 110

Languid, and void of sense, the body lies:

Yet even then some other part appears

Disturb'd with hope, with joy, and empty fears.

But farther, to convince you that the soul

Is part, and not th' harmony of the whole;

For, though some limbs are lost, life keeps her
seat;

But when few particles of vital heat,

And our last breath goes out, life likewise flies,

And the forsaken carcase wastes and dies:

Which proves, our lives not equally depend, 120

For their first rise, continuance, and end,

On ev'ry part; but chiefly heat and air

Make life within us, and preserve it there:

Then both these two are there; but swiftly gone,

And leave our limbs, as treach'rous death comes
on.

Now since the nature of the mind and soul

Is fully found, and prov'd a part o' th' whole;

Let those that call it harmony, and please

Their fancies, to derive such words as these,

From music's sounds, or whence soe'er it came,

Apply'd to that which had no proper name,

Take back their term again; 'tis here o'erthrown,

And useless prov'd: Let us go farther on.

Next, then, I must affirm the soul and mind

Make up one single nature, closely join'd:

But yet the mind's the head and ruling part,

Call'd reason, and 'tis seated in the heart:

For there our passions live, our joy, our fear,

And hope, which proves the mind must needs be
there:

But the inferior part, the soul, confin'd 140

To all the limbs, obeys the ruling mind,

And moves as that directs; for only that

Can of itself rejoice, or fear, or hate.

Passion and thought belong to that alone;

For soul and limbs are capable of none.

As when the hand, or eye, or head complains,

All the whole body is not vex'd with pains:

So often, when the lab'ring mind, oppress'd,

Sinks under cares, the soul enjoys her rest.

But when the mind a violent passion shakes, 150

Of that disturbance too the soul partakes;

Cold sweats bedew the limbs, the face looks pale,

The tongue begins to falter, speech to fail,

The ears are fill'd with noise, the eyes grow dim,

And feeble shakings seize on ev'ry limb,

And thus, on sudden frights men often swoon,

A strange effect! from which 'tis plainly known,

The mind and soul are join'd, and make but
one.

For here the mind's force strikes the soul, and so

The stroke goes on, and strikes the body too, 160

But, to enlarge this instance more, this proves

The mind material too, because it moves

And shakes the limbs, makes them look pale and

wan;

In short, directs and governs the whole man;

All which is done by touch: And all that touch

Are bodies; therefore mind and soul are such.

You find the spirit with the body dies:

Both pain and pleasure share but mutual ties:

For when by manly force the bearded darts,

Shot through the membranes, jag the tender
parts; 170

Though present death does not attend the

wound,

Yet chilling damps the sick'ning soul surround:

Drooping we bend towards the magnet ground

With such desire, as shows an earth-born mind,
Doubtful to take its flight, or lag behind.
Hence the soul's kindred with the body's plain,
Since by corporeal darts it suffers pain.

The mind prov'd body, I'll go on to find
What sort of body 'tis that makes the mind.
First then, it is a small and subtle one; 180
Because no action is so swiftly done,
As what the mind begins. This instance proves
The mind, than other things more swiftly moves.
But what thus easy to be mov'd is found
Of very little seeds, and very round
Must needs be fram'd; so that the weakest shove
May push them forward on, and make them move.
Water by flightest strokes is mov'd, and flows,
'Cause small and slipp'ry parts the streams com-
pose.

But honey and thick liquors stubborn prove; 190
Made dull, and heavy, and unapt to move;
For all their parts more join'd, and closer fall,
Because they're not so round, so smooth, and
So heaps of poppy seed, so sand, disjoin'd, [small.
Is scatter'd by the softest breath of wind;
But massy stones, or darts, together cast,
Stand firm against, and scorn the roughest blast;
Which proves that seeds small, smooth, and round,
are best

For vig'rous motion; rough, and great for rest.

Now since the nature of the mind is found 200
So apt to move; of bodies small and round
It must be fram'd: Which knowledge, lovely
youth,

Will lead thee on to undiscover'd truth.

For hence, by easy inf'rence, you may guess }
How subtle all its parts! what small recess, }
If crush'd together, it would all possess! }
For when the stroke of fate invades the heart,
And the affrighted mind and soul depart,
The weight and bulk remain; contented death
Leaves all secure, but vital sense and breath: 210
Therefore the seeds that frame this soul, through
all

Our limbs diffus'd, are subtle, thin, and small:
Because when that's all gone, each limb retains
The former bulk, the former weight remains.

So when the brisker spirits leap from wine,
And parts from odours with the air combine;
When from our limbs a subtle humour flows,
The body weighs the same, the same bulk }
shows;

Because small seeds all juice, all smells compose. }
'Tis certain then the seeds that frame the mind
Are thin, and small, and subtle, and refin'd; 221
For when the mind is gone, the former weight
Each limb retains, the bulk remains as great.

And yet 'tis mix'd; for when life's pow'rs
decay,

A gentle breeze, with vapour, flies away;
This vapour likewise shows that air is there,
All heat has air; for heat, by nature rare,
Must still be intermix'd with parts of air. }

Well then, we know the mind and soul com-
prise } [rise,
Three things; yet from all these no sense can
No vig'rous thought from such a frame as this. }

Then we must add a fourth thing to this frame;
And yet that fourth, though something, has no
name: 233

Its parts are smooth, small, subtle, apt to move,
When press'd, or troubl'd by the weakest shove:
From this comes sense. This the first stroke re-
ceives,

And then the impulse to the vapour gives,
Then to the unseen wind, then to the air,
Thence through our limbs 'tis scatter'd ev'ry
where.

The blood, with troubled motion, strikes the
heart, 240

And a quick sense runs through each inward part:
Then through the marrow, then through ev'ry
bone,

Whether it be a sharp, or pleasing one:
But vi'lent passions, as strong grief, or fear
Scarce enter far, and make disturbance there;
But strange convulsions run our body o'er,
And life and soul fly out at ev'ry pore.
But oft the motion on the surface plays,
Stops there; and that's the reason that life stays.

Next, how these four are mix'd, I would re-
hearse, 250

How fitly join'd; but now my flowing verse
The poorness of the Latin tongue does check;
Yet briefly, and as that permits, I'll speak.

They all confus'dly move; no diff'rent space
To each allotted, and no proper place
Where this divides from that, and lies alone;
But all their pow'rs conjoin'd arise as one.
So gen'rally, in ev'ry peace of meat,
Our sense discovers odour, savour, heat, 259
The flesh the same: So heat, and air, and wind
Make up one nature mix'd, and closely join'd
With that quick force, which makes them move,
and whence

Through all the bodies parts springs vig'rous sense.
This nature's deeply hid; this does possess
The inmost space, and most remote recess.
As in our limbs, the soul's remov'd from view,
Because its seeds are thin, and small, and few;
So this fourth nameless force within the soul
Lies hid, its chiefest part, and rules the whole.
So likewise must the heat, and air, and wind
Be in convenient place, and order join'd:
This must be uppermost, that lower fall,
To make it seem one nature, fram'd of all;
Lest heat and air, plac'd sep'rately, distract
The power of sense, and make it cease to act.

Heat in the mind is shown, when passions rise;
When anger burns, it sparkles through the eyes:
And when the trembling body shakes for fear,
And blood grows cold, we know that wind is
there.

In those the pow'r of air is chiefly seen,
Whose heart's untroubled, and their looks serene:
Those have most heat, by nature most inclin'd
To rage; such is the lion's furious mind,
Who, roaring, bursts with gen'rous disdain,
Nor can his breast his vi'lent rage contain.
Most parts of wind compose the deer's cold soul;
From whence a trembling chill runs through the
whole.

The peaceful ox contains most parts of air;
 And is not subject to much rage, or fear:
 A temper, 'midst the lion and the deer. 290
 So mens minds differ too; though moral rules
 And arts can polish, and reform our souls:
 Yet still some seeds remain; they still appear
 Through all the masks and vizards we can wear;
 Some small remainders of the primitive mind,
 Some evil passions will be left behind:
 Whence some are prone to rage, some to distrust;
 Some fearful are, and some more mild than just.
 A thousand more varieties they show; 299
 Each diff'rent mind has diff'rent manners too.
 Whose hidden causes I shall ne'er explain,
 Or names sufficient, and expressive feign
 For all those infinite varieties [rise.
 Of shapes, whence all these diff'rent manners
 Yet this, methinks, might be affirm'd as true;
 Those tracts of nature are so weak, so few,
 Which learning leaves unchas'd; that we, in
 spite of these,
 May rival ev'n the gods in happiness.
 This nature through the limbs spreads ev'ry
 where,
 And life, and health, preserves with prov'dent
 care: 310
 For they are join'd, and each on them depends,
 And the least separation death attends.
 As when from grains of myrrh you force away
 The rav'ning smell, their natures too decay;
 So parts the soul and limbs, you all destroy;
 So close they join, and common life enjoy!
 Nor can the soul and body, separate,
 Perceive or think in their divided state:
 For the first stroke is by the nerves convey'd,
 And from their jointly motions sense is made. 320
 Besides, the body is not born alone,
 Nor grows, nor lives, when mind and soul are
 gone:
 For though the water, heated o'er the fire,
 May lose some vapours, yet remain entire,
 The limbs, when mind and soul are fled, submit
 To the same fate, and die, and rot with it.
 Nay more, e'er tender infants see the light,
 Before they pass the confines of the night:
 While yet within their mothers womb they lie,
 If these two separate, they fail, and die. 330
 Whence learn, that since the cause of life's com-
 bin'd,
 And lies in both, their natures too are join'd.
 Farther, who to the limbs all sense denies,
 And says, the soul, which through the body lies,
 Is subject of that motion we call sense,
 He fights against the clearest evidence.
 What need of arguments, what need of words;
 The strongest proof the thing itself affords:
 Yet ev'ry limb wants sense, the soul once gone,
 And loses much as feeble age comes on. 340
 That eyes no objects see, to sight oppos'd;
 But that the soul, as through wide doors unclos'd,
 Looks through them, is plain nonsense: 'Tis
 refel'd
 Ev'n by their sense, who this wild fancy held:
 This seems so plain, 'tis brought so near our eyes,
 That he is blind, or shuts them, who denies:

Chiefly when fulgid objects view'd, the sight
 Grows dim, and dazzled by too great a light:
 For doors unclos'd, no harm, no danger know,
 Whatever body 'tis that passes through. 350
 Were the eyes doors through which the soul
 did look,
 View'd all around, and her fair prospect took,
 Our sight would stronger, quicker, better prove,
 If th' eyes pluck'd out, we all the bars remove.
 And now to solve these doubts, must not be
 brought,
 As learn'd Democritus's school has taught,
 That soul and limbs are equal, o'er the whole,
 To ev'ry limb an equal part of soul.
 For first, the seeds of souls are less than those,
 Which all the bodies grosser parts compose; 360
 Neither in number, nor in bulk so great,
 And o'er the limbs in distant spaces set:
 So that as few, and little as suffice
 For that weak motion, whence our senses rise;
 So few, so little, we must all confess
 Those diff'rent spaces which those seeds possess.
 For often falling dust we scarce perceive;
 Nor dew by night, nor what the spiders weave,
 When o'er our limbs the subtle chains are spread,
 Or the decaying web falls o'er our head: 370
 Nor plumes, nor chaff, nor such light things as
 these;
 Nor the soft motion of the wand'ring fleas:
 So that a strong impression must be made,
 And the quick stroke to many parts convey'd,
 Before the little bodies of the soul
 Can feel, and through those distant spaces roll,
 Meet, strike, and part again, and thus perceive;
 Be pleas'd with the first object's stroke, or grieve.
 The mind's the chiefest part of all the whole;
 Life more depends on that, than on the soul: 380
 When that departs, no soul can longer stay;
 But servilely attends, and flies away,
 Expires, and vanishes in the same breath,
 And leaves the limbs in the cold hands of death,
 But he still lives, whose mind remains alone;
 Although his limb's lop'd off, the soul is gone.
 So let ingenious tyrants malice strive,
 Of many limbs, though not of all, deprive;
 And so divide the soul, the man will live. }
 Thus leave the pupil sound, but cut the white, 390
 We still enjoy the nobler pow'r of sight:
 But that once hurt, though all the parts around
 Be left entire, and firm, and free from wound,
 The pow'r decays; and an eternal night,
 And frightful darkness all o'erspreads the sight;
 Darkness, where'er the wounded eye-balls roll:
 And like these two, in this, are mind and soul.
 And now, my lovely youth, to let thee know,
 That souls and minds are born, and mortal too
 I'll write such verse, as shall appear to be 400
 By curious labour wrought, and worthy thee:
 Do you take both express'd by either name,
 Both words in this dispute express the same.
 So that, for instance, when the soul you find
 Prov'd mortal, think I likewise mean the mind: }
 Since both do make but one, two natures join'd.
 First then, since I have prov'd the soul consist
 Of smaller parts than water, smoke, or mist;
 E e iij

Because than all these three more apt to move,
 And take impression from a weaker shove ; 410
 For by the images of smoke and streams,
 And thinnest mists, 'tis mov'd, as when in dreams
 From fancy'd altars smoky clouds arise,
 And in dark rolls are scatter'd through the skies ;
 Those thoughts are rais'd by subtle images. }
 And since you see, that when the vessel's broke,
 The waters runs away : since the thin smoke,
 By ev'ry tempest scatter'd through the air,
 Confus'dly mixes with it, and does perish there ;
 Conclude the thin contexture of the mind, 420
 An easier prey to ev'ry rougher wind,
 With ease dissolv'd when from the body gone ;
 'Tis toss'd in air, all naked, and alone.
 For since the limbs, that vessel of the soul,
 Could not contain its parts, and keep it whole,
 When bruise'd, or drain'd of blood ; how then can
 air,
 A body, than our flesh and blood more rare.

Besides : 'tis plain that souls are born and grow ;
 And all by age decay, as bodies do :
 To prove this truth ; in infants, minds appear 430
 Infirm, and tender as their bodies are :
 In man, the mind is strong ; when age prevails,
 And the quick vigour of each member fails,
 The mind's pow'rs too decrease, and waste apace :
 And grave and rev'rend folly takes the place.
 'Tis likely then the soul and mind must die ;
 Like smoke in air, its scatter'd atoms fly :
 Since all these proofs have shown, these reasons
 told,

'Tis with the body born, grows strong, and old.
 Farther : as violent pains, and strong disease
 Torment the limbs, and all the body seize ; 441
 So grief and trouble mind and soul surprise :
 'Tis likely therefore, that the soul too dies.
 Sometimes, when violent fevers vex the brain,
 The mind grows mad, and raves with equal pain.
 Sometimes, when dull and death-like lethargy,
 And lasting sleep sits heavy on the eye,
 The soul is lull'd : the man nor knows, nor hears ;
 His friend's kind voice, nor sees their falling tears ;
 While they with pious care about him weep, 450
 And strive to rouse him from his death of sleep.
 Since then the limb's disease affects the mind,
 That must be mortal too : for still we find,
 By thousand instances, diseases wait
 On death, as the sad messengers of fate.

Besides ; when wine's quick force has pierc'd
 the brain,
 And the brisk heat's diffus'd through ev'ry vein ;
 Why do the members all grow dull, and weak ?
 The tongue not with its usual swiftness speak ?
 The eye-balls swim ? the legs not firm, and strait :
 But bend beneath the bodies nat'ral weight ?
 Unmanly quarrels, noise, and sobs deface
 The pow'rs of reason, and usurp their place ?
 How could this be, did not the precious juice
 Affect the mind itself, and spoil its use ?

Now things, that can be thus disturb'd, that cease
 From usual actions, by such lets as these,
 Would die, suppose the force, or strokes increase. }
 Oftimes with violent fits a patient falls,
 As if with thunder struck ; and foams and bawls, 470

Talks madly, shakes, moves here and there, breathes
 short ;

Extends, and tires his limbs with antic sport ;
 Because the venom, scatter'd o'er the whole,
 Makes such strange stirs, and motions through the
 soul ;

As boisterous storms, which o'er th' ocean rave,
 And raise white curls upon the foaming wave :
 He groans, because, when pain'd, the feeds of
 voice

Break forth in a confus'd and troubled noise :
 He's mad, because the parts of soul and mind
 Are by the poison's violence disjoint'd, 480
 Disturb'd and toss'd : but when the causes cease,
 The black malignant humours, and disease,
 In some convenient vessel lurk in peace ;
 His weakness wears, and he forgets his pain :
 His strength, his life, his sense return again.
 Now since diseases can this soul divide,
 While strengthen'd by, and to the members ty'd ;
 Who can believe, this tender substance, mind,
 When from the body loos'd, can brave the wind ?

And since our minds as well as bodies feel 490
 The pow'rs of medicines that change or heal,
 They must be mortal : for to change the soul,
 You must, or change the order of the whole,
 Take off some old, or add some parts anew :
 Now what's immortal, common sense has told,
 Can gain not one new part, nor lose one old :
 For whatsoever suffers change, unties
 Its union, is not what it was ; but dies.

Therefore the mind, or by diseases griev'd,
 Or by the pow'r of medicines reliev'd, 500
 Shows herself mortal : Such plain evidence,
 Drawn from the strongest reason, surest sense,
 Does all their specious sophistry oppose,
 And either way confutes, and overthrows.

Besides, experience shows that patients die
 By piecemeal ; through the toes, then legs, then
 thigh [moves,
 Creeps treach'rous death ; then through the rest it
 By slow degrees ; and this one instance proves
 That the soul mortal is ; since death does slowly
 spread ;

And some parts are alive at once, and some at once
 are dead. 510

But if you think the soul, by fate oppress'd,
 Can to one limb retire, and leave the rest,
 That part, where so much soul has residence,
 A greater must enjoy, and quicker sense :
 But since none such appears, 'tis plain it flies
 By piecemeal through the air, and therefore dies.
 But grant what's false ; the soul can backward
 And huddled up, within one member lie ; [fly,
 Yet this infers the soul's mortality.
 For what's the difference, if by latest breath, 520
 Expell'd, or huddled up, 'tis crush'd to death ?
 While from the limbs the senses steal away,
 And by degrees the pow'rs of life decay.

And since the soul is part, and since it lies
 Fix'd in one certain place, as ears, or eyes ;
 So, ev'n as those, when from the body gone,
 Perceive not, nor endure, but perish soon ;
 The mind can't live, divided from the whole,
 The limbs, which seem the vessel of the soul,

Or somewhat, if you please, more nearly join'd :
Because these two the closest ties do bind. 531

Lastly, both soul and body join'd perceive,
Exert their nat'ral pow'rs, endure, and live :
Nor can the soul, without the limbs, dispense
Her vital pow'rs; nor limbs, without the soul,
have sense.

For as the eye grows stiff, and dark, and blind,
When torn from off her seat; so soul and mind
Lose all their pow'rs, when from the limbs
disjoin'd :

Because 'tis spread o'er all, and there preserves
Her life, by vital union with the nerves. 540

Nor could the little seeds of soul commence
Those short vibrations, that are fit for sense,
Were the space great; which, strictly all en-
clos'd.

They well perform : but from the body loos'd,
And to the wide inconstant air expos'd,
Could ne'er enjoy; because the air and mind
Can never, as the soul and limbs be join'd;
For could the thin inconstant air controul,
And keep in order too the fleeting soul,

And she those motions too of sense maintain, 550
Which now she does through ev'ry nerve and vein,
And all our limbs; then we might justly call
The air a body, and an animal.

Thus then the soul, all naked and alone,
When from the body loos'd, her cov'ring gone,
Must die, both soul and mind, for both are one.

Besides : since when the mind and soul are fled,
The carcase stinks, and rots as soon as dead;
How can'st thou doubt, but that, the union broke,
The scatter'd soul flies through the limbs, like
smoke. 560

And therefore must the body's fabric fall,
Because the soul, that did preserve the all,
Upheld, and strengthen'd it, is now no more,
But fled through ev'ry passage, ev'ry pore,
Which shows the soul, as all her pow'rs decay,
Her parts dissolv'd, flies scatter'd all away.

Nay more : whilst in these limbs, as death
comes on,

Her parts are all dissolv'd, before she's gone;
Nay, while she's yet alive, some strokes pre-
vail, 569

And shake the soul; her pow'rs begin to fail;
The members tremble, and the face looks pale,
As if 'twere real death. This happens when we
swoon;

Ev'n then the mind and soul are almost gone;
The ties of union almost all undone :
For then the mind's assaulted, and would bow
To fate, if shaken by a stronger blow.

Then who can think, that from the members gone,
Expos'd to th' air, all naked, and alone,
It can, but one short moment be secure;
Much less, as long as time, as endless years, en-
dure; 580

Besides; what patient e'er perceiv'd the soul
Forake the dying members, safe and whole?
Or that by slow degrees it seems to rise,
First through the throat, then higher jaws; then
flies :

But ev'ry sense in'ts proper organ dies.

And were the soul immortal, would the mind
Complain of death; and not rejoice to find,
Herself let loose, and leave this clay behind?

As snakes, whene'er the circling year returns,
Rejoice to cast their skins; or deer their horns. 590

And why is not the soul produc'd in any part,
I' th' head, or hands? Why only in the heart?
But that each being has its proper seat;
And there begins; there grows mature, and great:
Thus flames ne'er rise from waves, nor cold from
heat.

And if the soul's immortal; if she lives
Divided from the body; if perceives,
She must enjoy five senses still: for who
Can fancy how the soul can live below,
Unless 'tis thus endow'd? Thus painters please, 600
And poets too, to draw their souls with these.
But as without the soul, nor eye, nor ear,
Nor either hand can touch, or see, or hear,
So neither can this soul, this mind perceive
Without these hands, these eyes, these ears; nor
live.

Besides; our vital sense is spread o'er all;
The whole composure makes one animal :
So that if sudden, vi'lent strokes divide
This whole, and cast the parts on either side;
The soul and mind too suffer the same fate, 610
And part remains in this, and part in that.
Now what can be divided, what can lie,
And waste in several parts, can likewise die.
So chariots arm'd on ev'ry side, to wound,
When fiercely driv'n, bring death to all around :
And yet the wounded man, so quick's the blow,
Is scarce disturb'd; scarce seems to feel, or know ;
His wound : and now but half a body grown,
Still hastes to fight, still eagerly goes on;
Nor misses he his arm, dragg'd o'er the field, 620
And by the chariots torn, much less his shield;
Others, that lose their hands, that climb the
wall,

Reach on, or feel; and wonder at their fall :
Others, their legs lopp'd off, attempt to rise,
While the poor foot lies trembling by, and dies :
And when the head's chopp'd off, the eyes and face
Still keep their nat'ral, still their vital grace ;
The look is vivid still, nor seems like dead,
Till every particle of soul is fled.

So likewise chop a ven'mous serpent's train, 630
You'll see each single part is vex'd with pain ;
Each turns, each bleeds, and sprinkles all the
ground

With pois'nous gore, each wriggles at the wound :
What then? Has ev'ry part its proper soul ?
This were to place a thousand in one whole.
Thus then the soul, by the same fatal blow,
That chopp'd the pois'nous tail, is cut in two :
Therefore 'tis mortal, subject unto fate,
Because divisible as well as that.

Farther : were soul's immortal, ne'er began, 640
But creep'd into the limbs to make up man,
Why cannot they remember what was done
In former times? Why all their mem'ry gone ?
Now if the mind's frail pow'rs so far can waste,
As to forget those num'rous actions past,
'Tis almost dead; and sure can die at last.

Therefore the former soul must needs be dead;
And that, which now informs us, newly made.

But when the body's made, when we begin
To view the light, if then the soul creep'd in, 650
How is it likely it should seem to grow,
Increase, and flourish, as the members do?
No: she would live confin'd to her close cage,
With pow'rs, as great in infancy, as age.
Again then and again, the soul is born and dies:
For let's suppose it fram'd without; what ties
Could knit this soul so close? How could this mind,
As sense assures, with ev'ry limb be twin'd?
For now 'tis knit to ev'ry nerve, and vein,
To ev'ry bone, that ev'n the teeth feel pain: 660
As when with sudden chop they grind a stone;
Or when cold water thrills the heated bone.
Since then 'tis join'd so close, how can this soul,
Loos'd from limbs, bones, and nerves, fly off se-
cure and whole?

But now suppose the mind was fram'd before,
And then infus'd: Grant this, I'll ask no more:
This proves 'tis mortal too: for while the soul
Insinuates her substance o'er the whole,
Its parts must be dissolv'd; the nat'ral tie
Of union loos'd: Therefore the soul can die. 670
As meats, diffus'd through all the members, lose
Their former nature, diff'rent things compose:
So minds, though safe and whole they first begin
To enter, are dissolv'd in ent'ring in,
Because those subtle parts, this soul contains,
Must be diffus'd through all the nerves and veins:
And that which enter'd, rules the body now,
Is the same soul, that dy'd in passing through;
And therefore souls are born, and perish, too.

Besides; from carcases, some parts alone, 680
Or the whole substance of the soul is gone,
If only part, 'tis dead; its seeds disjoin'd;
For some do fly away, some lurk behind:
But if all goes, why then do troops of flies,
Why num'rous insects from the bodies rise,
Swarm o'er the members? What's the cause of
this?

But grant you can believe, a proper soul
For ev'ry worm descends secure and whole;
Nor think it strange, that when the former's gone,
A thousand little souls should come for one; 690
Yet still 'tis doubtful, whether ev'ry mind
Hunts carefully for seeds of proper kind,
And fashions its own case, or else does wait
Till all the limbs are perfect, all complete,
And then goes proudly in, and takes her seat.
For what should prompt the soul to all this pains?
What make her work? Since free from slavish
chains

Of matter; hunger, cold, no sharp disease,
To anxious cares her happy substance seize:
From the united limbs she suffers these. 700
But grant it good for minds to put on clay,
How are the bodies form'd, what curious way?
How, in what manner is the action done?
Souls cannot, therefore do not frame their own.
And did they enter perfect frames, what art
Could subt'ly twine one soul with ev'ry part;
That this should act on that, so nearly join'd;
The mind affect the limbs; the limbs the mind?

Besides; why lions fury? Why the deer
From their cold fires derive their nat'ral fear? 710
Why foxes craft? Why proper pow'rs adorn
Each diff'rent kind, unless the souls are born?
For were the souls immortal, could the mind
Fly off, and leave his former case behind,
And take another of a diff'rent kind?
What change in an'mals manners must appear?
The tyger-dog would fly pursuing deer;
The hawk forget his rage, and learn to fear,
Trembling at ev'ry little dove that flies; 719
Men would be foolish all; and beasts be wise.
For 'tis absurd, that this immortal mind
Should change according to the diff'rent kind
Of body, unto which the soul's confin'd.
For things thus changeable, the nat'ral tie
Of union broke, the scatter'd parts can fly
Dispers'd, disorder'd, and themselves can die.
But if they say, that souls, expell'd by fate,
To other bodies of like kind retreat;
Then tell me why: Why does the wisest soul,
When creep'd into a child, become a fool? 750
Why cannot new-born colts perform the course
With equal straining as a full grown horse?
But that the souls are born, increase, and grow,
And rise mature, as all their bodies do.
Perchance they'll say; weak minds, and tender
sense

Belong to tender bodies: Poor defence!
This yields the cause: this grants that minds are
frail,
Whose former life and pow'rs can change and fail.
Besides; come tell me, why a soul should grow,
And rise mature, as all the members do? 740
If 'twere not born? When feeble age comes on,
Why is't in haste, and eager to be gone?
What? does it fear, it makes such haste away,
To be imprison'd in the stinking clay?
What? does it fear the aged heap's decay?
Or that 'twill fall, and crush the mind beneath?
Fond fear! immortal beings are exempt from
death.

'Tis fond to think, that whilst wild beasts beget,
Or bear their young, a thousand souls do wait,
Expect the falling body, fight and strive, 750
Which first shall enter in, and make it live.
Or is't agreed, do previous leagues declare,
That 'tis her lawful right, who first comes
there,

To enter in; and so no need of war?
Besides: no trees in heav'n, no stars below,
The hills no fish, the stones no moisture know;
Each has its proper place to live and grow.
So neither souls can live without the blood,
And nerves, and veins, and bones: for grant they
could, 759
Then through one single part, as arm, or head,
'Twould first be fram'd; and thence o'er th' others
spread;

As water, into vessels pour'd, does fall
First to one part, then rise, and cover all.
But since 'tis certain, that a proper place
Is settled for the life, and the increase
Of mind and soul, 'tis folly to believe,
They can be made without the limbs, or live.

Therefore the soul, spread o'er the limbs, must fail,

And die with them, as years and death prevail.

For that immortal beings should lie confin'd 770
To mortal, and their diff'rent pow'rs be join'd,
And act on one another, is absurd; [ford,
Plain nonsense! What more fond can dreams af-
Than mortal with immortal join'd in one,
Should feel those harms, 'twas free from when
alone?

Besides, what is immortal, must be so
Because 'tis solid, 'bove the pow'r of blow;
Whose parts no wedge divides; which knows no
pore;

And such are seeds, as I explain'd before:
Or else, because like empty space, 'tis such 780
As is secure from stroke, and free from touch;
Or else, because it can admit no bound,
'Tis infinite, and knows no place beyond

To which the seeds may sink: this makes the all
Eternal; there's no place whence seeds may fall,
And breed confusion there: no space does lie
Without the whole, to which the parts may fly,
And leave the mighty all to waste and die. }

Now 'tis not perfect solid; ev'ry mass 789
Between the seeds contains some empty space:
Nor is it void untouch'd; for subtle wind,
With rapid storms, can hurry on the mind,
Or take one part, and leave the rest behind. }
Besides, there's space enough, to which the tie
Of union loos'd, the scatter'd parts may fly. }
Thus then the mind is mortal, and can die. }

But if you think't immortal, free from wound,
Because its substance is encompass'd round,
Fenc'd from destructive causes; or that such
Can very seldom if at all approach: 800
Or if they should fly off before they make
Confusion there: this is a grand mistake:
For, not to mention how diseases vex
The soul, what fears of future ills perplex;
Whence guilty conscience shall affright the mind;
For sins strike deep, and leave despair behind:
'Tis mad, forgetful, sometimes lethargy,
And deadlike sleep sit heavy on the eye.

Then what has bugbear death to frighten man,
Since soul can die as well as bodies can? 810

For as we neither knew, nor felt those harms,
When dreadful Carthage frighted Rome with
arms,

And all the world was shook with fierce alarms;
Whilst undecided yet, which part should fall,
Which nation rise the glorious lord of all:
So after death, when we shall be no more,
What though the seas forsake their usual shore,
And rise to heav'n? What though stars drop from
thence?

How can all this disturb our perish'd sense?

But now, suppose the soul when separate, 820
Can live, and think in a divided state;
Yet what is that to us, who are the whole,
A frame compos'd of body, join'd with soul?
Nay grant the scatter'd ashes of our urn
Be join'd again, and life and sense return;
Yet how can that concern us when 'tis done;
Since all the mem'ry of past life is gone?

Now we ne'er joy, nor grieve to think that we
Were heretofore, nor what those things shall be,
Which, fram'd from us, the foll'wing age shall
see. 830

When we revolve how num'rous years have run,
How oft the east beheld the rising sun,
Ere we began, and how the atoms move,
How the unthinking seeds for ever strove;
'Tis probable, and reason's laws allow,
These seeds of ours were once combin'd as now:
Yet now who minds, who knows his former state,
The interim of death, the hand of fate,
Or stopp'd the seeds, or made them all commence
Such motions, as destroy'd the former sense? 840

He that is miserable, must perceive
Whilst he is so: he then must be and live:
But now, since death permits to feel no more
Those cares, those troubles which we felt before:
It follows too, that when we die again,
We need not fear; for he must live who lives in
pain.

But now the dead, though they should all return
To life again, would grieve no more, nor mourn
For evils past, than if they'd ne'er been born. }

Now when you hear a man complain, and
mean, 850

And mourn his fate, because, when life is gone,
His limbs must waste, and rot in earth, or feast
The greedy flames, or some devouring beast,
All is not well: He, by strong fancy led,
Imagines sense remains among the dead.
Nor can I think, though he himself denies,
And openly declares the whole man dies,
But that some strong conceits he still believes,
Fond fool! that he himself himself survives:
For now, ev'n while he breathes, ev'n while he
lives, 860

And thinks he must be torn, or burnt, he grieves:
Thinks still his carcase must be he, and thence
His idle fears infer, there must be sense:
And hence he grieves, that he was born to die,
Subject to treacherous mortality: [death
But never thinks, fond fool! that when kind
Shall close his eyes in night, and stop his breath,
Then nothing of this thinking thing remains
To mourn his fate, or feel sharp griefs and pains.
And if 'tis miserable to be torn 869

By beasts, when dead; why is't not so to burn?
If that's an ill, why not as great a one
To be oppress'd with earth, or marble stone?
Or dipp'd all o'er in honey? or be roll'd,
O'er boist'rous waves, on cliffs expos'd to cold?

Ay, but he now is snatch'd from all his joys;
No more shall his chaste wife, or prattling boys
Run to their dad with eager haste, and strive
Which first shall have a kiss, as when alive. 870

Ay, but he now no more from wars shall come,
Bring peace and safety to his friends at home.
Wretched, O wretched man! one fatal day
Has snatch'd the vast delights of life away:
Thus they bewail, but go no farther on;
Nor add, that his desires and wants are gone;
Which if they thought, how soon would all give
o'er

Their empty, causeless fears, and weep no more?

'Tis true, thou sleep'st in death, and there shalt lie,
Free from all cares, to all eternity: 889

But we shall mourn thee still; no length of years
Shall overcome our grief or dry our tears.

Now I would gladly know, come tell me why,
Why dost thou pine with grief, and weep, and
figh?

Why dost thou vex thyself, and beat thy breast,
Because thou once must sleep in death, and rest?

So when the jolly blades, with garlands crown'd,
Sit down to drink, while frequent healths go
round,

Some, looking grave, this observation make:

All the delights are short we men can take:

Now we enjoy, but gone, we wish in vain, 900

In vain desire to call them back again:

As if the greatest ill in graves they fear,
Were thirst, or to want wine, or garlands there,
Or any other thing they fancy here.

Fools! ev'n in common sleep what cares molest?

What thoughts for life, or health, disturb our rest?

For men eternally might still sleep on,

Free from such cares, their rest disturb'd with
none:

Yet then the mind is well, 'tis whole, it lives,
And aptly moves, nay, and almost perceives;
Small strokes will make the man, and he re-
vives. 911

Then death, if there can be a less than least,

Is troubled less with anxious cares than rest.

Because in death few parts of mind remain;

And he that sleeps in death ne'er wakes again.

But now, if nature should begin to speak,
And thus with loud complaints our folly check:

Fond mortal, what's the matter thou dost sigh?

Why all these fears, because thou once must die,

Must once submit to strong mortality? 920

For if the race thou hast already run

Was pleasant; if with joy thou saw'st the sun;

If all thy pleasures did not pass thy mind

As through a sieve, but left some sweets behind,

Why dost thou not then, like a thankful guest,

Rise cheerfully from life's abundant feast,

And with a quiet mind go take thy rest?

But if all those delights are lost and gone,

Spilt idly all, and life a burden grown;

Then why, fond mortal, dost thou ask for
more, 930

Why still desire to increase thy wretched store,

And wish for what must waste like those before?

Not rather free thyself from pains and fear,

And end thy life, and necessary care?

My pleasures always in a circle run,

The same returning with the yearly sun.

And thus, though thou dost still enjoy thy prime;

And though thy limbs feel not the rage of time;

Yet I can find no new, no fresh delight,

The same dull joys must vex the appetite, 940

Although thou could'st prolong thy wretched
breath [death.

For num'rous years, much more if free from

What could we answer, what excuses trust?

We must confess that her reproofs are just.

But if a wretch—a man oppress'd by fate,
Mourns coming death, and begs a longer date,

Him she more fiercely chides: Forbear, thy sighs,
Thou wretch, cease thy complaints, and dry thy
eyes.

If old, thou hast enjoy'd the mighty store

Of gay delights, and now can'st taste no more;

But yet because thou still did'st strive to meet 941

The absent, and contemn'dst the present sweet,

Death seems unwelcome, and thy race half run,

Thy course of life seems ended, when begun;

And unexpected hasty death destroys,

Before thy greedy mind is full of joys.

Yet leave these toys, that none besit thy age;

New actors now come on; resign the stage.

If thus she chides, I think 'tis well enough;

I think 'tis nothing but a just reproof: 960

For rising beings still the old pursue,

And take their place; old die, and frame the
new:

But nothing sinks to hell, and sulph'rous flames,

The seeds remain to make the future frames:

All which shall yield to fate as well as thou;

And things fell heretofore ev'n just as now:

And still decaying things shall new produce;

For life's not giv'n to possess, but use.

Those ages that in long possession ran,

And measur'd hasty time, ere we began; [on;

What are they all to us? From this think farther

And what is time to us, when life is gone?

Besides, what dreadful things in death appear?

What tolerable cause for all our fear?

What sad, what dismal thoughts do bid us weep?

Death is a quiet state, and soft as sleep.

And all, which we from poets tales receive,

As done below, we see, ev'n whilst alive.

No wretched Tantalus, as stories tell,

Looks up, and dreads th' impending stone in hell:

But heavy weights of superstitious care 981

Oppress the living; they disturb us here,

And force us chance, and future ills to fear.

No Tityus there is by the eagle torn;

No new supplies of liver still are born:

For grant him big enough, that all the nine,

Those poets acres, his vast limbs confine

To narrow bounds; but let him spread o'er all,

And let his arms clasp round the wat'ry ball;

Yet how could he endure eternal pain? 990

And now his eaten liver grow again?

But he's the Tityus here, that lies oppress'd

With vexing love, or whom fierce cares molest: }

These are the eagles that still tear his breast.

He's Sisyphus, that strives with mighty pain

To get some offices, but strives in vain;

Who poorly, meanly, begs the people's voice,

But still refus'd, and ne'er enjoys the choice:

For still to seek, and still in hopes devour,

And never to enjoy the long'd-for pow'r, 1000

What is it but to roll a weighty stone

Against the hill, which straight will tumble down?

Almost at top, it must return again,

And with swift force roll through the humble
plain.

Lastly, since nature feeds with gay delight,

And never fills the greedy appetite;

Since ev'ry year, with the returning springs,

She new delights, and joys, and pleasures brings;

And yet our minds, amidst this mighty store,
Are still unsatisfy'd, and wish for more: 1010
Sure this they mean, who teach that maids below
Do idle pains, and care, and time bestow,
In pouring streams into a leaky urn,
Which flow as fast again, as fast return.

The furies, Cerberus, black hell, and flames,
Are airy fancies all, mere empty names:
But whilst we live, the fear of dreadful pains
For wicked deeds, the prison, scourge, and chains,
The wheel, the block, the fire, affright the mind,
Strike deep, and leave a constant sting behind. 1020
Nay, those not felt, the guilty soul presents
These dreadful shapes, and still herself torments,
Scourges and stings; nor even seems to know
An end of these, but fears more fierce below,
Eternal all. Thus fancy'd pains we feel,
And live as wretched here as if in hell.

But more to comfort thee——
Consider, Ancus perish'd long ago;
Ancus, a better man by much than thou:
Consider, mighty kings in pomp and state 1030
Fall, and ingloriously submit to fate.

Consider even he, that mighty he,
Who laugh'd at all the threat'ning of the sea;
Who chain'd the ocean once, and proudly led
His legions o'er the fetter'd waves, is dead.

Scipio, that scourge of Carthage, now the grave
Keeps pris'ner, like the meanest common slave.

Nay, greatest wits, and poets too, that give
Eternity to others, cease to live. 1039

Homer, their prince, that darling of the nine
(What Troy would at a second fall repine
'To be thus sung)? is nothing now but fame;
A lasting, far-diffus'd, but empty name.

Democritus, as feeble age came on,
And told him it was time he should be gone;
For then his mind's brisk pow'rs grew weak, he
cry'd,

I will obey thy summons, fate, and dy'd.

Nay, Epicurus' race of life is run;
That man of wit, who other men outshone,
As far as meaner stars the mid-day sun. 1050

Then how dar'st thou repine to die, and grieve,
'Thou meaner soul, thou dead, ev'n whilst alive?
'That sleep'st, and dream'st the most of life away;
'Thy night is full as rational as thy day?
Still vex'd with cares, who never understood
The principles of ill, nor use of good;

Nor whence thy care, proceed: but reel'st about
In vain unsettled thoughts, condemn'd to doubt.
Did men perceive what 'tis disturbs their rest,
Whence rise their fears, and that their thought-
ful breast 106

Is by the mind's own nat'ral weight oppress'd.
Did they know this, as they all think they know,
They would not lead such lives as now they do;
Not know their own desires, but seek to find
Strange places out, and leave this weight behind.
One, tir'd at home; forsakes his stately seat,
And seeks some melancholy close retreat,
But soon returns; for, press'd beneath his load
Of cares, he finds no more content abroad:
Others, with full as eager haste, retire, 1070
As if their father's house were all on fire,
To their small farm; but yet, scarce enter'd
there,

They grow uneasy with their usual care;
Or, seeking to forget their grief, lie down
To thoughtless rest, or else return to town:
Thus they all strive to shun themselves in vain,
For troublesome he sticks close; the cares re-
main;

For they ne'er know the cause of all their pain:
Which if they did, how soon would all give o'er
Their fruitless toys, and study nature more? 1080
That is a noble search, and worth our care;
On that depends eternal hope or fear:
That teaches how to look beyond our fate,
And fully shows us all our future state.

Our life must once have end: in vain we fly
Pursuing fate; ev'n now, ev'n now we die.
Life adds no new delights to those possess'd;
But since the absent pleasures seem the best,
With wing'd desire and haste we those pursue;
But those enjoy'd we loathe, and call for new. 1090
Life, life we wish, still greedy to live on;
And yet what fortune with the foll'wing sun
Will rise, what chance will bring, is all un-
known.

What though a thousand years prolong thy
breath,
How can this shorten the long state of death?
For though thy life shall num'rous ages fill,
The state of death will be eternal still:
And he that dies to-day, shall be no more,
As long as those that perish'd long before.

NOTES ON BOOK III.

VER. 1. IN the first thirty-two verses of this book, Lucretius addresses himself to Epicurus of Athens, and calls him the father of the Epicurean philosophy. Democritus, indeed, was the first who set it on foot; but Epicurus so improved and perfected it, that the poet, with good reason, styles him the parent and inventor of it. He praises him for the happiness of his wit, and

acknowledges the benefits he has conferred on mankind, in having explained the Nature of Things, overthrown all belief of Providence, and expelled the fears and terrors that arose from that opinion. Then he asserts almost the same thing, that L. Torquatus does, in Cicero, lib. i. de Finib. "Ego arbitror Epicurum unum vidisse verum, maximisque erroribus hominum animos liberasse,

et omnia tradidisse, quæ pertinent ad bene beateque vivendum." I am of opinion, that Epicurus only discovered the truth, that he delivered the minds of men from the greatest errors, and taught all things that conduce to a good and happy life.

Ver. 3. He means Epicurus. See the note on ver. 88. Book i.

Ver. 5. The words in the original are,

—Quid enim contendat hirundo
Cicnis?—

And how our translator came to change the swallow to larks, I cannot well tell; nor why, in this place, he gives to the swan the epithet of vigorous: Lucretius certainly alludes to the singing of the swan, not to his strength: Besides, the lark is a tuneful bird, and, perhaps sings sweeter than the swan; for swans and geese, I believe, are alike melodious; though the first of them have had the good fortune to be celebrated by all the ancient poets for the sweetness of their voice: And even Macrobius, on the dream of Scipio, lib. ii. cap. 3. says, "Aves quoque, ut lusciniæ, ut cygni aliæque id genus, cantum veluti quadam disciplina artis exercent." See the note on ver. 479 of Book ii. But swallows, on the contrary, are blamed for their harsh chattering. Thus Anacreon, Ode xii.

Τισαὶ θέλεις ποιῆσαι;

Τὶ χατὶλε χελιδῶν;

Foolish prater, what dost thou
So early at my window do,
With thy tuneless serenade?

Cowley.

Yet from the fabulous, though universally received traditions of the sweet singing of swans before their death, the poets have assumed to themselves the title of swans. And Horace would even be thought to be changed into a swan:

Jam jam residunt cruribus asperæ
Pelles, et album mutor in alitem
Superne, nascunturque leves
Per digitos humerosque plumæ.

Lib. ii. Od. 20.

And the Anthology gives the same name to Pindar:

Θήβης ἀγυγίης Ἑλικώνιος ἴσατο κύχνος
Πίνδαρος ὁμερόφωνος.

Tuneful Pindar, the Heliconian swan of ancient Thebes: Thus too Virgil is called "Mantuanus Olor," the Swan of Mantua: And Theocritus terms the poets Μουσῶν ὄρνιθες, the birds of the muses, as the commentators say, in allusion to swans, which Callimachus calls Μουσῶν ὄρνιθες, and in another place, Ἀπόλλωνος παρὶδ ροι, the associates of Apollo, which is indeed a bold expression; but they were consecrated to him, and consequently beloved by the muses and poets. Moreover, Cicero, in Tuscul. i. says, that the swallow being an importunate, chattering bird, represents the ignorant; but the swan, who never sings till he feels his death approaching, seems by that to

foresee that there is some good in death, and therefore it is an emblem of the learned: Whence the Greek adage, Τοῖς ἀσονται κύχνοι, ὅταν χολοιοῖ σιωπήσωσι. The swans will sing, when the jays hold their peace, is said of those silly tattlers, who ought to be silent in presence of the learned.

Ver. 11. An excellent comparison! Lucretius avouches, that, like the industrious bee, he gathers honey from the most fragrant flowers, while he collects and follows the wise doctrine and lessons of Epicurus.

Ver. 13. Faber believes he alludes in this place to the Χρυσὰ Ἔπη, golden verses of Pythagoras.

Ver. 17. For what reason is there that men should fear the gods, whom they now know not to have been the authors of this world, nor to take any notice or care of the affairs of it?

Ver. 19. "Apparet divum nomen," says Lucretius, looking through the gaping walls of the world, I plainly see the gods, no less than I do all things else; but "nufquam apparent Acherusia templa,"

No hell, no sulph'rous lakes, no pools appear.

Ver. 26.

Therefore there are none, and they are only idle dreams, and empty fictions.

The words of the original are,

—Sedesque quietæ,
Quas neque concutiunt venti, neque nubila nimbis
Adspergunt, neque nix acri concreta pruina
Cana cadens violat: semperque innubilus æther
Integit, et large diffuso lumine ridet.

Which Lucretius translated from this passage of Homer:

Οὐλυμπόνδε, ὅθι φάσι θεῶν ἕδος ἀσφαλὲς αἰεὶ
ἔμμεναι· ἔτ' ἀνέμοισι τινάσσεται, ἔτε ποτ' ὁμορῶ
Δεῦσ' ται, ἔτε χιῶν ἐπιπίδναται· ἀλλὰ μάλ' αἰθήρ
Πέπταται ἀνέφελος, λευχὴ δ' ἐπιδεδρομεν αἴγλη.

Οδυσσ. Ζ.

Ver. 23. That is to say, for the gods. Thus too, Book i. ver. 81. speaking of the nature of the gods, he asserts it to be

Sufficient to its own felicity;

And that it wants nothing that is in our power to give it.

Ipsa suis pollens opibus, nil indiga nostri.

Lucr. l. i. v. 61.

Ver. 26. Lucretius says only,

—Nufquam apparent Acherusia templa.

See the note, Book i. ver. 152. And methinks our translator, in this place, seems to have had in view, not so much the fabulous hell of the heathens, which Lucretius denied, and derided, as that real place of eternal torment that we Christians justly believe, and tremble at; and which is thus excellently painted by Milton, in all its horror;

The lake that's fraught, and burns with liquid fire,

Unquenchable: the house of woe and pain!

A dungeon horrible! which, all sides round,
As one vast furnace, flames: yet from those flames

No light, but rather darkness visible

Serves only to discover sights of woe,

Regions of sorrow, doleful shades, where peace

And rest can never dwell; hope never comes

That comes to all; but torture without end

Still urges, and a fiery deluge fed

With ever-burning sulphur, unconsum'd, &c.

Ver. 32. The author of Hudibras seems to have regarded this passage, when he says,

—As he profess'd,

He had first matter seen undress'd;

He took her naked, all alone,

Before one rag of form was on.

The Chaos too he had descry'd,

And seen quite through: or else he ly'd.

Ver. 33. Having in the first and second book treated at large of the seeds themselves, and of their figures and motions, he now promises, in these eight verses, an accurate disputation concerning the soul, the mortality of which he will endeavour to evince, to the end he may deliver mankind from the fear of death, and the dread of future punishment after it.

Ver. 40. The words in Lucretius are, "Omnia suffundens mortis nigrore;" and Creech, in his note upon them, says, that nothing was ever more elegantly expressed, and that there is no where to be found a more beautiful image. I wish I could say the like of his interpretation of it; But to fully with fear, is, in my opinion, not to pass a more severe censure upon it, a very bold metaphor.

Ver. 41. But some perhaps may say, that other philosophers have done what Lucretius promises, and that not Epicurus only delivered men from the fear of hell, since many others taught, that the soul is mortal, and consequently that we have nothing to fear after death; and therefore that Epicurus does not deserve this mighty praise, nor does Lucretius confer a greater benefit on mankind than others have done before him: To which the poet answers, in these fourteen verses, that other philosophers did indeed talk very big, but when the trial came, they started, and stood aghast at death, as much as any of the vulgar; they patiently lived on, and endured torments, infamy, and all the calamities of life; and when dangers threatened, or sickness seized them, they confessed, of all men, the most abject souls, and betrayed a mind most subject to superstition.

Ver. 43. Some of the ancients believed the soul to be a suffusion of blood about the heart, and consequently that it is the blood itself; as Empedocles and Critias. Witness Aristotle, de Anima, lib. i. c. 2. Cicero, Tuscul. i. Macrobius, on the dream of Scipio, l. i. c. 14. and Tertullian of the Soul, cap. 4. According to this opinion,

Homer gives death the epithet, purple: *πρῶφύρεος Σάρατος*. Iliad. v. v. 83. Virgil likewise alludes to it: *Æneid*, ix. v. 349.

Purpuream vomit ille animam.

And *Æn.* x. v. ult.

Undantique animam diffundit in arma cruore.

Nor are we without frequent instances of this in our English poets. Milton says of Abel,

—He fell, and deadly pale,
Groan'd out his soul, with gushing blood effus'd.

And Sir R. Blackmore:

Gasping he lay, and from the grievous wound
The crimson life ebb'd out upon the ground.

And Lee, in the tragedy of Nero:

With many a wound she made her bosom gay;
Her wounds, like flood gates, did themselves
display,
Through which life ran in purple streams away.

And Cowley, David. 4.

His life for ever spilt, stain'd all the grass around.

And even Moses often says, that the soul is in the blood: he repeats it no less than thrice in one chapter, Lev. xvii., and alleges it as a reason for the precept, not to eat blood.

Ver. 52. By the manes the ancients understood three different things: I. The souls of the dead: II. The place in hell, to which the souls went after death, and where they had their abodes: and in this sense Virgil, *Georg.* iv. v. 467. says of Orpheus, that he went to the manes:

*Tænarias etiam fauces, alta ostia Ditis,
Et caligantem nigra formidine lucum
Ingressus, Manesque adiit, Regemque tremen-*
dum, &c.

III. The infernal gods. In which sense too the same Virgil, *Georg.* iv. v. 489. speaking likewise of Orpheus, says,

—Incautum dementia cepit amantem,
Ignoscenda quidem, scirent si ignoscere manes.

And Cicer. 2. de Leg. 37. "*Deorum Manium jura sancta sunt.*" But of the manes, or souls of the dead, in which sense our author is to be taken, Apuleius, lib. De Deo Socratis, gives this account: "*Manes animæ dicuntur melioris meriti, quæ in corpore nostro Genii dicuntur: corpori renunci-antes, Demures: cum domos incurfionibus infestarent, Larvæ appellabantur: contra si bonæ fuerint, Lares familiares.*" From whence we may gather, I. That, in general, they are called Lemures: II. That of these Lemures, they who were at rest, took care of the houses of their living relations, and were called Lares, household gods: III. That the souls of those who had led wicked lives, had no resting places after death, but being excluded from the infernal mansions, remained upon earth, punished, as it were, with exile, and haunting the houses of the living, were

called Larvæ, hobgoblins. IV. When it was doubtful what fate had happened to the soul, i. e. whether it was a Lar, or a Larva, they called it Deus manes. They were called Manes, either à *manando*, because they glide and skim through the air: For so says Festus in these words: "Manes Dii ab Auguribus vocabantur, quòd per omnia manare credebant: eosq; Deos superos et inferos dicebant:" where we see, that they gave sometimes the name of manes to the gods above, as well as to those below: Or, as others say, from the old word manus, which signifies good, or merciful: But Servius says, that the infernal gods were called Manes by Antiphrasis, *quia non boni*, because they are not good. Moreover, the ancients were wont to sacrifice black victims to the manes, to the infernal gods, and to the dead, but white to the gods above. Thus Proteus, in Virgil, directing Aristæus how to appease the manes of Eurydice, commands him to sacrifice to her a black sheep:

Placatam Eurydicen vitulâ venerabere cæsâ,
Et nigram mactabis ovem, &c.

Georg. iv. v. 546.

And the ghost of Anchises, foretelling Æneas of his future descent into hell, says to him,

———Huc casta Sybilla

Nigrantum multo pecudum te sanguine ducer.

Æneid, v. v. 735.

And in the sixth Æneid, v. 233. Virgil describing those sacrifices, says,

Quatuor hic primum nigrantes terga juvencos
Constituit,—
Voce vocans Hecaten, &c.

And again:

———Ipse atri velleris agnam

Æneas matri Eumenidum, magnæque forori
Ense ferit, &c.

V. 249.

Of which Arnobius adv. Gentes, lib. 7. deriding the superstitious ceremonies of the Pagan religion, gives the reason in these words: "Quæ in coloribus ratio est, ut merito his albas, illis nigras conveniat, nigerrimasque mactari? Quia superis Diis, inquit, atque hominum dexteritate pollutibus, color albus acceptus est, ac felix hilaritate candoris. At vero Diis lævis, sedesque habitantibus inferas, color fulvus est gratior, et tristibus suffectus è fucis."

These sacrifices to the manes were called *inferiæ*, under which word six things were contained; water, honey, milk, wine, blood, and hair: of all which, see at large, Euripid. in Orest. and in Iphig. Virg. Æn. iii. v. 66. and v. v. 77. Senec. in Oedip. &c.

Ver. 55. Having given these instances of the vainness of those philosophers, whose followers had set them up for rivals to Epicurus, and shown, even by their own practice, that their doctrines are incapable to take away the fear of death, he adds in these four verses, that no credit is to be given to men who talk big, when they are blessed

with the smiles of fortune: But if when men are beset with dangers, and oppressed with misery, they then give proofs of an unshaken temper of soul, it must be granted, that philosophy has improved their minds, and been of use to them.

Ver. 59. Faber says, that the twenty-eight following verses cannot be sufficiently read and considered, so many good things are contained in them. For it is certain that the fear of death is the cause of avarice, treachery, ambition, cruelty, envy, despair, &c. And hence arises the great glory of Epicurus, who, as Lucretius pretends, has chased away that dread of death, which is the root of so many evils.

Ver. 71. Macrobius Saturnal. lib. vi. cap. 2. observes, that Virgil has imitated this passage of Lucretius, in his second Georgic, v. 510. in these words,

——Gaudent perfusi sanguine fratrum;
Exilioque domos et dulci limina mutant,
Atque alio patriam quærunt sub sole jacentem.

Which Dryden interprets thus:

Some thro' ambition, or thro' thirst of gold,
Have slain their brothers, or their country fold;
And, leaving their sweet homes, in exile run,
To lands that lie beneath another sun.

Ver. 73. How much better he, who repines not at the prosperity of others; but satisfied and pleased with what he is, acts cheerfully and well the part that is allotted him. Persius, in his sixth Satire, says very pertinently to this purpose,

Heic ego securus vulgi, et quid præparet auster
Infelix pecori, securus; et angulus ille
Vicine nostro quia pinguior: et si adeo omnes
Ditescant, orti pejoribus.

Which Dryden has thus excellently paraphrased:

Secure, and free from bus'ness of the state,
And more secure of what the vulgar prate,
Here I enjoy my private thoughts, nor care
What rot for sheep the southern winds prepare;
Survey the neighb'ring fields, and not repine
When I behold a larger crop than mine:
To see a beggar's brat in riches flow,
Adds not a wrinkle to my even brow.

Ver. 79. Fannius, flying from the enemy, killed himself, for fear of falling into their hands:

Hostem cum fugeret, se Fannius ipse peremit:

Hic, rogo, non furor est; ne moriari, mori?

says Martial, l. 2. Epigram 80. To whom we may observe, by the way, that the author of Hudibras was beholden for his thought, when describing the effects of fear, he says, that it makes men

Do things not contrary alone
To th' force of nature, but its own;
The courage of the bravest daunt,
And turn poltroons to valiant:
For men as resolute appear
With too much, as too little fear;

And when they're out of hopes of flying,
Will run away from death by dying.

Self-murder is certainly one of the most unaccountable frenzies that ever raged in the minds of miserable men: And yet how frequent are the deplorable instances of such wretches, as, groaning under the calamities of life, put an end to themselves and their discontents together; or, as Dryden somewhere elegantly expresses it,

Who, when oppress'd, and weary of their breath,
Throw off the burden, and suborn their death.

And the same poet, in his description of the temple of Mars, has painted one of these homicides in colours so lively, as scarce any pencil but his own can imitate:

The slayer of himself yet saw I there;
The gore, congeal'd, was clotted in his hair:
With eyes half-clos'd, and gaping mouth, he lay,
And grim, as when he breath'd his sullen soul
away.

This is the effect of despair: But many of the ancients, even of those who held the soul to be immortal, laid violent hands on themselves, believing they should go directly to heaven. Of this number were Clearchus and Chrysippus, Zeno and Empedocles; the last of whom threw himself one night, unseen of any, into the flaming chasm of Mount Ætna, that, by disappearing on a sudden, it might be believed he was gone to the gods. Among the Latins, besides many others, we have the famous example of Cato, that prince of the Roman wisdom, who all his life was an exact imitator of the Socratic doctrine, and who before he killed himself, is said to have read Plato's treatise of the Immortality of the Soul, and by the authority of that philosopher, to have been encouraged to commit the most horrid of crimes. And Cleambrotus too killed himself, upon reading of that very book. Democritus, who was of another persuasion, yet nevertheless,

Sponte sua letho caput obtulit obvius ipse.

Lucret.

But as Lactantius observes, all these philosophers were detestable homicides: For if he, who takes away the life of another, be guilty of murder, so too is he who takes away his own. Nay, his crime is the more heinous, in that it can be punished by none but God alone; and as we came not into this life of our own accord, so neither may we leave this tenement of clay, unbidden of him, who placed us in it. "Sic homicida nefarius est, qui hominis extinctor est; eidem sceleri obstrictus est qui se necat, qui hominem necat; imò verò majus esse facinis existimandum est, cujus ultio Deo soli subjacet: Nam sicut in hanc vitam non nostra sponte venimus, ita rursus ex hoc domicilio corporis, quod tuendum nobis assignatum est, ejusdem jussu nobis recedendum est, qui nos in hoc corpus induxit tam diu habitaturos, donec jubeat emitti." De falsa Sapient. cap. 18. And Virgil himself, all heathen as he was, has nevertheless

allotted to such execrable wretches that place of torments, to which the justice of God has decreed them:

Proxima deinde tenent mœsti loca, qui sibi letum
Insontes peperere manu, lucemque; perosi
Projecere animas. Quam vellent æthere in alto
Nunc et pauperiem, et duros perferre labores!
Fata obstant, tristisque palus inamabilis unda
Alligat, et novies Styx interfusa coerces.

Æn. 6. v. 434.

Which Dryden renders thus:

The next in place and punishment are they,
Who prodigally throw their lives away:
Fools, who repining at their wretched state,
And loathing anxious life, suborn'd their fate:
With late repentance now they would retrieve
The bodies they forsook, and wish to live,
Their pains and poverty desire to bear,
To view the light of heav'n, and breathe the
vital air.

But fate forbids: the Stygian pools oppose,
And, with nine circling streams, the captive souls
enclose.

Ver. 87. These six verses are repeated, from Book II. v. 58. and will be so again, Book VI. v. 32.

Ver. 93, 94. Some of the ancient philosophers held the mind to be a vital habit of body, as health in a man who is well. Of this opinion Aristoxenus is said to have been the author: He practised physic, and was an excellent musician: He first was a hearer of Lamptus of Erythræa, then of Zenophilus the Pythagorean; and lastly of Aristotle. Yet Cicero does not allow him to have been the author, but only a favourer of this opinion. "Aristoxenus, Musicus, idemque philosophus, animum esse censet ipsius corporis intentionem quandam, velut in cantu et fidibus quæ harmonio dicitur: sic ex corporis totius natura et figura varios motus oriri, tanquam in cantu sonos. Hic ab artificio suo non recessit, et tamen dixit aliquid, quod ipsum, quale esset, erat multo ante et dictum, et explanatum a Platone." Aristoxenus, the musician, and philosopher, held the mind to be, a certain consent and accord of the body, as that in musical instruments, which is called Harmony. Thus from the nature and figure of the whole body proceed various motions, as different notes in music. This man straggled not away from his employment, and yet said a thing, which, such as it was, Plato had both said and explained long before. This passage of Plato, which Cicero here speaks of, is in his Phædon, and contained in these words: Καὶ γὰρ ἔν τῳ Σώματι, οἷμαι ἔγχεσθαι καὶ αὐτόν τε τῷτο ἐνθεσθῆναι, ὅτι τοῦτο τί μάλιστα ὑπολαμβάνομεν τὴν ψυχὴν εἶναι, ὥστε ἐντεταμένῃ τῷ σώματι ἡμῶν, καὶ συνεχομένῃ ὑπὸ θεοῦ, τὴν ψυχὴν, τὴν ζῆσθαι, τὴν ὑγρῇ τοιῶν τινῶν κρασιν εἶναι, τὴν ἀρμονίαν αὐτῶν τῶν τινῶν τὴν ψυχὴν ἡμῶν, ἐπεὶ δὲ ἡ ταῦτα καλῶς τὴν μίξιός τε κραθῆναι πρὸς ἀλλήλα. Yet, whoever will take the pains to consider it, will find, notwithstanding what Cicero says, that Aristoxenus seems to have taught one doctrine,

and Plato another. But Lactantius, Institut. 7. cap. 13. explains this harmony of Aristoxenus in a few words. "Sicut in fidibus, ex intentione Nervorum efficitur concors sonus atque cantus, quem Musici Harmoniam vocant: ita in corporibus, ex compage viscerum et vigore membrorum vis sentiendi existit." As in musical instruments, an accord and consent of sounds, which musicians call harmony, is made by the due disposition and tuning of the strings; so in bodies, the power and faculty of perception proceeds from the due connection and vigour of all the members and interior parts of the body. Macrobius, on the dream of Scipio, lib. i. cap. 14. ascribes this opinion to Pythagoras and Philolaus. Now Lucretius, in these seventeen verses, explains the meaning of it, and brings his first argument against it, to this purpose. It often happens, says he, that when a man feels pain in his body, he rejoices in his mind; and often when his body enjoys a perfect indolence, his mind is most miserably tormented. The soul therefore is not an accord, not a vital habit, or due disposition and temperament of the whole body; but a part of the man, distinct from the body, no less than the hand, the foot, the head, &c. are parts of a human body, distinct from one another.

The mind.] The chief part of the soul; for the soul consists of the three parts: viz. the mind, the memory, and the will.

Ver. 94. The poet is in the right to say, that the mind is a part of man; for it is, indeed, the informing, but not an assisting part, as a mariner in a ship, and a coachman in his box, as the academics believed. But he is grossly mistaken, when he adds, that it is as much a part of man as the feet, the hands, the eyes, &c. are parts of the whole animal. For in this he makes no distinction between the integral and essential parts, as we term them; for the integral, or integrating parts, make up the whole compound, inasmuch as it consists of matter: thus the head, the eyes, the hands, the feet, the legs, &c. constitute the whole body; but the essential parts make the essence and existence of the whole compound. Thus matter and form, thus body and soul constitute the whole man; but Lucretius believed with Epicurus, that the soul is corporeal, and so held it to be an integral part of man.

Ver. 96. This Lucretius calls *Sensum Animi*, the sense, the operation of the mind, as we express it, and which he pretends is in man, in like manner as the sight, the hearing, the touch, &c. Now the sense of seeing is made in the eyes, the sense of hearing in the ears, &c. And thus he would fix the sense of the mind in a certain part of man.

Ver. 98. A due proportion, agreement, or accord of all its parts.

Ver. 105. The mind, which is hid within us; for the body is the conspicuous or visible part of man, but the mind is concealed within us, and invisible.

Ver. 110. In these four verses, he brings his second argument, not unlike the former. In sleep the joints are relaxed, the nerves, as it were, un-

braced. There is then no accord of the interior parts, no consent of the members; but the whole frame, and each part of it, is untuned and languid; yet, even then in dreams, something that belongs to the man that is agitated, is grieved, rejoices, &c. Now, it is the mind which then perceives. The mind, therefore, is not the harmony of the whole body, since the body is relaxed by sleep, in like manner as there is no harmony in an instrument when the strings are slackened.

Ver. 114. His third argument, to prove that the soul is not the harmony of the body, is contained in these twelve verses to this effect. As in musical instruments, if you take off some of the strings, the whole accord perishes; so if some of the members of a body were lopped off, the whole body would perish likewise; and thus there would be no life, no sense remaining. But we know very well, that men who are mutilated, and have lost some of their limbs, live nevertheless, and enjoy their senses. Even when a man has lost many of his limbs, his life and senses will remain entire; but if some certain particles of heat and air fly away from the body, the animal drops down, and dies: no life or faculty of perception remains. From whence it appears, that life and sense do not proceed from the harmony of all the members, nerves and bowels, but depend on those particles of heat and air.

Ver. 122. Lucretius says, "Est igitur Calor & Ventus vitalis in ipso—Corpore, &c." And our interpreter is in the wrong to use the word air in this place, instead of wind or vapour. This will evidently appear by and by, when the poet comes to treat of the different kinds of atoms that compose the Epicurean soul.

Ver. 126. In these eight verses, he concludes this disputation concerning the harmony of the soul and body: and after his usual manner, derides and scoffs at that belief. Let these fiddlers, says he, hug themselves in their harmony, a term foolishly invented, and more foolishly explained. I will lose no more time in refuting their nonsense.

Ver. 130. The poet adds not this without reason: for the word harmony is likewise taken for the jointing and setting together of words, or any other more solid matter. Thus we read in Aristophanes *ἀρμονίαν διαχασκυσίαν*. And thus, too, Hesychius, on a certain passage of Herodorus, interprets the word *ἀρμονίαν* by *σύνθεσιν*, conjunction, or joining together.

Ver. 131. "Proprio quæ tum res nomine egebat," are the words of Lucretius. And Faber, in his note upon them seems surprised that our poet says, the soul had no proper name before it was called a harmony, since the words *θυμός*, *νῆς*, and *ψυχή*, were in use long before. As for *θυμός*, says he, it may be objected against propter *Πολυσημασίαν* because of its many significations; and some perhaps will urge, that *νῆς* is an action, not a faculty. But what can be alleged against *ψυχή*; for, though it be sometimes used to signify the blood, as in the Clouds of Aristophanes, where he says, that the bugs,

which he calls Corinthian bugs, τὰν ψυχὴν ἐκ-
πίνεσθαι, drink up the soul, yet it ought to be taken
after the common opinion of the Oriental nations,
who placed the seat of the soul in the blood.
Thus far Faber; upon which Creech says, with
good reason, that that critic might have spared
his labour, if he had reflected, that Lucretius says
all this by way of scoff and derision.

Ver. 144. Lucretius uses the words mind and
soul indifferently one for the other; and, indeed,
why should he not, since both of them compose
but one nature? But he places the mind, in which
the reason resides, and is the chief and noblest
part of that nature, in the heart, where all the
passions have their seat likewise, and show them-
selves: τὸ δὲ λογικὸν ἢ θύρακι, ὡς δῆλον ἐκ τῶν
φύσεων, καὶ τῆς χαρᾶς, says Diogenes Laertius. And
Epicurus himself taught, τὰ πάντα τὰ τὰς αἰσθήσεως
ἐν τοῖς σπένδοις τόποις εἶναι. Plutarch. de Plac. Phi-
losoph. lib. 4. cap. 4. But the soul, the inferior part
of this nature, and in which the locomotive fa-
culty is chiefly placed, is diffused through the
whole body, and moved as the mind directs: yet,
though it obeys the mind, it partakes not of all its
passions, but of those alone that are violent. Hence
the mind is often oppressed with grief and sadness,
when the soul is in perfect tranquillity. But if
the whole soul be affected with any mighty grief,
the animal falls into a swoon, nor is even life it-
self out of danger. Whence it is certain, that the
mind is joined to the soul, because it moves it;
and by means of that impulse, the soul too moves
the body. This is contained in twenty-seven ver-
ses, and with this agrees what the same Plutarch
says in the place above cited: Δημόκριτος, Ἐπικū-
ρος, διμερῆ τὴν ψυχὴν, τὸ μεν λογικὸν ἔχασαν ἐν τῷ θύ-
ρακι καθύπερθε, τὸ δὲ αἰσθητικὸν καθ' ὅλην τὴν σύγκρισιν
τῷ σώματι διεσπασμένον.

Ver. 136, 137. The words in Lucretius are,
Sed Caput esse quasi, & dominari in corpore toto
Consilium, quod nos Animum Metemque voca-
mus.

To which purpose I have seen an excellent expres-
sion of Tertullian, where he calls the mind, " Sug-
gestum animæ," which I know not how to ren-
der otherwise than the prompter of the soul. The
whole passage, as I find it cited, runs thus: Pro-
inde & Animum, sive Mens est, NOTΣ apud Græ-
cos, non aliud quid intelligimus, quam Suggestum
animæ, ingenitum & infinitum, & nativitas pro-
prium, quo agit, quo sapit, &c.

Ver. 137. Not Epicurus and Lucretius only
seated the mind in the heart; for Epedocles,
Parmenides, and Democritus placed it there like-
wise. Yet Aristotle, Plato, Pythagoras, and Hip-
pocrates taught, that the rational part of the mind
is seated in the brain; and the irascible part of
it in the heart. But of this see at large, Lactantius,
de Officio Dei. c. 16.

Ver. 138. In these two verses, he argues, that
the seat of the mind is in the heart, because the
passions of joy and fear exult, and show themselves
there: for fear and joy are the chief passions of
the mind. Therefore, where the effects of any

thing are, there, too, the thing itself must of ne-
cessity be. But this reason seems to be weak: for
otherwise we must grant a mind and understand-
ing in beasts likewise; for even in their breasts
the passions of fear and of joy exult, and discover
themselves no less than in ours.

Ver. 140. Here Lucretius seems to advance
contradictions: For, I. If the mind and soul are
joined together, and the mind only be seated in
the heart, and no where else, how can the soul,
that part of the mind, wander through the whole
body? II. If the soul obeys the commands of the
mind, she either obeys always, or sometimes re-
sists. If she obeys always, she understands of her-
self, as well as the mind, since she is so subservient
to the will of her master: but to what serves this
obedience? That she may partake with the mind,
not in little, but in violent emotions, as if the
mind were conscious to herself alone of slight dis-
turbances, and imparted nothing of them to the
soul.

Ver. 152. Even some of our English poets seem
to have been obliged to Lucretius for this descrip-
tion of a person falling into a trance: and Dryden
among the rest.

—A sickly qualm his heart assail'd,
His ears rung inward, and his senses fail'd.

Pal. & Ars.

His sight grows dim, and ev'ry object dances,
And swims before him in the maze of death.

All for Love.

And Otway in like manner:

A sudden trembling seiz'd on all his limbs,
His eyes distorted grew, his visage pale,
His speech forsook him, life itself seem'd fled.

Orph.

Ver. 161. In these six verses, he proves by the
same argument, that the mind and soul are of a
corporeal nature: for the mind must of necessity
touch the soul, because it moves it; and since the
soul drives on the body, that too must be done by
touch.

Tangere enim & tangi, nisi corpus nulla potest res.
Nothing but body can be touch'd, or touch.

Epicurus himself has comprehended this and the
following argument in these words: οἱ λεγοντες
ἀσώματον εἶναι τὴν ψυχὴν ματαιάζουσιν ἑδὲν γὰρ ἂν ἰδύ-
νατο ποιεῖν ὅτι πάχειν εἰ ἢν τοιαύτη ἡ νῦν δὲ ἰναργῶς
ἀμφοτέρω ταῦτα διαλαβεῖναι περὶ τὴν ψυχὴν τὰ συμ-
πτώματα. In this argument, our translator has
omitted one instance of the effects that the mind
works upon the body, which Lucretius has ex-
pressed by these words, " corripere ex somno cor-
pus," that it awakes the body from sleep.

Ver. 167. These twelve verses contain another
argument to prove the materiality of the soul.
The mind suffers with the body; a wound hurts
the one, and the other languishes. And whether
the weapon, or the wounded body excite these
motions, and perturbations in the mind, it is the
same thing: for either of them evinces the mind
to be of a corporeal nature.

FF

TRANS II.

Creech had totally omitted this passage of his author, as he likewise has several others; and these eleven verses are not his; nor indeed do I know whose they are: they were sent to me, and I was the rather willing to insert them, that this edition might be complete, and want nothing that is contained in the original. I think I have in this note given the sense of Lucretius, and from thence the reader may judge how rightly these lines express it. Meanwhile, he may, if he like them better, instead of the two first of these verses, take the two following:

Besides the mind and body bear a part,
By mutual hands compell'd to mutual smart.

Lucretius is not in this place proving the soul to be mortal, but only a fellow-sufferer with the body, and consequently material; nor will he by any means allow it to be a spirit.

Ver. 169. This passage, in the original, runs thus:

Si minus offendit vitam vis horrida Teli,
Ossibus ac nervis disclusis, intus adacti;
Attamen insequitur languor, terraque petitus
Suavis, & in terra mentis qui gignitur æstus,
Interdumque quasi exurgendi incerta voluntas.

These five verses Lambinus suspects to be supposititious, and deems them unworthy of Lucretius. And the judicious Gassendus, whose opinion is justly held to be of more weight than that of a thousand such as Gifaneus and Pareus, who admit of these verses, approves of his suspicion. But Faber endeavourso illustrate and correct them.

In terra mentis qui gignitur æstus,
He changes into

Interdum moriendi gignitur æstus;

then he adds: They, who through any affliction of mind, have, at any time, fallen into swoons, know very well what this means: for then, we, faltering, seek the ground ("succidui terram perimus,") not without some sense of ease and pleasure. Sometimes, too, we desire to die, and sometimes the wavering will fluctuates between an uncertain and doubtful resolution, whether to live or die. Virgil describes something like this in the dying Dido, after she had stabbed herself. The verses are admirable.

Illa graves oculos conata attollere, rursus
Deficit: infixum stridet sub pectore vulnus.
Ter sese attolens, cubitoque inixa, levavit;
Ter revoluta toro est: oculisq. errantibus, alto
Quæsit cælo lucem, ingemuitq. repertâ.

Æn. 4. v. 688

Thrice Dido try'd to raise her drooping head,
And fainting thrice, fell grov'ling on the bed.
Thrice op'd her heavy eyes, and sought the light,
And having found it, sicken'd at the sight.

Dryd.

Moreover, the "æstus moriendi," means a full purpose, a certain resolution, &c. to die. They who by nature or afflictions are inclined to be sad, will, I

believe, approve of this emendation; nor will others perhaps dislike it. Thus far Faber. But Creech is of another opinion. I, says he, who, both by nature and through crosses and afflictions, am more than a little disposed to sadness and melancholy, nevertheless disapprove this correction. The poet describes the perturbations of the mind in a wounded body. It drops as soon as it receives the blow; while it lies on the ground it feels other emotions, and sometimes it is seized with a desire or will, but that not fully bent and determined to rise up from the ground. The wounded perceive all this; and why may not Lucretius describe what they experience? I therefore interpret, "Mentis in terra," Of the mind grovelling on the ground, together with the wounded body. Thus Creech; but the person, who translated this passage, seems to be rather of Faber's opinion.

Ver. 178. If we may give credit to Lucretius, he has sufficiently evinced the mind to be of a corporeal nature; and in these twenty-six verses, he teaches, of what sort of body this mind consists. The atoms, says he, that compose the mind, are very small, smooth, and round. For the mind is most easy to be moved; and whatever is so, must be composed of particles, which, by reason of their texture, as well as of their size and figure, are most subject to motion. For let us but consider other things, water, for example, is very subject to move, because its parts are small and volatile: but honey moves with more difficulty, because its parts are more intricate, and more closely joined together. Again; a heap of the seeds of poppies, or of grass, is scattered by a gentle wind; but a heap of darts or of stones resists a much stronger blast: the stones and darts are heavy and rough bodies, but the seeds are round, smooth, and small; *ψυχὴ συγκείται ἐξ ὁμόμων λειοτάτων, τὰ τραγυλοῦσιν, &c.* (Gassendus inserts this particle) *πολλῶ τινὶ διαφρεσὶ ἢ πυρὶ.* Epicurus in Laertius, lib. x. But not only Epicurus and Lucretius held that the mind is most easy to be moved; and that it moves of itself; for Plato taught the same thing. And so too did the Pythagoreans, who defined the mind, "Numerus seipsum movens," a self-moving number. But Aristotle, I. de Anim. denies that the soul is moved in the least; and affirms it to be the motionless cause of the motion of the body. But he was more in the right, who said,

Τὴ ψυχὴ: τὸ κινούμενον.

Τὴ ἀψυχὸν; τὸ μὴ κινούμενον.

Nician. opud Glossog.

Of these different opinions of the Platonists and Peripatetics, you may see at large, Macrobius in Somn. Scip. lib. ii. c. 14.

Ver. 183. Hence, perhaps Cowley, David. iii. describing the swiftness of Asabel, says,

Scarce could the nimble motions of his mind
Outgo his feet; so strangely would he run,
That time itself perceiv'd not what was done.

Ver. 204. The poet has taught, that the mind consists of small, smooth, and round atoms, because it is very subject to motion. He, now, in

these twenty verses, teaches, that the nature of the mind and soul is subtle, of very slight texture, and compacted of minute bodies. For when an animal dies, the whole soul flies away; and yet if you measure the dead body, you will find the bulk of the limbs to be as large as when the animal was alive: if you weigh it, you will find it as heavy. Therefore, what flies out of it, is something that is extremely subtle and minute. For, take away any solid or large part, the size will be different, and different the weight. In a word, as we conclude that the spirits of wine, the fragrant of odorous bodies, and the taste of savoury, consist of subtle and minute particles; because, when the wine is become flat and vapid, when the odorous body has lost its fragrant, and the savoury is grown tasteless and insipid; yet the bodies themselves retain the same weight, and the same bulk they had before; so, for the same reason, we ought to conclude the like of the soul also. Epicurus, in the tenth book of Laertius, says, *ψυχὴ σῶμα ἐστὶ λεπτομερὲς, παρ' ὅλον τὸ ἄθροισμα παρισταμένον*. The soul is a body consisting of very tenuious parts, and diffused through the whole bulk of the animal.

Ver. 224. In these five verses, he asserts, that the subtle atoms, of which he has composed the mind, are of different kinds: for he had observed, that a vapour exhales from dying animals, and that warm too, together with intermixed air; without which there is generally no heat. But a dying person expires, or breathes out his soul: therefore, that soul consists of vapour, air, and heat. *Ψυχὴ σῶμα ἐστὶ λεπτομερὲς παρ' ὅλον τὸ ἄθροισμα παρισταμένον, προσμεικρύνον δὲ πνεύματι θερμὴν τινὰ κράσιν ἔχοντι, καὶ πῆ μὲν τῷ πρὸς μίξι, πῇ δὲ τῷ αἵματι* says Epicurus, in Laert. lib. x. And in Plutarch, *Adversus Colorem*, the Epicureans are said, *τὴν δὲ ψυχὴν ἕσσαν συμπύκνυντες ἐκ τίνος θερμῆς, καὶ πνευματικῆς, καὶ αἰρῶδους*.

Ver. 229. This soul, that consists of vapour, air, and heat, is manifestly imperfect; it has not yet the faculty of perception or thinking; therefore some fourth thing, whatever it be, must be added to the other three. This fourth thing consists of the very smallest, smoothest, and most subtle atoms; because it is the first thing that moves, and by its motion stirs up the vapour, the heat and the air; and according to its different motions, all the parts of the body feel either pleasure or pain. If this motion be more violent than the texture of the mind can suffer, if it penetrates even to the bones and marrow, the soul is dissipated, and death follows. If the motion be less vehement, and stop at the surface of the body, then the soul remains whole and entire; and a sense arises either of pleasure or of pain. This the poet has comprised in twenty-one verses, Plutarch 4. de Plac. Philos. c. 3. says, that Epicurus did not make the nature of the soul simple, but held it to be *κρᾶμα ἐκ τισσάρων, ἐκ ποικίλης πυράδους, ἐκ ποικίλης αἰράδους, ἐκ ποικίλης πνευματικῆς, ἐκ τισσάρων τίνος ἀκατανομαστικῆς, ἢ ἢν αὐτῇ αἰσθητικόν*, something composed of four certain things, viz. of something fiery, of something airy, of something windy, and of a fourth name-

less something, from which proceeds its faculty of sense and perception.

Ver. 237. Here our interpreter has committed a like fault with that we observed above, ver. 122. What he here calls vapour, he should have called heat or fire. Lucretius always uses the words *ventus* or vapour, wind or vapour indiscriminately, but never either of them to express the heat or the air of which the soul is composed. His words in this place are,

*Prima cietur enim parvis perfecta Figuris,
Inde Calor motus, et venti cœca potestas
Accipit; inde Aer. inde omnia mobilitantur.*

Ver. 250. Here the poet tells us, that he is going to undertake a difficult task, and that the Latin tongue does not supply him with proper and significant words to express his subject, and to keep up to the dignity of it. He proceeds, however, and in these twenty six verses, teaches, that these four things, heat, vapour or wind, air, and the fourth something without a name, are entirely blended with one another; insomuch, that they compose one most subtle substance, which being diffused through the whole body of the animal, is contained by, and within the body, and is the cause of its preservation; yet they are not all seated in the same place. That part of the body, which is properly called the mind, being placed deepest and most inwardly, or in the inmost recesses of the whole body, is, as it were, the foundation of the whole soul; but the wind, the heat, and the air, are so mingled with one another, that they compose one substance, according to the different nature of animals. Thus heat, savour, and odour, are mixed together in every animal, yet constitute but one body.

Thus we have the composition of the Epicurean soul; but how contemptibly the ancients erred in explaining the nature of the mind and soul, is sufficiently manifest even from their different opinions concerning it. Cicero, Lib. i. Tuscul. Quæst. reckons up no less than thirteen, which are as follows. I. Some held the mind to be the heart itself. II. Others, not the heart, but that it is seated in the heart. III. Others thought fit to make it a part of the brain. IV. Others would not have it a part of the brain, but held that it is seated in the brain. V. Empedocles believed the soul to be a suffusion of blood in the heart. VI. Others held it to be a breath, or gentle wind. VII. Zeno taught that it is a fire. VIII. Aristoxenus, a harmony. IX. Pythagoras and Xenocrates, a number. X. Plato taught, that it consists of three parts: 1. Reason in the head: 2. Anger in the heart: 3. Covetousness in the lower part of the diaphragm. XI. Dicaearchus held, that it was nothing at all, but a mere empty name. XII. Aristotle believed it an *ἰτελική*, perpetual and never-ceasing motion. XIII. Democritus and Epicurus, a texture of tenuious atoms. And others had still other opinions concerning it. See book i. ver. 141.

Ver. 254. In these four verses, he gives the reason why the manner in which these four natures

combine to make up one soul, cannot be perceived: viz. because the atoms, of which these four different natures consist, are so subject to motion, that by reason of their continual and ceaseless agitation, they are confounded with one another; so that their separate and peculiar powers cannot be distinguished either in time or place.

Ver. 262. He means the fourth nameless thing, which Lucretius himself calls in this place, "Animæ Anima," the soul of the soul, because it gives motion and sense to each and every of the members of the body; and for that it excels the other three natures, wind, heat, and air, in subtlety, and in quickness of motion.

Ver. 270. In these six verses, he gives the reason why those three natures, vapour or wind, air, and heat, ought to be subject to the fourth nature that has no name; lest, says he, either the air, the heat, or the wind, should prevail separately; and by that means prejudice, nay, entirely destroy the senses: therefore, that fourth nature ought to govern, that it may impart out of itself to the other three, the motions that are called sensiferous, i. e. that confer sense.

Ver. 276. In these fifteen verses, the poet proves, that even the minds of irrational animals are composed of vapour or wind, heat and air. Grant this, says he, and then it is easy to give a reason for all their different tempers. For why, for example, is a lion prone to anger and rage, but because the heat prevails in his mind? Whence proceeds the timidity of deer, but from the vapours that predominate in their souls? The ox owes his quietness of temper, and evenness of mind, being neither much inclined to fear or anger, to the calm and peaceful air. For the eyes of an enraged animal glow with heat; nay, we not only see the sparkles themselves flashing out; the deer tremble and quake for fear, and the drudging ox is grave and quiet. And here, if Gassendus will not take it amiss, I will insert the following passage out of Stobæus: τὸ μὲν πνῦμα κίνησιν, ὅδε ἀπὸ θερμίας, τὸ δὲ θερμὸν τὴν φαινομένην θερμότητα τοῦ σώματος, τὸ δὲ ἀκίνητον αἰσῶσιν τὴν ἐν ἡμῖν ἱμπεροῦσαν αἰσθησίν. The wind the cause of motion, the air of rest, the heat of the warmth that is seen in the body; and, lastly, the nameless thing, of the sense that is within us.

Ver. 291. In these eighteen verses, he teaches, that one of these three things predominates in man likewise, for some are prone to anger, others to fear, while others are mild, sedate, and easy. And the innumerable variety of tempers proceeds from the variety of the mixtures that may be made of these three things, by reason of the different degrees of each ingredient. Yet philosophy may greatly mend a vicious nature, though not so much, but that some footsteps, τῆς κακίας, of innate malice will still remain; which, nevertheless, will not hinder any man from living with less content and pleasure; though we see, that they who have had the greatest advantages of learning and education, cannot entirely subdue their natural passions, nor put a full stop to their career.

Ver. 308. Thus the poet extols the power and efficacy of his philosophy, imitating therein the

vain-glorious boast of Epicurus, ζῆσθαι δὲ ὡς θεὸς ἐν ἀνθρώποις and ἄλλῃ γὰρ εἰσὶν ὁρτῶ ζῶν ἀνθρώπος ἐν ἀνθρώποις ἀγαθοῖς.

Ver. 309. In these twelve verses, he joins this soul, which is formed of heat, vapour, air, and the fourth something that wants a name, to the body, and blends them in such a manner, that neither the body can remain whole and safe without the soul, nor the soul entire without the body. The Epicureans held, that the soul is contained in the body, [Epicurus, in Laertius, uses the word *εργάζεσθαι*, to hide, and in Empiricus, *διακρύπτειν*, to keep safe] and that the body is mutually held by the soul, that it may not precipitately rush to dissolution. For they believed an animal to be, as it were a web in the loom, that the body is as the chain, and the soul the woof; so that the intertexture of each with the other, composes the whole work; but if either of them be dissolved, the other, and therefore both together must be dissolved likewise. For example, take a lump of frankincense, and separate the odour from it, and neither the frankincense nor the odour will remain entire; and we ought to believe the same of the soul and body.

This was the opinion of the Epicureans; a doctrine no less impious than false: for though the soul be the keeper and safeguard of the body, yet the body is not likewise the keeper and safeguard of the soul; nor are they interchangeably the cause of each other's preservation. The soul gives to the body vital motion, sense, and life; nor is even the understanding itself bound to the body by any corporeal organ. The form, indeed, contains the body, but is not contained. Therefore his assertion is false, that the soul is contained by the body, and that it cannot act without the organs of the body. But the Epicureans were of opinion, that the soul is contained in the body almost in the same manner as water is in a vessel, which keeps it in, because it is a thicker substance; thus they will have the soul to consist of very tenuious atoms, but the body of much thicker principles. This is almost what Lucretius himself says by and by, ver. 424.

For since the limbs, that vessel of the soul,
Could not contain its parts, &c.

Ver. 311. He means the soul and body which compose the nature he speaks of two verses before.

Ver. 315. That is, the soul, the mind, and the body; the whole animal, the whole man.

Ver. 316. That is to say, that the atoms of which the soul consists, cannot exist apart, and separated from those that compose the body; nor on the contrary.

Ver. 321. He again demonstrates in these twelve verses, this adunation of the soul and body. The body, says he, is neither generated, nor grows without the soul: and when the soul takes its flight, when its particles are withdrawn, the vital chain is unlinked, the members putrify, and at length the body perishes. Meanwhile, what becomes of the soul? It is dispersed into empty air

and vanishes away. Since, therefore, neither of them are safe and whole, without the other, we must believe that their substances are most closely combined and united together.

Ver. 333. Hitherto the poet has asserted, that neither the body can act or perceive apart from the soul; nor the soul when separated from the body. But that sense is produced in all the members, by the common motion of both of them, acting conjointly. He now, in these eight verses, opposes those philosophers, who affirm that the soul only is capable of that motion which we call sense; and appeals to experience against their opinion: for, let it be granted, that the body feels, we could not be more conscious of that sense than we now are; therefore, it must be granted, that the body does feel. But some may object, if the body have sense, how comes it not to retain that power and faculty of perception, when the soul is gone out of it? Because that power and faculty belong not to the body alone, but to the body conjoined and united to the soul. Epicurus, in the 10th book of Laertius, asserts the same doctrine in these words: *ἡ μὲν (Anima) εἰλήσκει τὴν αἰσθητήν (sentiendi facultatem) ἐν μὴ ὑπὸ τῷ λοιπῷ ὁμοεισμάτῳ ἐκείνῳ πᾶσι· τὸ δὲ λοιπὸν ὁμοεισμάτῳ παρασκευάσαν ἐκείνη τὸν αἰσθητὴν αἰσθητήν, μηδέποτε τὴν αὐτὴν τοιότα συμπτύματα παρ' ἐκείνης διὸ ἀπαλλαγίσης τῆς ψυχῆς ἢ ἐκείνη τὸν αἰσθητὴν, ὃ γὰρ αὐτὸ ἐν ἑαυτῷ ἐκείνη τὴν δύναμιν, ἀλλ' ἐξ ἑαυτῆς ἀμα συγκινημένη αὐτῇ αὐτὴν ἀφύσει παρασκευάζει.*

Ver. 341. Now because there were some who held that the whole compound body, that is to say, an animal ought not to be said to have sense, or to perceive, but that the soul by itself and alone performs that office, without the assistance or co-operation of the organs, which they pretend are but in the nature of doors, that being thrown open, the soul that is seated within, sees all external objects: among whom was Epicharmus, whose saying *ὦς ὄρα, ὦς ἀκούει*, the mind sees, the mind hears, is very well known; and Cicero too is of the same opinion, Tusc. i. where he says: "Nos enim ne nunc quidem cernimus ea, quæ videmus. Neque enim ullus sensus est in corpore, sed, ut non solum phyfici docent, verum etiam medici, qui ista aperta et patefacta viderunt, viæ quasi sunt ad oculos, ad aures, ad nates, à sede animi perforatæ." For we do not even now perceive those things which we see. Neither is there any sense in the body; but as not only the natural philosophers teach, but the physicians too, who have plainly seen them open and displayed abroad, there are, as it were, ways and passages bored through to the eyes, to the ears, and nostrils, from the seat of the soul. Lucretius, therefore, in these fourteen verses, brings two arguments to evince the weakness of this opinion: for if the eyes, says he, were merely doors, how come they to feel any violence and pain from bright and glittering objects? Besides, pluck out those eyes, those mere doors as you call them, the soul ought then to perceive external objects much better, because the prospect would then be more free and uninterrupted.

Ver. 355. Lucretius has before asserted, that

the soul is extremely small in bulk, and that its whole substance, if it were assembled apart into one, might be contained in a very little space; and he now, in these twenty-eight verses, declares the same more at large, in opposition to Democritus, who held, that as many parts as there are of the body, so many parts too of the soul are contained in them, that is to say, in each one; and consequently, that the soul has as many parts as the body. But were this true, we should feel every thing that touched any part of the body. For when any particle of the body, and the part of the soul that is joined to it, come to be moved, why should not sense arise from that motion? But there are many things, as he proves by several examples, which we do not perceive when they touch us; they therefore are mistaken, who join a part of the soul to every part of the body.

Ver. 356. Democritus a philosopher, born at Abdera in Thrace, about five hundred years before Jesus Christ. He learned astronomy of the Chaldeans, and geometry of the Persians; at length he went to Athens, and gave all he had to the republic, reserving to himself only a little garden, where he might freely meditate on the works of nature. This is that philosopher, who is said to have laughed at the vicissitudes of fortune, and at the vain anxieties and follies of men; from whence he was surnamed Gelastus. See more of him below, ver. 1044, and Book iv. ver. 335.

Ver. 379. Lucretius, ver. 134, of this book, has seated the mind, in which the reason and the faculty of sense reside, in the heart; but he has diffused the soul, in which the locomotive faculty is placed through the whole body. Now, in these nineteen verses, he makes that mind the chief instrument in the preservation of life. And whatever others think, this is not absurd nor dissonant to the Epicurean philosophy. The mind, ver. 270, which for the most part consists of that fourth nameless something of Epicurus, which alone bestows the faculty of sense, is joined to the animal in such a manner, that it is the foundation of the whole frame, soul and all together. But withdraw the foundation, and all the superstructure must of necessity tumble down. The mind and the soul, continues he, may properly be compared to the eye; the ball, the mind; the soul, the rest of the orb: wound the ball, and blindness inevitably follows: wound any other part of the eye, the power of sight will nevertheless remain.

Ver. 389. The gladiators at Rome, when almost all their limbs were wounded and hacked to such a degree, that they had no manner of use of them, and even when many of them were entirely cut off, yet lived a great while in that maimed condition. And Nardius relates, that at this day, at Cairo in Egypt, the robbers on the high way, who are cut asunder near the naval, and then thrown on a heap of unslacked lime, live for several hours, talk to the standers by, and answer them questions.

Ver. 390. The crystalline part of the eye,

which a vitreous humour follows inwardly, and outwardly an aqueous. It is commonly called the light, or sight of the eye. The vitreous humour is contained in a tunicle or little skin, which the Greeks therefore call *ἀμφιβλόςρον*, surrounding.

Ver. 398. Being now going to prove, that the soul is mortal, he promises, in these nine verses, that he will spare no labour in this disputation; but because he has distinguished, as the stoics likewise do, between the soul and the mind, lest his Memmius should not rightly comprehend the force of his reasons, he gives notice, that all his arguments are bent with equal strength against the mind and soul likewise; both of which compose but one substance.

Ver. 407. In these twenty-one verses, he brings his first argument, to prove the mortality of the soul, under which name he comprehends the mind also, from the subtleness and tenuity of it, which he has before demonstrated, and now confirms again. For the soul, says he, is a corporeal something, more subtle, more apt to move, and more subject to dissolution, not only than water, but even than mist or smoke; since it is stirred and moved by things more thin and subtle than either smoke or mist, to wit, by the very images of those things, which often move the soul in our dreams; and, therefore, it must of necessity be more easily dissipated than they. And it is in vain for any one to object, that when it is dissolved from the body, it remains entire in the air; for how can the subtle air preserve that safe, which often exhales through the pores of a thick body?

Ver. 410. Because the soul is moved by the very images of water, mist, and smoke, when the mind thinks of those things in sleep. And the images of all things whatever are more tenuous than the things themselves.

Ver. 411. For Epicurus held, that nothing can be seen, nay, not so much as thought upon, or even dreamed of, but by the means of images; as we learn from Cicero, *l. de Finibus*.

Ver. 420. The conclusion is false; as indeed is this whole argument, to prove the corporeality, and consequently the mortality of the soul; and it is answered in one word, that the soul is a spirit. Besides, though the mind, when the body is asleep, does not think of smoke, water, mist, or other things of the like sort, it is not she that receives the images of those things, but the fancy, which is an interior faculty of the soul; and these images being thus admitted into the fancy, the mind makes use of them, to know the things whose images they are. Add to this, that the mind knows other things whose images are neither received within herself, nor in the fancy neither. Thus it is no proof that the soul is corporeal, because the mind makes use of corporeal images, to come at the knowledge of things. And, therefore, the poet adds, without reason, that when the soul is gone out of the body, it cannot subsist in safety, from the very air, which is more rare than the body, by which alone the soul could be contained; for the soul is a spirit

and wants not air to preserve and keep itself alive.

Ver. 424. As if, because the water runs out, when the vessel that contains it is broken; the soul were contained in the body in such a manner, that when this is destroyed, that too must dissolve, and vanish into air. But certainly Lucretius stabs himself with his own weapon; for if the soul be dissolved, when the body is broken to pieces, as the water runs out of a broken vessel; then the more the body is obstructed and closed up, the faster the soul will be detained and kept in it, as a well-closed vessel holds the water more safely than one that is leaky; yet, though in a violent death the body be not broken, nay, though in men that are hanged, it be in some measure closed and stopped up, the soul nevertheless flies out of it with greater ease, than when the body is cut to pieces limb by limb. It is indeed a vessel, but made of earth, and the soul is contained in it, but proceeds from heaven; and when death comes, both of them return to the place from whence they came; the body is committed to the earth, and the soul seeks her native heaven. Let Lucretius then make the most of his weak argument.

Ver. 428. In these twelve verses, is contained his second argument against the immortality of the soul. Whatever, says he, is generated, grows up, waxes old, and decays with the body, is mortal: But all this is true of the soul: For children are no less infirm in mind, than weak in body; as they grow up, and the strength of their body increases, they strengthen in judgment likewise. But in old age, both mind and body decay, and dodder alike.

This argument is confuted by Lactantius, *lib. vii. de Div. Præm. c. 12.* where he argues to this purpose. This reason, says he, holds not good as to the soul, though indeed it be true inasmuch as it relates to the body; which, because it is made of a perishing element, is corruptible: but the human soul, because it is derived from a celestial subtilty, neither dies nor is corruptible; on the contrary, it is an eternal spirit, that deduces its origin from the spirit of God. Therefore this common axiom, "*Quicquid natum est, interire necesse est,*" whatever is born, must of necessity die, can hold good only in corporeal things. The soul, indeed, is born with the body, but it proceeds perfect from God; nor does age add any thing to it, or take any thing from it. The strength of the mind does indeed increase and decay, but this happens not through any imperfection in the soul itself, but through the deficiency of the organs of the body. Aristotle too argues to the same effect, *l. de Anim. cap. 4.*

Ver. 440. These sixteen verses contain his third argument. When the body is seized with a fit of sickness, the mind is possessed with grief, fear, &c. But in that disease the body is wasted; and it is likely too that the mind wastes with sorrow. Nay, the mind is sometimes diseased itself; for the mind of a lunatic raves, and the mind of a lethargic person is stupid. Since, therefore, the

violence of disease and pain penetrates into the very mind, we ought to believe that the mind is mortal. Panætius, in Cicero, Tuscul. I. uses the same argument, which Cicero likewise there confutes in these words: "Sunt hæc ignorantis, cum de æternitate animorum dicantur, de mente dici, quæ omni turbido motu semper vacat; non de partibus iis, in quibus ægritudines, iræ, libidinesque versentur; quas is, contra quem hæc dicuntur, semotas à mente & disclusas putat," &c.

Ver. 466. This disease, Celsus lib. v. cap. 20. calls a stupid heaviness, and an almost irresistible necessity of sleep, with an alienation of mind. Hence they derive it from the Greek word *Ανδνη*, oblivion, because that disease is attended with a forgetfulness of all things; occasioned by the brain's being oppressed with too great a quantity of pituitous matter.

Oldham describes it thus:

A sleep, dull as the last—
On all the magazines of life did seize,
No more the blood its circling course did run;
But in the veins, like icicles, it hung.
No more the heart, now void of quick'ning heat,
The tuneful march of vital motion beat;
Stiffness did into all the sinews climb,
And a short death crept cold through ev'ry limb.

Ver. 453. Lactantius, de Divin. Præm. lib. vii. cap. 12. shows the weakness of this conclusion in these words: "Quia anima juncta est cum corpore, si virtute careat corpus, contagio ejus ægrefcet: imbecillitas de societate fragilitatis redundat ad mentem." Because the soul is united with the body, if the body want strength or health, the soul will sicken with the contagion of the body; a weakness redounds to the mind from its fellowship with frailty. Thus the mind is said to be sick or in pain, only by way of metaphor: for it is the defect of the body only, that makes the mind cease to operate, or that causes it to operate amiss. Thus too Aristotle, de Anim. lib. i. cap. 4. teaches that hate, love, anger, fear, grief, and all the other passions, as we call them of the mind, are not indeed defects or weaknesses of the understanding, but of the body in which it resides: For the understanding is something that is more divine and free from all passion. And, therefore, as the same Lactantius argues very well; "cum dissociata fuerit à corpore, vigeat ipsa per se; nec ulla jam fragilitatis conditione tentabitur, quia indumentum fragile projecit. Loco citat."

Ver. 456. These thirteen verses contain his fourth argument, in which he produces a drunken man, bawling and raving without sense or reason, confounding heaven and earth together, and neither his hands, his feet, his eyes, his ears, nor even his mind itself capable of performing their proper offices. Now what can be the cause of all this, says he, but the brisk and impetuous spirits of the wine, which having diffused themselves through the whole body, affect, disturb, and distract the mind? And certainly whatever can be disordered

to this degree by a slender force, may be destroyed by a more violent.

Ver. 462. Singultus, the word Lucretius here uses, signifies not only a sobbing, but a yexing, which we commonly call the hiccough, a frequent effect of too much drinking.

Ver. 465. This too is false; for the mind is not affected by the strength of the wine, but the brain and the fancy, which the fumes of the wine render cloudy and confused; and this is the reason that the mind cannot perceive and act with the same clearness as before. It is not therefore any fault or defect of the mind, but of the organs of the body. In like manner, the weakness and heaviness of the members that attend drunkenness, cannot be imputed to the mind, but to the body, which being weakened by the strength of the wine, is become incapable of being guided and governed by the soul. Thus the sun is not said to have contracted a blemish, because he shines not into a room whose windows are closed up. Nor is the hand grown weak, because it throws not the dust of a pounded stone so far as it did the stone, while it was yet whole and unbroken.

Ver. 469. His drunkard having made his exit, the poet, in these twenty-one verses, for his fifth argument, brings in a man seized with an epileptic fit, and prostrate on the ground; a horrid spectacle which none are willing to behold. However, the elegance and liveliness with which Lucretius describes this image, make us regard it not without some pleasure; for he extends the wretch in so moving a manner, and so strongly paints his strugglings and his other motions, that even though we should be displeased at his ill-placed wit, we cannot but forgive the artist. Being seized with the fit, he raves and talks wildly; but that raving, says the poet, is a mark of the dissolution of the substance of the mind, at least of the perturbation of it. And he who can believe, that what may be dissipated within the body itself, can remain entire in the open air (for when the soul is freed from the body, it can be no where else), may with as much reason pretend, that water will stay in a vessel full of holes, and leak out of one that is found.

This argument being but a confirmation of the last, requires no other solution than that has had already: nor, indeed, does that strength of disease disturb the mind, but distorts the body and all its members; and yet the soul is then said to suffer, because it does not act after its usual manner. Thus how skilful soever be the player on a harp, yet if the strings of his instrument be out of tune, he can make them utter no other than discordant and unharmonious sounds.

Ver. 490. The sixth argument is in these sixteen verses to this effect. We see that this mad and raving mind may, by the help of physic, be recovered and restored to its former state: and thus, there is some change made in the mind. Therefore, either some new parts are added, or some are taken away, or else the particles of the mind are placed in another order; for all change

is made either by addition, detraction, or transposition of the particles. But every thing must, of necessity be mortal that receives new parts, that loses any of its parts, or of whose parts the position and order is changed. Therefore, whether the mind grow sick, which the foregoing arguments have proved, or whether it grow well again, it either way confesses its own mortality.

Ver. 501. Not in the least for the reason here alleged; because, though the raving or madness of the mind be cured by hellebore, or other remedies of like nature, yet the cure is not of the mind, but of the brain; which being restored to its former health, the mind performs her functions as before.

Ver. 505. The seventh argument is included in these nineteen verses. Men often die limb by limb, and expire by degrees. Therefore, the soul too dies by degrees. For, who will pretend that the soul, that most lively and sensible thing, resides in the dead members of the body that are void of all sense. But if you think that the soul retires out of the dying members into the more inward parts of the body; why do not those parts to which the soul retreats, and where she is contracted into a narrower space, enjoy a more lively and brisker sense? Has the soul, by being thus shut up in a less compass, lost the power of sense? Take care of granting that; for what decays and loses its nature by being thus contracted and huddled up, is as much mortal as that which flies dispersed, and is torn to pieces in the air.

Ver. 516. The falsehood of this conclusion may be evinced even from the doctrine of Lucretius himself. For ver. 137. of this book, he fixes the seat of the mind in the heart; but the soul, because he believed it corporeal, he has diffused through the whole body, and yet not disjoined it from the mind. Therefore, it may by degrees contract itself from the extremest parts of the body to the heart, where the mind, to which it is joined, has its residence. But there is another answer to this argument: for since the soul is incorporeal, it is diffused whole through all the body, and whole in every part of the body; so that when any part of the body dies, or is cut off, the soul does not therefore die, nor is it therefore cut off: but remains safe and whole in the other sound and whole parts of the body, nor does it go out of the body, till the body be dissolved by death. Thus, for example, the intentional species, as they call it, is whole in all the place, and whole in each part of the place: For instance; in whatever place, or in whatever part of a place you set a mirror, or fix your eye, there the whole image will every where be found. Thus too, say the Romanists, the body of our Lord Jesus Christ is whole under the whole species of the bread, and whole under every part of the bread, in the blessed sacrament of the Eucharist.

Ver. 524. These eight verses contain the eighth argument. The mind is a part of man, as is proved above, ver. 93. and has a certain place allotted for it; as there is for the nose, the eyes, &c. But pluck out the eyes, and cut off the nostrils, and

neither will those perceive colours, nor these smell odours. Therefore, we must acknowledge the same of the separated soul, since it is no less joined to the body than the other parts of it.

In answer to this argument, we say, that the soul is indeed a part of man: but not such a part as the feet, the eyes, the arms, &c. for it is only an essential part, as they call it, and is the principle of life to its own self: but the other parts of man derive their vital motions, and their senses from the soul. Therefore, it is not strange, that the other parts, when they are disjoined from the whole man, have no sense remaining in them, since they are separated from their principle of vital sense. Lactantius gives this argument another answer. The soul, says he, is not a part of the body, but in the body: in like manner, as what is contained in a vessel is not part of the vessel, no more than the goods in a house are part of the house; so neither is the soul, because the body is, as it were, the vessel and receptacle of the soul, therefore a part of the body. "Anima non est pars corporis, sed in corpore est: Sicut id, quod vase continetur, vasis pars non est; nec ea, quæ in domo sunt, partes domus esse dicuntur: ita non anima pars est corporis, quia corpus vel vas animæ est, vel receptaculum." De Divin. Præm. c. 12.

Ver. 529. So Cicero Tuscul. 1. "Nosce animum tuum, nam Corpus quidem est quasi vas, aut aliquod animi receptaculum." Know thy mind, for the body is indeed as a vessel, or certain receptacle of the mind. Thus Xenocrates in Antioch, calls the body $\psiυχῆς σκηνος$, the tabernacle of the soul. In Cratyl. $\psiυχῆς σῆμα$, the sepulchre of the soul.

Ver. 532. The ninth argument is in these twenty-five verses to this purpose. While the body and soul are joined together, the animal lives and is sensible; when the soul is gone, the body is insensible, and so too is the soul when separated from the body. The mind is as the eye of the body, and who expects to see with an eye that is torn out? Besides, were not the atoms of the soul contained in the veins and nerves, they could not be affected by those motions that are the cause of sense: for all those motions require a certain space, and fixed and definite bounds. But if you pretend that the soul, after its dissolution from the body can be contained or held in by the air, you may as well at the same time, affirm likewise, that the air is an animal which seems most absurd and most false. Epicurus writes thus to Herodotus. $\text{Καὶ μὴν τὸ λυομένη τῷ ὄλῳ ἀθρόιστατος, τὴ ψυχῇ διασωρίζαι. καὶ ἀπὸ τῆς αὐτῆς δυνάμεως, ὅδε κινῆσαι, ὡς τὸ ὑδ' αἰσθάνειν κίνησαι. Οὐ γὰρ διὸν τὸ νοεῖν αὐτὸ αἰσθανόμενον, μὴ ἐν τῇ τῷ σπασίματι ταῖς κινήσει ταύταις χεράμενον, ὅταν τὸ σιγάζοντα, καὶ περιέχοντα μὴ τοιαῦτα ᾖ, ἐν οἷς νῦν ὅσα ἔχει ταύτας τὰς κινήσεις.$

Ver. 536. This comparison is not just. For, though the soul be the principle of life to the body; yet the body is not so to the soul. It is not therefore to be wondered at, that the body perceives nothing without the soul. But who can

doubt but that the soul has the power of perception without the body, since it is the principle of all sense.

Ver. 553. This inference is too absurd; for what necessity is there, that the air into which the soul flies at its separation from the body, should become an animal? Has it any of the organs or dispositions that are proper for vital sense? The soul, after it is separated from the body, always retains its innate propensity to animate the body again at the resurrection.

Ver. 557. In these ten verses, is included the tenth argument. When the soul, which is seated in the inmost parts of the body, as being the foundation of the whole animal, is fled away, the ruinous body putrifies, and moulders into dust. Now, whence can proceed this total destruction of the body, except because the soul that propped it up, and held all the members together, has forsaken them, and is fled away through all the pores and issues of the body? And the soul too, being thus divided into so many minute parts, at her going out of the animal, seems to be prepared and got ready for her total dissipation.

Ver. 565. This inference which the poet draws from this argument, is altogether ridiculous, as if the soul exhaled through the pores and passages of the body, as the smoke of frankincense does through the holes of a censer. The soul is wholly incorporeal, and therefore goes unhurt and whole out of the whole body, as well as out of each pore and passage of it. And the body's corruption when the soul is gone out of it, argues not any divisibility of the soul; but proceeds from the want of that vital agitation, which the body has from the soul only.

Ver. 567. These fourteen verses contain the eleventh argument, which is to this purpose: In what we commonly call a swoon, the strength and powers of the mind and soul are shaken to such a degree, that were the cause but a little more violent, the soul itself would be dissolved. Since, then, the mind can be thus disordered, even while the body hides and protects it: who can believe that so subtle a substance, when it comes to be turned out from its place of shelter, can resist and hold good against the restless violence of the winds and other things that will be continually assailing it.

Thus Lucretius: but we know very well, that this "*Deliquium animi*," as the Latins call it, this fainting of the mind, does not in the least argue the mortality of the soul; but only a deficiency or failure in the organs of the whole body: to which organs, when they are thus obstructed, the vital and animal spirits which the soul makes use of, as helps to the preservation of life, cannot be transmitted.

Ver. 581. In these ten verses, the poet brings his twelfth argument; and, to leave no stone unturned, he appeals to the dying, and asks, Which of them ever perceived his soul rising up from the extremest parts of his body, and then go out whole at his mouth? Or whether they do not rather perceive it dying in each part, as every sense does in its proper organ? Nor is it to be doubted, says

he, but that the dying are conscious of the dissolution of their souls; otherwise why do they complain? They should rather rejoice to lay down the burden of the body, as a snake is to cast off her slough, or as a stag to drop his ponderous and overgrown antlers.

Ver. 585. Neither Lucretius, nor any man else, ever experienced the truth of what he here advances: for what dying person ever told the standers by, that he perceived what his soul was doing, which way it was going, or how it went out of his body, from which part of it it first retired, &c. For his saying that it goes out through the jaws is only a vulgar way of speaking. And since the soul is wholly spiritual, it may, as we said before, go out whole through the whole body, or at any part of it.

Ver. 586. This part of the argument is wretchedly weak indeed; and Lactantius, lib. 7. de Divin. Præm. cap. 13. has fully answered it in these words: "*Equidem nunquam vidi qui quereretur se morte dissolvi: Sed Lucretius fortasse Epicureum aliquem viderat, etiam dum moritur, Philosophantem, ac de sua dissolutione in extremo spiritu differentem. Quomodo sciri potest utrum dissolvi se sentiat, an corpore liberari, cum in exitu lingua mutescat? Nam dum sentit, et loqui potest, nondum dissolutus est: Ubi dissolutus est, nec sentire jam, nec loqui potest: Ita queri de dissolutione aut nondum potest, aut jam non potest. Et enim non prius quam dissolvatur, intelligit se dissolutum iri. Quid, quod videmus plerosque morientium non dissolvi conquerentes, sed enim se, et proficisci, et ambulare testantes; idque aut gestu significant, aut, si adhuc possunt, et voce pronunciant. Unde apparet non dissolutionem fieri, sed separationem, quæ declarat animam permanere.*" Indeed, I never saw any man who complained that he was dissolved in death. But Lucretius perhaps had seen some Epicurean philosophizing, even when he was dying, and reasoning of his dissolution at his last gasp. How can it be known, whether a man perceives his soul to die, or to be freed from the body, since the tongue is speechless in the moment of death? For so long as a man perceives and speaks, he is not dissolved. When he is dissolved, he can then neither perceive nor speak; therefore, either he cannot yet bemoan his dissolution, or now he can no longer bemoan it. For how can he know he is dissolved before he is dissolved. Besides, we see many dying persons, not complaining of their entire dissolution, but affirming that they are going, that they are departing, that the soul is going out of the body; and this they signify by signs and gestures; or, if they are able, they pronounce it with their tongue. Whence it appears there is no dissolution but a separation of the soul from the body; which separation evinces the permanency of the soul.

Ver. 589. Tertull. de Pall. Theophylact. in cap. 10. Matth. Aristot. Hist. Nat. l. 8. c. 7. et Plin. lib. viii. c. 27. says, that serpents, when they perceive themselves growing old, cast off their skins, and are clothed again with new, which Virgil confirms in these excellent verses:

Qualis ubi in lucem locuber, mala gramina pastus,
Frigida sub terrâ tumidum quem bruma tegebat;
Nunc positus novus exuvius, nitidusque javentâ
Lubrica convolvit sublato, pectore terga,
Arduus ad solem, et linguis micat ore trifurcis.

Æn. 2. ver. 471.

So shines renew'd in youth, the crested snake,
Who slept the winter in a thorny brake;
And casting off his slough when spring returns,
Now looks aloft, and with new glory burns.
Restor'd with pois'nous herbs, his ardent sides
Reflect the sun; and rais'd on spires he rides,
High o'er the grass he hissing rolls along,
And brandishes by fits his forked tongue. *Dryd.*

Ver. 590. Pliny, in the eighth book of his Natural History, chap. 32. speaking of deer, says, "Cornua mares habent, solique animalium omnibus annis stato veris tempore amittunt." The males have horns, and are the only animals that lose them every year at a certain time in the spring. And Waller, describing the head of a stag, takes notice of the same thing.

So we some antique hero's strength
Learn by his lance's weight and length;
As these vast beams express the beast
Whose shady brows alive they dress.
O fertile head, which ev'ry year
Could such a crop of wonder bear!
Which, might it never have been cast,
Each year's growth added to the last,
These lofty branches had supply'd
The earth's bold son's prodigious pride:
Heav'n with these engines had been scal'd,
When mountains heap'd on mountains fail'd.

Ver. 591. These five verses contain his thirteenth argument. He has already said, that the mind is seated in the heart; and now he concludes from thence, that it is confined to the heart in such a manner, that it cannot exist elsewhere. He who looks for souls in the air, may as reasonably expect to find flames in water, and ice in fire: for all natural things have certain and fixed places to be born and live in.

But this argument is false; for birds, for example, are hatched in a nest, and yet live out of the nest. A nut is produced upon a tree, and a grain of corn in the ear, and yet they are kept in granaries. Then, why should not the soul, if it were created in a certain part of the body, be able to live out of it. But as Lactantius, lib. 7. de Div. Præm. c. 12, argues admirably well, the poet contradicts his own doctrine; for book ii. ver. 964. he says,

—Each part returns when bodies dies;
What came from earth to earth, what from the
sky } [high
Dropp'd down, ascends again, and mounts on }

which ought not to have been said by him, who now asserts, that the soul dies with the body. But to use the very words of Lactantius, "Veritate victus est, et imprudenti ratio vera surrepsit;" he is convicted by a truth which happened to slip from him unawares.

Ver. 596. In these ten verses, the poet brings his fourteenth argument. If you imagine, says he, the separated soul to be immortal, you must believe it sensible too; and consequently endowed with five senses: but from whence can these senses arise, since the organs of the senses, the eyes, the nostrils, the hands, the tongue, the ears, are all putrified in the abandoned body?

The answer to this argument is, that the senses that are ascribed to the soul after death: as hearing, seeing, &c. are not properly called senses; but it is the very power and faculty of perception and understanding, which is called the senses in each distinct and different sort, and which of itself, for instance, discerns colours no less than the eye, hears sounds no less than the ear, &c.

Ver. 600. He derides the fables of the ancients concerning the souls of men, which, as they feigned, went into hell after death, where they enjoyed all their senses, as when they were alive.

Ver. 606, 607. His fifteenth argument takes up these thirty-four verses. The soul, says he, being diffused through the whole body, must of necessity be divided, if the body be cut in two by a violent and sudden stroke. For example, if a limb of a soldier be cut off by an armed chariot, the motion of the dissected part is a proof that the soul is divided likewise. This the poet elegantly and at large describes; and then brings a second instance in the parts of a serpent chopped to pieces; and urges, that it must be granted, either that there are several souls in the same animal, that is to say, in a man or a serpent, and that the keenness of the weapon, even though the blow be given at random, divides the members of the animal so exquisitely, that it leaves to each soul its proper seat; which no man in his senses will allow, or else it must be confessed, that the single soul which is diffused through the whole body of the animal, is cut into many pieces, and consequently is mortal.

To this argument we answer, that besides that the Christian faith teaches, that the soul of man is incorporeal; if the mind have chosen to itself its peculiar seat in the heart, as Lucretius pretends it has, it can never be divided, unless the heart be cut to pieces; but this we know to be false. Then as to what he instances in the amputated limbs of soldiers, it is not the soul that remains in them, and causes that palpitation; but certain warm spirits, that, by stirring up and down in the yet living nerves and muscles, move the mangled and chopped off limbs; nor do they forsake them till they are seized and benumbed with cold. As to the inference he draws from serpents, we answer, that their rejected parts have life, because the soul of animals is corporeal and mortal too.

Ver. 607. That is to say, the soul is in the whole animal, or in every part of the animal: for where the faculties of the soul are, there the soul is likewise; nor can those faculties exist where the foundation and cause of them is not; but the soul is the foundation of them. And this is what made Aristotle say, that if the eyes were in the feet, the feet would see.

Ver. 614. Lucretius calls them "falciferos Currus," scythe bearing chariots, alluding to the armed chariots which the ancients made use of in their armies, and which Xenophon, in book 6. of the Institution of Cyrus, describes in these words. Πολυμήθεια καλίσκουσιν ἄρμαϊα τροχῶς τε ἰσχυροῖς, ὥς μὴ ῥαδίως συνλίσσῃται, ἄξονί τε μακροῖς ἥτις γὰρ ἀναλίσσεται πάντα τὰ πλάϊα, τὸν δὲ δίφρον τοῖς ἡνίοχοις ἐπόισεν, ὥσπερ πύργον, ἰχυρῶν ξύλων ὕψος δὲ τέλει ἐπὶ μέγρι τῶν ἀγώνων, ὥς δύνῃσι ἡνιοχεῖσθαι οἱ ἵπποι ὑπὲρ τῶν δίφρων· τὸς δὲ ἡνίοχας ἰωρράκισι πάντα πλὴν τῶν ὀφθαλμῶν, προσέειπε δὲ καὶ δρόπανα σιδήρεα ὥς διπῆχια πρὸς τὸς ἄξονας ἔνθεν καὶ ἔνθεν τῶν τροχῶν, καὶ ἄλλα πόλιν ὑπο τῶν ἄξων εἰς γῆν βλέποντα, ὥς ἐμβαλόντων εἰς τὸς ἡνίοχας τοῖς ἄρμασιν. He took care, says he, to have warlike chariots made with very strong wheels, that they might not be easily broken, and large axle-trees, that they might not be apt to overthrow. The coachman's seat or box was made like a tower, of strong timber, and elbow-high, that they might govern the horses as they sat in their seats. The charioteers were armed from head to foot; to the axle-trees on both sides of the wheels he fastened scythes of iron, two cubits in length, and others beneath the axle, turning downwards towards the ground, as if he meant to drive over and trample down his enemies with this sort of chariots. And Vegetius de re Milit. l. 3. c. 24. says, "Quadrigas falcatas in bello Rex Antiochus et Mithridates habuerunt, quæ ut primò magnum intulere terrorem, ita postmodum fuere derisui." King Antiochus and Mithridates, in their wars, made use of chariots drawn by four horses, and armed with hooks or bills; which at first were very dreadful in an army, but at length were laughed at. Lucretius mentions them again, book v. ver. 1392. But we have a better authority for this sort of chariot, than any of the heathens can give us; 1 Sam. xiii. and Cowley, David. iv. describes them thus,

Here, with worse noise, three thousand chariots pass,

With plates of iron bound, or louder brass,
About it forks, axes, and scythes, and spears;
Whole magazines of death each chariot bears;
Where it breaks in, there a whole troop it mows,
And with lopp'd panting limbs the field bestrews:
Alike the valiant, and the cowards die;
Neither can they resist, nor can these fly.

Ver. 630. To what Lucretius here says of serpents, and which all men know to be true, I will add what many have experienced of vipers; the head of which animal will live a considerable time after it is cut off; if you prick in the mouth, it will catch fast hold of the instrument that wounds it; and if you flea the rest of the body, and take out the bowels, and then throw it into water, it has been observed to live for an hour after, and even to move with vigour.

Ver. 634. I answer, it has: For, as Aristotle says, the more ignoble animals have indistinct and unseparated organs, after the manner of plants; wherefore that part which is analogical to the heart is extended throughout the whole

body. Hence it is, that the rescinded parts live, because each enjoys its proper fountain of life.

Ver. 640. These nine verses contain the sixteenth argument. If, says he, the soul be immortal; if, as Pythagoras and Plato believed, it existed entire before the body was perfected, why does no man, Pythagoras only excepted, remember the life he led before? And if the soul, by going into the body, lose all remembrance of things past, why should not a thing that is vitiated to such a degree be subject to farther corruption, and to death?

This argument proves nothing against the immortality of the soul, but rather condemns the metempsychosis of Pythagoras: For neither do we Christians pretend that the soul pre-exists before it is infused into the body; but believe that it is created by the Almighty, at the time that it is insinuated into the body. Souls, therefore, are not from all eternity, but created eternal, and in time. But Pythagoras held, that souls are eternal, and that they pass from body to body, as well of man as of beast. Now, this doctrine of the transmigration of souls was originally an Egyptian doctrine, as Herodotus and Diodorus Siculus both affirm; but if lying Philestratus may be believed, the Egyptians had it from the Bramins. It is agreed by all, that Pythagoras first brought it into Greece, where he had a mind to be thought the first author of it. To make the people believe him, and give credit to his doctrine, he told them an impudent lie: that his soul had been in Euphorbus at the time of the Trojan war, and that in the six hundred years between that and his birth, his soul had gone through several other bodies before it came into his. He faced them down by a singular gift of remembering all the stages through which his soul had passed in its travels. "O mirum," says Lactantius, "et singularem Pythagoræ memoriam! O miseram oblivionem nostram omnium, quæ nesciamus, quid ante fuerimus! sed fortasse vel errore aliquo, vel gratia sit effectum, ut ille solus lethæum gurgitem non attigerit, nec oblivionis aquam gustaverit." But let us hear Pythagoras tell his tale. First, When Euphorbus was killed by Menelaus, which was in the year before J. C. 1185, then his soul, as he said, came into Æthalides, the son of Mercury. After his death, it came into Hermodimus, then into one Pyrrhus, a fisherman of Delos, and at last to Pythagoras. This is the way that Porphyrius, p. 201, tells the story. But the Scholiast on the Electra of Sophocles says, that Pythagoras himself used to say that his soul was in Æthalides before it came into Euphorbus; and this is confirmed by Diogenes Laertius, lib. viii. who cites Heraclides for it, and he lived near the time of Pythagoras; and likewise by the Scholiast on Apoll. Argonaut. i. who reports it from Pherecydes, an intimate friend of Pythagoras. They tell their story with particulars well worth knowing, if they were true: As that Pythagoras came by this wonderful memory by the favour of Mercury, whose office it was to carry souls into hades, and who gave the soul of his own son Æthalides,

in its way thither, the privilege not to taste of the waters of Lethe, the drinking of which makes souls forget their former estate and being, and whatever else has passed in this world. And thus, it is plain, how, as Pythagoras was wont to say, Euphorbus remembered that his soul had dwelt formerly in the body of Æthalides; Hermotimus, that his had been in both those; the fisherman, that his had inhabited those three bodies; and Pythagoras, that his had been in them all. They tell us farther, how it came to pass, that in six hundred years, that soul of his was only in the two bodies of Hermotimus and the fisherman; for, as Diogenes Laert. lib. viii. affirms, Pythagoras himself used likewise to say, that Mercury gave the soul of his son Æthalides leave to rest sometimes in hades, and at other times to travel unbodied above ground; and that even the soul which was in him, had, after the fisherman's death, rested 207 years, before it entered into his body. But whether these particulars be true or not, the doctrine of the transmigration of souls is sufficiently proved, if the soul of Pythagoras had at any time formerly been in the body of Euphorbus. And Porphyrius, p. 191, and his scholar Jamblichus, cap. xviii. both tells us, that Pythagoras himself affirmed it, nay, that he proved it to be true beyond dispute. But these philosophers wisely took care to conceal that part of their ware which would have disgraced all the rest. It was the Egyptian doctrine, that souls passed out of men into beasts, fish, and birds. And this too Heraclides in Laertius affirms, that Pythagoras used to say of himself, and that he remembered not only what men, but what animals, nay, what plants his soul had passed through; and, what was a greater gift even than that which Mercury bestowed on Æthalides, Pythagoras took upon him to tell many others, how, and where their souls had lived before they came into their bodies; particularly one who was beating a dog, he desired to forbear, because, in the yelping of that cur, he heard a friend's soul speak to him. So too Empedocles, who lived in the next age after Pythagoras, and was, for a while, the oracle of his sect, declared of himself, that he had been first a boy, then a girl, then a bird, then a fish. Apollonius too, if we may give credit to Philostratus, had the same impudence; for that writer tells us, that he owned his soul to have been formerly in the master of a ship. He showed one young man who had in him the soul of Palamedes; another that of Telephus, who were both killed in the time of the Trojan war; and in a tame lion, that was carried about for a sight, he said, there was the soul of Amasis king of Egypt. How could such fictions come into mens heads? There is more than idle fancy in them; and they plainly discover a pernicious design of the devil, to confound the two doctrines of the immortality of the soul, and of the resurrection of the body; for if these fictions were true, there would be no difference between the soul of a man and the soul of a brute, or that of a plant; and at the resurrection, there would be more bodies than souls to

animate them. To tell what tricks Pythagoras used, to impose on men the belief of this no less absurd than impious doctrine, would make this digression too tedious; therefore, I will only add, that Cicero in *Tuscul.* observes, that Plato too, who taught that the universal ideas of things are from all eternity, and eternal, held, if not a perfect remembrance, a reminiscency at least of the actions that passed in the life that preceded the infusion of the soul into the body. And against these doctrines of these two philosophers, Lucretius chiefly directs this argument, and some of the following.

Ver. 649. The seventeenth argument, in these sixteen verses, is to this purpose: If the soul were infused into a perfect body, it ought to have been done in such a manner, that it might be in that body like a bird in a cage; not as it now is, when it seems to grow, and be so much of a piece with it, that it cannot be safe and whole out of it, and thus betrays itself to have had a beginning, and to be liable to have an end.

If this argument be brought only against the Pythagoreans, we need not concern ourselves about it; but if it be levelled against us, who assert, that immortal souls are infused into our bodies the moment they are created, it is already answered in our note upon the second argument, ver. 428; to which we add besides, that the soul is infused into the body, not as an assisting form, as they call it, such as is the pilot in a ship, and the coachman in a chariot; but as an informing form, and as the principle of vital motion. But its departure from the body, to which it is so closely and inly joined, without any division of its parts, but whole and free from all stain and blemish of corruption, is a privilege due to its spirituality; for whatever is spiritual cannot be disjoined or divided.

Ver. 665. These fifteen verses include the eighteenth argument. Let us grant, says the poet, that the soul is, as they will have it, first formed, and infused afterwards; yet it must of necessity suffer change, as it is diffused into all the different mazes and pores of the body, its site and order is changed, and the whole substance divided into parts. For let any thing flow into so many pipes, so many passages and holes as are in the body, it must of necessity be turned and twisted about in many manners. For example, the food we eat, while it is conveyed through the veins and other conduits of the body to every member of it, loses its first form, and takes up one that is quite different. And we ought to believe, that the soul too undergoes a like change, and consequently is mortal.

This argument is answered by what we have several times asserted, for since the soul is incorporeal and spiritual, why may it not be infused whole and without any division of its parts, into the body, and all its members? And if, for instance, the whiteness of the milk spreads itself through the whole substance of the milk, without any division of itself, how much rather may the soul diffuse itself through the body? Besides, nei-

ther does the meat that is distributed into the members of animals, die and perish; but after it is concocted by the natural heat, it is converted into the nature of the body it feeds.

Ver. 680. These twenty-nine verses includes the nineteenth argument. If the soul, says he, when it goes out of the body, leaves some particles behind, they being thus separated, argue the soul to be subject to dissolution; if it leaves none, no cause can be alleged why so many worms take life in the carcase; for to pretend that so great a number of souls flow together from without to the place from whence one departed, would be very absurd indeed; and yet it would be more absurd to say that each soul chooses for itself what seeds are most proper to make itself a body, that she may suffer all those ills from which she is exempted when out of a body; or that she enters into a body already made, since it is impossible that she can fit and fashion herself to inform each part of it.

It is scandalous to waste time in confuting these trifles; however, to solve all these arguments in a word, I say, that the human soul being incorporeal, it leaves not any remains of itself in the body, nor is the generation of worms in a dead carcase made of the corruption of the soul that animated that body, but of the corruption of that carcase only, as it likewise happens in cheese, in rotten earth, &c. Nor, lastly, are the souls of the worms infused from without, but, to use the words of Lucretius, are generated, as often as there happens to be in those carcasses, or in any other putrified bodies, any seeds or atoms that are fit and proper to generate those insects.

Ver. 709. The twentieth argument is in these thirty verses, and attacks the doctrine of Pythagoras and of Plato. If these immortal souls, says he, had so often been shifted out of the body of one animal to the body of another, the natural dispositions of the animals would by little and little have been changed and altered. Thus the lion would not now be fierce, the deer not fearful, the fox not crafty; the dog would run from the stag, and the dove would pursue the hawk; beasts would be wise, and men void of reason; for the soul of the dove would often be in the hawk, and the soul of a beast inform the body of a man, and in like manner on the contrary: but if it be pretended that the nature of the soul changes according to the different natures of the bodies, and that of whatever kinds the souls are, they put on the manners that agree with the bodies into which they enter, I ask no more; for whatever can be changed is mortal, since in every change there must be a transposition, and consequently a dissolution of the parts. But if it be pretended, for example, that human souls go only into human bodies, why does that soul, which, but now, behaved itself wisely in the body of a man grown up to the years of maturity, play the fool at the rate it does when it is infused into the body of a child? Does the mind grow weak and tender in a weak and tender body? If it does, it is changed; and no man in his senses will dare

affirm, that a thing so often changed is immortal.

This whole argument is bent only against the Pythagoreans, who held that souls pass from body to body, as well as of man as of beast. But what he advances, that souls change according to the passions, dispositions, and manners of the different bodies, and grow with them, is already answered in the note on ver. 429.

Ver. 717. Lucretius calls it "*Canis Hyrcano de femine*," a dog of the Hyrcanian breed. Hyrcania is a country of Asia, which has the Caspian sea on the east, Iberia on the west, Armenia on the south, and Albania on the north. Now, in this country there are a great quantity of panthers, leopards, and tygers, the males of which animals, they say, sometimes couple with bitches, who bring forth a very sagacious sort of dog, and these are they of which our poet here speaks.

Ver. 730. For as Cicero says in Cato, "*Temerritas est florentis ætatis, prudentia senectutis*:" Rashness is the effect of youth, and prudence of old age. And Aristotle teaches the same thing in *Ethic vi.* where he says, that though prudence be requisite in every thing, yet nothing is learned without experience and practice, therefore a child cannot be prudent, since age alone can make him so.

Ver. 735. What Lucretius means is this: They cannot deny but that the mind is tender in a tender body; for example, that the mind of a child of two or three years old is weak and infirm; but if it be true that a mind, which was strong before, becomes weak in a weak body, it follows from thence, that the mind is mortal. But the difference of the organs in the bodies answers this part of the argument.

Ver. 739. In these nine verses, is contained the twenty-first argument. Lucretius having hitherto fought this battle with his utmost strength, with all his skill and application of mind, and having besides, as he fancies, routed his adversaries, he now detaches some light-armed arguments in pursuit of the fugitives, and, in the first place, desires to know why a soul is so passionately fond of an adult body? And why it lothes the members that are grown feeble with age, and hastens to get out of them? For, if it were immortal, it would not dread the imbecility of infancy, nor the ruins of old age.

This argument is of so little weight, that it scarce deserves an answer. For who can believe that the soul retires from the body in apprehension of being crushed to pieces, or in dread of any danger that can happen to her from the fall of her tenement of clay; she leaves it because its organs are so impaired and weakened that she can no longer perform in them the functions of life.

Ver. 748. The twenty-second argument is in these seven verses, where the poet urges, that it is ridiculous to believe that a multitude of souls are waiting at the coitions and births of animals, and contending who shall get first into the body, unless, perhaps, it is agreed among them that the first comer shall be first served.

This argument, absurd as it is, nevertheless, presses hard upon the Pythagoreans, though it do not in the least affect us, who teach and believe, that God creates the soul the very moment it is infused into a new-formed body.

Ver. 755. The twenty-third argument is contained in these fifteen verses, in which he observes, that as all other things have a fixed and certain region or place allotted them, to be born, to grow, and to live in, so has the soul likewise, and therefore can no more exist out of the body than fish can out of the water, than a tree in the air, or than a cloud in the sea: Nor can it be doubted in the least, but that the soul is born, grows, lives, and exists in and with the whole body; for otherwise we should feel it formed, sometimes in the head, sometimes in the shoulders, nay, in the heels, and perceive it diffusing itself by little and little through the whole body.

This argument is to the same purpose as the thirteenth, and is answered in the note on ver. 593. The first thirteen verses of it are repeated, Book v. ver. 140.

Ver. 762. Here our translator has followed the emendation of Faber, which, nevertheless, in his Latin edition of Lucretius, he condemns, as not agreeing in the least with the lection of any of the ancient copies; and therefore he is rather of opinion to reject entirely this verse of his author,

Tandem in eodem homine, atque in eodem vase maneret,

than to admit it, as corrected by Faber, who makes it run thus:

Tandem in toto homine, aqua ut in toto vase maneret.

He owns, however, the correction to be ingenious, and that he is not better pleased with the conjectures of others concerning this passage.

Ver. 770. In these six verses, which contain the twenty-fourth argument, he says, that it is downright folly to believe that things, so different as mortal and immortal beings, can be joined together, and that a mortal thing (the body) which, when separated from that immortal thing (the soul), is subject to no harms nor inconveniencies, should, when it is united to that immortal thing, be liable to those pains and afflictions with which men are daily oppressed.

If Lucretius could not comprehend how a mortal body could be joined to an immortal soul, how came he to find out that the void, which is incorporeal and eternal, is intermixed with created things that are corporeal and mortal? But others, and great philosophers too, could comprehend it very well; as Aristotle, who asserted immortal souls in mortal bodies; and Plato, who taught that the Eternal Mind is infused through all the parts of this transitory and corruptible world: And Hermes, who, as Lactantius, lib. xii. de Divin. Peæm. witnesses, composed the nature of man of something mortal, and something immortal, from whence is become, as it were, the hori-

zon that joins the highest to the lowest, and the earthly to the heavenly. Thus these men, and others too, acknowledged some things partly mortal, partly immortal: and indeed the extremes would otherwise have been without a middle, and therefore they were in the right to make some things mixed of mortal and immortal.

Ver. 776. The twenty-fifth argument is contained in these twenty-one verses, and is to this effect: Nothing is eternal and immortal, except either by reason of its solidity, as an atom, or because it is free from stroke, as the void, or lastly, because there is no place out of which, or from whence any bodies can come to dash it to pieces, or into which its dissolved or broken parts can retire, as the *τὸ Πᾶν*, universe. But the soul is nothing like any of those three things, for it is composed of seeds, and therefore not perfectly solid: It is not a void, because it affects the body, and in its turn is affected by it: And no man will pretend that the soul is the *τὸ Πᾶν*, universe; therefore it is mortal. These twenty-one verses are repeated, Book v. ver. 395.

To all the objections he brings in this argument against the immortality of the soul, we answer, I. That the soul, indeed, is not an atom, but that not an atom only is eternal. II. That the soul is not the void, but that not the void alone is eternal. III. That indeed the soul is not the universe, but that not the universe only is eternal: for God is eternal and immortal, and the souls of men are eternal and immortal: thus, besides the three that Lucretius mentions, there is a fourth sort of immortal things. And Plutarch, de Nat. Deor. reasoning according to the doctrine of Epicurus, tells us, that even he allowed four kinds of things to be free from corruption, and that under the fourth kind was included the soul of man.

Ver. 797. The twenty-sixth, and last argument against the immortality of the soul, is contained in these twelve verses. If any one pretend that the mind is either fenced from things that are contrary and destructive to it, or that if any such things should advance against it, they cannot reach it, or if they do reach it, they cannot hurt it, but are repelled before. This opinion is overthrown by the diseases of the body, of which the mind too bears a part: to which may be added, the restless cares and anxieties of life, and the dread of punishments after death: but what is yet more, and worse than all these, add conscience, that inward hell: and, lastly, add madness and lethargy: and thus you will be forced to confess, that the mind is not protected from pernicious things, but that, on the contrary, it is miserably oppressed by them.

This argument is, as we said before, not a proof of any defect in the soul, or in the mind, but argues only the weakness and imperfections of the body and its organs. Thus Lucretius concludes his disputation concerning the mortality of the soul: and to evince the insufficiency of his arguments, and how much they fall short of reaching his design to prove the soul mortal, it will not be

amiss to take a short view of them from the beginning of this book. First, then, he grants the soul to be a substance, distinct from these visible members, and divides it into two parts, the soul, properly so called, and the mind, which is the governing and ruling part, and takes the heart for its proper seat, whilst the soul is diffused over the whole body; but these two are but one nature, and united, because the mind can act on the soul, and the soul on the mind, and therefore both are material,

Tangere enim et tangi sine corpore nulla potest res.

For nought but body can be touch'd or touch.

This substance of the soul is a congeries of round smooth atoms, and consists of four parts, wind, heat, air, and a fourth nameless thing, which is the principle of sense. This soul is not equal to the body, as Democritus imagined, but its parts are set at distance, and when pressed by any external objects, meet, and jumble against one another, and so perceive. This is the description of the Epicurean soul, and the manner of its acting; and all the arguments they propose against its immortality, endeavour likewise to evince it material, and that too from the mutual acting of the soul and body on one another.

To examine each particular, I shall first grant it material, and then consider the validity of that consequence; secondly, prove it immaterial, and show that an immaterial being can act on a material, and then discourse on the validity of that consequence, which infers it to be immortal, because it is immaterial.

And here I shall admit the distinction between soul and mind, taking one to be the principle of life, and the other of sense, but cannot allow them to be one nature, because of their mutual acting, unless the body too, on the same account, be but one nature with the soul, which Lucretius himself denies. This mind is seated in the brain, a thousand experiments assuring us, that when there happens any obstruction in the nerves, the animal feels not though you cut the part that lies below the stoppage, and yet the least prick above it raises the usual pains and convulsions. Now, suppose this mind material, and consider, that it has been already proved, that matter is not self-existent, and therefore depends on another substance for its being; now I suppose any man will grant that it is as easy to preserve as to make a thing, for preservation is only a continuing that being which is already given; and therefore though the soul were material, yet the consequence is weak. And thus the Stoics, though they acknowledge nothing but body, τὴν δὲ ψυχὴν γινώσκοντες καὶ φθαρτὴν λέγουσιν, ἅπ' ἐνδὺς δὲ τοῦ σώματος ἀπαλλογῆσαν φθείρεσθαι, ἀλλ' ἐπιμένειν τινὰς χρόνους καθ' αὐτὴν, τὴν μὲν τῶν σπυδαίων μετρίως εἰς πῦρ ἀναλύσιναι τῶν πάντων, τὴν δὲ τῶν ἀφρόνων πρὸς ποσὸς τινὰς χρόνους. And affirm the soul to be generated and corruptible; yet it is not destroyed as soon as divided from the limbs, but re-

mains some time in that state; yet the souls of the vicious and ignorant some few years, but those of the wise and good till the general conflagration of the world.

Secondly, That the soul is immaterial, is evident from its operations; for when any external object presses on the organ, it can only move it; now, let this motion be inward, arising from the pressure of the external object, or let it be an endeavour outward, proceeding from the resistance of the heart, as Mr. Hobbes imagines, or else a little trembling of the minute parts, as the Epicureans deliver, yet what is either of these motions to sense? For, strike any piece of matter, there arises presently that pressure inward, and the endeavour outward; and yet I believe no man accounts a workman cruel for breaking a stone, or striking a piece of timber, though, according to this opinion, he may raise as quick a sense of pain in these as in a man: Nor must any one object the different figures and contrivances of stones and nerves, for those only make the motion more or less easy, but cannot alter the nature of the pressure; besides, let us take several round little balls, and shake them in a bag that they may meet, strike, and reflect, who can imagine that here is any perception? That these balls feel the motion, and know that they do so? And indeed the Epicureans grant what we contend for, since they flee to a fourth nameless thing, i. e. they cannot imagine any matter under any particular schematism fit to think and perceive. But grant that simple apprehension could belong to matter, yet how could it unite two things in a proposition, and pronounce them agreeable? How, after this conjunction, consider them again, and collect, and form a syllogism? For there is no cause of either of those two motions, and therefore they cannot be in matter. For, suppose two things proposed to consideration, and let their simple pressure on the organs raise a phantasm, this is the only motion that can be caused by the objects; now, let these be removed, and any man will find himself able to consider the nature of these objects, compare their properties, and view their agreement, which must be a distinct motion from the former, and this too can be done several hours, months, or years, after the first pressure of the objects, and after the organs have been disturbed with other motions, and consequently the first quite lost; and, after all this, he can join these two objects thus compared, with a third, and compare them again, and, after that, bring the two extremes into a conclusion, and all this by the strength of his own judgment, without the help, the pressure, or direction of any external impulse. Besides, the Epicureans grant they have a conception of atoms, void, and infinite, of which they could never receive any image, and consequently no cause of their conception, matter being not to be moved but by material images, and those too of equal bigness with the corpuscles that frame the soul. Other reasons may be produced from the disproportion of the image of the object to the organ, it being impossible that any

thing should appear bigger than the organ, if sense were only the motion of it, or of some parts contained in it, because it would be able to receive no more motion than what came from some part of the object of equal dimensions to it. But I hasten to show, that an immaterial being can act on a material. And here we must mind again, that the sublunary matter is not self-existent, and therefore depends on something that is so; now, this being cannot be matter, for all matter is divisible, and therefore inconsistent with necessary existence; now, this substance, as he created, so he must move matter, for motion is not a necessary mode of it, as every man's senses will evince; and it is the same thing to create and preserve a being, with such and such a mode or accident, as it is barely to create it. And this infers, that he can act on matter as much as the soul now does; and this action is not any thing distinct from his will; the same power that created moves it; and, that this may be easily conceived, every man has a secret witness in himself, and may be convinced from his own actions. But let us consider a little farther, and we shall find motion as difficult to be conceived as this mode of action; for those that define motion to be only a successive mode of being in respect to place, only tell us the effect of it, when we inquire after its nature; I shall therefore take it for a physical being, and distinct from matter as its transitions out of one body into another sufficiently evince; and any man may easily observe how full of contradictions Cartes is when he treats of this subject, having determined motion to be only a mode of matter. Now, all the definitions of the philosophers prove, that we have no idea of this but from its effects, and therefore its manner of acting, of transition, &c. is as hard to be conceived, as the mode of action in an immaterial substance, and yet no man doubts it.

Thirdly, There is a great contest about brutes, some allowing them perception, others asserting them to be nothing but machines, and as void of all sense as an engine. This latter opinion is irreconcilable to their actions, and to that experience we have of their docility, and the relations of their cunning, even from those mens mouths, which are great sticklers for this fancy: and this arises from a common opinion, that if they grant brutes immaterial souls, as they must do if they allow them perception, the consequence will be unavoidable, therefore they are immortal. But to speak freely, I could never perceive any strength in this argument; and if I had no stronger convictions, I could subscribe to Seneca's opinion, in his epistle 102. "*Juvabat de animæ æternitate quærere, imo meherculè credere; credebam enim facillè opinionibus magnorum virorum rem gravissimum promittentium, magis quàm probantium.*" It was delightful to inquire into the eternity of the soul, nay even to believe it: For I easily gave credit to the opinions of great men, who promised a thing of the highest importance, rather than proved it. For immateriality does not infer necessity of existence, or put the thing above

the power of him that framed it; therefore immortality is a gift of the Creator, and might likewise have been bestowed on matter; and thus beasts may be allowed substances capable of perception, which may direct, and govern them, and die, and be buried in the same grave with their bodies. But we have such great evidence for the immortality of the mind of man, both from the dispensations of Providence, and infallible promises, that I could not give a firmer assent, nor have a stronger ground for my opinion, if the proofs could be reduced to figures, and proposed in squares, and triangles.

Besides the general, he produces many particular arguments, from the different operations of the soul in the several stages of our life. He had observed (and who can be ignorant of it) that though both in childhood, youth, and old age, the notices of external objects are extremely clear and perfect, yet at first our apprehensions and our memories are weak, our judgment and reason little, and very different from the accurate perception of riper years: and that decays again, and extreme old age slowly leads back to our swaddling clothes and our cradles: To these he adds the various distempers that are incident to man; how sometimes the mind is lulled into a lethargy, and then waked again into a frantic fit; and how at last death steals in upon our life, and wins inch by inch, till it becomes master of the whole: And hence he infers the increase and decay of the mind, and that it is born, and dies: Now these arguments cannot startle any one that considers the immortality of the soul is not to be inferred from any attribute of its own substance; but the will and pleasure of the Author of its being: and therefore did it really suffer all those disturbances he imagines, yet who doubts but a tormented thing may be kept in being, since the torment itself is not death: But natural philosophy will account for these distractions, if we consider what life is, and how the soul must depend on the body, as to its operations: If we distinguish life from sense it is nothing else but a due motion and digestion of the humours; and this agrees to plants as well as sensibles; they are nourished, grow, and live alike; and an animal dies, because some of these are either lost, or depraved: for were her habitation good and convenient, the soul would never leave it, she has no such reluctancy to matter, nor is so afraid of its pollutions, as the Platonists fancy, that she should be eager to be gone; but when the body fails, and is unfit for those animal motions, over which it was her office to preside, she must retire from the lump of clay, and go to her appointed place: So that the soul suffers nothing when the limbs grow useless, as even common observation testifies; for a palsy in the arm or leg does not impair the judgment; and often when the limbs are feeble, and the body sunk to an extremity of weakness, the mind is vigorous and active, and very unequal company for the decaying matter. And as for the pain and torture that accompany death, and make the tragedy more solemn, it is evident, that suppose the soul

immortal, it is impossible it should be otherwise; so that this can be no argument for the Epicureans, which, admit the contrary supposition, can be so easily explained: And here we must conceive the mind as the chief part of man, a judging substance, but free from all anticipations and ideas; a plain "rasa tabula," but fit for any impressions from external objects, and capable to make deductions from them; in order to this, she is put into a body curiously contrived, fitted with nerves and veins, and all necessary instruments for animal motion; upon these organs external objects act by pressure, and so the motion is continued to the seat of this soul, where she judges according to the first impulse, and that judgment is called either pain or pleasure; so that the action of the soul is still uniform and the same; and the various passions arise only from the variety of the objects she contemplates: but now because she has memory, and from these notices once received can make deductions, she is capable of all those affections which are properly called passions, as grief, joy, &c. All which are acts of reason, and are compatible to brutes too, according to their degree of perception: and besides, since the mind makes use of the body in her most intellectual actions, as is evident from that weariness that is consequent to the most abstracted speculations; the disturbance she receives, proceeds from the unfitness of the organs, but she works as rationally in a madman as in a sober, in a fool as in the most wise; because she acts according to the utmost perfection her instruments will permit.

But because this notion of a "rasa tabula" will not agree with those who are fond of some, I know not what, innate, speculative, and practical ideas, it will be necessary to consider the instances they produce. The first is that of many geometrical figures; for instance a chiliagon, of which we can make perfect demonstrations, which presuppose an idea of the subject, though we can have no image or representation of it from our fancy: but in proposing this instance they do not attend, that these properties belong to a chiliagon, because it contains so many triangles, which is a figure obvious enough to sense: The second is that of a deity, upon which Cartes's whole philosophy depends; and here he grants this to be imperfect, i. e. really none at all, because not agreeable to the object, whose idea it pretends to be: yet this is enough to guide us in our religion, because the highest our minds can reach: but even this we have from sense; from the consideration of the imperfections of all things, with which we are conversant, we rise to the knowledge of an all-perfect; so that all the attributes we can conceive, are just in opposition to what we discover here; and therefore according to the different apprehensions that men have entertained of such things, so various have been their notions of the Deity, as is evident from the heathen world: And this makes way to discover, how we got all those particular notions which we call the law of nature, and are said to be written in our hearts: For when man

TRANS. II.

was first created in his perfect state, without any prejudice of infancy or education, he had as much knowledge as was designed for that order of creatures in the universe; the notions of all things were clearly represented, and good and evil appeared naked, and in their proper shapes: These notions have been delivered down to us, and from these once made plain, the mind necessarily infers such practical rules, as are called the law of nature: And this explication will give an account of the diversity of manners and opinions amongst men, and of the various interchanges of barbarity and civility throughout the world.

Ver. 809. But grant the soul to be mortal, that it was once born, and that a time will come when it must die, what advantage is this to us? Lucretius answers in these eleven verses. We, who are wholly mortal, need no longer be in dread of death, nor of the punishments after death, at which the generality of mankind are so dismayed: For as the battles, tumults, and Carthaginian wars did not molest us, who were not born in those days; so too, since the soul is mortal, as well as the body, no wars, no tumults, nor any other cares, or afflictions will vex us after death. Epicurus, in Laertius, lib. 10. says, Συνεθίζε δὲ σεαυτὸν ἐν τῷ νομίζεσθαι μὴδὲν πρὸς ἡμᾶς εἶναι τὸν θάνατον, ἵππερ πᾶν ἀγαθὸν, καὶ κακὸν ἐν τῇ αἰσθήσει, εἴησις δὲ ἐστὶν αἰσθήσεως ὁ θάνατος, ὅθεν γινώσκεις ὁρθῇ μὴδὲν εἶναι πρὸς ἡμᾶς τὸν θάνατον. Accustom thyself to consider that death is nothing to us, because all good and ill are discerned by sense: but death is a privation of all sense, whence we truly know that death is nothing to us. This opinion Cicero, lib. 1. Tuscul. Quæst. has included in these words: "Natura vero sic se habet, ut quomodo initium nobis rerum omnium ortus noster offerat, sic exitum mors; quæ ut nihil pertinuit ad nos ante ortum, sic nihil post mortem pertinebit. In quo quid potest esse mali; cum mors nec ad vivos pertineat, nec ad mortuos? alteri nulli sunt, alteros non attingit." Such is the nature of man, that as our birth was to us a beginning of all things, so death will put an end to all. And as death was nothing to us before we were born, so neither will it be any thing to us when we are dead. What ill then can there be in death, since it belongs neither to the living, nor the dead. The living feel it not, dead are not.

For when our mortal frame shall be disjoin'd,
The lifeless lump uncoupled from the mind;
From sense of grief and pain we shall be free;
We shall not feel, because we shall not be.

Dryd.

Ver. 812. The chief city of Africa, and for a long time the rival of Rome, with whom she thrice contended for the empire of the world. Scipio first took it, and made it tributary to Rome; and afterwards Scipio Æmilianus destroyed it.

Ver. 819. For as Cicero says, "Qui satis viderit id quod est luce clarius, animo et corpore consumpto, totoque animante delero, et facto interitu universo, id animal, quod fuerit factum

G 2

esse nihil; is plane perspiciet, inter Hippocentaurum, qui nunquam fuerit, et regem Agamemnonem, qui fuit, nihil interesse: Nec pluris nunc facere M. Camillum hoc civile bellum, quam illo vivo ego fecerim Romam captam." He who sees what is clearer than the light, that if soul and body both perish, if the whole animal die and be destroyed, that which was an animal is become nothing; he too will clearly perceive, that there is no difference between a Centaur, that never was, and king Agamemnon, who once was: And that M. Camillus is no more concerned at this civil war, than when he was alive, I was concerned that Rome was taken. M. Tull. lib. i. Tuscul. Quæst.

Ver. 820. In these twenty-one verses the poet continues and says; suppose the soul could feel, when she is separated from the body, yet what would that be to us, who are not soul only, but something made up of soul and body? Nay, let us farther suppose, that we shall return to life again, and be the same we now are, that is to say, that after a certain revolution of time, the same atoms will by chance meet again, and, joining together, compose the same body we now wear; yet all this mighty bustle will be nothing to us who now are, or to us who shall be hereafter. In like manner, as while we are now living, we take no thought for the other ourselves that we formerly were, nor for the other ourselves that we shall be in time to come: for when we shall suffer death, an interrupting pause, a gaping space comes between what we are, and what we shall be; after which no remembrance will remain of the state in which we have been; as we now feel not before hand the smarts and sorrows we shall then endure. Dryden has given another turn to this passage, and renders it thus:

Nay, ev'n suppose, when we have suffer'd fate,
The soul could feel in her divided state;
What's that to us? For we are only we,
While souls and bodies in one frame agree.
Nay, though our atoms should revolve by
 chance,
And matter leap into the former dance;
Though time our life and motion could restore,
And make our bodies what they were before;
What gain to us would all this bustle bring?
The new-made man would be another thing.
When once an interrupting pause is made,
That individual being is decay'd:
We, who are dead and gone shall bear no part
In all the pleasures, nor shall feel the smart,
Which to that other mortal shall accrue,
Whom, of our matter, time shall mould anew,
For backward if you look, on that long space
Of ages past, and view the changing face
Of matter, tost, and variously combin'd
In sundry shapes; 'tis easy for the mind
From thence t' infer, that seeds of things have
 been
In the same order as they now are seen:
Which yet our dark remembrance cannot trace;
Because a pause of life, a gaping space

Has come betwixt, where memory lies dead,
And all the wand'ring motions from the sense are
 fled.

Ver. 828. The meaning of these three verses is; we are not solicitous concerning those, who formerly were the very and individual beings we now are; nor are we solicitous neither for them, nor do we bear any part in their affliction, who hereafter shall be moulded out of the same matter, which now composes this frame of ours. Let us suppose, for instance, that another, yet the same poet Lucretius had lived before this of ours, certainly this Lucretius was nothing troubled concerning him; and suppose farther, that there has been since, or will be hereafter, a third Lucretius; certainly our Lucretius was not in the least concerned for him neither: so that neither they who have been, nor they who will be, even though they have been, or shall be other ourselves, neither have contributed, or will contribute, to our grief or joy.

Ver. 841. In these nine verses he explains the same argument more at large; he who hereafter shall live in misfortunes, must be, when those misfortunes fall upon him: But the dead have ceased to be, and will never return from the grave. "Vestigia nulla retrorsum." Therefore the dead can in no wise be miserable.

For whosoe'er shall in misfortunes live,
Must be, when those misfortunes shall arrive;
And since the man who is not, feels not woe,
For death exempts him, and wards off the blow,
Which we, the living only, feel and bear,
What is there left for us in death to fear?
When once that pause of life has come between,
'Tis just the same, as we had never been.

Dryd.

Ver. 850. In these twenty-six verses he blames those who are too solicitous concerning their sepulture, and says, that anxiety proceeds from the belief of the immortality of the soul: For why, should a man, who believes he shall feel nothing after death, trouble himself about what shall become of his dead body?

And therefore, if a man bemoan his lot,
That after death his mould'ring limbs shall rot:
Or flames, or jaws of beasts devour his mass:
Know, he's an unsincere, unthinking ass:
A secret sting remains within his mind;
The fool is to his own cast offals kind;
He boasts no sense can after death remain,
Yet makes himself a part of life again;
As if some other he could feel the pain.

Dryd.

But the poet seems in this place to allude to that trite story of Diogenes, who being asked what he would have done with his carcase after he was dead, answered, He would have it thrown away unburied: and being put in mind that the beasts, and birds of prey would then devour him, he bid them put a stick in his hand, that he might drive them away: To which it being replied, That he

would not be able to do so; because he would be deprived of motion as well as of sense: How? said he, shall I be deprived of sense? What matter then what becomes of my body?

Ver. 851. Epicurus accused Democritus of believing, that there is sense in the body after death. This we learn from Tully, in his first book of the Tuscul. Quest. and no doubt but Lucretius in this place meant to chastise that philosopher.

Ver. 870. The poet hints at the three different ways of sepulture, that were used by the ancients: Some were burnt, some buried in the earth, and some were put into stone coffins, filled up with honey; of all which you may consult Salmasius to Solinus, p. 850. But perhaps Lucretius intended to give a slight chastisement to Heraclides of Pontus, and to Democritus of whom Varro "*περὶ παφῆς*;" Quare Heraclides Ponticus plus sapit, qui præcepit, ut comburerent, quam Democritus, qui ut in melle fervarent: quem si vulgus secutus esset, periam si centum denariis calicem Mulsi emere possimus." Heraclides, who advised to burn dead bodies, was wiser than Democritus, who would have them be kept in honey; for if his advice had been generally followed, a cup of metheglin would be worth a great deal of money. For so scrupulous a concern for their sepulture was mean, and wholly unbecoming of philosophers. Even Petronius was braver and more wise than this comes to. "*Attamen fluctibus obruto non contingit sepultura: tanquam interfit perituum corpus, quæ ratio consumat, ignis, an fluctus, an mora: quicquid feceris hæc omnia eodem ventura sunt: feræ tamen corpus lacera-bunt; tanquam melius ignis accipiat.*" But a man, whose dead body is rolled up and down in the waves, is deprived of sepulture: As if it were of any moment, by what means the body, that must perish, is consumed; whether by fire, by water, or with length of time: whatever thou dost with it, it will be the same at long run: but wild beasts will tear it to pieces? as if fire would not hurt it as much. Lucretius, therefore, justly blames this too great concern, this over-care for a senseless lump of clay, at best but the very leavings of a soul: and says,

If, while he live, this thought molest his head,
What wolf, or vulture shall devour me dead;
He wastes his days in idle grief, nor can
Distinguish 'twixt the body, and the man:
But thinks himself can still himself survive;
And, what, when dead, he feels not, feels alive.
Then he repines, that he was born to die;
Nor knows, in death there is no other he,
No living he remains his grief to vent,
And o'er his senseless carcase to lament.
If, after death, 'tis painful to be torn
By birds, and beasts; then why not so to burn?
Or, drench'd in floods of honey to be soak'd?
Embalm'd, at once to be preserv'd and chok'd?
Or on an airy mountain's top to lie,
Expos'd to cold, and heav'n's inclemency?

Ver. 874. This was rather the ancients way of embalming than of burying their dead; as we

may gather from the above-cited passage of Varro, and from Xenophon, lib. v. *Ἑλληνικῶν*, where he relates, that Agesipolis king of the Lacedæmonians, being seized with a violent distemper, of which he died the seventh day after he was taken, was put into honey, and brought to Lacedæmon, where, says he, he was buried in a royal sepulchre, *καὶ ἐκεῖνος μὲν ἐν μέλιτι τέθεικε, καὶ κομισθεὶς οἰκαδὲ, ἐτυχὲς τῆς βασιλικῆς παφῆς.*

Ver. 876. Because it is commonly esteemed a great misfortune to be deprived by death of the blessings we enjoy in life, and because men are apt to bewail themselves that they must die, and leave all those joys behind them! Lucretius, in these twenty verses, derides that vain anxiety, and tells the self-tormentor,

But to be snatch'd from all thy household joys,
From thy chaste wife, and thy dear pratt'ling
boys,
Whose little arms about thy legs are cast;
And climbing for a kiss, prevent their mother's
haste,
Inspiring secret pleasure through thy breast;
All these shall be no more: thy friends oppress
Thy care and courage now no more shall free:
Ah! wretch, thou cry'st: Ah! miserable me!
One woeful day sweeps children, friends, and
wife,
And all the brittle blessings of my life:
Add one thing more, and all, thou say'st, is true;
Thy want and wish of them is vanish'd too.
Which, well consider'd, were a quick relief
To all thy vain imaginary grief:
For thou shalt sleep, and never wake again;
And quitting life, shalt quit thy living pain:
But we thy friends shall all those sorrows find,
Which in forgetful death thou leav'st behind:
No time shall dry our tears, nor drive thee from
our mind,
The worst that can befall thee, measur'd right,
Is a sound slumber, and a long good-night.

Dryd.

Socrates, in the dialogue of Plato, inscribed Axiochus, says to the same purpose: "*Ἡκουσα δὲ ποτὶ τὸ τῷ Προδίκῳ λίγονός, ὅτι ὁ θάνατος ἔστι περὶ τὰς ζῶντας ἔστιν, ἔστι περὶ τὰς μέσηλαχότας ὅτι περὶ μὲν τὰς ζῶντας ἔστιν, οἱ δὲ ἀποθανόντες ἔκ εἰσιν, ὅτι ἔστι περὶ τὸ νῦν ἔστιν (ἔστι γὰρ τίθινκας) ἔστι, ἔστι πᾶσι τοῖς ἔστι περὶ σὲ, σὺ γὰρ ἔκ εἰσιν. Μάταιος ἂν ἡ λύπη περὶ τῷ μὴ ὄντος. μήτε ἰομένῃ περὶ Ἀξιοχόν, Ἀξιοχόν ὁδύρεσθαι, καὶ ὁμοίον, ὡς εἰ περὶ τῆς Σκύλλης, ἢ τῷ Κενταύρῳ τὴν ὁδύρεσθαι, τῶν μήτε ὄντων, μήτε ὕστερον περὶ τὴν τελευταίαν ἰσομένων. Τὸ γὰρ φερέρον τοῖς ἔστιν ἔστιν, τοῖς δὲ ἔκ εἰσιν πᾶσι ἂν εἴη;*

Ver. 895. For as death is esteemed a perpetual sleep, so is sleep a temporary death, or at least an image of death.

Stulte, quid est somnus gelidæ nisi mortis imago?

And the general, who killed one of his soldiers, whom he found sleeping upon duty, said pleasantly enough; "*Talem reliqui, qualem inveni.*" I left him as I found him.

G g ij

Ver. 896. Weak and foolish are they who bewail the dead without measure; and they too, who repine and grieve that themselves must die, but more foolish they, who in their feasts and merriments,

————— Would be thought the wits,
And yet disturb their mirth with melancholy fits,
When healths go round, and kindly brimmers flow,
Till the fresh garlands on their foreheads glow.
They whine and cry; Let us make haste to live;
Short are the joys that human life can give.

Dryd.

And thus they damp their delights with the remembrance of death, as if in the grave they were to be parched up with unquenchable thirst, or tormented with the want of any of the enjoyments of this life.

Eternal preachers! who corrupt the draught,
And pall the god, who never thinks with thought.
Idiots with all that thought, to whom the worst
Of death, is want of drink, and endless thirst;
Or any fond desire as vain as these.

Dryd.

But Lucretius bids them call to mind, that

Ev'n in their sleep, the body wrapt in ease,
Supinely lies, as in the peaceful grave,
And wanting nothing, nothing can it crave.

Why then do the fools dread a want of any thing when they are dead; since death, more than sleep, scatters the principles of the soul, and more deprives men of their sense. For

Were that sound sleep eternal, it were death;
Yet the first atoms then, the seeds of breath,
Are moving near to sense; we do but shake
And rouse that sense, and straight we are awake.
Then death to us, and death's anxiety
Is less than nothing, if a less can be;
For then our atoms which in order lay,
Are scatter'd from their heap, and puff'd away;
And never can return into their place,
When once the pause of life has left an empty space.

Dryd.

Ibid. It was the custom of the ancients, as well Greeks as Latins, at their feasts and entertainments, not only to strew their rooms with flowers; but themselves, the guests, and even the waiters wore garlands of flowers on their heads; and this they did, says Pliny, to dispel, by the fragrance of the flowers, the vapours and heaviness that proceeded from too much drinking. "Crapulam et gravedines capitis, impositis coronis, olfactione discutiant," lib. 21. Nat. Hist. cap. 19. Nay, even the very goblets were crowned likewise with garlands.

Crateras magnos statuunt, et vina coronant.

Virgil.

And

Tum pater Anchises magnum cratera coronâ
Induit, implevitque mero, &c.

Which cannot be interpreted as some do the

————— Κρατήρας περιστέφανο ποτήρια.

of Homer. They crowned bowls with drink; and bowls, say they, may then be said to be crowned with drink, when they are filled so full that the liquor rises above the brims of the bowl; and this we call a bumper, from the wine's swelling higher than the brims of the glass. But Homer may as well be construed, they crowned bowls of drink, as bowls with drink. It is evident too, from several places in scripture, that garlands were likewise in great use among the Jews at their feasts, especially their nuptials, Isa. lxi. 10. The Latin reads, like a bridegroom crowned with garlands, Wisd. ii. 8. Ezek. xii. 16. Lam. v. 25. Ecclef. xxxii. 1. &c.

Ver. 899. We find something to the same purpose in Petronius, where he describes the banquet of Trimalchio, who, when a servant, had brought in a silver skeleton, and set it on the table, cried out,

Heu, heu nos miseros! quam totus homuncio nihil est:

Sic erimus cuncti, postquam nos auferet orcus:
Ergo vivamus, dum licet esse bene.

And the old Epicurean epigram gives the same advice;

Cum te mortalem noris, præsentibus exple
Deliciis animum post mortem nulla voluptas.

To which I add the following lines out of Anacreon, as they are rendered by Cowley:

Crown me with roses whilst I live;
Now your wines and ointments give.
After death I nothing crave;
Let me alive my pleasures have,
All are Stoics in the grave.

}

But St. Jerome, writing against Jovinianus, blames these inconsiderate revellers in these words: "Manduca, et bibe; et si tibi placet, cum Israele lude confurgens, et canito; Manducemus et bibamus, cras enim moriemur. Monducet et bibat, qui post cibos expectat interitum; qui cum Epicuro dicit: Post mortem nihil est, et mora ipsa nihil est."

Ver. 916. That his disputation against the fear of death may be the more efficacious, the poet, in these twenty-nine verses, introduces nature speaking, and thus strengthens his arguments by the authority of the person that speaks. If thou hast met with crosses and afflictions, if thy whole life has been one continued course and series of adversities, lay down thy burden, wretch, and learn at last to suffer ease. If thou hast been prosperous, and led a life of joy and pleasure, go away content with the bounteous blessings I have given thee. Expect no new. There is a vicissitude of all things, as well as of times and seasons; the same always succeed the same. If age has not yet weakened and impaired thy strength and vigour, yet thou hast enjoyed all the good things that I can give thee. And if thou art worn out with years, why dost thou dread and delay to die? Let us suppose, says Lucretius,

G g iij

Which Cowley has thus rendered :

In a full flood stands Tantalus, his skin
Wash'd o'er in vain, for ever dry within.
He catches at the stream with greedy lips,
From his touch'd mouth the wanton torrent slips.
You laugh? yet change the name, this fable is thy
story,
Thou in a flood of useless wealth dost glory;
Which thou canst only touch, but never taste,
Th' abundance still, and still the want does last.

Macrobius in Somn. Scip. lib. i. cap. 10. "Antequam studium Philosophiæ circa Naturæ inquisitionem ad tantum vigoris adolefceret, qui per diversas gentes auctores constituendis sacris ceremoniarum fuerunt, aliud esse inferos negaverunt, quam ipsa corpora, quibus inclusæ animæ carcerem sædum tenebris, horridum fordibus, et cruore patiuntur: hoc animæ sepulchrum, hoc Ditis concava, hoc inferos vocaverunt, et omnia, quæ illic esse credidit fabulosa persuasio, in nobismetipsis, et in ipsis humanis corporibus assignare conati sunt.

—Illos aiunt epulis ante ora positis excruciiari fame, et inediâ tabescere, quos magis magisque acquirendi desiderium cogit præsentem copiam non videre: qui in affluentia inopes, egestatis mala in ubertate patiuntur; nescientes parta respicere, dum egent habendis." But Lucretius represents the fable of Tantalus otherwise, and interprets it in a different manner, telling us, that

No Tantalus looks up with fearful eye,
Or dreads th' impending rock to crush him from
on high; [hours;
But fear of chance on earth disturbs our easy
Or vain imagin'd wrath of vain imagin'd pow'rs.
Dryd.

Where we see he follows their opinion, who say, that a stone is hanging over the head of Tantalus in hell, the fall of which he perpetually dreads. Thus too Euripides in Orestes:

Κορυφῆς ὑπερῆλλου δαιμαίνων πύργον
Ἄρι ποταῖται, καὶ τίνει ταυτὴν δίκην.

Ver. 984. In these eleven verses, he describes the punishment, and explains the fable of Tityus, the son of Jupiter, by Elara, daughter of Orchomenus. He attempted to ravish Latona, the mother of Apollo, who killed him with his arrows, and sent him into hell, where a vulture is continually digging into his liver, and feeding upon it; which, nevertheless, grows as fast as the vulture devours it. He is feigned to have been of so enormous a size, that, when he lay down, his body covered no less than nine acres of ground. Thus Ovid. Metam. iv. ver. 457.

Viscera præbebat Tityus lanianda, novemque
Jugibus distentus erat.—

And Virgil, Æn. vi. ver. 595.

Nec non et Tityon, Terræ omniparentis Alumn-

num,
Cernere erat, per tota novem cui jugera corpus
Porrigitur; rostroque immanis vultur obunco
Immortale jecur tundens, sæcundaque pænis
Viscera, rimaturque epulis, habitatque sub alto
Pectore; nec fibris requies datur ulla renatis.

There Tityus was to see, who took his birth
From heav'n; his nursing from the foodful earth,
Here his gigantic limbs, with large embrace,
Enfold nine acres of infernal space;
A rav'nous vulture in his open'd side,
Her crooked beak and cruel talons try'd;
Still for the growing liver digg'd his breast;
His growing liver still supply'd the feast;
Still are his entrails fruitful to their pains,
Th' immortal hunger lasts, th' immortal food re-
mains.
Dryd.

But Lucretius teaches that this is merely a fable of the poets, and that

No Tityus, torn by vultures, lies in hell;
Nor could the lobes of his rank liver swell
To that prodigious mass for their eternal meal;
Not though his monstrous bulk had cover'd o'er
Nine spreading acres, or nine thousand more;
Not though the globe of earth had been the gi-
ant's floor.
Nor in eternal torments could he lie;
Nor could his corps sufficient food supply;
But he's the Tityus, who by love oppress'd,
Or tyrant passion preying on his breast,
And ever anxious thoughts, is robb'd of rest.
Dryd.

And this opinion of Lucretius is confirmed by Servius, who, on the above-cited passage of Virgil, says, "Sane de his omnibus rebus mire reddidit Lucretius, et confirmat in nostrâ esse vitâ omnia, quæ finguntur de Inferis. Dicit enim Tityum amorem esse, hoc est Libidinem, quæ, secundum Physicos et Medicos, in jecore est, ut Ritus in Splene, Iracundia in Felle," &c. And Macrobius is of the same opinion, when he says, "Vulturem jecur immortale tundentem nihil aliud intelligi voluerunt (veteres) quam tormenta conscientiæ, obnoxia flagitio, viscera interiora rimantis, et ipsa vitalia indefessa admissi sceleris admonitione laniantis, semperque curas, si forte requiescere tentaverint, excitantis, tanquam fibris renascentibus inhærendo, nec ulla sibi miseratione parcentes; lege hæc, qua se judice nemo nocens absolvitur, nec de se suam potest vitare sententiam." In Somn. Scip. lib. i. cap. 10. And with this agrees the epigram in Petronius:

Qui vultur jecur ultimum pererrat,
Et pectus trahit, intimaque fibras,
Non est quem timidi vocant Poetæ,
Sed cordis mala, livor atque luxus.

Prometheus too is said by some to suffer the like punishment.

Ver. 995. In these ten verses, he explains the fable of Sisyphus, the son of Æolus, who, for infesting Attica with his robberies, was slain by Theseus, king of the Athenians; in whose honour the Greeks feigned that Sisyphus was condemned in hell to roll a stone to the top of a mountain, which, when with great labour he had forced it up, tumbled down again, so that he was always to begin his task anew. But Lucretius says,

The Sisyphus is he, whom noise and strife
Seduce from all the soft retreats of life;

To vex the government, disturb the laws;
 Drunk with the fumes of popular applause,
 He courts the giddy crowd to make him great,
 And sweats, and toils in vain to mount the sov'-
 reign seat;

For still to aim at pow'r, and still to fail,
 Ever to strive, and never to prevail,
 What is it but in reason's true account,
 To heave the stone against the rising mount;
 Which, urg'd and labour'd, and forc'd up with
 pain,
 Recoils, and rolls impetuous down, and smokes
 along the plain. *Dryd.*

And Macrobius, in the place last cited, agrees with Lucretius in this opinion, and says, "Saxum ingens volvere inefficacibus laboriosisque conatibus, vitam terentes, atram filicem lapsuram semper et cadenti similem, illorum capitibus imminere, qui arduas potestates, et infaustam ambiunt Tyrannidem, nunquam sine timore victuri, et cogentes subiectum vulgus odisse, dum metuat, semper sibi videntur exitium, quod merentur excipere."

Ver. 1005. In these ten verses the poet explains the fable of the Fifty Daughters of Danaus king of the Argives, who were married to the fifty sons of their father's brother Ægyptus; and who, all of them, except Clytemnestra, killed their husbands in one night. Of them the poets fabled that they were doomed to fill a leaky vessel with water. See Macrobius in Somn. Scip. lib. i. cap. 10. and Horat. Od. 2. lib. iii. But Lucretius interprets it of the luxurious, who are never filled or satisfied with the blessings of this life; and says,

Then still to treat thy ever-craving mind
 With ev'ry blessing, and of ev'ry kind,
 Yet never fill thy rav'ning appetite,
 Though years and seasons vary the delight;
 Yet nothing to be seen of all the store;
 But still the wolf within thee barks for more.
 This is the fable's moral, which they tell,
 Of fifty foolish virgins damn'd in hell
 To leaky vessels which the liquor spill,
 To vessels of their sex which none could ever fill.

Dryd.

Ver. 1015. In these twelve verses, he teaches, that there are no such things as the Furies, Cerberus, nor any of those punishments with which the guilty are said to be tortured in hell; and, indeed, having taught that souls are mortal, it of necessity follows, that there are no punishments after death. He therefore interprets all those things to be meant only of this life; and says that,

As for the dog, the furies, and their snakes,
 The gloomy caverns and the burning lakes,
 And all the vain infernal trumpery,
 They neither are, nor were, nor e'er can be.
 But here on earth the guilty have in view,
 The mighty pains to mighty mischiefs due:
 Racks, prisons, poisons, the Tarpeian rock,
 Stripes, hangmen, pitch, and suffocating smoke;
 And last, and most, if these were cast behind,
 Th' avenging horror of a conscious mind,

Whose deadly fear anticipates the blow,
 And sees no end of punishment and woe,
 But looks for more at the last gasp of breath:
 This makes a hell on earth, and life a death.

Dryd.

To this purpose, Cicero in his oration for Roscius Amerinus, says admirably well. "Nolite putare, quemadmodum in Fabulis, eos, qui aliquid impiè sceleratèque commiserunt, agitari et perterri Furiarum tedis ardentibus: sua quamque fraus, suos terror maxime vexat, suum quemque scelus agitat, amentiaque afficit, suæ malæ cogitationes conscientiaque animi terrent. Hæ sunt impiis assiduæ domesticæque Furia, quæ dies noctesque parentum pænas à consceleratissimis filiis repetunt." Do not fancy what the fables say, that men who have committed any impious or wicked action, are haunted and terrified with the flaming torches of the furies. Every man's own offences, his own terror chiefly disturb him; every man's own wickedness haunts and makes him mad; his own cruel thoughts, and the consciousness of his own guilt terrify him. These are to the impious those assiduous and domestic furies, who day and night require and avenge the punishments of the parents, of their most flagitious sons. And Lactantius says, there are three passions that drive men headlong into all manner of wickedness: anger, covetousness, and lust. Therefore, the poets said there are three furies that torment the minds of men. Anger seeks for revenge; covetousness for riches; and lust for sensual delights. "Tres sunt Affectus, qui homines in omnia facinora præcipites agunt Propterea Poetæ tres Furias esse dixerunt, quæ mentes hominum exagitant: ira ultionem desiderat, cupiditas opes, libido voluptates." De vero Cultu, cap. 19.

Ibid. *The Furies*] They were three in number; the daughters of the river Acheron, and of night. The poets feigned them to have snakes instead of hair, and to be the inflictors of the torments in hell; and also, that they always bore flaming torches and whips in their hands. Virgil, *Æneid*. vi. v. 576.

Continuo fontes ultrix accincta flagello
 Tisiphone quatit insultans, torvosque sinistra
 Intentans angues, vocat agmina sæva fororum.

And ver. 605.

—Furiarum maxima juxta
 Accubat—
 Exurgitque facem attollens, atque intonat ore.

Straight o'er the guilty ghosts the fury shakes
 The sounding whip, and brandishes her snakes;
 And the pale sinner with her sisters takes.
 The queen of furies by their sides is set:
 —Her hissing snakes she rears,
 Tossing her torch, and thund'ring in their ears.

Dryd.

Ibid. *Cerberus*] He is feigned by the poets to be a dog with three heads, that guards the gates of hell. Apollodorus describes him with three heads, a dragon's tail, and his back stuck thick with ser-

pents heads of several sorts. Hesiod, in Theogon. gives him fifty heads, Virgil, *Æneid.* vi. ver. 417.

Cerberus hæc ingens latratu regna trisauci
Personat, aduerso recubans immanis in Antro
——Horre videas jam colla colubris,
——tria guttura pandens.

——In his den they found
The triple porter of the Stygian fount,
Grim Cerberus, who soon began to rear
His crested snakes, and arm'd his bristling hair.
Op'ning his greedy grinning jaws he gapes
With three enormous mouths. *Dryd.*

Thus too Horace, *Od.* 2. lib. iii.

Cessit immanis tibi blandienti
Janitor aulae
Cerberus, quamvis furiale centum
Muniant angues caput ejus, atque
Spiritus teter, saniesque manet
Ore trilingui.

Ver. 1018. Here our translator has changed the ancients way of punishing criminals into the more modern punishments; he takes no notice of what Lucretius calls

——Horribilis de saxo jactu, deorsum :

Which Dryden, who keeps more close, in this place, to the original, renders the Tarpeian rock, which was a precipice, from whence such as were guilty of treason against the state were thrown down. It was called Mons Tarpeius, from Tarpeia, a vestal virgin, who was buried there. This was she, who agreed with the Sabines to betray the capitol to them, provided they would give her what they wore on their left arms; which they promised to do; she meant their bracelets: but they had no sooner entered the capitol by her means, than they fell to throwing their targets upon her, which instantly pressed and smothered her to death. Horace, lib. i. sat. 6. mentions this punishment :

——Audes
Dejicere è saxo cives; aut tradere Cadmo ?

Ver. 1021. Dryden, in the tragedy of Aurengzebe, has an excellent description of the tormenting terrors of a guilty mind; and which agrees very well with this passage of our author :

Severe decrees may keep our tongues in awe :
But to our thoughts what edict can give law ?
Ev'n you yourself to your own breast shall tell
Your crimes, and your own conscience be your
hell :
Amidst your train this unseen judge will wait ;
Examine how you came by all your state ;
Upbraid your impious pomp ; and in your ear
Will hollow rebel ! traitor ! murderer !
Your ill-got pow'r, wan looks, and cares shall
bring ;
Known but by discontent to be a king :
Of crowds afraid, yet anxious when alone,
You'll sit, and brood your sorrows on a throne.
And Lee, in Mithridates, says finely :

My ugly guilt flies in my conscious face :
And I am vanquish'd, slain with bosom war.

Ver. 1027. In these thirty-two verses, the poet rebukes that worthless race of men, who seem to think themselves born for no other purpose, than to indulge themselves in ease and pleasure, and to waste their days in idleness : For why should such men, who are altogether useless in their generations, repine at their being subject to the same laws and necessity of fate, to which the most potent emperors, legislators, founders of cities, the greatest wits, and the most illustrious in arts and sciences, have in all times been subject, and forced to submit. Certainly their condition ought to be worse, and yet they complain of its being equal. Ancus, says he, Xerxes, and Scipio, died long ago. All the poets, and even Homer, the prince and father of them all; Democritus, nay, Epicurus himself, the best of all philosophers, is dead : Therefore.

When thoughts of death disturb thy head,
Consider, Ancus, great and good, is dead :
Ancus, thy better far, was born to die :
And thou, do'st thou bewail mortality ?

Dryd.

Be gone then, whosoever thou be, and learn not to deplore the inevitableness of that destiny, which such, and so great men, especially Democritus, and Epicurus, have willingly, nay, joyfully undergone.

Ver. 1028. Ancus Martius : He was the fourth king of the Romans, and grandson of Numa by a daughter. Of him Livy. "Avitæ gloriæ memor : medium erat in eo ingenium, et Numæ et Romuli memor, cuilibet superiorum regum belli pacisque et artibus et gloria par." He was emulous of the glory of his progenitors, and seemed to have inherited a mixed temper of mind, between that of Numa and of Romulus. He was equal to any of his predecessor kings in the glory and arts both of war and peace. Virgil has not omitted to make Anchises show him to *Æneas* among the race of his successors :

——Quem juxta sequitur jactantior Ancus,
Nunc quoque jam nimium gaudens popularibus
auris.

Æn. vi. ver. 815.

For he obtained the kingdom by the favour and voice of the people, as well as of the senators.

Ver. 1029. Lucretius took this thought from Homer, who says,

Κάθ' αὖτις καὶ Πάριος ὄπις ὅλο πᾶλλον ἀμείνων.

Ver. 1032. In these four verses he speaks of Xerxes, the king of the Persians, who, by laying a bridge over the Hellespont, and digging a channel round the mountain Athos, walked over the sea, and sailed upon land, as Herodotus in Polyhymn, says of him. Consider, says Lucretius,

How many monarchs, with their mighty state,
Who rul'd the world, were over-rul'd by fate ?

That haughty king, who lorded o'er the main,
And whose stupendous bridge did the wild waves
 restrain,
In vain they foam'd, in vain they threaten'd wreck,
While his proud legions march'd upon their back;
Him death, a greater monarch, overcame,
Nor spar'd his guards the more for their immortal
 name.

Dryd.

Ver. 1033. "Et contempsit, aquis insultans, murmura ponti," says Lucretius, alluding, in all appearance, to what the same Herodotus says of him: That hearing that his bridge over the Hellespont was broken to pieces by a storm, he commanded three hundred stripes to be given to the waves, and the sea to be lashed, and bound in chains; and that some of those who were ordered to execute this sentence, severely chid and reproached the insolent sea in these words: "O thou salt and bitter water; thy lord sends thee this greeting, and inflicts this punishment on thee, because thou hast basely done an injury to him, who never gave thee any provocation. But know, that the great king Xerxes will walk over thee, in spite of all thou canst do to hinder him. It is with good reason that no man sacrifices to thee, since thou art at best but a bitter and deceitful stream." Manilius, lib. i. ver. 773.

Perfidis et victor strârat qui classibus æquor.

Which Creech has thus paraphrased;

Next Persia's scourge, who strew'd the joyful
 flood

With Xerxes fleet, and check'd the growing god:
Who broke his force, when Neptune bore the
 chain,

And prov'd his juster title o'er the main.

Ver. 1036. *Scipio*] He speaks of P. Cornelius Scipio Africanus Major, who in the year U.C. 543, when he was but 24 years of age, was, preferably to others, sent into Spain, from whence he drove the Carthaginians. In the year 549, he was made consul, and the year following sent proconsul into Africa; where having overcome the Carthaginians, he obliged Hannibal to return out of Italy to the defence of his own country; having subdued Carthage, he imposed a tribute on the Carthaginians, and made them give him hostages; for which he was surnamed Africanus: He was allowed a triumph at the end of the second Punic war, in the year 553. Then he was made censor in the year 555, and again consul in the year 560. He was thrice chosen prince, or president of the senate. He went legate, or lieutenant-general, in the expedition against Antiochus king of Syria, which was commanded in chief by his brother Lucius, who, for the victory he obtained over that king, was surnamed Asiaticus. Our Scipio, being returned to Rome, was accused by the tribunes of the people, of having taken money of Antiochus to procure him a peace; and thinking it unworthy of a man like himself to be present, and plead in his own defence, he went to

Liternum in Campania, and died there about the year 567. Though our translator has omitted it, Lucretius in this place calls him *belli fulmen*, the thunderbolt of war! in which he showed the way to Virgil, who, in *Æn.* vi. ver. 482, calls both the Scipios Major and Minor,

———Duo fulmina belli,
Scipiadas.———

And to Cicero likewise, who, in his oration for Cornelius Balbus, speaking of others of the Scipian family, says: "Cum duo fulmina nostri imperii Cn. et P. Scipiones subito in Hispania extincti occidissent." And Dryden, in his translation of this passage, was careful not to omit the giving him that appellation:

The Roman chief, the Carthaginian dread,
Scipio, the thunderbolt of war is dead,
And, like a common slave, by fate in triumph }
 led.

The other was the son of Æmilius Paulus Macedonicus, who was adopted into the Cornelian family by the son of Scipio Africanus Major, and called Publius Cornelius Scipio Æmilianus: He took and utterly destroyed Carthage, in the third and last Punic war, and reduced Africa into the form of a Roman province; for which he triumphed and gained the surname of Africanus Minor. This last famed for his justice, as well as for his great knowledge in the art of war, whence the proverb, "Scipione justior et militior:" which we find in Tertullian's *Apologet.* chap. 2. Lucius Florus, speaking of them says, "Fatale Africæ nomen Scipionum videbatur." See more of them in Livy, Velleius Paterculus, Orosius, Appian. de Bello Civil. Lucius Florus, Aurelius Victor, et Eutropius.

Ver. 1040. *Homer*] Thus too Manilius, in the beginning of his second book, is lavish in the praise of Homer, and having mentioned the chief arguments of his poems, he concludes with a high character, and styles him, "The Fountain of all Poetry:"

——Cujus ex ore profusos
Omnis posteritas latices in carmina duxit,
Amnemque in tenuis ausa est deducere rivos,
Unius secunda bonis.———

Which Creech thus renders:

———From whose abundant spring,
Succeeding poets draw the songs they sing.
From him they take, from him adorn their
 themes;
And into little channels cut his streams:
Rich in his store———

Ovid. *Amor.* lib. iii. eleg. 8, to the same purpose,
——à quo, ceu fonte perenni,
Vatum Pieriis ora rigantur aquis.

And Longinus, de *Sublim.* sect. 13. says, that not only Sterpsichorus and Archilochus, but Herodotus the historian, and Plato the philosopher, owe their

chief beauties to Homer. Lucretius therefore with good reason, speaking of the inventors of arts and sciences, says;

—Quorum avus Homerus
Sceptra potitus eadem sopitu' quiete 'ft.

Upon which our translator expatiates; and this thought, "What Troy," &c. is taken from Waller. Dryden keeps closer to the original, and renders this passage thus:

The founders of invented arts are lost;
And wits, who made eternity their boast:
Where now is Homer who possess'd the throne?
Th' immortal work remains, the mortal author's gone.

Ver. 1044. *Democritus*] Of whom says Lucretius, "Sponte sua letho caput obtulit obvius ipse." Which Hermippus in Laertius explains. When Democritus was worn out with age, and seemed to be near his death, his sister was one day complaining to him, that if he should chance to die ἐν τῇ τῶν θεομαρτυρίων ἑορτῇ (festivals in honour of Ceres), she should not be able to perform her vows to that goddess: but he bid her take heart, and bring him every day some warm loaves of bread: by smelling to which he kept himself alive till that solemnity was at end: Now it lasted three days, and when they were past ἀλυπτότατα τὸν βίον παρέκαλε. Diog. Laert. lib. ix. in Vit. Democ. And thus, to use the words of Dryden,

Democritus, perceiving age invade,
His body weaken'd, and his mind decay'd,
Obey'd the summons with a cheerful face;
Made haste to welcome death, and met him half the race.

Of Democritus, see more, ver. 356 of this book; and ver. 335 of book iv.

Ver. 1048. *Epicurus*] Of whom see book i. ver. 88, and the beginning of this book. Our poet here praises him, as far excelling all the other wise: and yet, says he, even he was forced to submit to death:

That stroke, ev'n Epicurus could not bar,
Though he in wit surpass'd mankind, as far }
As does the mid-day sun the midnight star.
Then thou, dost thou disdain to yield thy breath,
Whose very life is little more than death?
More than one half by lazy sleep possessest; }
And, when awake, thy soul but nods at best,
Day-dreams and sickly thoughts revolving in }
thy breast.

Eternal troubles haunt thy anxious mind,
Whose cause and cure thou never hop'st to find:
But still uncertain, with thyself at strife,
Thou wander'st in the labyrinth of life.

Dryd.

Ver. 1059. The poet has taught before, that the fear of death is the fountain from whence proceeds all our uneasiness of mind: He now resumes that subject, and in these twenty-six verses, teaches, that the inconstancy and instability of men proceed from no other cause. Uneasy in town, they go into the country, but are restless

there, and straight return to town; they wish for things, which, when obtained, they lothe. Men in all conditions are oppress'd with a load of cares and anxieties of mind, because, wherever they go, they carry with them the fear of death, and all the uneasy wishes and desires that spring from it; but would they govern themselves by the precepts of true philosophy, that is to say, by the wise doctrine of Epicurus, they would learn that the soul is mortal, and every man would lay down the load that he feels so heavy.

Oh! if the foolish race of man, who find
A weight of cares still pressing on their mind,
Could find as well the cause of this unrest,
And all this burden lodg'd within their breast,
Sure they would change their course, not live as now,

Uncertain what to wish, or what to vow:
Uneasy both in country and in town,
They search a place to lay their burden down:
One, restless in his palace, walks abroad,
And vainly thinks to leave behind the load;
But straight returns; for he's as restless there,
And finds there's no relief in open air:
Another to his villa would retire,
And spurs as hard as if it were on fire;
No sooner enter'd at his country door,
But he begins to stretch, and yawn, and snore;
Or seeks the city which he left before. }
Thus, ev'ry man o'erworks his weary will }
To shun himself, and to shake off his ill,
The shaking fit returns, and hangs upon him }
still:

No prospect of repose, nor hope of ease;
The wretch is ignorant of his disease,
Which known, would all his fruitless troubles spare,

For he would know the world not worth his care;
Then would he search more deeply for the cause,
And study nature well, and nature's laws.
For in this moment lies not the debate,
But on our future, fix'd, eternal state;
That never-changing state which all must keep,
Whom death has doom'd to everlasting sleep.

Dryd.

Ver. 1085. Lastly, He tells us, in these fifteen verses, that it is a folly to fly from what we cannot avoid; and to be so fond of life, even though we are sure to meet with no new blessings, and that the longer we live the more afflictions we shall undergo:

Why are we then so fond of mortal life,
Beset with dangers, and maintain'd with strife?
A life, which all our care can never save,
One fate attends us, and one common grave.
Besides, we tread but a perpetual round,
We ne'er strike out, but beat the former ground,
And the same mawkish joys in the same track }
are found.
For still we think an absent blessing best, }
Which cloy, and is no blessing when possess'd;
A new-aring wish expells it from the breast, }

The fev'rish thirst of life increases still;
 We call for more and more, and never have our
 fill:
 Yet know not what to-morrow we shall try:
 What dregs of life in the last draught may lie.
Dryd.

Ver. 1091. To this very purpose, Dryden, in the tragedy of Aurengezebe, after his inimitable manner:

When I consider life 'tis all a cheat,
 Yet, fool'd with hope, men favour the deceit;
 Trust on, and think to-morrow will repay;
 To-morrow's falser than the former day,
 Lies more; and while it says we shall be blest'd
 With some new joys, cuts off what we possess'd.
 Strange coz'nage! None would live past years
 again,
 Yet all hope comfort from what yet remain;
 And from the dregs of life think to receive
 What the first sprightly running could not give.
 I'm tir'd with waiting for this chemic gold,
 Which fools us young, and beggars us when old.

Ver. 1094. Lucretius concludes this book with telling us, in these six verses, that death is equally eternal and immortal, if it seize us to-day, or many ages hence: For,

Nor by the longest life we can attain
 One moment from the length of death we gain;
 For all behind belongs to his eternal reign:
 When once the fates have cut the mortal thread;
 The man as much to all intents is dead;
 Who dies to-day, and will as long be so,
 As he who dy'd a thousand years ago.

ANIMADVERSION,

BY WAY OF RECAPITULATION, ON THE THIRD
 BOOK OF LUCRETIVS.

WHEN Lucretius disputes of matter and its motions, if you except only some of his assertions that are levelled against Providence, which of the philosophers argues more rationally, or more pertinently to his subject? But when he comes to reason of things removed from sense, of the soul, and its faculties, no man is more weak, none more wide from the purpose. Let us but consider what a soul he has fabricated for himself: A subtle corporeal substance, composed of minute and voluble parts of wind, air, and heat, that are diffused through the whole body in such a manner as to be separated from one another by very small intervals of space. To these three he adds a fourth, I know not what nameless thing, extremely subtle, and most easy to be moved, which being seated in the heart, is the principle of sense, and perceives the images that come from all things; and this is the perfect and consummate soul of the Epicureans. Now, let us imagine a spider in a box, that she has spun her web through the whole cavity of the box, and dwells herself

in the middle of the web, then let us farther imagine, that some flies come into the web, and, being caught there, move the threads of it; at this motion, suppose the spider to be alarmed, that she runs all over her web, catches the flies, and devours them: imagine all this, and you have so perfect a representation of the Epicurean soul catching the *εἰδωλα* images, that nothing can be more like it. Are these discoveries worthy of a philosopher?

From ver. 92 to ver. 134, he sufficiently proves, that the soul is not a harmony of the whole body. From thence to ver. 161, he, to no purpose, joins the mind, as a master, to that abject slave, the soul. I confess, that when the mind is shaken by any violent fear, the soul is disturbed; so too when the harper trembles, the harp utters not true harmony. With like success, he goes on to ver. 178, endeavouring to evince, that the soul is corporeal; for he presumes that to be certain, which he ought to prove by arguments to be so; and we may positively affirm, that there may be touch without body.

Now, since he has not proved the soul to be corporeal, why need we trouble ourselves about what he advances to ver. 224, concerning the tenuity of it? Yet we must allow that the poet has evidently demonstrated that the particles of the soul, granting it to be corporeal, must be both subtle and voluble; nor will we contend with him concerning the composition of the soul to ver. 309. For he may as well say that the soul is composed of the seeds of air, vapour, and heat, as of the particles of any other matter. But by adding, ver. 232, to these three a fourth thing, that has no name, he confesses, that no kind of body can be conceived or thought of, that is, or can be, the principle of sense.

But he prudently commits the safety of this thin and subtle soul to the dense and strong body, to ver. 333: and then to ver. 355, he bestows on the body the faculty of perception: yet what is more foolish? what more remote from, and even repugnant to common sense? nay, what is less consonant even to his own maxims and doctrine? For how can the body partake of sense, since none of that fourth nameless thing helps to compose it? Then, to ver. 379, he disputes successfully against Democritus, at least I will not contradict him, not thinking it worth the while to examine whether of their opinions is best, since both of them are absurd. And as he but now gave the soul to the custody of the body, so now to ver. 398, he interchangeably gives the guardianship of the body to the soul. And I envy neither of them their tuition. But let us examine the arguments by which he assaults the immortality of the soul itself.

The first is from ver. 407. to ver. 428. And in this he divides and disperses this thin and subtle corporeal substance, as he supposes that of the soul to be, and he has my leave to do so. Let the mind be corporeal, and though it be thick and composed of perplexed and intricate particles, I will allow it to be subject to dissolution.

The second argument, from ver. 428. to ver. 440, the third from thence to ver. 456, and the fourth from ver. 457. to ver. 469, prove nothing. For we do not in the least perceive that the mind is born, grows, decays, and waxes old with the body. We perceive, indeed, that the body is born, grows and decays; but we have no experience of any increase or decrease in the mind. But, says he, the mind is not strong in a child, and in the old it decays. And how does he prove this? Because, says he, a child is foolish, and an old man doats. In like manner, place a very skilful workman in an engine, and let us suppose that some parts of that engine are too stiff, others too limber, some worn away, others clouterly, it would be foolish in us to expect any due and regular motions of that engine, even though that most skilful artist took a great deal of pains, and employed his utmost art in working it. Besides, says he, the mind is susceptible of cares and grief, and therefore must be subject to dissolution. I suppose he means that it must be so, for I cannot, at present think of any other reason for that conclusion, because grief is elsewhere said to be piercing, and cares devouring, "*quia luctus penetrans, et curæ edaces,*" such reasoning is worthy of this mortal and corporeal soul. The same answer that solved the second argument will solve the fourth.

To the three following arguments, from ver. 456. to ver. 505, let the physicians give an answer, if there be need of it. Let the legs stagger, the tongue falter, and the eyes swim, what is all this to the soul? Let brawls and unmanly quarrels be the effect of drunkenness; what great matter is there in this either? For, though a player on the harp be ever so skilful, yet if you untune his instrument, if you screw some of the strings up too high, and slacken others too much, let him touch them ever so artfully, they will utter only discordant and unharmonious sounds; though before they were thus disordered and put out of tune, they made the sweetest harmony. And in the epileptic disease, a foul humour disorders and disturbs the organs, and thence proceed those boisterous and unruly motions. But since the disease affects and weakens the organs only, what else does the physic relieve? The seventh argument, from ver. 505. to ver. 524, asserts, that, as a man dies limb by limb, so the soul too goes away, and dies by degrees, as if the limbs could not grow cold but the soul must grow cold likewise. Besides, this argument supposes the soul to be corporeal, and diffused through the whole body, which, nevertheless, he has not yet proved, and I dare promise, no man ever will.

The eighth argument, from ver. 524. to ver. 532, is of no weight: For the soul has not the power and faculty of understanding, and of reasoning, from any exterior thing, as the ear has that of hearing, and the eye that of seeing; but she has it in herself, and of herself, and therefore it is no wonder, nor does it follow, that though the ear, separated from the body, cannot hear, nor a separated eye see; the mind, separated from

the body, cannot therefore perceive, understand, and reason.

To the ninth argument, from ver. 533. to ver. 557, this answer may be given: In like manner, as when we see a soldier fighting with a sword, or any other weapon, we do not say, that without those arms he could give no wounds, for he has hands besides to strike with; so though the soul be clothed with members, as with a panoply, or complete suit of armour, and thus performs many functions with corporeal organs, yet we cannot pretend that when she has put off, as it were, that military array, she has no function either of understanding or perception remaining.

No man can allow any strength to be in the tenth argument, from ver. 556. to ver. 567, unless he perceive that the soul is, as it were, the foundation of the whole animal, and that the body is seasoned with soul, as with salt, that it may not stink and putrify.

The eleventh argument, from ver. 567. to ver. 581, is nothing but a sort of quibble, for the whole stress of it consists in this, that the defection of spirits, which we call a swoon, the Latins call "*animi deliquium,*" a fainting of the mind.

The two following arguments, from ver. 581. to ver. 596, deny that the soul can go whole out of the body, unless it be expired through the jaws; nor is this in the least absurd, if the soul be corporeal: and they add farther, that the soul, fearing its future dissolution, leaves the body unwillingly, and with regret. To this Cato answers in Cicero: "*Quid quod sapientissimus quisque æquissimo animo moritur, stultissimus iniquissimus? Nonne vobis videtur animus is, qui plus cernit et longius, videre se ad meliora proficisci? Ille autem cujus obtusior acies, non videre? Equidem effector studio patres vestros, quos colui et dilexi, videndi. Neque vero eos solum convenire aveo, sed illos etiam de quibus audiivi, et legi, et ipse conscripsi. Quo quidem me proficiscentem haud scio quis facile retraxerit. Quod si quis Deus mihi largiatur; ut ex hac ætate repuerescam, et in cunis vagiam, valde recusem: nec vero velim, quasi decurso spatio, a calce ad carceres revocari.*" What is the reason that a wise man dies with a sedate and quiet mind, and a fool with the greatest impatience and reluctance? Do not you think that the soul of the wise man, which sees most and farthest, discovers she is going to a better world? And that the soul of the fool is dim-sighted, and sees nothing of it? For my part, I burn with longing to see your fathers, whom I loved and honoured; nor do I desire to meet them only, but others also, of whom I have heard, and read, and writ. And were I going to them, I know not who it is should easily persuade me back. Nay, if any god would grant me the privilege of becoming a child again, and to bawl in a cradle, I would absolutely refuse it; for, having run my race, I would not willingly go back to the starting-post to run it over again. In the last place, they affirm, that the mind, because, if we may believe Epicurus, it is always seated in the heart of man, cannot remain safe and whole out of the

heart; as if birds, because they are hatched in a nest, cannot live out of it.

The fourteenth argument, from ver. 506. to ver. 606, is of the same piece with the others, and favours of vulgar stupidity to boot. Nor would the poet have been so copious in explaining the fifteenth, from ver. 606. to ver. 640, if he had rightly understood animal motion, and the instruments that serve to make it. To the next, from ver. 641. to ver. 649, let Plato and Pythagoras answer, for they only are concerned. The seventeenth and the eighteenth, from ver. 649. to ver. 680, suppose the corporeal soul to be diffused through the whole body, and to be annexed to all its parts, than which nothing is more false, nothing more absurd. It resides in the head, like a prince in his throne, and there it governs.

How trifling the observation he makes, from ver. 680. to ver. 709, is, will be obvious to every man who knows, and who has seen with his eyes, that worms, maggots, &c. are often bred in the earth, in plants, in cheese, &c. things altogether inanimate.

Let such as believe the transmigration of souls solve the difficulties which the poet raises against them, from ver. 709. to ver. 739. And then, as to what he alleges from ver. 739. to ver. 748, I will only say, that the soul would be a fool indeed if it did not desire a brisk and vigorous body, and fly from one that is decrepit and worn out with age. Of what he says, from ver. 749. to ver. 755, let them take care, if any such are to be found, who think the absurdities of Pythagoras worth a reply. And because the three and twentieth argument, from ver. 755. to ver. 770 is the same in effect with the thirteenth, it shall have no other answer but what that has had already.

To his four and twentieth argument, from ver.

770. to ver. 776, we say, that the most excellent philosophers hitherto have not thought it incongruous and absurd to join together a mortal and immortal being. And in opposition to what he urges, from ver. 776. to ver. 797, I will establish a fourth kind of things, viz. incorporeal, immortal substances, and Epicurus will not have the confidence to deny them an existence, since he himself has bestowed on his gods immortality, and exemption from dissolution. Lastly, As to his six and twentieth argument, which is the last he brings against the immortality of the soul, we do not deny but that the mind is affected with piercing grief, and vexed with devouring cares; nor but that when the body is seized with certain diseases the mind cannot perform its due functions. But we stiffly deny the consequence he draws from thence, viz. that therefore the soul is mortal.

I could here be more copious, and show that Lucretius has to no purpose brought this heap of argument, since they are incapable of delivering us from the fear of death; for to men who abound in prosperity, and enjoy all the delights of life, what can be more calamitous than that death which is *εἰρησὶς αἰσθήσεως*, a privation of sense: And to propose to the unfortunate and miserable such a death as will utterly destroy them, and thus put an end at once to them and their calamities together, would be the same thing as to propose shipwreck to a man tost in a violent storm, that by being plunged and drowned in the waves, he may, once for all, exempt himself from the dangers of the raging deep. And thus behold the mighty comfort which the doctrine of Epicurus affords us! Such a relief will ever be unwelcome, and hateful to all pious and good men, and those pleasing only to the impious, whom no philosophy ought to avail.

BOOK IV.

THE ARGUMENT.

- I. LUCRETIVS begins this fourth book, from ver. 1. to ver. 30, with the same comparison he brought in the first book, ver. 931, to give the mind of his Memmius some ease and respite from the crabbedness of the subject upon which he was then disputing; and he uses it here again, to bespeak as well the docility as the attention of his readers.
- II. He proposes the subject treated of in this book, which has a manifest connection with the former three: For having, in the first and second books, taught at large what the principles of things are, and what their nature, how they differ from one another in figure, how they are moved, and how they create all other things; and having, in the third book, fully explained the nature of the mind and of the soul, as being the chief and most excellent of all created bodies, he very judiciously, from ver. 29. to ver. 47, subjoins this other disputation concerning the sensation of animals, as well when they are awake, as when they are sleeping, which, to use the expression of Lucretius, is as much as to say, concerning the senses of the mind as well as those of the body. And, to carry on this disputation the more regularly, he begins with the images of things, and warmly insists, that all sensation is made by them. Therefore,
- III. from ver. 46. to ver. 115, he teaches, that certain most tenuious and subtle images are continually flowing from the surfaces of all bodies, that they fly to and fro in the air, but that, nevertheless, they are invisible, unless they be reflected upon the sight from mirrors, or water.
- IV. Then, to ver. 127, he describes the extreme tenuity of such images, and from thence takes occasion to confirm the doctrine he taught in the first book concerning the exiguity of his atoms.

V. From ver. 126. to ver. 228, he distinguishes between two kinds of images; one of those that of their own accord are bred in the clouds, which sometimes represent the images of giants, sometimes of mountains, and sometimes of huge monstrous beasts; the other, of those that fly off from the surface of things, and are, as it were, the films or membranes of them. Lucretius calls them "exuviae rerum," and then teaches, that these "exuviae" are continually flowing from the surface of all bodies, and that they are borne through the air with such wonderful celerity that they easily outstrip the swiftness even of the rays of the sun. VI. Forasmuch as the sight is accounted the first and chief of all the senses, he begins with it, and from ver. 227. to ver. 480, he teaches, that it proceeds from the incursion and striking of those images upon the eyes, in like manner as the other senses are caused by corpuscles that come from without to the several organs of sensation. Meanwhile, he explains all things that relate to the efficient causes of sight, and proposes several problems touching vision, of which he gives the true reasons and solutions. VII. But lest any man should take pretext, from the explication of these problems, to accuse the senses of deception or fallacy, he, at large, asserts their dignity, from ver. 479. to ver. 536, and takes occasion, by the way, to confute the sceptics, but chiefly from ver. 479. to ver. 490, and at last lays it down as an indisputable maxim, that all truth is grounded on the certainty, and on the belief of the senses. VIII. Having thus disputed of sight, he goes to work with the other senses likewise, and from ver. 535. to ver. 622, teaches, first, that voice and sound are corporeal images, which strike the ear, and are the cause of hearing. Then he explains the nature of voice, and the manner of its formation, and gives a reason why the same voice is heard by many persons at once, tells what an echo is, and what causes it. IX. From ver. 621. to ver. 722, he gives instructions concerning savour and taste, and touching odour and smell; namely, what savour and odour are, and why all do not perceive them; why the same food is sweet to some and bitter to others; why one odour is more agreeable to one than it is to another; and why the same voice strikes a terror into some, and pleases, at least does not fright others. X. From ver. 721. to ver. 832, he treats of imagination, and cogitation, which, he says, are made likewise by the same most subtle images of things presenting themselves to the mind. In the next place, he proposes and explains several problems relating to cogitation; why, for example, we seem to see, in our dreams, persons who are dead; why the images of things seem to tarry with us while we are thinking of the things whose images they are; why any man thinks on a sudden upon whatever he will; why we seem to ourselves to move in our dreams. XI. From ver. 831. to ver. 905, he teaches, that the tongue, the eyes, the nostrils, the ears, in a word, that all the organs of sensation were made before the use of them, quite contrary to what has happened in regard to all artificial things, the invention of which succeeded the foreseen want and usefulness of them. He gives the reason, likewise, why animals seek after their own meat and drink; why we move whenever we please; and tells what it is that actuates and drives forward the mass of our body. XII. From ver. 904. to ver. 1036, he treats of sleep, and of dreams; and teaches, in the first place, how sleep is caused in us, and in all other animals; then he assigns several causes of different dreams; and, falling at length upon the subject of venery, he disputes, from ver. 1029 to the end of this book, of love, of barrenness, of fruitfulness, &c. with more freedom of thought, and broadness of expression, than perhaps some will allow to be fitting. But in subjects of such nature, all philosophers have been apt to indulge themselves very much, and to assume greater liberties than it strictly becomes them to take.

I FEEL, I rising feel poetic heats,
And, now inspir'd, trace o'er the muses seats
Untrodden yet. 'Tis sweet to visit first [thirst:
Untouch'd and virgin streams, and quench my
I joy to crop fresh flow'rs, and get a crown
For new and rare inventions of my own:
So noble, great, and gen'rous the design,
That none of all the mighty tuneful nine
E'er grac'd a head of laurels like to mine.
For, first, I teach great things in lofty strains, 10
And loose men from religion's grievous chains.
Next, though my subject's dark, my verse is clear,
And sweet, with fancy flowing ev'ry where;
And this design'd: For as physicians use,
In giving children draughts of bitter juice,
To make them take it, tinge the cup with sweet,
To cheat the lip; this first they eager meet,
And then drink on, and take the bitter draught,
And so are harmlessly deceiv'd, not caught:
For, by such cheats, they get their strength, their
ease, 20
Their vigour health, and baffle the disease.

So since our method of philosophy
Seems harsh to some; since most our maxims
fly;
I thought it was the fittest way to dress
These rigid principles in verse might please;
With fancy sweet'ning them, to bribe thy mind
To read my book, and lead it on to find
The nature of the world, the rise of things;
And what vast profit too that knowledge brings.
Now, since 'tis shown what things first bodies
are, 30
What diff'rent forms, what various shapes they
bear; [whole;
And how they move; how join to make one
And what's the nature of the mind and soul;
Of what compos'd; how fate unlinks the chain,
And scatters it into its seeds again.
Next, for 'tis time, my muse declares and sings,
What those are we call images of things,
Which, like thin films, from bodies rise in
streams,
Play in the air, and dance upon the beams: 39

By day these meet, and strike our minds, and
fright, [night :
And show pale ghosts, and horrid shapes by
These break our sleep, these check our gay de-
light.

For sure no airy souls get loose, and fly,
From hell's dark shades, nor flutter in our sky :
For what remains beyond the greedy urn,
Since soul and body to their seeds return?

A stream of forms from ev'ry surface flows,
Which may be call'd the film or shell of those :
Because they bear the shape, they show the frame,
And figure of the bodies, whence they came. 50
The dullest may perceive, and know 'tis true ;
For bodies, big enough for sense to view,
Do often rise : some more diffus'd and broke :
Thus fire, thus heated wood still breathe forth
smoke ; [gin,

And some more close, and join'd ; when heats be-
Some insects seem to sweat, and cast their skin :
The heifers cast the membranes of their horns,
Snakes leave their glitt'ring coats among the
thorns,

A glitt'ring coat, each tree, each bush adorns. }
We see with pleasure what we fled before,
We handle now the scales, and fear no more.
This proves that num'rous trains of images
(For why can these, and not more thin than these)
From ev'ry surface flow. For first they lie
Unchain'd, and loose, and ready for our eye :
They soon will slip, and still preserve their frame,
Their ancient form, and tell from whence they
came.

Nay more, they're thin, they on the surface play, }
Therefore few chains to break, few stops to stay
Their course, or hinder when they fly away. 70 }

For it is certain, that a num'rous store,
Not from the middle parts, as 'twas before
Observ'd, but even from the surface rise,
As colours, often loosen'd, strike our eyes.
Thus when pale curtains, or the deeper red
O'er all the spacious theatre are spread,
Which mighty masts, and sturdy pillars bear,
And the loose curtains wanton in the air,
Whole streams of colours from the top do flow, }
The rays divide them in their passage through, }
And stain the scenes, and men, and gods be-
low : 81 }

The more these curtains spread, the pleasing dye
Rides on the beams the more, and courts the eye :
The gaudy colour spreads o'er ev'ry thing,
All gay appear, each man a purple king.
Since curtains then their loosen'd colours spread,
Since they can paint the under scenes with red,
Then ev'ry thing can send forth images :
Those fly from surfaces as well as these,

'Tis certain then that subtle forms do lie 90 }
And dance, and frolic in our lower sky, }
Which, single, are too subtle for our eye. }

But now the odours, vapours, and thin smoke,
Fly scatter'd and confus'd, their order broke,
Because, whilst they from outward parts do flow, }
And through strait winding pores, and turnings
go, }

They are disorder'd in their passage through. }

But now these subtle films of loosen'd dyes
What can disorder, as from things they rise,
Since each upon the utmost surface lies ? }

Thus forms, which glass, which limpid streams
restore, 101 }

Bearing that shape, that dye, the body wore,
Must be compos'd of fleeting images
That rise from things : For why with greater
ease [these? }
Can these forms rise, than some more thin than
Then there are subtle shapes, like those that
streams

Or glass restores on the returning beams ;
In figure like ; but airy, thin, and light,
And single each, too subtle for our sight :
Yet coming thick, and in a num'rous train, 110
Reflected from the polish'd specular plain,
Can make us see ; and that's the reason why
The forms return again, in shape and dye
So like the things, and please the curious eye. }

Next learn how subtle, and how thin these
are. }

First, then, since seeds of things are finer far
Than those that first begin to disappear. }
But now to clear this, to confirm the more
The subtleness of seeds, explain'd before, }
And add new reasons to the former store : 120
How many animals, whose middle part
The sharpest eye, with all the help of art,
Can't see ? Dull art may throw her glasses by :
How subtle then the guts, the heart, the eye ?
How thin each little member of the whole ?
How infinitely small the seeds that frame the
soul ? }

But more——
Opopanax, or rue, that strikes the nose
With strongest smells, or others, like to those,
If shaken, thousand parts do fly from thence,
A thousand ways : but weak, nor move the sense.
And yet how subtle, if compar'd with these 131
How thin, what nothings are the images ?
How vast the disproportion 'twixt these two ?
'Tis more than thought can think, than words
can show.

But now, besides these subtle forms that rear
From bodies, thousand new are fram'd in air,
Fashion'd by chance ; and these when borne on
high,
Still change their shapes, and wanton in the sky :
Then join'd in various forms, grow thick and
move
Like clouds combin'd, and darken all above : 140
Hence prodigies ; hence some gigantic war,
Marshall'd in th' air, looks dreadful from afar,
And shadows all : Hence mountains seem to fly :
And scatter'd rocks cut thro' the wounded sky :
Hence other clouds do frightful streamers show :
We stare, amaz'd, and wonder at below.

Next learn——
How soon these forms fly off, how swift they
rise : }
For something still on ev'ry surface lies,
Just ready to depart, and strike our eyes. }
This, when on rare and thin composures tost,
For instance, clouds, strait enters, and is lost.

It breaks on rocks and woods; they ne'er restore
The forms, the image then appears no more:
But if 'tis thrown on dense, and smooth, as glass,
It must return: those things it cannot pass,
As clothes; nor break, because the thing's polite;
Hence forms return from such, and please the
sight:

And hence the polish'd glass, whate'er you place
Before, as swift as thought, returns the face:
Which proves that num'rous trains of forms
arose, 160

And such as the reflecting mirror shows,
Thin subtle images, all like to those,
Each moment spring; and hence 'tis justly said,
Their rise is quick; these forms are quickly made;

As num'rous rays must ev'ry minute flow
From the sun's orb, to keep all full of light below;
So num'rous images from things must rear,
Each minute rise, and wander through the air:
Because let hasty hands the mirror place, 169
This way, or that; yet still we view the face,
The colour, shape, returning from the glass.

So often, when the heav'ns, serene and bright,
Look, gay, and clear, and smile with gaudy light;
A horrid cloud straight hides its glorious face,
As if the shades of hell had left their place,
And fill'd the vaulted skies: so thick the night!
So dark the clouds appear, so much affright!
And yet how subtle, if compar'd with these,
How thin, what nothings are the images?
How vast the disproportion 'twixt these two! 180
'Tis more than thought can think, than words
can show.

Now next, how fast they move, how quick
they fly,
Parting with swiftest wings the yielding sky:
How they outstrip dull time where'er they go,
How quick, how swift they are in passing thro';
In few, but sweetest numbers, muse rehearse:
My few shall far exceed more num'rous verse.
'Thus dying swans, tho' short, yet tuneful voice,
Is more delightful than a world of noise.

First, then; experience tells, that thin, and light,
And subtle things are fit for hasty flight: 191
Such is the ray, the vapour of the sun;
How swift its race! 'Tis finish'd when begun:
For they are thin contextures: almost feed;
And cut the parted air with greatest speed;
No lets to stop, but when one part is gone,
Another flows and drives the former on:
The rays still rise in a continued stream,
The foll'wing lashes on the lazy beam:
So far their reason holds: the airy race 200
Of images must pass a mighty space,
Each point of time: For first, some force behind
Still drives them on t' outstrip the ling'ring wind;
Their texture is so thin, their frame so rare,
That they can freely enter any where,
And even penetrate the middle air.

Besides; if these composures from above
So swiftly through the lower region move;
If in one point of time the glorious ray 209
Swiftly descends, and shows approaching day;
From heaven to earth can take its hasty flight,
And gild the distant globe with gaudy light;

If this so swift, than swifter those that lay
On surfaces of things, which nought could stay; }
No stops could hinder as they fly away:
They larger space in that short time must fly,
While the sun's lazy beams creep through our sky.

Another instance of their swiftness this.—
In bowls of water set abroad by night,
We know that stars do shed their feeble light;
So quick the glorious ray descends from far, 221
And we look downward to behold the star:
Which shows the images, with eager haste,
From heav'n reach distant earth; they move so
fast, }

Before the single present now is past.
Slow time admires, and knows not what to call
The motion, having no account so small.

Thus then these images, that strike our eyes,
And make us see, from real things must rise.
Thus odours rise from gums; a gentle breeze 230
From rivers flow; and from the neighb'ring seas
Sharp salts arise, and fret the shores around:
Thus all the air is fill'd with murm'ring sound:
And whilst we walk the strand, and, pleas'd to
view

The wanton waves, or squeeze, or mingle rue,
Or salt, or bitter tastes our tongue surprise: }
So certain 'tis that subtle parts arise
From all, and wander in the lower skies:
These never cease to flow, because the ear, 239
And eyes, and nose, still smell, or see, or hear.

So feel by night, our touch will soon betray
The shape, like that the sight beheld by day.
Thus then the cause, whence touch and sight
must rise

Is one: the same affects the hands and eyes.
For, thus, if, when 'tis dark, we feel a square,
The touch informs what shape the thing does
bear;

What is it makes us see the like by day,
But the square image riding on the ray.
Therefore these images are cause of sight:
All would be dark without them, and all hid in
night. 250

But now these images, these subtle streams
Are scatter'd all around, on all the beams:
And therefore wheresoe'er we turn our eye,
(In that alone the pow'r of sight does lie)
These images appear, and quickly show
The colour, shape, and tell the distance too.

For these arising from the object seen,
Drive forward all the air that lies between:
This stream of air unto the eyes does flow,
And gently grates the ball, and passes thro': 260
This shows the distance—

For as the stream of air, that passes by,
Is long, or short; as that does strike the eye, }
So far, or near, the objects seem to lie.
All this is quickly done; at once we view
The distant thing, and know the distance too.

But more; no wonder that the eye descries
The things themselves, altho' the forms that }
Are single; far too subtle for our eyes. [rise,
For winds molest, cold makes the members
smart; 270

And yet what sense perceives each single part?

OF THE NATURE OF THINGS.

481

What sense each atom of the cold and wind?
None feel the single force, but all conjoin'd:
Then we perceive the stroke, when pains com-
mence;

As if external force did wound the sense;
In flints we press the utmost parts alone,
Yet feel not that: that is to touch unknown;
We feel the inward hardness of the stone.

Now learn; I'll sing why each reflected face
Is seen, as if remov'd beyond the glass;
For so it seems: As when the hind'ring door
Imprisons up the longing eye no more
But, open'd wide, permits the eager sight,
O'er objects, plac'd without, to take its flight,
View all around, and revel with delight.
The object then by double air is shown;
The air, that lies within the gate, is one:
And then the gate itself is plac'd between,
Then th' outward air, and then the object seen.

Thus when the image of the glass does rise,
And makes its passage forward to our eyes,
It drives before it all the air between;
So that is felt before the glass is seen:
And when we see the polish'd specular plain;
Our form flies to it, and returns again;
Still driving on the air that lies between;
So that is felt before the face is seen:
And that's the cause, why each returning face
Seems far remov'd, and plac'd beyond the glass.

But more; returning forms, that reach the
light,
Transpose the parts, and turn the left to right.
Because the forms, that strike the polish'd plain
Are not restor'd the same, unchang'd again;
But striking strong, are turn'd a diff'rent way.
This instance clears it: Take a form of clay
Not yet grown dry, and dash it on a seat;
Now if the form's entire, the front retreat,
And come behind, the parts preserve their site;
The right will seem the left, the left the right.

Besides; returning forms do often pass,
And fly from one into another glass.
Thus from one single thing these plains restore
Six images, and often ten, or more.
Thus let the thing be hid i' the farthest cell;
Yet place the plains by art, and set them well,
The flitting images to all will come,
And all the thing appear in ev'ry room. [plain,
But more; the shapes transpos'd by th' former
Which pass to others, there are turn'd again.

But convex glasses show the bodies site,
Restoring left as left, and right as right:
Because the image is reflected twice,
From glass to glass, and after strikes our eyes:
Or else 'tis turn'd about; for that the face
Is turn'd about as it does backward pass,
We learn ev'n from the figure of the glass.

But farther on: the image seems to wait
On all our steps, and imitate our gait.
For when we move and leave some parts o' th'
glass,

The parts thus left no more return the face;
For nature does by steady laws ordain,
That when a form comes on, and turns again,
The lines make equal angles with the plain.

TRANS. II.

The sight a fulgid object hates, and flies:
The sun ev'n blinds the bold and prying eyes,
Because the rays are strong, and swiftly fly,
And with repeated strokes disturb the eye.
Through pure and unresisting air they fall,
And break the texture of the injur'd ball.
Besides, all objects that are glaring bright,
Do hurt and burn the eye, and spoil the sight;
For flames a thousand hurtful parts contain,
Which strike the tender eye, and raise a pain.

Besides, whatever jaundice eyes do view,
Look pale as well as those, and yellow too.
For lurid parts fly off with nimble wings,
And meet the distant coming forms of things;
And others lurk within the eyes, and seize,
And stain with pale the ent'ring images.

More: though our eyes are all enclos'd in night,
They see those objects that are plac'd in light;
Because, though first the nearer darker air
Creeps ev'n into the eyes, and settles there;
Straight comes with vig'rous force the shining
ray,

Cleanses the pores, and drives the shades away;
For, 'tis more subtle, and more strong than they.
When this has cleans'd and open'd ev'ry pore,
Which the dark heavy air had stopp'd before,
The forms of things come in: they swiftly fly,
And strike, and raise a motion in the eye.

But now, when we ourselves are in the light,
The objects in the dark ne'er move our sight;
Because a thicker air does still come on;
A darker as the former dark is gone,
And stops the pores; and thus no forms can rise,
None move and find a passage to our eyes.

Now farther: 'tis by sure experience found,
A square when seen at distance seems a round;
Because all angles seem when seen from far,
Obtuse, or rather not at all appear.
For through the flitting air all forms that fly
Are struck and blunted in the lower sky,
And so grow weak, and never move the eye:
So all the angles hid, the things appear
All round, though each may be a perfect square;
Yet not like perfect rounds, and seen when near.
And shadows seem to move, to turn and stay
As bodies do; and servilely obey.

Now how can air, only depriv'd of light,
(For shadow is no more; a sudden night)
On all the members various motions wait,
And turn, and imitate her body's gait?
But thus it happens, when we walk by day,
Our bodies stop the passage of the ray;
But when we leave the place, they further flow,
And their warm kisses on the earth bestow.

And thus the shadow seems to move, to bend
As bodies do, and all their walk attend;
For still new rays spring from the glorious sun,
The former dying when their race is run:
And, therefore, earth is soon depriv'd of light,
And rays as soon come on and chase the night;
The negro darkness wash'd becomes a white.

And yet, here's no deception of the eye,
For 'tis its office only to descry,
Or how, or in what place the shadow is;
It must not pass the narrow bounds of this;

H b

But if the shadows are the same or no;
Whether they die; or as the body go,
'Tis not the office of the eye to know: 400
'Tis reason's office that; for that's design'd
Things nature, and philosophy to find;
Then fix not on the eye the failures of the mind.

Thus ships, though driv'n by a prosperous gale,
Seem fix'd to sailors; those seem under sail
That lie at anchor safe; and all admire,
As they row by, to see the rocks retire.

Thus stars seem fasten'd to the steady pole,
Though all with daily constant motion roll; 409
Yet they, when they have climb'd the tedious east,
Pass through the sky, and headlong fall to west.
And so the sun and moon seem fix'd above,
Yet sure experience tells us that they move.

And rocks in seas that proudly raise their head,
Though far disjoin'd, though royal navies spread
Their sails between; yet, if from distance shown,
They seem an island all combin'd in one.

So boys that whirl around, then cease to move,
Think all the pillars dance and roofs above:
So strong the thought, they dread the tott'ring
wall, 420

And fear the roof will crush them with the fall.

Thus when kind nature shows her infant-day,
And the new sun peeps forth with trembling ray,
And loth or fearful to begin the race,
Looks o'er the mountains with a blushing face;
That hill o'er which the humble beams appear
Scorching with neighb'ring flames is often near,
And we might touch the sun if we were there.

When yet the real space is vastly wide 429
Great tracts of land, and many a swelling tide,
The distant sun and that near hill divide.

Thus little puddles that in streets do lie,
Though scarce inch deep, admit the searching
eye,

To view as large a space as earth from sky.

Thus when in rapid streams my horse has stood,
And I look'd downward on the rolling flood;
Though he stood still, I thought he did divide
The headlong streams, and strive against the
tide;

And all things seem'd to move on ev'ry side.

Thus courts, though equal wide, yet seem to
bend, 440

And grow more narrow at the distant end:
The roof depress'd, the sides seem join'd in one,
The weary'd sight lost in a darksome cone.

The sun to sailors seems from sea to rise,
And set; for they see only seas and skies.
All which does seem t' oppose, and to commence
Strong proofs against the certainty of sense.

Thus ignorants, when plac'd on steady shores,
Think feeble ships are row'd with broken oars.
The rudder's shatter'd, and the planks appear,
And they are loth to trust their safety there; 451
Because that part which lies above the flood,
Seems firm and straight, and regular, and good,
But that below seems broke; and, turning up,
Ascends again and reaches near the top.

And when by night the clouds are whirl'd above,
The moon and glitt'ring stars do seem to move,
As driven forward by a secret force,
A diff'rent way from their own nat'ral course.

If any presses underneath his eyes, 460
Straight all the objects doubled seem to rise!
Two lamps appear when only one is brought,
His wealth seems doubled, and he's rich in
thought;

Each man appears increas'd in form and grace,
Almost Geryon, with a double face.

And, lastly, when the eyes with sleep oppress,
And all the body lies dissolv'd in rest;
The members seem awake and vig'rous still,
Now o'er a plain, now flood, or shady hill, 469
They seem to move; and, ev'n in darkest night,
They think they see the sun diffuse his light.
They see him chase the frighted shades away,
And clear a passage for approaching day:
They seem to hear a voice, though all around
Deep silence stands, nor bears the weakest sound.

Ten thousand such appear; ten thousand foes
To certainty of sense, and all oppose
In vain; not sense, but judgment 'tis mistakes,
And fancy'd things for real objects takes. 479

He that says nothing can be known, o'erthrows
His own opinion; for he nothing knows.
So knows not that: what need of long dispute!
These maxims kill themselves, themselves confute.
But grant this might be known, and that he knew;
Yet since he has discover'd nothing true,
What mark or what criterion then can show,
Or tell what 'tis to know, or not to know?
Or how could he, what truth, what falsehood
learn?

How, what was doubt, what certainty, discern?

From sense all truth and certainty infer; 490
In vain some strive to prove that sense can err:
For that which would convince, which would op-
pose

The senses, must be surer far than those.

Now, what is more to be believ'd than sense?

Is false and erring reason rais'd from thence?

Errors in parent sense can reason show?

Errors which she from sense alone can know?

And thus if sense be false, then reason too is so.

What, can the ears convince the eyes? Can those

Convince the hand, the palate, or the nose? 500

Tell them, whene'er they err, whene'er they
miss,

And give false notions? A fond fancy this!

For each a proper use and pow'r enjoys;

A proper object ev'ry sense employs.

Thus heat and cold and other qualities

Affect the touch, while colours strike the eyes,

Odours the smell, flavours the taste; but none

Invades another's right, usurps his throne,

All live at peace, contented with their own;

Therefore, from what the other senses show, 510

In vain we seek to prove one sense untrue;

Or from itself——

For still we must an equal credit give

To each; and all must equally believe.

'Tis truth whate'er the senses do declare;

Though reason cannot tell thee why a square

Should seem a perfect round when seen from far.

Better assign a false, than this pretence

Should overthrow the certainty of sense;

Question its truth, rather than that should fall,

On which depends our safety, life, our all. 524

For now, not only reason is o'erthrown,
Unless we trust our sense, but life is gone.
For how can man avoid the bad, or choose
What's good for life, unless they follow those?
Therefore, those pompous reasons some afford
Against our sense, are empty and absurd.

But, lastly, as in building, if the line
Be not exact and straight, the rule decline;
Or level false, how vain is the design! 530
Uneven, an ill-shap'd, and tott'ring wall
Must rise, this part must sink, that part must fall;
Because the rules were false, that fashion'd all.
Thus reason's rules are false, if all commence,
And rise from failing and from erring sense.

But now my muse, how proper objects please
The other senses, sing, 'tis told with ease:
First then, we sounds, and voice, and noises hear,
When seeds of sound come in and strike the ear,
All sound is body; for with painful force 540
It moves the sense, when with an eager course
It scrapes the jaws, and makes the speaker hoarse.
The crowding seeds of sound that strive to go
Through narrow nerves, grate them in passing
through:

'Tis certain then that voice which thus can wound,
Is all material; body ev'ry sound.

Besides, 'tis known to talk a tedious day,
How much it weakens, what it takes away
From all the nerves; how all the powers decay;
But chiefly, if 'tis loud, and spoke with noise;
And, therefore, little bodies frame the voice, 551
Because the speaker loses of his own,
His weakness tells him many parts are gone.

But more; the harshness in a voice proceeds
From rough; the sweetness from the smoother
seeds.

Nor are the figures of the seeds alike, [strike,
Which from the grave and murmur trumpet
To those of dying swans, whose latest breath
In mournful strains laments approaching death.

Thus voice, when rising from the lungs, it
breaks 560
Through jaws and lips, and all the passion speaks,
The tongue forms into words with curious art;
The tongue and lips do fashion ev'ry part.

And therefore, if the speaker be but near,
If distance fit, you may distinctly hear
Each word, each air; because it keeps the frame
It first receiv'd; its figure still the same.
But if the space be great, through all the air
The sound may fly diffus'd, and perish there:
And therefore, though we hear a murmur noise,
No words: the air confounds and breaks the
voice. 571

Besides, one sentence when pronounc'd aloud
By strong-lung'd criers, fills the list'ning crowd,
Breaks into many, for it strikes them all,
To ev'ry single ear it tells the tale.
But some parts of the voice that miss the ear,
Fly through the air diffus'd, and perish there.
Some strike on solid buildings; and restor'd,
Bring back again the image of the word:
This shows thee why, whilst men through caves
and groves, 580
Call their lost friends, or mourn unhappy loves,

The pitying rocks, the groaning caves return
Their sad complaints again, and seem to mourn.
This all observe, and I myself have known
Both rocks and hills return six words for one.
The dancing words from hill to hill rebound,
They all receive, and all restore the sound.
The vulgar and the neighbours think, and tell
That there the nymphs and fauns and satyrs
dwell; 589

And that their wanton sport, their loud delight
Breaks through the quiet silence of the night:
There music's softest airs fill all the plains,
And mighty Pan delights the list'ning swains:
The goat-fac'd Pan, whose flocks securely feed,
With long-hung lip he blows his oaten reed.
The horn'd, the half-beast god, when brisk and
gay, [play.

With pine-leaves crown'd, provokes the swains to
Ten thousand such romances the vulgar tell,
Perhaps lest men should think the gods will dwell }
In towns alone, and scorn their plains and cell: }
Or somewhat; for man, credulous and vain, 601
Delights to hear strange things, delights to feign.

Nor is it strange, that things which still deny
An easy passage to the sharpest eye, [come,
Through such the smallest voice and sound can
As when we whisper in a well clos'd room;
Voice can pass crooked pores; but rays reflect,
Unless the pores be open; all direct,
And ev'ry passage strait as 'tis in glass, 609
Through which all sorts of species freely pass.
Besides, we know voices and sounds divide,
And scatter through the air on ev'ry side;
One breaks to many, as in darkest nights,
One shaken spark will make a thousand lights.
And therefore, all the num'rous voids around
Receive the voice, and each is fill'd with sound:
But now the visive rays scarce e'er decline, }
They still proceed by the exactest line; }
So sounds can pass where never ray can shine. }
But yet such sounds before they reach the ear, 620
Grow weak, and we for words soft murmurs hear.

We taste, that's soon explain'd, when flavours
wrung [tongue;
From meats by crushing teeth, immerse the
When juices flowing from the tender meat
(The tender food oppress'd does seem to sweat)
Bedew the palate; when they spread all o'er
The spongy tongue, and stand in ev'ry pore.
These juices, if their seeds be round and smooth,
Tickle, seem sweet and pleasing to the mouth;
But if the seeds be rough as they descend, 630
They hurt the nerves, seem bitter and offend.
The flavours please within the mouth alone; }
For when the food's descended farther down, }
We taste no more, and all the pleasure's gone. }
So when 'tis in the veins, when ev'ry pore
Is fill'd, we feel not, we are pleas'd no more,
And thus it matters not what sorts of food
Increase the limbs, and make the flesh and blood, }
If 'tis digestive, if for stomach good. 639

Now I'll explain why different sorts of meat
Please different men. Why that which one will eat,
Another lothes. Why things yield sweet repast
To one, but bitter to another taste.

Nay more : so vast the difference is, what proves
Strong poison unto one, another loves,
And eats, and lives. Thus hemlock juice prevails,
And kills a man ; but fattens goats and quails.
To know the cause of this, come search thy mind,
Some scatter'd notions must remain behind, 649
And look how strongly former reasons show,
That things, that bodies are compos'd and grow }
From various seeds, their mixture various too.

Besides, as animals in outward size
And frame are various ; seeds from whence they
rise, [springs
Have various shapes ; from diff'rent shapes there
An equal difference in the pores of things ;
So some are great, some small, and others square,
Or round, or polygons, or angular ;
For as the shapes are various that compose
The frame, so are the pores ; their shapes depend
on those. 660

It follows then, ———
That when one object yields a sweet repast
To one, but bitter to another taste ;
He that accounts it sweet, perceives the smooth
Round parts that tickle, and that please the mouth ;
But he that thinks it bitter, rough alone
And hooks does feel : the smooth glide gently
down :

But those with pointed hooks as they descend,
Strike through, and lance the organ, and offend.

These rules apply'd, each single case explain :
For instance ; when a man is torn with pain, 671
Whether from inbred gall the fever came,
Or putrid air begot the hurtful flame ;
The organ's chang'd, so those which pleas'd be-
fore,

Are lothsome now, now they delight no more ; }
Their figures disagree with ev'ry pore.
But those do most agree, those fit the part
Which fret the injur'd nerves, and cause a smart :
For, as I said before, seeds rough and smooth
Lie hid in ev'ry thing, in honey both, 680 }
Or to offend, or to delight the mouth.

Now next for smell. ———
First, then, 'tis certain streams of odours rise
From ev'ry thing ; but for their diff'rent size
And figures, they do diff'rently agree
To animals. Thus honey strikes the bee ;
Though far remov'd, the vulture smells the slain ; }
The hound with faithful nose pursues the train ; }
And geese, Rome's saviours once, perceive a
man.
Thus beasts preserve their lives, they know their
food 690

By smell ; and fly the bad, and choose the good.
Odours are dull, and those of swiftest wings,
Not to propose the images of things,
Scarce fly so far as feeble sounds ; but toss'd
By angry winds, in flitting air are lost.
For first, the pleasing odour slowly flows
From inmost parts : for that it comes from those,
Ev'n common sense assures ; for heat, or press,
Or bruise, or break the gums, the smells increase.
In parts are greater far than parts of voice, 700
(This makes its flight more slow and short than
noise),

Because through walls it cannot freely go,
Though sounds can find an easy passage through ;
And thus 'tis hard to find an object out
By smell alone, but we must trace about,
Because the odours, wand'ring in the air,
Grow dull and weak, and lose their briskness there,
Nor quickly lead us to the thing that's sought ;
And therefore hounds are often at a fault.

Not only sounds and tastes, but images 710
And colours, diff'rent eyes offend and please.
Thus when the cocks call forth the morning
light, }
The fiercest lions cannot bear the sight,
Their courage sinks, and they prepare for flight, }
For subtle pointed particles that lie }
In cocks, sent forth, offend the lion's eye ; }
These pains straight force him turn his head and
fly.

Yet these hurt not our eyes, they cause no pain ;
For they ne'er enter, or return again 719
Through proper pores ; and so the skin preserves
Her texture whole ; they never lance the nerves.

Now farther (my delight), my muse will show
What things do move the mind, and whence they
flow.

First, then, thin images fill all the air,
Thousands on ev'ry side, and wander there.
These, as they meet, in various dance will twine,
As threads of gold, or subtle spider's line :
For they are thin ; for they are subtler far
Than finest things that to the sight appear. 729
These pass the limbs ; no narrow pores controul ;
They enter through, and strike the airy soul.
Hence 'tis, we think we see, and hence we dread }
Centaur and Scyllas, Cerberus' monstrous head, }
And many empty shadows of the dead. }
For various images fly ev'ry where ; [air
Some rise from things ; and some are form'd in }
By chance ; and some from these combin'd ap- }
pear.

The image of a centaur never flew
From living centaurs ; never nature knew,
Nor bred such animals. But, when by chance
An image of a man in various dance, 741
Did meet a horse, they both combin'd in one :
And thus all monstrous images are shown.
These airy images, extremely thin,
Pass through the limbs, and strike the soul with-
in ;

They move with ease, the soul is apt to move
And take impression from the weakest shove.

That thus 'tis done is certain : ———
Because the objects still appear the same
To mind and eye, in colour and in frame ; 750
But now the eye receives some thin refin'd
And subtle forms : so likewise must the mind ;
For 'twixt these two this only diff'rence lies,
The mind sees finer objects than the eyes.

Thus often while the body lies oppress'd
With heavy sleep, the mind seems loos'd from
rest ;
Because those images do strike and shake
The airy soul, as when we were awake :
The stroke's so lively, that we think we view
The absent dead, and think the image true : 760

This cheat must be, because the sense is gone,
Bound up by sleep; for by the sense alone,
Fancy'd from real, true from false is known.
Besides, the mem'ry sleeps, and rest does seize
That ruling pow'r, and charms it into ease;
It lies unactive, dull, nor can controul
The errors of the mind, nor tell the soul [lieve,
That they are dead, whom her vain thoughts be- [seem
From cheating images to see alive.

Besides, no wonder that these forms should
To move; as often as in vig'rous dream 771
They seem to dance; for when the first is gone,
And straight another rises, straight comes on,
The former's site seems chang'd, 'tis quickly
done.

So swift, so num'rous are the forms that rise,
So quickly come, so vast the new supplies!
A thousand weighty queries more remain,
Ten thousand more, all which we must explain,
Ten thousand more, or else our search is vain.
First, then: 'tis ask'd, why men with so much
ease,

Can think on any object what they please?
For what? Are still th' obedient forms at hand,
And wait on our imperious will's command?
And straight present whate'er the will desires,
Whether 'tis heav'n, or earth, or sea, or fires,
Wars, senates, battles, fights, of pomp, and state?
Does nature these, as she commands, create?
Since fix'd in one, one constant place, the mind
Can think on various things of diff'rent kind.

And why the images, with wanton pace, 790
Can seem to move and dance? Why's ev'ry grace
And measure kept? Why do they clasp their arms,
And toss their legs, and show a thousand charms?
What, have these wantons skill, they thus delight
To show their fairy tricks, and dance by night?
The reason is, each part, each single now
Of running time, as reason seems to show,
Has num'rous parts; and so, in shortest space,
Ten thousand forms may fly through ev'ry place,
Diff'rent and various; here and there may rove,
So num'rous are they, and so swift they move.

But since these forms are subtle and refin'd, 802
They are too thin to be perceiv'd by mind;
Unless she set herself to think and pry,
Contracting close her intellectual eye.
But this not done, the fleeting images,
Unseen, unthought on, and unheeded, cease:
And when she seeks to know, contracted close,
She pries upon the thing, and therefore knows.
Thus when the curious eye designs to view 810
An object subtle, and refin'd, and new,
Unless contracted close she strictly pries;
In vain she strives, the object 'scapes the eyes.
Nay, ev'n in plainest things, unless the mind
Takes heed, unless she sets herself to find;
The thing no more is seen, no more belov'd,
Than if the most obscure and far remov'd.
What wonder, then, if mind the rest should lose,
And only what she strives to know she knows?

(Besides, the mind oft thinks small objects great,
And thus she leads herself into a cheat). 821
And often too, a form of diff'rent kind
From what it seem'd before, affects the mind,

And strikes the fancy. Thus the form that came
A man before, is chang'd; in diff'rent frame
Presents a woman now to our embrace;
Or shows some other change in age or face.
Yet 'tis not strange, that monstrous forms com-
mence

In fancy, when soft sleep has lull'd the sense
And mem'ry, so that neither can controul 830
The erring thoughts; neither direct the soul.

But now avoid their gross mistake, who teach
The limbs were made for work; a use for each.
The eyes design'd to see, the tongue to talk,
The legs made strong, and knit to feet to walk;
The arms fram'd long and firm, the servile hands
To work, as health requires, or life commands;
And so of all the rest, whate'er they feign,
Whate'er they teach is nonsense all, and vain. 840

For proper uses were design'd for none;
But all the members fram'd, each made his own.
No light before the eye, no speech was found
Before the tongue, before the ears no sound;
In short, the working feeds each limb create
Before its use, so 'tis not fram'd for that.
We knew to fight before the help of art,
To bruise and wound before we fram'd a dart;
And nature taught us to avoid a wound,
Before the use of arms and shields was found. 850

Before beds were, ev'n nature threw us down
To rest: we drank before a cup was known.
These various things convenience did produce,
We thought them fit, and made them for our use.
Thus these, and thus our limbs, and senses too,
Were form'd before that any mind did know
What office 'twas that they were fit to do.
Therefore, 'tis fond to think that these began,
For proper uses made, bestow'd on man.

What wonder is't that bodies ask for meat?
That nature prompts an animal to eat? 860
For I have taught before, how thousand ways
Small parts fly off, and ev'ry thing decays:
But more from lab'ring animals retreat,
More inward parts fly off in breath and sweat;
And so the body wastes, and nature fails,
The strength decays, and grief and pain prevails.
And therefore, meat's requir'd, a new supply,
To fill the places of the parts that die,
Recruit the strength, allay the furious pain,
And stop each gaping nerve, each hungry vein. 871

The cooling drink to ev'ry part retreats,
That wants the moisture, and the num'rous heats
That burn and fire the stomach, fly before
The coming cold, and we are scorch'd no more.
Thus drinks descend, and thus they wash away
Fierce thirst. Thus meats do hunger's force allay.

And next I'll sing, why men can move, can run
Whene'er they please; what force the members on;
What move the dull unactive weight, and bear
The load about: you with attention hear. 880

First then, the subtle form's extremely thin,
Pass through the limbs, and strike the mind
within:

That makes the will; for none pretends to do,
None strives to act but what the mind does know;
Now what the mind perceives, it only sees
By thin and very subtle images.

So when the active mind designs to move
 From place to place, it gives the soul a shove;
 The soul spread o'er the limbs, ('tis quickly
 done, 889
 For soul and mind are join'd, and make up one)
 That strikes the limbs, so all is carry'd on.
 But more than this; the body then grows rare,
 The pores are open, and the flitting air,
 As 'tis in motion still, must enter there:
 This spreads o'er all, and both these things com-
 bin'd,

Force on the limbs, as ships both oars and wind.
 Nor is it strange such little parts should shove
 The heavy mass of limbs, and make them move,
 And turn them; for unseen and subtle gales 899
 Drive forward heavy ships with lab'ring sails;
 And yet, when these rush on with mighty force,
 One hand may turn the helm and change the
 course:

And engines, pullies too, with ease can rear
 The greatest weights, and shake them in the air.
 Next, how soft sleep o'er all spreads thoughtless
 rest,

And frees from anxious cares the troubled breast;
 In few, but sweetest numbers, muse, rehearse,
 My few shall far exceed more num'rous verse.
 Thus dying swans, though short, yet tuneful voice,
 Is more delightful than a world of noise. 910

You entertain my words with willing mind,
 And list'ning ears; lest what my muse design'd
 Should seem absurd, impossible to be,
 And truth be slighted, while the fault's in thee,
 And wilful blindness will not let thee see.

When the divided soul flies part abroad,
 And part oppress'd with an unusual load,
 Retiring backward, closely lurks within,
 Then sleep comes on, and slumbers then begin:
 For then the limbs grow weak, soft rest does seize
 On all the nerves, they lie dissolv'd in ease. 921
 For since sense rises from the mind alone,
 And all the sense is lost as sleep comes on:
 Since heavy sleep can stop, dull rest controul
 The sense, it must divide and break the soul.
 Some parts must fly away, but some must keep
 Their seats within; else 'twould be death, not
 sleep.

For then no subtle atoms of the mind,
 No little substance would be left behind;
 As sparks in ashes, which might well compose, 930
 The sense restor'd as flames arise from those,

But now I'll sing what 'tis that breaks the soul,
 What spreads enfeebling rest o'er all the whole;
 And why the bodies lie dissolv'd in ease:
 Great things! You carefully attend to these.

First, then, the surfaces of things must bear
 The constant impulse of the neighb'ring air,
 Still vex'd, still troubled with external blows,
 And, therefore, shells, or rinds, or films enclose,
 Or skin, or hair, on ev'ry body grows: 940
 Besides, our breath when drawn in that short
 stay,

Grates off some inward parts, and bears away,
 In its return again, its conquer'd prey.
 Since, then, our limbs receive, and since they bear
 These strokes within, without, and ev'ry where;

Since some creep through the pores, and strive to
 breed

Confusion there, and disunite the seed;
 The body's strength must fail, by just degrees,
 Its vigour weaken'd by enfeebling ease:
 Some souls they drive away, and some they press,
 Drive deeper in, and shut in close recess: 951
 Some parts, spread o'er the limbs, no more
 combine,

Nor with the rest in friendly motion join:
 For nature stops the passages between.

Now since the atoms diff'rent ways are tost,
 And lose their usual course, their sense is lost:
 And when that prop is gone, the lids must fall,
 The limbs grow dull, and weakness spread o'er all.

Thus after meals we sleep, because the food,
 Spread through the veins, and mingled with the
 blood, 960

Does only what the air was wont to do;
 For that does press the soul, and break it too.
 So, after labour, or with toil oppress'd,
 Or bellies full, we take the foundered rest:

For then the atoms of the mind retreat
 The farther in, and take the deeper seat:
 And more fly off, more substance of the soul,
 And those within to distant spaces roll
 More scatter'd, and divided o'er the whole.

But more; what studies please, what most
 delight, 970
 And fill mens thoughts, they dream them o'er
 at night.

The lawyers plead, make laws, the soldiers fight,
 The merchants dream of storms, they hear them
 roar,

And often shipwreck'd, leap or swim to shore:
 I think of nature's pow'rs, my mind pursues
 Her works; and, ev'n in sleep, invokes a muse:
 And other studies too, which entertain [gain.
 Mens waking thoughts, they dream them o'er a-

Thus they, who with continued sport and play,
 Make the dull troublesome time haste away, 980
 The objects, though remov'd, yet leave behind
 Some secret tracks, and passage through the
 mind,

And fit for images of the same kind:
 Before their waking eyes those sports appear;
 They see the wantons dance, and seem to hear
 The speaking strings breathe forth the softest air.

The same companions still, the same delight,
 And the same painted scenes still please the sight:
 So strong is use, such custom's pow'r confess'd;
 And not in thoughtful man alone, but beast: 990

For often sleeping racers pant and sweat,
 Breathe short, as if they ran their second heat;
 As if, the barrier down, with eager pace
 They stretch'd, and were contending for the race:
 And often hounds, when sleep has clos'd their
 eyes,

Will toss and tumble, and attempt to rise:
 They open often, often snuff the air,
 As if they press'd the footsteps of the deer;
 And, sometimes wak'd, pursue their fancy'd
 prey, 999

The fancy'd deer, that seems to run away,
 Till quite awak'd, the follow'd shapes decay.

And softer curs, that lie and sleep at home,
Will often rouse, and walk about the room,
And bark, as if they saw some strangers come.

But now from images, whose forms comprise
Rough principles, the frightful dreams arise:
Thus birds will start, and seek the woods by
night,

Whene'er the fancy'd hawk appears in sight,
Whene'er they see his wing, or hear him fight.

But seeds that raise heroic thoughts in men, 1010
Ev'n such are often rais'd in dreams; for then
They fight, are taken captive, and rebel;
They shout and groan, as if the victor fell:
Some strive, some weep, some sigh; and oft a-
fraid,

Pursu'd or torn by beasts, cry out for aid:
Some talk of state affairs, and some betray
The plots their treach'rous minds had form'd by
day

Some fly from following death; and others, thrown
From lofty pinnacles, sink headlong down;
But waking, though they know themselves a-
bus'd, 1020

Yet are their pow'rs, their spirits so confus'd,
They lie half-dead in deep amaze, remain
Thoughtless, and scarce recover sense again.

Others, when thirsty, fancy purling streams,
Sit down, and quaff the river off in dreams.

[The youth, by Morpheus chain'd with vessels
full,

Dreaming he's near some sink, or lazy pool,
A briny flood discharges from his veins,
And the rich Asian quilt and bedding stains.]

And those whose blood boils high, whom vig-
'rous age 1030

Has fill'd with seed, and fir'd with lustful rage,
If pleasing dreams present a beauteous face,
How hot his blood, how eager to embrace;
Nay oft, as in the fury of the joy,
The flowing seed pollutes the am'rous boy.

[Then first our seed begins its busy rage,
When strength confirms our limbs with rip'ning
age:

For other matters other things do move;
But human seed, the object which we love:
This, when prepar'd, at first does bear fresh
grace 1040

From ev'ry limb, as it the whole does trace,
To certain fibres, still it does obtain
About the procreative parts to reign:
Enrag'd the region swells; a will does breed,
Where lust directs, there to project the seed:
The mind provokes the turgid nerves to move
Tow'rd that dear idol, whence she drank her love:
For mostly all receive the wound; and there
The blood beats high, from whence our smart
we bear,

And rosy streams gush on the charming foe, if
near.] 1050

Love rises then, when, from a beauteous face,
Some pleasing forms provoke us to embrace;
Those hawks to lust, when with a tickling art
They gather turgent seed from ev'ry part,
And then provoke it: Then rise fierce desires;
The lover burns with strong, but pleasing fires;

Which often are pursu'd by following care,
Distracting thoughts, and often deep despair.

Nay, though the pleasing object is remov'd,
Though we no longer view the thing belov'd, 1060
Yet forms attend: or if we chance to hear
Her name, love enters with it at the ear.

But 'twill be wise and prudent to remove
And banish all incentives unto love:
And let thy age, thy vig'rous youth, be thrown
On all in common, not reserv'd for one:
For that breeds cares and fears; that fond dis-
ease,

Those raging pains, if nourish'd, will increase:
Unless you fancy ev'ry one you view,
Revel in love, and cure old wounds by new. 1070

Nor do they miss the joy who love disdain,
But rather take the sweet without the pain:
Nay, they have greater sweets, while lovers arms
Shall clasp their dears, while they behold their
charms. [pleas'd,

Straight doubts arise, their careless mind's em-
Which sweets must first be rifl'd, which enjoy'd:
What they desir'd they hurt, and 'midst the bliss
Raise pain; and often, with a furious kiss,
They wound the balmy lip: this they endure,
Because the joy's not perfect, 'tis not pure. 1080
But still some sting remains, some fierce desire
To hurt whatever 'twas that rais'd the fire:
But yet the pains are few, they quickly cease;
The mix'd delight does make the hurt the less.

Perhaps they hope that she that struck, the same
Can heal; that she that rais'd, can stop the flame.
Fond fancy this in love! We ne'er give o'er;
The more we know and have, we wish the more.
'Tis true, because the meat and drink's con-
vey'd

To proper vessels; thirst and hunger's stay'd. 1090
But now from beauty, now from forms that please,
What comes, but thin and empty images?
Ev'n such as he enjoys, that drinks in dreams;
His thirst increases 'midst the fancy'd streams.
So love deludes poor men; their cov'tous eye,
What long, what frequent fights can satisfy?
What from the tender limbs, with wanton play,
And am'rous touch, poor lovers bring away?

Nay, ev'n in the embrace, whilst both employ
Their strength; and bodies feel the coming joy;
Though then they twine, and bill like loving
doves, 1100

Though ardent breathings fire each other's loves;
In vain! fond fools, they cannot mix their souls,
Although they seem to try, in am'rous rolls;
So strictly twin'd, till all their pow'rs decay,
And the loose airy pleasure slips away:
Then a short pause between, and then returns
The same fierce lust, the same fierce fury burns;
Whilst they both seek, whilst they both wish to
have

Whate'er their wanton fancies, wanton wishes
crave; 1110

For this no cure, for this no help is found;
They waste and perish by a secret wound.

Besides, they waste their strength, their vigour
kill,

And live poor slaves unto another's will;
H h iij.

Debts they contract apace, their money flies :
 Their fame, their honour too, grows sick, and dies.
 Rich shoes, and jewels, set in gold, adorn
 The feet ; the richest purple vests are worn.
 The wealth, their fathers toil'd, and fought to gain,
 Now buys a coat, a mitre, or a chain. 1120
 Great shows and sports are made, and royal feasts,
 Where choicest meats and wines provoke the
 guests :

Where gawdy tapestry, and odours spread
 O'er all the room, and crowns grace ev'ry head :
 In vain : for still some bitter thought destroys
 His fancy'd mirth, and poisons all his joys.

[First, guilty conscience does the mirror bring ;
 Then sharp remorse shoots out her angry sting ;
 And anxious thoughts, within themselves at strife,
 Upbraid the long mis-spent luxurious life.] 1130
 Perhaps some doubtful word torments his mind,
 Sinks deep, and wounds, and leaves a sting be-
 hind.

Perhaps he thinks his mistress' wanton eyes
 Gloat on his friend, perhaps faint smiles he spies.

Such mischiefs happen ev'n in prosperous love :
 But those, that cross and adverse passion prove,
 Those wretched lovers met ten thousand more,
 Ten thousand scarce can measure the vast store,
 So obvious all, that with the strictest care
 'Tis good to keep my rules, and shun the snare ;
 'Tis easier to avoid, than break the chain, 1141
 When once entrapp'd, or be redeem'd again ;
 The nets are strong, and we may strive in vain. }

Yet, though securely caught, you may be free
 Again, unless you are resolv'd to be
 A trifling slave ; and from your thoughts remove
 The faults in mind and face of her you love :
 For often men, quite blind by fond desire,
 First think their loves great beauties, then ad-
 mire ;

Their pow'ful working fancy still supplies 1150
 With borrow'd shape, and flattering disguise,
 The meaner beauties great necessities. }
 Hence 'tis, that ugly things, in fancy'd dress,
 Seem gay, look fair to lovers eyes, and please.
 The black seems brown, the nasty, negligent ;
 Owl-ey'd, like Pallas, and my heart's content :
 The little dwarf is pretty, grace all o'er ;
 The vast, surprising ; and we must adore ; 1158
 The stammering lips ; the lover thinks he hears
 The broken sounds breath'd forth in softest airs :
 She's modest if she's dumb, and nought can say ;
 The fierce and prattling thing is brisk and gay ;
 She's thin, if hectic, and but one remove
 From death ; the meagre is my slender love :
 The great and swelling breast like Ceres is ;
 The big and hanging lip, a very kiss.

Ten thousand such : But grant the sweetest face,
 Grant each part lovely, grant each part a grace,
 Yet others equal beauties do enjoy,
 Yet we have liv'd before without this toy : 1170
 Yet she is base ; yet she perfumes, to hide
 Her nat'ral smell, her maids on ev'ry side
 Stand off, and smile, and waggishly deride. }

Nay, though a lover, when deny'd the bliss,
 Stands long, and waits, and warms with soft'ning
 kiss

The less obdurate gate ; though then he pours
 His ointments on, and crown, the gates with
 flow'rs ;

Yet, when admitted : when no longer coy,
 The Miss provokes the eager fool to joy :
 Then ev'ry thing offends, he fancies none ; 1180
 But seeks some fit excuses to be gone :
 Then he forgets the stories he design'd ;
 Nor tells how much her coldness vex'd his
 mind, [kind? }

Nor sighs, and why, my dear, was you un-
 Then grieves he gave to her that awful love,
 He only vow'd to the great pow'rs above.

And this our Misses know, and strive to hide
 Their faults from those (the cov'ring's decent
 pride)

Whom they would cheat, and bind to an amour ;
 Though foul behind, they look all bright be-
 fore ; 1190

In vain ; for thou canst understand the cheat,
 Discover, know their wiles and gross deceit.

Nay, if she's free, if not designs to vex,
 Nor cross thy courtship, or thy thoughts perplex, }
 She'll show the common failures of her sex.

[Nor always do they feign the sweets of love,
 When round the panting youth their pliant limbs
 they move ;

And cling, and heave, and moisten ev'ry kiss ;
 They often share, and more than share the bliss ;
 From ev'ry part, even to their inmost soul, 1200
 They feel the trickling joys, and run with vigour
 to the goal,

Stirr'd with the same impetuous desire,
 Birds, beasts, and herds, and mares their males re-
 quire ;

Because the throbbing nature in their veins
 Provokes them to assuage their kindly pains :
 The lusty leap th' expecting female stands,
 By mutual heat compell'd to mutual bands.
 Thus dogs with lolling tongues by love are ty'd ;
 Nor shouting boys, nor blows, their union can
 divide :

At either end they strive the link to loose ; 1210
 In vain ; for stronger Venus holds the noose.
 Which never would those wretched lovers do,
 But that the common heats of love they know ; }
 The pleasure therefore must be shar'd in com-
 mon too. }

The child still bears the form, whose seed pre-
 vails,

If mother's, her's, if father's, then the male's :
 But those, that show a part of either face,
 Are made of seed, whose friendly pow'rs em-
 brace ; [the mass, }

When neither this nor that prevails, and forms
 And oft with joy indulgent father's view'd 1220
 The grandfire's image in their sons renew'd :
 Because the little mass of seed remains
 Entire, and whole within the father's veins,
 Which from the grandfire fell : this Venus takes,
 Of this a likeness in the shapes she makes ;
 She imitates the grandfire's voice, or hair,
 His smile or some peculiar grace, and air :
 For these on proper seeds depend, and rise
 From proper shapes, as well as hands or eyes.

The male's, and female's seed agree to make 1230
 The tender young, of both the young partake;
 But yet that sex the young resembles most,
 That has more pow'rful seed, more vig'rous lust.
 Nor do the gods decree, nor thoughts em-
 ploy,

Which mortal shall, which shall not get a boy,
 As some believe; and therefore sacrifice,
 While clouds of incense from the altars rise;
 Make vows, and pray'rs, temples and altars build,
 To please the angry gods, and beg a child:
 Fond fooling this, to court the pow'rs above, 1240
 They sit at ease, and never mind our love.

But male and female, though they oft em-
 brace,

In vain endeavour to increase their race,
 If either's seeds too subtle, thin, and fine;
 Or else too gross, and dull for that design;
 For if too thin, the vessels ne'er retain
 The seed receiv'd; it straight flows out again, }
 And all the kind endeavour is in vain.

But if too gross and dull, it moves but slow,
 And little pores refuse to let it through: 1250

Or it lies fullen there, unfit to breed,
 Nor kindly mixes with the female seed;
 For all not fit with all: Thus some do prove
 Unfruitful, after many years of love;

Though they have often prov'd the nuptial joy,
 And strove but all in vain to get a boy:

Yet by a second husband's apt embrace, }
 They quickly bear a fair and num'rous race,
 And the decaying families increase.

They see their sons grow strong with youthful
 rage, 1260

The joy and comfort of their feeble age,
 [So much it does impart, that seed with seed
 Should of the kindly mixture make the breed;

And thick with thin, and thin with thick should
 join,

So to produce and propagate the line.
 Of such concernment too is drink and food,
 T' incrassate or attenuate the blood.

Of like importance is the posture too,
 In which the genial feat of love we do:
 For as the females of the four-foot kind 1270
 Receive the leaping of their males behind,
 So the good wives with loins uplifted high,
 And leaning on their hands, the fruitful stroke
 may try:

For in that posture they will best conceive;
 Not when, supinely laid, they frisk and heave:
 For active motions only break the blow,

And more of strumpets than of wives they }
 show: [liquors flow.

When answ'ring stroke with stroke the mingled }
 Endearments eager, and too brisk a bound
 Throw off the ploughshare from the furrow'd
 ground: 1280

But common harlots in conjunction heave,
 Because 'tis less their business to conceive,
 Than to delight, and to provoke the deed;
 A trick which honest wives but little need.

Nor is it from the gods, or Cupid's dart,
 That many a homely woman takes the heart;
 But wives, well-humour'd, dutiful and chaste, }
 And clean, will hold their wand'ring husbands
 fast: [last.

Such are the links of love, and such a love will }
 For what remains, long habitude and use 1290

Will kindness in domestic bands produce:
 For custom will a strong impression leave;
 Hard bodies, which the lightest stroke receive,
 In length of time will moulder and decay;
 And stones with drops of rain are wash'd away.

NOTES ON BOOK IV.

Ver. 1. THE first twenty-nine verses of this book, in which the poet invites the attention of his Memmius, or any other reader, are in Book I. v. 931. where you may consult our notes upon them. Some blame Lucretius for this long repetition: Nor indeed have we one single instance of the like battology in any of the ancient poets. Moreover, we may observe, that our translator has employed the two whole verses, which begin this book, to render only these four words of his author: "Avia pieridum peragro loca:" Now the muses were called Pierides, either from Pierius, a mountain of Thessalia, in which they are said to be born of Jupiter and Mnemosyne: or from the victory they gained over the nine daughters of Pieros the Macedonian, who had challenged the muses to sing with them, and being overcome, were by the same muses changed into so many magpies. This fable is related at large by Ovid, Metamor.

5. v. 677. where, speaking of them after their transformation, he says,

Nunc quoque in alitibus sacundia prisca remansit,
 Kaucaque garrulitas, studiumque immane lo-
 quendi.

Ver. 19. "Deceptaque, non capiatur," says Lucretius. The rhetoricians call this an oxymoron: a figure frequently used by the Latin poets: Of the like nature is this in Terence:

At enim cave, ne priusquam acceperis, amittas.

Thus too Ennius, wittily enough, speaking of the Pergama, the castle of Troy, upon mount Ida:

Quæ neque Dardaniis campis potuere perire,
 Nec cum capta, capi, nec cum combusta cremari.

Which Virgil would be sure not to omit in his *Æneis*; but thought it worthy of the mouth even of Juno herself:

—Num siegis occumbere campis,
Num capti potuere capi? Num incensa cremavit
Troja viros? — *Æneid.* 7. v. 294.

Of this nature too is the *Ἐχθρῶν ἄδρα δῶρα*, in the Ajax of Sophocles: and if a man would, he might soon collect a pedantic heap of them from the ancient as well as modern poets.

Ver. 26. To this purpose Waller says finely,
Well-sounding verses are the charms we use,
Heroic thoughts, and virtue to infuse:
Things of deep sense we may in prose unfold;
But they move more, in lofty numbers told.

Ver. 30. In the six first of these seventeen verses, the poet briefly recites the subjects of his disputations in the preceding books: In the first and second, he has treated of the nature of atoms, of their properties, motions, and coalitions: in the third, of the principles of the soul; and has considered the soul itself, as well when united to the body, as when separated from it; and then in the following eleven verses, he includes the argument of this book, and says that he will now treat of the images, which, like films and membranes of bodies, are perpetually flowing from the surface of things, and presenting their species and figures to us: If they come whole, and without mixture, we then perceive things that truly have a being: if they come maimed, inverted, or joined to one another, from thence proceed the phantasms of Centaurs and the like monsters; and sometimes, too, the spectres of the dead: for the soul, we know, dies with the body. And thus the poet performs the promise he made us, Book I. v. 163. where speaking of the soul, he said he would sing,

What frights her waking thoughts, what cheats
her eyes,
When sleeping or diseas'd, she thinks she spies
Thin ghosts in various shapes about the bed,
And seems to hear the voices of the dead?

Moreover, the four first of these verses, in the original, are repeated verbatim, from Book III. v. 31. though our interpreter, in this place, has varied in his translation of them.

Ver. 37. He means the species, or forms of things, that are commonly called intentional. Democritus, and after him Epicurus, called them *εἰδωλα*, *τιπας*, and *ὁμίνας*, idols, images, and membranes: Cicero, *imagines*: Quintillian, *figuras*: Catus, *specula*: Lucretius, *effigies*, *imagines*, *species*, *formas*, *exuvias*, *spolia*: and, *quasi membranas*, or *Cortices*, &c. "Quorum incursum," says Cicero, "non modo videmus, sed etiam cogitamus:" By whose incursum, that is, by whose presenting or showing of themselves to the mind, or to the sense, we not only see, but think likewise.

Ver. 41, 42. Lucretius, after having copiously discoursed of the nature of the soul, and endeavoured to prove it mortal, goes on here, and pre-

tends to solve one argument, which still seemed to press his opinion, and that is drawn from the various apparitions that sometimes present the images of our deceased friends, and make so lively and vigorous an impression on the fancy, that we cannot but think them real, and something beside naked imagination: but because he intermixes this with his discourse of the senses, and makes it depend on the Epicurean explication of vision, I shall be obliged briefly to consider his doctrine, and that being overthrown, discourse of the strength of the argument. Well then, not to trouble him about his other senses, concerning vision, he delivers this: Thin subtle images constantly rise from the surfaces of all bodies, which make an impression on our organs, and then the notice is communicated to the soul. To confute this, we need look no farther than his own principles, and consider that he has made weight a property of matter, and an endeavour downward a necessary adjunct: And, therefore, all motion upward is violent, and proceeds from external pressure or impulse.

Now any man knows, that the species are propagated any way with equal ease, and we see as well when the object is placed below our eye, as when above it: But there is no force to make these images rise, and therefore it is impossible they should. Their own nature opposes the air (as all must grant) that lies behind the object, is unfit to give the impulse to the solid parts of the upper surface, that on the side, to drive it upward: and I believe none will think these images are raised by the air that is perpendicular to the superficies; and this argument more strongly concludes, if we consider his explication of distance, for there he requires, that these images should drive on all the air between the object and the eye, though it often resists and beats furiously against them, which cannot be done but by a considerable force, and a greater strength than can be allowed these subtle forms, though rising from any body, in the most convenient position, and when their weight can assist their motion: But more; if such images arose, it must be granted, that the object must seem changed every minute, and it would be impossible to look upon a cherry for the space of an hour, and still perceive it bluish with the same colour; because every image that moves our eye, cannot be above one hundred times thinner than the skin of that fruit; for I believe any man will freely grant, that this skin so divided, will be too transparent to be perceived; or if it may still be seen, let the division proceed, and at last the absurdity will press, and follow too fast and too closely to be avoided: I shall not mention, that contrary winds must disturb these images, break their loose order, and hinder their passage; but only take notice, that it is impossible such images should enter at the eye, and represent an object as great as we perceive it: for these images rising from the surface, must proceed by parallel lines; and their parts maintain as great a distance as the parts of the body whence they sprung; because they come from every part of

the object, and are commensurate to it: and therefore cannot be pressed closer without penetration or confusion.

But suppose vision might be thus explained, grant every one, like the man in Seneca, had his own image still walking before him, yet imagination and thought have their peculiar difficulties.

Ver. 42. Thus the ghost of Anchises appeared to Æneas, and frightened him in his sleep:

Me patris Anchisæ, quoties humentibus umbris
Nox operit terras, quoties astra ignea surgunt,
Admonet in somnis et turbida terret imago.

Æn. 4. v. 361.

And Dryden calls them,

Forms without body and impassive air:
The squalid spectres, that in dead of night
Break our short sleep, and skim before our sight.

Macrobius observes, that the words of this passage "simulacraque luce carentum," which we here find in Lucretius, are transcribed by Virgil, in *Georg.* 4. v. 472. where we read,

Umbre ibant tenues, simulacraque luce carentum.

Ver. 43. We may observe, that Lucretius passed this over very slightly: for Epicurus did not approve of any farther inquiry into τὰ φυσικά, natural things, than barely what might contribute more easily to deliver the minds of men from the slavery of religion. The words of this passage, in the original, are,

—ne forte animas Acheronte reamur
Effugere, aut umbras inter vivos volitare.

Where the word Acheron, the name of one of the rivers of hell, is taken for hell itself: for the ancient Greeks held, that there were five rivers in the infernal abodes; namely Acheron, Cocytus, Styx, Phlegethon or Pyriphlegethon, and Lethe: Now these names were taken from several fountains and rivers in Greece, which by reason of their noxious natures and qualities, were feigned to be in hell likewise. There were two rivers called by the name of Acheron; one in Elis, a maritime country in the west of Peloponnesus, and this river flows into Alpheus, near the place where stood a famous temple dedicated to Pluto and to Proserpine, as we find in Strabo, lib. viii. The other in Thesprotia, a country of Epirus, and flows out of the lake Acherusia to the town of Cithyrus, according to the same Strabo, lib. viii. and Pausanias in Atices. Cocytus, as the same Pausanias tells us, was a river of the same country, not far from Acheron, and whose waters were extremely bitter. Styx was a fountain of Arcadia, that sprung out of a high rock, near the city Nonacres, and fell into the river Crathis: its waters were so venomous, that whoever but tasted of them died immediately: This we learn from Pausanias in Arcadicis. And Pliny, lib. xxxi. cap. 2. says, that they not only killed those that drunk of them, but produced likewise poisonous fish. This was the river which

the gods held in so great veneration, that they were wont to swear by it; and if they violated their oath, they were deprived of their divinity, and interdicted the use of nectar for a hundred years: Hence Virgil *Æn.* vi. v. 323.

—vides Stygiamque paludem,
Dii cujus jurare timent, et fallere numen.

And Hesiod in *Theog.* tells us, that this honour came to be granted to this river, because her daughters Victoria, Vis Robur, and Zelus, had assisted the gods against the Titans. There were several rivers called by the name of Lethe, or, as Casaubon would rather have it, "fluvius Lethes," the river of Lethe, or oblivion, in the genitive case, or else "Lethæus fluvius," the Lethæan river. One in Portugal, according to Strabo and Mela, and now called Lima, another in Africa, about the Syrtis Major, and not far from the city Berenice, according to Lucan: a third in Bœotia, near the town Libadia, according to Pausanias in Bœoticis: and Strabo, lib. xiv. reckons up many other rivers of the same name. To Phlegethon, or Pyriphlegethon, there is not, that I know of, any particular place assigned, except the hot fountains about Avernus, as Strabo reports out of Homer. Now every one of these names signifies something mournful and disastrous: Acheron is derived from ἄχος, sorrow, and ῥίω, I flow: Cocytus from κοκύω, I lament: Styx from στυγίω, I pursue with haste: Phlegethon, or Pyriphlegethon, from πῦρ, fire, and φλέγω, I burn: Lethe from λήθη, oblivion, because to drink of its waters, causes a forgetfulness of all things. All which is finely described by our English Homer, in his *Paradise Lost*, Book II. where he calls them,

—th' infernal rivers that disgorge
Into the burning lake their baleful streams:
Abhorred Styx, the flood of deadly hate;
Sad Acheron, of sorrow black and deep;
Cocytus, nam'd of lamentation loud,
Heard on the rueful stream, fierce Phlegethon,
Whose waves of torrent fire inflame with rage,
Far off from these a flow and silent stream,
Lethe, the river of oblivion, rolls
Her wat'ry labyrinth; whereof who drinks,
Forthwith his former state and being forgets,
Forgets both joy and grief, pleasure and pain.

Virgil, besides these, places likewise Eridanus, the Po, in the Elysian fields:

Plurimus Eridani per sylvam volvitur amnis.

Æneid. vi. v. 659.

Ver. 47. In these twenty-four verses, he first asserts, that these images, which are as it were the films and membranes of things, are continually flying off from the surfaces of them; and then he proves this assertion thus: The very eyes testify that many things emit bodies out of themselves; some rare and subtle, as smoke from wood, and heat from fire; others more dense and closely joined: Thus grasshoppers and snakes drop their skins; then who can doubt but that tenuous and subtle images fly off from the surfaces of things,

since they they cast off forms that are more solid and condensed, especially since there are minute corpuscles placed in the surface, or outmost front of things, that can easily disengage themselves and fly away. Epicurus, in Laertius, says, these images come, ἀπὸ τῆς σωματικῆς ἐπιτολῆς, from the surface of bodies. And again: καὶ μὲν καὶ τύποι ὁμοιοσχημονεῖ τοῖς σπειρμένοις εἰσι λειψότησιν ἀπὸ χονδρῆς μακρὰν πᾶν φαινομένων, τῶν δὲ τῶν τύπων εἰδωλὰ προσπαγορεύειν, Laert. lib. x.

Ver. 57. The words in the original are,

Et vituli cum membranas de corpore summo,
Nascentes mittunt.

The new-born calves drop the pellicules in which they are wrapped up. How well our translator has here followed the sense of his author, the reader is left to judge.

Ver. 58. See the note on ver. 590 Book III.

Ver. 60. This and the following verse are not so much as hinted at in Lucretius.

Ver. 67. This is the image of their form; for form according to Epicurus, is that which continually remains in the surface of the body, while the image, as a spoil, is continually flying away. For this we have the testimony of Empiricus, who says, Epicurus taught that some colour, for example, always inheres in a solid body, but that something gets loose from it, and this is its image.

Ver. 71. In these nineteen verses, he confirms what he assumed in the preceding argument, and proves it by an example, which demonstrates, that colours get loose, and are reflected from the surfaces of things, in such a manner as argues likewise the direption and getting off of images. For the curtains, says he, that are hung up in a theatre, reflect their colours on all the decorations of the stage, and on the spectators,

Ver. 75. That tapestry hangings were hung up over the Roman theatres to shade the spectators from the rays of the sun, we learn from many of the ancients. Virgil, Georg. III. v. 24.

Vel scena ut versis discedat frontibus, utque
Purpurea intexti tollunt aulæa Britanni.

Now these hangings were called "Aulæa, ab aulâ Attali," from the court or palace of Attalus, the wealthy king of Pergamus, who, having no children, made the commonwealth of Rome his heir. He first found out the art of inweaving and embroidering with gold; and to this invention, the Babylonians added several colours, as we learn from Pliny, lib. viii. cap. 58. Hence The Attalic and Babylonian garments and hangings were in great esteem among the ancients, Sil. Ital. lib. 14.

Lætæ Tyros, quæque Attalicis variata per artem
Aulæis scribuntur acu——

They were likewise called "peripet asmata," from περιπτερεῖν, "ab extendendo," by reason of the largeness of them. Lucretius, in this place, calls them, "vel magnis intenta theatris," and

the colours he gives them are the *luteus*, *rufus*, and *ferruginus*. The colour which the ancients called *luteus*, was a yellow colour, and had its name from the herb *lutea*, willow-herb, or loose-strife, which helped to dye it. This is the colour of the yolk of an egg, and of the flower, which the Latins called *caltha*, in English turn-sole, or sun-flower, to which Virgil therefore gives the epithet *luteola*:

Mollia luteola pingit vaccinia calthâ.

Eclog. ii.

The brides used to dress themselves in this colour, Plin. l. xxi. cap. 8. "Lutei video honorem antiquissimum in nuptialibus flammeis totum fœminis concessum." Hence Catullus gives that colour to the sock of Hymen the god of marriage:

Huc veni niven gerens
Luteum pede foccum.

Thus Seneca, in Hipp. of Hercules, marrying as a woman:

Crura distincto religavit auro,
Luteo plantas cohibente focco.

The colour they called *rufus* was a deep red, or flesh colour. Catull. in Egnat.

Quod quisque minxit, hoc sibi solet mane
Dentes atque rufam provocare gingivam.

The colour *ferruginus*, of which our translator makes no mention, is not the colour of rusty iron, as some will have it to be, but of smooth and polished iron, after it has been heated in the fire, and is grown cold again, as the buckles we wear in mourning. This is not what we call the bright brown, as the London edition of the Dauphin's Virgil, on the eighteenth verse of the second eclogue erroneously interprets it, but rather a violet colour, and seems to be a mixture of red, black, and cerulean, whence it is frequently used for those three colours. For red, Æn. xi. v. 772.

———Ferrugine clarus et ostro.

For black, Æn. vi. v. 303, speaking of Charon.

Et ferrugineâ subvectat corpora cymbâ.

And Georg. i. ver. 467, of an eclipse of the sun,

Cum caput obscurâ nitidum ferrugine tinxit.

For cerulean in Plautus. Mil. Glor. 4. 43.

Facito ut venias huc ornatu naucleriaco; causiam
Habeas ferrugineam, culturam ad oculos lineam:
Palliolum habeas ferrugineum: nam is color thalassicus.

That is to say, cerulean, or the colour of the water of the sea.

Ver. 81. He means the images of the gods that were in the theatres; for games and plays were a part of the Pagan religion.

Ver. 82. What Lucretius here says, and his translator means, is this, the more the walls of the theatre are darkened, so that no place be open on

the sides to let in the light, the more, &c. The words in the original are,

Et quantò circum magè sunt inclusa theatri,
Mœnia, tam magis hæc intus perfusa lepore
Omnia conrident conrepta luce diei.

Ver. 90. In these three verses, he concludes from what he has hitherto been arguing, and from what he has proved, that there are such things as the images of which he is speaking.

Ver. 93. He has already taught, ver. 66, that these images

—Still preserve their frame,

Their ancient form, and show from whence they came.

And now, in these eight verses, he shows that he did not teach that without cause; for the reason why they retain the same form is, because they fly away from the surfaces of bodies, from which every individual part of the images gets away with equal facility, and those parts are not conveyed from thence through any mazes or involutions, as odour, smoke, vapour, and other things of the like nature are, because they flow from the interior parts of bodies; and for that reason fly away confused and dispersed.

Ver. 101. Lastly, he proves, in these fourteen verses, that there are such things as these images, which get loose, and fly away from the surfaces of bodies; and that the images that we see in mirrors, in water, or in any smooth and polished body, are exactly like the things whose images they are; therefore those forms must necessarily be composed of the images that flow from the substances of the things themselves; for no other reason of that so exact similitude can be given, but that the very utmost film, which before adhered to the whole thing, is separated from it, as it were a membrane, and strikes into the glass or water. And you ought to take notice, that the image of each thing that is seen in the glass, or in water, is not single and one only, but many; which, nevertheless, by being reflected to the eyes by a continual and never-ceasing reverberation, seem not to be many, but only one image. Experience indeed shows that the images are transmitted into the glass from the very bodies whose images they are; since when those bodies are present the images strike into the glass; but if any thing interpose, their progress into the glass is intercepted: besides, if the bodies move, they move in like manner; if the bodies are inverted, they too are inverted: if the bodies depart, the images go away; and when the bodies are absent, there remain no images at all.

Ver. 115, 116. Having hitherto proved the existence of these images, and being now going to explain their properties, he first teaches, in these twelve verses, that the most extreme tenuity, even such as can scarce be conceived, must be allowed them. To comprehend this aright, imagine, that the images are nothing else but the most subtle contextures of atoms in the nature of pellicles. And how prodigious is the subtleness of atoms, since innumerable myriads of them are

necessary to compact the smallest animal, a mite, for example, or even the least member of it? Hence we may gather, that if an image consist of such atoms as do not cohere and stick together, κατὰ βάθος, "secundum profunditatem," which is Epicurus's own expression, it must be more subtle and thin by many myriads of myriads, than the thickness of one single mite, or of any particle of it. Epicurus himself says, ἐτι τὰ εἰδωλα ταῖς λεπτότησιν ἀναπερβλήτως κίχεται, ἔδν ἀνιμαρῖον τῶν φαινομένων. And Lucretius is of the same opinion with him. That images are nothing else than, ἀπορροίας, effluviūms or emanations of the most subtle and tenuous contextures of the outmost atoms, that are continually flowing from bodies into the ambient space; in which Epicurus follows the opinion chiefly of Plato and Empedocles, who held images to be certain, material, or substantial effluviūms. But Aristotle taught that they are mere accidents, that have no substance whatever; but that, nevertheless, they are produced from visible bodies, and that, passing through the air, they affect the sense of sight, and are reflected from mirrors, and other things of like nature. But others of the learned are of opinion, that images are nothing but light, either directed from lucid bodies, or reflected from others, and striking upon the eye. But as to the opinion of Epicurus and Lucretius, there is this difficulty: How it is possible, since so many particles are continually flowing from the surface of things, that every visible body should not be at length quite wasted and consumed away? St. Augustin, in Epist. lvi. to Diosc. starts the same question. To which this answer may be given, that those visible things may be repaired by other corpuscles that are continually flowing to them, so that as much as they lose of their substance by the particles that flow from them to other things, so much may, on the other hand, come to them from elsewhere, and repair that loss. Nor is it to be feared, what some allege, that the thing itself would in this case change its figure, since the particles that come to it are of the same figure with those that go from it. It may farther be answered, that images are so very subtle that nothing perceptible can appear to be wanting on the surface of things, though these images do flow from them. And this Lucretius himself explains in the following argument.

Ver. 116. In these two verses, our interpreter but obscurely, if at all, expresses the sense of his author, who instances, in the principles of which all things are made, and by way of similitude, endeavours to prove, that these images are of a most tenuous nature. For, says he, they consist of atoms which are invisible to our sight and more minute than all those things that the eyes can scarce, nay, not at all perceive: it is therefore no wonder that our senses cannot perceive the images of things, while flowing from the bodies they glide through the air, unless they are reflected from the smoothness of mirrors, or of any other smooth and polished bodies, since they cannot perceive even the atoms of which they are

composed. And thus, since they are imperceptible to the sight, they must of necessity be of a very tenuous nature.

Ver. 127. In these eight verses, the poet argues to this effect: Since so great a quantity of little bodies exhales from these strong smelling herbs, as to fill with odour all the ambient neighbouring air, it cannot be expressed how small each part is that comes off from the surface; and consequently, since an image consists only of those particles that fly away from the surface of bodies, and have analogy with the sensorium of the sight, it surpasses all belief how subtle and tenuous an image must be, especially since, in a great length of time, nothing can be perceived to be exhaled or worn away. Certainly the subtileness of an odoriferous steam or vapour is altogether wonderful, and consequently so too must be that of the particles of which such vapours consist; of those, for example, that exhale from an apple for several months together; and yet the apple cannot be perceived to be wasted or diminished. Consider, besides, how thick that vapour is in respect of an image, and you will easily believe, that if all the images which flow from a body, for the space of many years together, were compacted into one, they would not make so great a mass as that of a vapour which flows out in a moment of time.

The juice of the herb *panax*, or *panacea*, so called ἀπὸ τῆ παντὸς ἀκείν, from healing all diseases. See Pliny, lib. xxv. cap. 3. and Columel. lib. xi. cap. 3. We call it in English, all-heal. The other herbs which Lucretius here mentions, are,

———*Abfynthia tetra*,

Abrotonique graves, et tristia centaurea.

Abfynthium is the herb wormwood, of which there are several sorts: I. *Seriphium*, or *marinum*, sea wormwood, which produces the seed that we commonly use against worms in the belly. II. *Sanconicum*, French wormwood, almost like the former in its tender and jagged leaves, but its colour is whiter, and its smell not so rank. III. *Ponticum*, or *Romanum*, which has a less leaf, and sweeter odour; and is by some called wormwood-gentle. See Pliny, lib. xxvii. cap. 7. IV. *Lacifolium*, our common wormwood. *Abrotonum* is the herb we call southern-wood: and of this too there are several sorts: I. *Abrotonum mas*, the southern-wood, or small southern-wood, which grows in the fields. II. *Abrotonum famina*, the or great southern-wood, which grows in the woods, and upon mountains. III. *Abrotonum ficulum*, which is a kind of small southern-wood, and has a very sweet smell. It is probable this last is the sort Lucretius speaks of. Of *centaurea*, *centaury*, see Book ii. ver. 384.

Ver. 135. Having explained this usual and general manner of the generation of the images, which Epicurus calls ἀποστάσεις, and ἀπορροίας, because they are made by a continual direption and avolation of tenuous, as it were, membranes, from the surface of bodies; he now, in these

twelve verses, explains another sort of images, which the same Epicurus calls σύστασις, because they are, as it were, certain conglutinations and coagmentations that are formed in the air of their own accord, as so many clouds, and do not indeed flow from the things which they represent. Diodorus Siculus, lib. iii. relates, that in the regions of Africa, that lie beyond the Syrtes and Cyrene, prodigious spectres are often formed of their own accord: περί γὰρ τίνος καίρου καὶ μάλιστα κατὰ τὰς ἡριμίας, Σύστασις ὁρᾶν κατὰ τὸν αἶρα παρτοίων ζώων ἰδίας ἰμφαίνεσθαι τῶν δὲ αἱ μὲν ἡριμῶσιν, αἱ δὲ κίνησιν λαμβάνουσι, καὶ ποτὶ μὲν ὑποφεινῶσι, ποτὶ δὲ διάκνῶσι. Sometimes, and even when the weather is calm, there are seen in the air certain compositions or coagmentations, representing the figures of all sorts of animals; some of these are quite without motion, and some are moved; sometimes they fly the pursuers, and then again pursue those that fly. Diodorus, who was himself an Epicurean, makes use of Epicurus's own term, Σύστασις. The like too is confirmed by Pomponius Mela, to happen in that part of Mauritania that lies behind mount Atlas. Pliny also says, that something of the same nature is frequently seen in the countries of Scythia, that lie within Imaus. And what Kircherus published, not long ago, of the Morgana, or amazing prodigy, that was seen at Rhegium, now Rezzo, in Italy, is very well known. In short, in most countries many see such spectres and images, or at least think they see them.

Ver. 141. Of these battles in the air, of which, by the way, Lucretius makes no mention, Milton gives us this description:

As when, to warn proud cities, war appears,
Wag'd in the troubled sky, and armies rush
To battle in the clouds; before each van
Prick forth the airy knights, and couch their
spears,
Till thickest legions close; with feats of arms
From either side of heav'n the welkin burns.

Moreover, Faber believes this passage of Lucretius to be shadowed from the clouds of Aristophanes.

Ver. 147. In these eighteen verses, he proves, by an argument drawn from a mirror, that images are every moment emitted from things in a perpetual, ceaseless flow. Bring a mirror, and the image of any thing that is placed before it immediately appears, which would not be, unless the image of that thing flowed from the very body of it, and were reflected from that mirror. If it be asked, why other things do not reverberate images, he answers, because some other things are rare, and the images pierce through them; others, either porous or rough, and that these cut and dissipate the images: but let them strike on a polished and flat body, like a looking-glass, and they are reflected to the eyes in an instant of time. Epicurus himself in Laertius, says, ἡ γένεσις τῶν εἰδωλῶν ἅμα τῇ νοήματι συμβαίνει, τὸ γὰρ ῥέον ἀπὸ τῆς σωματικῆς ἐπιτελῆς συνεχῆς συμβαίνει, εὐχόμενα

οὐκ ἔστι τῇ σφαιρικήν θήσιν, καὶ τὰς τῶν ἀτόμων ἐπὶ πολὺν χρόνον, εἰτὶ ἐνίοτε συνεχόμενη ὑπάρχει.

Ver. 156. That is to say, the smoothness of the mirror preserves the image. And here it will not be improper to observe, that all men agree that two things are chiefly requisite in the nature of mirrors: Smoothness, which never is without splendour or shining, and density of body: Nor can one of these suffice without the other; for if the body be smooth and shining, but of such a nature that the image may pass through it, it will not be a mirror, nor restore the images. Hence it is evident, that Plato in *Timæus* is mistaken, where he does not require density as necessary in a mirror, but only splendour and smoothness. Now there are two opinions concerning the cause of the reflection that is made by mirrors. Some hold, that the images of the bodies placed against mirrors are seen in them, not because the images which we see are in the glass, but because the sight of the eyes, being darted upon the mirror in a straight line, is reflected upon itself from the mirror in another straight line. This was the opinion of the Pythagoreans, and is still of the mathematicians. But others, of whom Epicurus seems to have been the first, will have the images to be transmitted from the bodies into the glass, or any other smooth and dense body, and to be actually in it; and that they are seen in the same manner, and for the same reason that all other things are, and are seen. But we shall have occasion to say more of this by and by, when the poet comes to argue particularly of mirrors.

Ver. 163. For Lucretius believes with Epicurus and Plato, that the image we regard in a mirror is not one constant, fixed, certain, and same thing, but image after image, still succeeding in the place of each other in an instant of time, and without any interval or interruption.

Ver. 165. In these seven verses he illustrates, and confirms the perpetual and never-ceasing flux of images, that all things may be full of light, rays must be continually emitted from the sun. For the same reason, images likewise must be perpetually flying away from things; for which way soever you turn the mirror, the images of the opposite things appear; nor do they ever disappear so long as those things keep their places.

To confirm yet more this argument of Lucretius, we may add to the instance he brings of the beams of the sun two other examples: I. The flame of a candle neither is, nor appears to be always one and the same flame, but only by reason of the never-ceasing substitution of like and equivalent little flames. II. A river is one and the same river, only because of the equivalence of the waters that are incessantly succeeding and driving one another away. Hence it is, that the parts of an image that proceed from hollow parts, are more slowly cast upon the mirror, and reflected more slowly likewise upon the eyes, than the parts that are gibbous and jut out. And, therefore, though the image be seen imprinted on a flat thing, yet it makes an impression of a hollow or round thing on the eye. But Macrobius, lib. vii.

Saturn. 14. endeavours to overthrow this opinion of Epicurus.

Ver. 172. These ten verses contain another argument, but of less weight than the former. We see the serene unclouded sky often overcast on a sudden with thick and darkening clouds. But these clouds rise up from the earth, or from the sea; they are thick and heavy bodies: what then can stop thin and light images?

Ver. 180. This and the following verses are repeated from above, ver. 125. as they are likewise in the original.

Ver. 182. In these eight verses, Lucretius tells us, that he is going to dispute of the swiftness of these images; and that indeed there will be no need of a long disputation, since mirrors demonstrate that images move with the greatest celerity that the mind of man can conceive.

Ver. 188. These two verses in the original run thus:

Parvus ut est cycni melior canor; ille gruum
quam

Clamor in ætheriis dispersus nubibus austri.

And we find them almost word for word in Antipater, in *Errin. lib. iii. Epigram.*

Λαίτερος κύκνου μικρὸς θρόνος, ἢ, πολλῶν,
Κράγμος ἐν ἑρκιναῖς κιδνάμενος νεφέλαις.

To what is already said of the singing of swans, Book II. ver. 479. and Book III. ver. 5. I will here add, that the ancient poets gave to one another the title of swans. Virgil. *Ecl. ix. ver. 27.*

Vare, tuum nomen—

Cantantes sublime ferens ad sidera cycni.

i. e. "Poetæ," according to Servius and all the annotators. Thus too Horace, *Od. ii. lib. iv. ver. 25.*

Multa dircaum levat aura cycnum.

that is, Pindar the Theban poet. Nor was it the poets only who believed the singing of swans, for even Cicero tells us, that swans are sacred to Apollo, because they seem to have from him the gift of divination, inasmuch as foreseeing the good there is in death, they die singing, and with joy: "Cycni Apollini dicati sunt, quod ab eo habere divinationem videantur; qui prævidentes quid in morte sit boni, cum cantu et voluptate moriuntur." *Tuscul. 2. 73.* Nevertheless, their singing is a mere fiction; and, indeed, both living and dying, they are mute, or at best make only a harsh displeasing sound: Therefore it is the more surprising, that there is such agreement of opinion among the Greeks and Latins concerning the melodious singing of swans. Nazianzenus, *Orat. 34.* believes their singing to be only this, that when they spread and clap their wings, the wind gets in, and whistles between their feathers. Of the cranes here mentioned by Lucretius, our translator takes no notice. The Latins called them *grues*, from the crunkling noise they make. They have a very long neck and beak, and are very common about the river Strymon in Macedonia,

on the confines of Thrace. They are said to foresee the stormy weather, nay even a shower of rain, and to fly from it in great numbers together. Hence Virgil Georg. i. ver. 374.

—Aut illum (scil. imbrem) surgentem vallibus imis

Aeræ fugere grues. —

And for this reason Milton gives them the epithet, prudent: when speaking of birds, he says:

Part loosely wing the region, part more wise,
In common, rang'd in figure, wedge their way.
Intelligent of seasons, and set forth
Their airy caravan, high over seas.
Flying, and over lands, easing their wings
With mutual flight: so steers the prudent crane
Her annual voyage borne on winds; the air
Floats as they pass, fann'd with unnumber'd
plumes.

These are the birds that are said to make war with the Pigmies; a people of Ethiopia, who inhabit the fens of the Nile, and exceed not three spans in stature, as Pliny witnesses. Of their wars with the cranes Juvenal pleasantly enough,

Ad subitas thracum volucres, nubemque sonoram;
Pygmæus parvis currit bellator in armis:
Mox impar hosti, raptusque per aëra curvis
Unguibus à sæva fertur grue. —

Sat. xiii. ver. 168.

Which our Creech has thus rendered,

When cranes invade, his little sword and shield
The Pigmy takes, and straight attends the field:
The fight's soon o'er; the cranes descend, and
bear

The sprawling warriors through the liquid air.

Ver. 190. In these seventeen verses, he explains the swiftness of images, by making a comparison between their motion and that of the rays of the sun, which reach from heaven to earth in an imperceptible space of time. But from whence proceeds this velocity of the sun-beams? They are small and subtle bodies: They are easily emitted from the body of the sun: They are incessantly in pursuit of one another, and therefore the following urges on the foregoing ray; and the interjacent air can be no hindrance to bodies of so thin a texture. If these are the reasons that the rays of the sun move so swiftly, the same reasons likewise will evince the extreme celerity of images.

Ver. 193. This is taken from Cowley. See the note, Book ii. ver. 141.

Ver. 204. That is, their subtle nature; for an image, though it be corporeal, has not any dimension of profundity, but is all surface; as Epicurus says in Laertius, lib. 10.

Ver. 207. In the last argument, he proved that images move as swiftly as the rays of the sun; but now, in these eleven verses, he makes them much swifter: for, says he, the images are more subtle; and what conduces very much to their celerity, they flow from the surface of things, and

easily disengage and set themselves free: but heat and light are emitted from the inward parts of the sun.

Ver. 216. This and the following verse are repeated from Book ii. ver. 156. as well in the original as here.

Ver. 218. In these ten verses he calls experience to his assistance. All sight is made by images: now, set a mirror, or a bowl of water abroad in a clear night, and the images of all the stars will be reflected from the mirror or the water, and meet the eyes in a moment of time. Judge then, how swift must be the passage of those images.

Ver. 219. Faber, in his note on this place, says, that it is more surprising to consider, how many different species of itself water reflects all around, by its trembling motion; which Virgil describes in the following verses:

Sicut aquæ tremulum labris ubi lumen ahenis,
Sole repercussum, aut radiantis imagine Lunæ,
Omnia pervolitat latè loca jamque sub auras
Erigitur, summique fert laquearia tecti.

Æn. viii. ver. 221

Which Dryden thus translates:

So when the sun by day, or moon by night,
Strike on the polish'd glass their trembling light;
The glitt'ring species here and there divide,
And cast their dubious beams from side to side:
Now on the walls, now on the pavement play,
And to the ceiling flash the glaring day.

Ver. 226. This and the following verse our translator has transcribed out of the first book of Cowley's Davideis.

Ver. 228. But this flux or streaming of the images into the eyes, must be granted, says the poet in these thirteen verses, because certain effluvia from other things insinuate themselves into all the other senses. Epicurus too made use of the same argument, as Macrobius witnesses Lib. vii. Saturn. 14. in these words: "In propatulo est quod decepit Epicurum: à vero enim lapsus est aliorum quatuor sensuum secutus exemplum: Quia in audiendo gustando, et odorando, atque tangendo nihil è nobis emittimus, sed extrinsecus accipimus quod sensum moveat: Quippe et vox ad aures ultro venit, et auræ in nares influunt, et palato ingeritur quod gignit saporem, et corpori nostro applicantur tactu sentienda. Hinc putavit et ex oculis nostris nihil foras proficisci, sed imagines rerum ultro in oculis meare." It is manifest what deceived Epicurus: for he was led into his error by following the example of the four other senses. And because, in hearing, smelling, tasting, and touching, we emit nothing out of ourselves, but receive from without what moves and affects the sense. Thus sounds come to the ears of their own accord, and odours flow into the nostrils. Thus the taste is produced by things that are received into the mouth; and whatever we perceive by touch is applied to the body. Hence he believed, that nothing goes out from the eyes, neither; but that the images of things come of their own accord into the eyes.

Ver. 247. These ten verses contain another argument. When we handle any thing in the dark, for example, a body that is quadrangular, how do we know it to be a square, but by its quadrangular figure? And if we place the same body before our eyes in the light, how do we then know it to be a square, but by its quadrangular image?

Ver. 249. In these two verses, Lucretius concludes, that images alone are the cause of sight: this too was the opinion of Epicurus, who held, that vision is caused by images that perpetually flow from things, and strike our eyes; and that this was his opinion, is affirmed by Aulus Gellius, in these words: "Epicurus autem affluere semper ex corporibus simulacra quædam corporum ipsorum, eaque sese in oculos inferre, atque ita fieri sensum videndi putat." Noct. Attic. lib. v. c. 16. Epicurus believed, that from all bodies some images of these bodies are perpetually flowing; that they convey themselves into the eyes; and that thus is produced the sense of sight. And Macrobius, lib. vii. Sat. c. 14. says the same thing. "Censet Epicurus ab omnibus corporibus jugi fluore quædam simulacra manare, nec unquam tantulam moram intervenire, quin ultro ferantur inani figurâ coherentes corporum Exuvie quarum receptacula in nostris sunt oculis, et ideo ad deputatam sibi à naturâ sedem proprii sensus recurrunt." Epicurus believed that certain images are perpetually flowing from all bodies, and that without the least interval of time, the exuvie of bodies, composed of mere empty figures, are of their own accord conveyed to our eyes, which are their proper receptacles; and that therefore they are continually hastening to the proper seat of sense that nature has assigned them. Epicurus himself in Laertius, teaches, that these images *ἰπερισσύναι*. And in Plutarch we find *εἰδῶλαν εἰσπνοῖς*, the insinuation of images, and in Cicero *εἰδῶλαν ἐμπίπτειν*. Thus we see what was the opinion of Epicurus concerning the cause of sight. But Plato held, that seeing is produced from the conjunction and affinity of two fires or lights; of one that goes out of our eyes, and of another that flows from the sun, or from the light. But the main dispute formerly was, whether vision be performed by the emission or reception of the rays of light. The mathematicians were persuaded, that certain rays that stream from the eyes, and reach to the object seen, enlighten and render it visible or apparent to the sight, and consequently are the cause of that sense. And this belief they grounded on observations, that would by no means justify their opinion; for they had taken notice that several animals which can see by night, as cats, owls, &c. have eyes that sparkle in the dark; and from thence they inferred, that the light which is observed to be in their eyes, when it is night, is the cause they see, when other creatures, whose eyes are not so radiant, have no sight at all. But this opinion has been long since exploded: and Aristotle retorted very well, that vision cannot be performed by emission of the rays; because in that case it would follow, that we should have as clear a sight of things, and discern them as distinctly

in the dark as by day: That philosopher, therefore, lib. ii. De Anim. teaches, that sight is not made by the emission of rays from the eyes, but from the function and act of the objects that come within the reach of sight, being often repeated, and coming into the eyes. The Stoics held, that rays come forth from within, even to the surface of the eyes, and drive the air to the thing seen, in such a manner, as to make as it were a cone, the point of which is in the surface of the eye, and the basis in the thing itself that is seen: and they explain this their opinion by the following example. As when the hand feels any thing with a stick, it perceives by the stress, and according to the degree of resistance it meets with, whatever the stick touches, that is to say, whether it be hard, soft, smooth, rough, dirt, stone, wood, cloth, &c. So the eye perceives every thing by the protended air; suppose a white, black, yellow, deformed, beautiful, &c. object. Most of the followers of Aristotle, how differently soever they interpret his opinion in this matter, use this very comparison, but place the colour as the hand, the light of perspicuity as the stick, and the eye as the thing touched. But the Stoics suppose the eye to be as the hand, the air as the stick, and the object seen as the object touched. Pythagoras and his followers believe, that the sense of seeing is caused by the reflection of the sight; when the rays that stream and extend themselves from the eyes to the thing seen, are so reflected from it to the eyes, that they do, as it were, bring word back what sort of thing it is. Empedocles, though he admitted an effluence from things into the eyes, yet he believed at the same time, that some fiery spirits are emitted from the eyes to the objects; and would have the eyes to be as it were a lantern. And these were the chief opinions concerning the cause of sight. But the now uncontroverted opinion is, that sight is formed by reception of the rays, and that the eye emits not any light to enlighten objects; but that vision proceeds from the immision of the rays of light into the humours of the eye; and is formed by the rays proceeding from various points of a visible object; inasmuch, that all the rays from one point of an object, are so inflected in the tunics and humours of the eye, that they join again into one point at its bottom, and there paint the distinct idea of the object: but to show how it there causes sight would be too long a digression in this place.

Ver. 251. In these six verses, the poet farther teaches, that the images that are continually flowing from the surface of things, are present in all places, and standing all around us, so that nothing hinders us to see on their part, if we but turn our eyes, that are designed for no other use than to see them. Epicurus himself writes to the same purpose, in the epistle to Herodotus: *Δεῖ δὲ καὶ νομίζειν ἰππευσίοντος τινὸς ἀπὸ τοῦ ἔξωθεν τὰς μορφὰς ὁρᾶν ἡμᾶς, καὶ διανοεῖσθαι· ὃ γὰρ ἐν ἀποσφραγίσαις τοῖς ἔξω τὴν ἐαυτῶν φύσιν τῇ τῆς χροῖας, καὶ τῆς μορφῆς, διὰ τὸ αἶρος τῷ μετὰ ἡμῶν τῆς κακείνων ὕδατος τῶν ἀκρίνων, ἢ οἷον δῆτα ῥευμάτων ἀφ' ἡμῶν πρὸς ἐκείνα σπαραγμομένον ὅλος, ὡς σύντων τινῶν ἰππευσίοντος ἡμῶν ἀπὸ*

τῶν πραγμάτων ὁμοζωόντων καὶ ὁμοιομόρφων κατὰ τὸ
 ἰνάρματον μέγιστος εἰς τὴν ὄψιν ἢ τὴν διάνοιαν, ὡς ἴσως
 τὸν Φορβύς χρωμένον.

Ver. 256. These are the very words Epicurus himself makes use of; and Lucretius after him believed, that an image is as it were a shadow or type, which coming from the thing itself, brings with it the figure and colour of it; and which striking upon the eyes, exhibits and imprints in them the same figure and colour. Thus Epicurus seems to have meant that impression and representation of the image, which, by reason of the smoothness of the eye, appears in the surface of it; and which may be seen in the pupil of any man's eye, if we look narrowly upon it. And this seems to have been the opinion of Democritus, as we find in Aristotle, lib. de Sens. et Sens. cap. 2. where Democritus saying τὸ ὄραϊν εἶναι ἔμφασιν, that seeing is an apparition, Aristotle blames him for it; and objects that that apparition is caused only, ὅτι τὸ ὄμμα λαβόν, because the eye is smooth and glossy. Moreover, Lucretius himself, as we have seen in the third book, condemns their opinion, who, contrary to the doctrine of Epicurus, believe that the mind and soul see from within through the eyes as through a window; and asserts, that it is not the mind, nor the soul, but the eyes themselves that see, because they are endowed with soul, as well as all the other parts of the body. See book iii. ver. 130. et seq.

Ver. 257. There are many problems, and those too very curious, concerning vision. Some of these Lucretius proposes and explains. I. It is certain that we not only see the colours and figures of things, but understand, at the same time, how far the objects seen are distant from us: but how can the images that flow from the surface of things, be the cause of this? The poet answers in these ten verses. The image, striving to get to the eyes, drives forward all the air before it; now, this stream of air is longer or shorter, as the object is more or less distant. But the longer or shorter that stream of air is, which, produced by the image, strikes the eye, so much longer or shorter the interval of space between the object and the eye must be allowed to be. But Lucretius and Epicurus are mistaken in this; for the distance is not known by the eye, but by the superior faculty, the intellect, which compares and judges between the eye and the thing seen.

We may judge of the distance of an object by the disposition of the "axis visionis:" for the soul, always attending to the various and different perceptions, easily determines the length of the "axis opticus," by the force it imparts to the fibres of the retina: inasmuch that the colour of the object being first known, for the impressions vary according to the difference of the colours, it is easily judged, that the body is more or less distant. Thus, though a black body causes not so great an impression as a white; yet, if we look at a black ten yards from us, and at a white twenty, though the impression of this last be much the stronger, yet we judge the former to be the nearest to us, because the soul first discerns between, and knows

the difference of those colours: and we know for certain, that men, who have been long accustomed to judge of distances, are not so subject to mistake in that affair, as others who have had no experience therein; and the reason of this is, because their souls have formed a more perfect idea of the length of the optic axis, by means of the force it imparts. The particular disposition of the eye conduces likewise very much to the forming a right judgment of the distance of objects: for we widen our eye when we are to regard an object distant from us; and lengthen it when we look at one that is very near us: and, therefore, in all probable appearance, the eye is proportionably and gradually changed, as we view a nearer or more distant object. For example, if I look at an object very near me, my eye is lengthened by the contraction of the oblique surrounding muscles: but if the same object be carried by degrees farther off from me, those muscles are gradually relaxed, proportionably as the object removes; and, at length, the right muscles begin to widen the eye, the object drawing farther from it: this any man may observe to be true, when he looks at a bird, for instance, first rising very near him, and then flying from him by degrees, till at length it arrive at a great distance from him. Some attribute this appearance to the knowledge of the conjunction of the two "axes visionis," which may indeed be some help towards the distinguishing the distance of objects; and this is the reason why we cannot so well judge of the distance of an object, when we regard it only with one eye, as when we look on it with both. Moreover, the farther distant an object is from us, the more subject we are to be deceived in our judgment of its distance, as any man will readily conceive.

Ver. 267. In these twelve verses is contained the second problem. Why, since the objects themselves are seen, the images that strike the eyes one by one, and are the cause of our seeing them, can be seen themselves? To this Lucretius answers, after his usual manner, by bringing like instances. 1. We feel not the single parts of wind or of cold: but of all the wind, or all the cold, we are very sensible. 2. When we touch with our fingers the surface, or outmost colour of a stone, we feel not that surface and outmost colour; but only the interior hardness of the stone. Now, suppose the images to be as the single parts of the wind and cold, and the objects themselves to be as the whole wind and cold, and this difficulty is easily solved. In like manner, suppose the stone to be as the object, and the surface and outmost colour of it as the image. Thus atoms, the wind, and images are invisible themselves, though visible things are made of them, and though by their means other things are seen.

Ver. 277. He means what Lucretius here calls "Summum colorem," the utmost colour. For even by the doctrine of Lucretius, colour cannot be touched.

Ver. 279. Third problem. Why the images of things reflected from the surface of a glass mirror, are not seen in that surface, but as it were

within, or beyond it? The reason of this the poet gives us in these twenty-one verses. The eye knows the distance of the thing seen, by means of the air that is driven by the image to the eye. Now, when two airs are driven, the interval must of necessity be more extended, and even doubled. But the image of the glass (for we see the glass itself as well as the thing, whose image is reflected) protrudes one air, and the image reflected another. And this is the reason why the image appears to be not in the surface of the glass, but as if it were within and beyond it. He also illustrates this explication, by bringing an example of things that are seen in a straight line, and at a distance from a place within a building: in which case the images drive the air forward, as well through the space without doors to the very threshold, as through the space within doors from the threshold to the very eye. This reason, though it seems probable, is nevertheless not true; for as I said before, it belongs not to the eyes, but to the superior faculty, to discern and judge of distance.

Lucretius here affords us an opportunity to give a short account of the looking-glasses that are most common among us, and of which there are three sorts: viz. The plain, the concave, and the convex. The surface of the plain is an exact level, and these are the most general, and esteemed the best, because they reflect the object exactly the same, in site, distance, and magnitude, as it is represented to them. But the other two sorts, the concave and the convex, return the objects differing now in site, now in distance, now in magnitude, according to the site of the objects, and as the eye receives the reflection. Plain glasses, as I said before, cause no alteration either in the site, distance, or magnitude of the objects they represent. The reason of which is, because, being smooth and level, they give no other modifications to the rays, but only that of simple reflection, according as they fall on it. First. As to the site, it will be represented the same as it is out of the glass; that is to say, in the same line of attitude: and the object seems so much beyond the glass as it is on this side, because the rays reflected from the glass, run the same lines, and make the same impression on the retina, as they would do if the object were really on that side where it is represented: for the site of an object is distinguished by the impulse of the rays from a determinate region. Secondly, In regard to the distance, the object is represented as far beyond the glass as it is on this side of it, because the impression of the rays is altogether as strong after as before the reflection. For a clearer idea of this, see the note on ver. 257. where we have treated of the manner how to judge the true distance of an object from the eye. Thirdly, We see the magnitude of an object exactly the same as it really is, because the line of reflection from the glass being exactly equal with that of incidence from the object, the rays from the remoter points of the object will be as far distant from each other then, as they would be if the very object itself were really in the place where it is only represented. Nor, in-

deed, can we err in the magnitude, so long as we are right in our judgment concerning the distance of the object.

But before I close this note, I must not forget to observe, that our translator has omitted the three last verses of this argument, which in Lucretius run thus:

*Quare etiam atque etiam minime mirari est par
illis, quæ reddunt speculorum ex æquore visum.
Aeribus binis, quoniam res confit utroque.*

Lambinus absolutely rejects this; and Creech, in his Latin edition says, that he sees no cause why he need ever be ashamed of, or revoke that censure: because the verses are altogether useless, and have nothing to do in this place: and for that reason I have avoided to give them in this translation.

Ver. 290. Not the image that is emitted from the object placed before the glass, and that strikes into the glass; but the image that flows from the glass itself: for all things emit images, even mirrors themselves.

Ver. 299. For the image appears as far beyond the glass, as the object of which it is the image is distant from the glass.

Ver. 300. It is repugnant to the foregoing opinion of Epicurus, that the image in the glass should be turned towards the person whose image it is, and look back upon him. For, since the image flows from us, and goes straight forward, it ought, as it goes away, to show us its hinder parts, so that the right may answer to the right, and the left to the left. In like manner, as a player, when his mask is taken off, regards that part of it which he wore next him, that is to say, not the face, but the hollow behind it. To this purpose Macrobius, who, by this argument, endeavours to overthrow the opinion of Epicurus, that the images of things come into our eyes of their own accord. His words, speaking of that belief, are these: "*Cujus opinioni repugnat, quod in speculis imago adversa contemplatorem suum respicit: cum debeat, siquidem à nobis orta recto meatu proficiscitur, posteram sui partem, cum discedit, ostendere, ut læva lævam, dextera dexteram respiciat. Nam et histrio personam sibi detractam ex eâ parte videt, quâ induit; scilicet non faciem, sed posteriorem cavernam.*" Saturnal. lib. vii. cap. 14. This, therefore, is the fourth problem: and to solve the difficulty of it, Lucretius defends his opinion by the example which his adversaries allege to weaken it. Take, says he, a form or mask made of clay, not hardened; but while it is yet moist, and dash it against a beam or pillar, so as to invert it backwards, that the face may fill up the hollow; and you will then see that brought to pass in the mask, which you are now astonished to see in the mirror. And, therefore, you ought not to doubt in the least, but that images, being, as they are, very tenuous substances, may, by dashing against the glass, be inverted backwards in like manner. For an image has no depth, nor profundity whatever. This solution of this problem agrees not ill, but is almost the

same with what Plato delivers in his *Timæus*, where he says, that in mirrors the right appears to be the left, because the contrary parts of the mirror are regarded by the contrary parts of the sight, as it happens in all things that are applied to, or placed against one another; as if, for instance, any man were placed in the room of the looking-glass, and had his face turned towards us; for in that case his right would be opposite our left; and so on the contrary. But the mathematicians in Euclid, *Optic. 19.* explain this matter otherwise, and demonstrate their opinions by several arguments. I. They teach, that the angle of reflection is alike, and equal to that angle which is made by the line of incidence into the glass from the point of the object seen: whence there will always be a reflection to the part that is opposite to that part of the glass upon which the line of incidence that is produced from the point of the things seen, happens to strike. II. They teach, that the images which are seen in glasses, are contained in the very shortest lines possible: therefore, when the right part of the thing seen answers, and is opposite to the left line of reflection rather than to the right, and so on the contrary; it causes the line of reflection which is most on the right, to fall on the right part of the image, and in like manner on the contrary: For which reason the left part of the object seen is opposed to the right part of the image; and on the contrary, the right to the left. III. They teach, that the image of the thing seen, and the very thing seen, are to one another in the nature of the two gladiators, who are contending face to face: for the right eye of the one answers to the left eye of the other. But observe, that this happens only in plain and convex glasses, for it is otherwise in the concave, in which the right parts answer to the right, and the left to the left: Of which Plato and Euclid give the reason, which is too long to be here inserted, though we shall have occasion to say something concerning concave glasses, below in the note on ver. 320.

Ver. 305. "*Cretea Persona*:" for the masks, which the actors wore at Rome, were made of chalk, or of potters clay. Therefore, "*cerea persona*," as some copies read it, is rejected. Lambinus is fond of "*Cressa*," or "*Cretea Persona*," pretending they were made of plaster that came from the island Crete, now called Candy, and situate in the *Ægean Sea*. All the old copies that Heinſius ſaw, read "*cretea*;" and in the *Catalects* of Petronius we find,
Dum ſumit creteam faciem Sertoria, cretam
Perdidit illa ſimul, perdidit et faciem.

which ſufficiently proves they were made of chalk, or ſomething of that nature: and renders the opinion of Lambinus liable to ſuſpicion.

Ver. 306. "*Allidat pilæve trabive*." *Pila* ſignifies a column or pillar, which the Greeks call *σῆλη*. Apuleius 3. *Metamorph.* "*Pila media quæ ſtabuli trabes ſuſtinebat. Feſtus, Pila, quæ parietem ſuſtentat, ab opponendo dicitur.*" Budæus likewiſe ſays, that the "*pilæ lapidæ*" in buildings, are pillars or ſtructures of hewn ſtone, which

are as the thighs of edifices; "*quæſi quædam ædificiorum femora.*" *Pila* ſignifies the moles that are built in water, ſuch as are at this day to be ſeen at Geneva. Virg. *Æn. ix. ver. 710.*

Qualis in Euboico Baiarum littore quondam
Saxea pila cadit, &c.

See likewiſe Vitruvius lib. v.

Ver. 310. In theſe ten verſes is contained the fifth problem, which he propoſes and ſolves. Why the ſame image is reflected from mirror to mirror, and ſeen in ſeveral at once, inſomuch that five or ſix images are reflected; or that the ſame image may be repreſented five or ſix times by as many glaſſes; the left part of which image will be inverted to the right, and the right to the left alternately? For whatever things are in the remotest parts of a building, the image of them may, by the means of ſeveral looking glaſſes, rightly and duly placed, be, as it were, brought out and conveyed through windings and turnings into any part of the houſe. Nay, it may be ſo ordered, that you may ſee your own back. For, take two plain glaſſes, and place one of them behind you in a ſhelving poſture, ſo that it may neither lie flat upon the ground, nor ſtand directly upright: Hang the other over your head in ſuch a manner, that it may be directly oppoſite to our eyes, and in a bending poſture likewiſe: you muſt of neceſſity ſee your own back in the glaſs that hangs up. Of which Lucretius gives this reaſon; becauſe the image of the thing that ſtrikes upon the glaſs, being returned from that glaſs, is reflected upon, and received into the oppoſite glaſs. But though all this be certain, yet it may be inquired, whether it be the ſame image that is multiplied ſo often; or whether a-new exuvies do not fly from off every image, as at firſt, the firſt image flew off from the body? Lucretius answers, That each image flies away from the object, and that the departure of the firſt is ſupplied by the coming of a ſecond, in a perpetual and never-ceaſing flux; for the image behind impels the image before; and thus they run in a ſucceſſive courſe, and urge on their predecessor images; inſomuch that the very image, which we this moment ſee in the laſt glaſs, was but juſt now in the firſt; and that a new ſucceeds in the room of that which went laſt away; and thus a perpetual ſucceſſion of images is made from glaſs to glaſs. This I take to be the ſenſe of Lucretius in this paſſage, which Creech has rendered but obſcurely and imperfectly.

Ver. 318, 319. Theſe two verſes run thus in the original:

Uſque adeo è ſpeculo in ſpeculum tralucet imago
Et cùm læva data eſt, ſit rurſum ut dextera fiat;
Inde retrorſum reddit ſe, et convertit eodem.

The meaning of which is, when the image is transferred from one glaſs to another glaſs, it changes its left part into its right; but when it is again reflected from the ſecond glaſs into the third, it reſumes the ſame order and ſite it had in the firſt glaſs; and will continue to change in like manner, as it paſſes into the other following glaſſes.

Ver. 320. In these seven verses is contained problem sixth. Why in those glasses, whose plains or faces are, as if they were several glasses opposed to one another to the right and left, the site of the image reflected is returned, so that the right part of the image answers to the right of the object, or thing seen, and the left in like manner to the left? The answer is: Because the plains or faces of that glass supply the place of glasses placed apart from one another, and are the cause that as in them the image is reflected from glass to glass, so it is reflected in these upon the same glass: and this indeed happens in concave glasses; of which, for that reason, Lucretius seems here to speak. And thus Gassendus himself interprets this passage: But Lambinus is of opinion, that the poet is speaking of many glasses joined together in the convex figure of a pillar. Now, we generally reckon seven sorts of glasses that restore the image after the same usual manner. I. The plain. II. The pillared convex. III. The pillared concave. IV. The convex made in the shape of a pyramid. V. The concave made likewise in the figure of a pyramid. VI. The globous convex. VII. The globous concave. By what means the reflection is made from plain glasses the poet has taught already: but seems to have omitted the reason of the several sorts of reflection from all the other glasses; for in these seven verses he seems to speak only of convex and concave glasses, though some think that even here he argues only of the other.

Ver. 327. In these seven verses is contained problem seventh, viz. Why our images that are seen in the glass, seem to move forward or backward, &c. as we ourselves do, and to imitate our actions? Of this he gives the following reason: Because, from whatever part of the glass we retire, and withdraw ourselves, the image cannot, from that moment, be reflected from that part: for all the images that are emitted from bodies, are reflected by equal and like angles. This, therefore, is appositely and truly ascribed to the variations of the image in the parts of the glass; which variations are caused by the several motions of the object; and these being different, the reflection likewise on the eye, and consequently the image, must differ in like manner. For, as the mathematicians truly assert, it is not the same image that remains seen; but when all the points, that is to say, all the parts of the object seen, are reflected, now from these, now from other parts, a new image is made of the whole object. Whence it follows, that, when the thing seen is moved, the image must of necessity seem to move likewise; since the parts of the thing seen continually answer to the parts of the image. And yet the image is not actually moved, but a new one is rather produced by the mutation of the sight of the object seen; but this happens by reason of the continual reflection of the parts of the image, which is made in the utmost censure of the glass. Hence it is evident, that if, whilst you are looking on your own image in a glass, there be others, who, either from the right, left, above or below

you, regard the same image of your own person, they will each of them see it in different places of the glass, and none of them in the place where you do; insomuch, that you cannot take any of their places, but you will see the image in another place than it was in before; from whence it is farther evident, that it is not only one image of yourself that you see in the glass, but innumerable images: and those too mutually mixing together in such a manner, that in the very place where you see your own nose, another may be so placed as to see your chin, another your forehead, a third your eye, a fourth your mouth, &c. and, nevertheless, not one of them sees any thing but one simple and distinct image.

Ver. 334. Hitherto of mirrors. He now proposes the eighth problem: Why glaring objects hurt the eyes, and why the sun even causes blindness? Of which, in these ten verses, he gives this reason: Because a splendid object sends forth many seeds of fire that burn the eyes; or is a sensible too strong for the organ of sense; and spoils, and renders it useless for this reason: because, by loosening its texture, it so perverts and destroys its due temper and commensuration, that it renders it incapable of receiving any longer any other sensibles. Aristotle, lib. iii. de Anim. says, it is common to all the senses, that if the things that fall under the sphere of their perception be too excessive, and surpass their due measure, they destroy the senses themselves. Thus, too much noise makes men deaf, too much splendour blind; and in like manner of the rest. For each sense is a certain proportion, and all proportion is destroyed by whatever is too much: for example, if the strings of an instrument be screwed too high, all the symphony is ruined.

Ver. 335. It is said of Democritus, that he made himself blind by staring on the glare of a brazen buckler that he placed in the sun; and this he did, that the view of external objects might no longer divert his mind from meditation. Laberius in Gellius, lib. x. c. 17.

Democritus Abderites, physicus philosophus,
Clypeum constituit contra exortum Hyperionis,
Oculos ut possit effodere splendore aëreo:
Ita radiis solis aciem effodit luminis.

Ver. 344. These six verses contain the ninth problem: Why all objects appear pale and lucid to those who have the jaundice? Because, says Lucretius, many lurid seeds flow from the ictical person, and stain the images as they come to him; at least, which is more probable, they dye those that are entering into his eyes.

"Quæcunque tuentur Arquati," That is, says Nonius, persons whose eyes are stained with the likeness of the colours, "Arqui, quem poetæ Irim vocant," of the bow, which the poets call Iris, the rainbow: For the ancient Latins writ *arguus*, not *arcus*. Lucretius, lib. vi. ver. 525.

Tum color in nigris exiit nubes arqui.

This disease, the yellow jaundice, was likewise called *icterus*, and *marbus regius*. It was called

Æros from the Greek, *ἰκτίος*, a kite, because the eyes of those who labour under that disease, seem in colour like the eyes of a kite, *regius morbus*, as Ovid observes,

Molliter excelsu quoniam curetur in aulâ.

Arquatus, as I hinted before, because their eyes are dyed with several colours, like the rainbow. It was also heretofore called "*Aurigo*, à colore auri," from the colour of gold, which the bile, diffused through the body, resembles: and persons, troubled with the disease, are called *aurigini*. *Sipontin*.

Ver. 346. *Lurid* is yellowish colour, drawing towards a blue.

Ver. 350. The tenth problem is in these seventeen verses. Why, when we are in the dark, we can see objects that are in light: though when we are in the light we cannot see objects that are in the dark? This, says he, is caused by the protrusion of the different air; for when the lucid air follows the dark, it purges and cleanses the pores of the eye, and makes room for the images of things to enter. For the bright and lucid air is more subtle than the dusky; at least, it has more strength, and is much easier to move. But when the dark air follows the bright, the passages of the eye are so closed and choked up by that dull and heavy air, that it becomes incapable to receive the images of things that offer themselves to it.

This was the opinion of Lucretius; but Aristotle and the mathematicians explain this matter in a few words: They say, that nothing can be seen of itself but, and that there are no other objects of sight than, light and colour; therefore, whatever is seen, is seen by the help and means of those two things. Now the sense of seeing is made by contact, that is to say, by the form or image of the object seen coming to the eyes. But the things that are in the dark cannot send their images to the eyes, for want of light and colour, by which they no sooner come to be enlightened, than they instantly emit their forms. Therefore, when we ourselves are in the dark, we may well see objects that are in the light, but not on the contrary.

Ver. 367. In these ten verses is contained the eleventh problem: Why things that are square seem round if beheld at distance? Square towers, for example, seem round, if we regard them from afar: the reason of which is, says Lucretius, because the image of a square tower, as it flies to us, is often struck by the air in its passage, by which means its angles are worn off, at least are so blunted, that when it comes to us, it strikes our eyes under a round or circular figure; yet that roundness is not so distinct and perfect, as if the object itself were round, and seen at a little distance.

Ver. 368. What I am here going to observe concerning the sight, holds good likewise as to all the other senses. When a square tower is seen from afar, and appears round, we must distinguish between these two things: First, That it seems round; and, second, that it is reputed and be-

lieved to be so. For that it appears round is most true; but that it is believed to be round, because it seems to be so, is false. Now the first belongs to the sight, or to the eye, which receives the appearance, representation, or image, as Lucretius and Empiricus term it, of the object seen: the other belongs to the mind, or intellectual faculty, which forms a judgment from that appearance. For the eye only reports, as I may say, to the understanding, the object it has seen; therefore it neither deceives, nor is deceived, but represents the thing as it received it; but it is the office of the mind to judge, whether the thing be, or be not such, as it appears to the eye and sight; so that the mind only deceives or is deceived, or neither deceives nor is deceived, in the judgment it makes. But Lucretius will argue more at large of these things hereafter, ver. 394 and 490, &c. where he says, that the senses are true and certain, and that their deception proceeds from the judgment of the mind. Petronius very pertinently to this purpose, and elegantly too, says,

*Fallunt nos oculi, vagique sensus
Oppressâ ratione mentiuntur:
Nam turris, prope quæ quadrata surgit,
Attritis procul angulis rotatur.*

And Macrobius Saturnal. lib. vii. cap. 14. "*Hæc (ratione) cessante visus inefficax est; adeo ut quod remus in aquâ fractus videtur, vel quod turris eminens visa, cum sit angulosa, rotunda existimatur, faciat rationis negligentia; quæ, si se intenderit, agnoscit in turre angulos, et in remo integritatem; et omnia illa discernit, quæ academicis damnandorum sensuum occasionem dederunt: Cum sensus unus inter certissimas res habendus sit, comitante ratione.*"

But it may be inquired, how and by what means the mind judges and discerns betwixt the different figures of objects: The answer to this is, That the figures of objects may be known, partly from their different colours, partly from their different reflections, and wholly from the knowledge of the divers parts of an object, its distance, and magnitude. Yet some give another reason, and say, that we know the figures of bodies from the particular impressions they make on the eye: For the rays that proceed from all the parts of an object, paint all its parts on the retina, in the fibres of which they cause an impression, in the same order in which they received their reflection: inasmuch that we know such a body to be square, because its image, formed by the impression of the rays on the retina, is square: For the rays from all the points of a square body, are collected by the humours, and form a quadrangular or square impression. The same may be conceived of all other figures of objects.

Ver. 377. In these seventeen verses is contained the twelfth problem. Why the shadow of our body, no less than the image of it in the glass, seems to walk with us, and imitates our postures? The thing itself is notorious, but the reason of it not so plain. Lucretius says it is this, because shade is only air deprived of light by some dense

body interposing between any place and the sun, and when this happens, that place is in some measure darkened and deprived of light; and therefore, as that dense body is moved, as it bows itself down, or raises itself up, the shadow too must of necessity vary its figure; because several figures of the air are deprived of light, in as many several manners as the body moves upright, bending forward, backward, &c. Dryden seems to have borrowed from this passage of Lucretius, that excellent description of shadows, which we find in a copy of verses of his to Sir Godfrey Kneller.

Shadows are but privations of the light;
Yet when we walk, they shoot before our sight;
With us approach, retire, arise, and fall;
Nothing themselves, and yet expressing all.

Ver. 389. This and the following verse run thus in the original:

Semper enim nova se radiorum lumina fundunt,
Primaque dispercunt, quasi in ignem lana trahatur.

Our translator takes no notice of the last words "quasi in ignem lana trahatur," and indeed they are variously explained. The poet illustrates, and teaches by an example, in what manner new rays are continually flowing from the sun's orb; and how they supply the place of the former that vanish away; viz. as it were like wool drawn through a flame; for then the wool that is first drawn would be consumed by the fire; whilst other wool is in the mean time drawing through it. Thus Lambinus, on the authority of several copies reads, and then interprets this passage; and Fayus approves of his interpretation. But Scaliger, in his observations on Catullus, corrects this lection, and reads *carmine* for *in ignem*: "quasi carmine lana trahatur;" taking *carmen* for the instrument used in the wool-manufacture, and which is likewise called *peñen*, in English a card. From whence *carminare* signifies the same as *peñinare*. "Varro de ling. Latin. Carminari lana tum dicitur, cum caret eo, quod in ea hæret." And Pliny, lib. ix. cap. 38. & lib. xix. cap. 1. uses the same word. In which sense we may interpret the meaning of Lucretius in this manner: That new beams flow from the sun as fast as the first vanish, as from a heap of wool new threads are drawn in the card, so that when the first are drawn and taken away, new ones may still be drawing in the same card. But this interpretation seems not so natural as the former. Faber retains the first reading, and observes it to be a Greek proverb, *ἐλπίων ἐκ πύργου*, and that it is used by Plato and Lucian, when they speak of a useless piece of work, and that never can be ended. "Dicitur de re inutili, ἀνὴρ πύργου, et quæ absolvi non possit." Creech in his Latin edition adheres to this interpretation; and says, it agrees very well with the meaning of the poet, and expresses properly enough that perpetual destruction of the rays of the sun. Nardius, for *in ignem*, reads *mar-*

gine, and others *imagine* erroneously, and without reason.

Ver. 393. *Nigras umbras*, the black shadows. A shadow seems black, because, as I said before, it is nothing but air deprived of light, or a privation of light; but light is white and clear, therefore shadow is black and dark.

Ver. 394. Having finished his disputation concerning sight and vision, he takes occasion from the two last problems, to assert and defend the certainty of the senses, which not those problems only, but several others that he enumerates as examples, to verse 489, seem to weaken and contradict. Now he insists that the senses are infallible, because they receive the images of things, just as they are brought to them. They understand not the nature of things, nor do they judge or determine any thing concerning it. Therefore there is no fallacy in them, but all errors proceed from the judgment of the mind. For example; though we may be deceived in seeing light or shade, yet that deception is not the fault of the eyes, but of the mind. For the office of the eyes is only to see the light and the shade; but it belongs not to them to determine what light and shade are, but to the mind; therefore, notwithstanding that a shadow seems to move, though it do not move, it being only a privation of light; yet our eyes are not deceived, for they see what it is their business to see; they see the shadows now in one place, now in another. Cicero, lib. iv. *Arcad. Quæst.* ascribes certainty to the senses, provided they be sound and strong, and that all things be removed that might be any obstacle to them. And Lactantius, lib. de *Opificio Dei*, cap. 9. is of the same opinion.

Ver. 404. In these four verses, Lucretius brings his first example to confirm his assertion, that neither the eyes, nor any of the other senses, are either false or fallacious, but that they are true and certain: as also, that the mind only deceives, and is deceived, in judging of things amiss, and otherwise than they are. For it is not the office of the eyes, to judge whether the ship be moved, or not, but of the mind only: from whence it follows, that not the eyes, but the judgment only errs, and is mistaken.

Ver. 407. Thus too Virg. *Æneid.* iii. ver. 72.
Provehimur portu, terræque urbisque recedunt.
Which Sir R. Blackmore seems to have imitated,
They spoom'd away before the shoving wind,
And left retreating towns and cliffs behind.

Ver. 408. In these six verses is contained example second, of the stars, the sun, and the moon, which seem to us to stand still, though they are whirled about in a perpetual and swift motion. Whence the poet argues, that the eyes are not deceived, because they see the sun, the moon, and the stars, in the places where they are; but that the mind errs in not discerning those to be several places, and imagining all those places, in which the sun, moon, and stars are, to be one and the same place.

The Steady Pole.] The end or point of the axle-tree, on which astronomers imagined the heavens to be turned. There are two of them; one in the north, noted by a star, called *polus arcticus*, the north pole; the other in the south, but invisible to us, called *polus antarcticus*, the south pole.

Ver. 414. These four verses contain Example III. in which the poet brings an instance of mountains, standing at some distance from one another in the midst of the sea; which nevertheless, when seen from afar, seem contiguous, and so like a continent, that they appear like one huge mountain only, or like one vast island: In which the eyes are not deceived neither, it being not their office to judge of the distance of objects: but the mind alone deceives, who imagines there is no space between the mountains, because there appears none.

Ver. 418. In these four verses, he proposes Example IV. When boys, says he, turn themselves often around, or are turned about by others, a giddiness ensues, and the walls and ceilings of the houses seem to them to move round, and be whirled about, even though they themselves stand still, and have ceased to run round. In which the eyes are not deceived, but the mind itself, which supposes, that the sensorium, in which the agitation continues, receives the images of things that stand still in the same manner, as it would receive the image of a thing in motion, if itself were at rest. The reason of this is, because the spirits that belong to the sight, being shaken and disturbed by the whirling motion of the body that runs round, fly about in a circular motion likewise, and cease not to move so soon as the body stands still; in like manner as a wheel that has been turned about with violence, ceases not its motion so soon as the moving hand is retired, but whirls several rounds afterwards.

Ver. 422. In these ten verses he brings Example V. of the sun, that seems to rise very near to mountains, though between the sun and those mountains there be an immense interval of space. For when the sun is seen to rise over mountains, he seems almost to touch them with his fires, and yet those mountains are scarce two thousand bow shot distant from us: nay, perhaps not five-hundred casts of a dart. The reason is, because the eye does not perceive the distance of objects, and therefore we suppose there is no distance at all. "*Rubrum tremulis Jubar ignibus,*" says Lucretius, "*Varro de ling.*" Latin. lib. 5. says, that the star which appears before sun-rising is called Jubar, "*quia in summo habet diffusum lumen, ut leo in capite jubar:*" And Festus: "*Jubar stella quam Græci φωσφόρον, id est, Luciferum appellant, quod splendor ejus diffunditur in modum jubar leonis.*" And Servius on this verse of Virgil, *It portis jubare exorto delecta juvenus.*

Æn. 4. v. 130.

says, "*Jubare exorto, i. e. orto Lucifero. Nam proprie Lucifer Jubar dicitur, quod jubar lucis effundat.*" Lambinus too follows these ancients; and others take Jubar in this place to signify the

splendor or light, that foreruns the rising sun, that is to say Aurora, or the morning itself: which last opinion is not without reason, since Jubar is sometimes taken for the brightness or splendor of any thing whatever: Statius Thebaid. ix. v. 895. "*Et pictum gemmis galeæ jubar.*" Yet notwithstanding all these authorities, Creech in his Latin edition of Lucretius says, that nothing is more certain, than that Jubar here signifies the sun: "*Nihil certius quam unam eandemque rem in hoc versu jubar,*" and verse 408. "*Solem appellari.*" Creech. in loc.

Ver. 432. In these three verses he produces Example VI. and alleges, that even in the shallowest waters is seen no less a space, than the distance between heaven and earth. For if any one looks down into water, not above an inch deep, he will seem to see the sky in it, lying as much below the earth as the sky is distant from it. The reason of which is, because the eye always sees the object on the side from which the ray comes last of all directly to it; and therefore sees the sky, or the sun and stars, in the place where the water is: and that by means of the ray, which, being between the water and the sky, or the sun and stars, is directly joined with that, which is between the eye and the water. In which case the mind itself, perceiving nothing between the directed and the reflected image, judges that the sky, or the sun and stars are really in that place, and transfers to beneath, all the space and distance that is above. And hence it is not the error of the eye, but of the mind.

Ver. 435. In these five verses is contained Example VII. of a man on horseback, standing still in the midst of a river, and looking down upon the water: for then some force seems to carry the body of the horse, even though he stand still, up against the stream: And on which side soever he casts his eyes, all things seem to flow and move in the same manner. In which not the eye, but the mind is mistaken; for, whereas the eye observes the waves succeeding one another in time, the mind apprehends besides, that they succeed one another in place; and thus judges one and the same place, to be as many places behind, as waves on that part have beat against the horse.

Ver. 440. What our translator here calls courts, Lucretius calls *porticus*. Now the most wealthy among the ancient Romans had stately walks both for fair and rainy weather: The first were in the shade of trees, and sometimes planted with box or rosemary, as Pliny witnesses in an epistle to Gallus. The second were under magnificent roofs, supported from one end to the other on pillars of an equal height, and placed at equal distances: The roof too was of an equal height, and the side-walls exactly alike, nor was the portico broader in any one place than in another. We may judge of the length of them from Juvenal, Sat. iv. v. 5. where, speaking of the luxurious Crispinus, he says,

*Quid refert igitur quantis jumenta fatiget
Porticibus?—*

And Sat. vii. ver. 178.

Balnea sexcentis, et pluris porticus, in quâ
Gestator Dominus, quoties pluit.—

Whence we may gather, that in these porticos they were sometimes carried in their coaches, for so we may call them, for the likeness of the use of them, and sometimes in their chairs on mens shoulders: Besides, that they sometimes walked on foot in them, either for their health or pleasure, is certain beyond all dispute: and for these several reasons these places were called *gestationis*, *Viridaria*, *deambulationes*, and *porticus*. In these walks they used sometimes to walk, or be carried a certain number of paces, as Plutarch reports of Cicero in his life. And this custom appears from the following ancient inscription which we find in Pignorius, de Servis, p. 141. and by which they knew when they had been carried, or had walked a mile.

IN HOC
POMARIO
GESTATIONIS
PER CIRCUITUM
ITUMETREDITUM
QUINQUIENS
EFFICIT PASSUS
MILLE.

These large places of recreation, these covered walks, were but suitable to their other magnificence: For their houses were for largeness like cities, as Seneca witnesses, Epist. 90. and 114. so that, according to the several seasons of the year, they sometimes used one part of their house, sometimes another. In these were their "Cœnationes, Vestibula, Atria, Peristylia, Bibliothecæ, Pinacothecæ, Basilicæ," and such structures, according to the state of public works. But to return to Lucretius, who in these four verses brings Example VIII. of such a porticus, as is above described: and says, that if we look into such a building at one end, especially standing at some distance from it, it will seem so to contract itself by degrees from the roof, the pavement, and on either side, that the prospect will end in a sharp point or cone. Of which the mathematicians give this reason: because those parts of parallel lines that are farthest removed from the sight, seem almost to meet at the end: which they demonstrate in this manner: In the first place, parallel lines must of necessity take up the same space and extent of ground. Let us suppose two parallel lines of a hundred feet long, to be ten feet distant from one another: Let ten traverse lines be made from one parallel to the other: These ten lines will be all alike, and each of them ten feet long: Let the eye be placed exactly on a level with that part of the ground or plain, where the first traverse line is drawn; the second line (I do not reckon that first which is next the eye) will seem longer than the third, the third than the fourth, the fourth than the fifth, the fifth than the sixth, the sixth than the seventh, the

seventh than the eighth, and the eighth than the ninth: so that the tenth or last will seem shorter than the others, because it is the most remote from the eye: The reason of which is; because the farther any magnitude is from us, the less it makes the angle that falls under the sight: And, on the contrary, the nearer any magnitude is to us, the bigger it makes that angle. Hence it comes to pass, that the most remote and topmost part of the portico may seem to end in a very little cone, and even to touch the ground or surface of the earth, and that the farthest parts of the two side walls seem to touch one another.

Ver. 443. For when the roof seems to descend, the floor to rise up, and the sides to meet together, the prospect must necessarily end in a sharp angle or point.

Ver. 444. In these four verses, he brings Example IX. and says, that to men at sea the sun seems to rise out of the water, and at his setting, to be plunged again into the waves. But this is a deception likewise of the mind, which, because the eyes see nothing that intervenes between the sun and the sea, erroneously supposes that nothing does intervene between them. Virgil describes finely the sun rising out of the sea;

Postera vix summos spargebat lumine montes
Orta dies, cum primum alto se gurgite tollunt
Solis equi, lucemque elatis narribus efflant.

Æn. 12. ver. 113.

Thus as finely rendered by our English Maro,

The morn, ensuing from the mountain's height,
Had scarcely spread the skies with rosy light;
Th' ethereal coursers, bounding from the sea,
From out their flaming nostrils breath'd the day.
Dryd.

Ver. 448. These eight verses contain Example X. of oars, which in the sea appear bent and broken: for that part of the oar, which in rowing is dipt in the water seems crooked or broken; but the part above the water is straight. Now, this too is an error of the mind, who does not observe, that the part of the oar, which is beneath the water, is seen by refracted rays, and does not appear to the eyes in the place and site, in which it indeed is, but beyond the surface of the water, from whence the rays tend directly into the eyes. Of which the mathematicians give us this reason: In seeing every thing, either the visual rays from the eyes strike upon the object seen, or are reflected back upon the eyes, or else they are broken: They strike or fall upon the object seen, when we see, for example, a horse, or any other body; or when we see colour in a body not dense, but smooth: They are reflected when we see, for example, a mirror, or any other body both dense and smooth: But they are broken when we see any thing through pellucid bodies; for example, through air and water, or through air and glass: Now the oars in a vessel seem broken because they are seen in this last manner, that is to say, through two transparent bodies; i. e.

through air and water; one of which is more transparent than the other; that is to say the air than the water; but water is more dense than air: and this is the reason that the rays, projected from the eyes upon the oars, that are plunged in water, are broken: for when we see that part of the oar that is dipt in the water, we see it not directly, but obliquely; nor do we indeed see it in the water, which is a denser body than the air, but only its shadow or image; because the line from the thing seen is not reflected in a straight line to the eye, but is broken on the surface of the water. Hence it is, that the eye sees not the thing in the due place, but in another: nay, sees not the thing itself, which is straight; but the shadow of it, which is bent and crooked.

Ver. 449. "*Clauda navigia*," says Lucretius: where the epithet *clauda* seems so properly applied, that I wish our interpreter had retained it in its natural signification. For let us suppose the oars to be the feet and legs of the vessels, by the help of which they walk through the water; and when these oars are broken, the vessels may well be said to be lame and crippled. The two first verses of this passage in Lucretius run thus:

*At maris ignavis in portu clauda videntur
Navigia, aplustris fractis, obnitier undis.*

In which Creech, in his Latin edition, has made an excellent emendation. For *in portu*, he reads *in ponto*; and indeed how can a ship in harbour be said to struggle with the waves? Had he been aware of this when he translated this passage, he would not have placed his ignorants upon the shores, because they could hardly discern, from such a distance, whether the oars of a vessel at sea seem broken or not: and he might have spared the next verse save one, And they are loth, &c. for which he has no authority from his author; who, by *maris ignavis*, means men unaccustomed to the sea, raw seamen.

Ver. 456. In these four verses is contained Example XI. of the stars, which by night seem to fly by the clouds, and to be hurried in a contrary motion: in which not the eye but the mind itself is deceived: For while the eye beholds the clouds, and perceives them in different places, the mind itself believes them unmoved from their place; and while the sight remains fixed upon them, the mind supposes, that it is not they that move along the sky, but the stars, that fly over, and pass by them.

Ver. 460. These six verses contain Example XII. concerning things that appear double, by reason of the pupil of the eyes being ever so little distorted; so that, for instance, we seem to see two candles for one, two faces of one man, for one face, &c. In which the mind itself is deceived, not considering that the eyes, in that distorted site, do not regard the objects seen with their usual and conjoined, but with unwonted and separated rays: and for that reason we perceive the object seen to be double. As if, for example, in like manner, we touch one round ball with the middle and forefinger transposed, we shall

seem to feel two balls. Aristotle, Problem, sect. 3. giving the reason of this example, says, That the same thing happens, as does to men drunk, who see two for one: For the principle of sight is moved in such a manner, that both eyes see not alike: There is this only difference, that the motion in men who are drunk, is made inwardly: but another reason may be given of it: When one of the eyes is pressed by the hand, the sight is bent and crooked, and the nerves are moved up and down, and distorted this way and that; and hence it is that the objects are doubled. But Cicero in Lucullus, says: "*Timagoras Epicureus negat sibi unquam, cum oculos torfisset, duas ex lucernâ flamulus esse visas: Opinionis enim est mendacium, non oculorum.*" Timagoras the Epicurean, denies, that when he distorted his eyes, he ever saw two flames from one candle; for it is a lie of the opinion, not of the eyes.

Ver. 463. I am sorry it is necessary to acquaint the reader, that Creech has put this poor thought in the mouth of his author.

Ver. 465. "*Et duplicis hominum facies*," says Lucretius. Geryon was a king of Spain, and said to have three bodies; therefore the word almost was requisite. See the note, Book V. ver. 30.

Ver. 466. In these ten verses, the poet brings his thirteenth and last example, concerning those things that we seem to see in our dreams, as if we were awake. For sometimes when we are found asleep, we seem to see the sun, the light, the sky, the sea, rivers, mountains, fields, &c. And all these things appear sometimes to move and change their places. Nay, we seem to hear sounds, and to speak, when all is in the deepest silence. This happens because the mind rashly and erroneously interposes her judgment concerning these things, and supposes they are indeed as they really appear to be. The like happens also in deliriums, in folly, and in madness. Thus Pentheus seemed to see two suns, two Thebes, and the furies too, as well as Orestes. Virgil. *Æn.* iv. ver. 469.

*Eumenidum veluti demens videt agmina Pentheus
Et solem geminum, et duplices se ostendere Thebas:*

*Aut Agamemnonius scenis agitatus Orestes,
Armatus facibus matrem, et serpentibus atris
Cum fugit, ultricisque sedent in limine Diræ.*

But we shall have occasion to speak more at large of dreams towards the end of this book.

Ver. 476. It is certain we are deceived in things, in which the senses are employed, but how does that argue the senses themselves to be fallible? The poet, in these four verses, shows the unreasonableness of this pretence; the senses receive the images of things, just as they are presented to them: they know not the nature of them, nor do they judge or determine in the least concerning them: therefore there is no error on their part; but all mistakes proceed from the judgment of the mind. The senses represent and make their report; according to which their reason judges, but often rashly, and inconsiderate-

ly. Epicurus himself writes to the same purpose to Herodotus; *Καὶ πᾶσα μὲν φαντασία ἐστὶ δianoia, ὅτι αἰσθῆσιν κατλαμβανομένη ἔμιν τοὶ διαλαμβανόμεναι, εἰς ἀλήθειαν τὸ δὲ ψεῦδος, καὶ τὸ δὲ διήμαρτη- μένον ἐν τῷ προσδοξαζομένῳ αἰεὶ εἰς ἡμετέραν τὴν κίνησιν ἐν ἡμῖν αὐτοῖς συνημμένη μὲν τινὶ φανταστικῇ ἐπιβολῇ, διάληψιν δὲ ἔχουσιν, καθ' ἐν τῷ ψεύδῳ γίνεσθαι,* &c. Besides, we may gather the opinion of Epicurus concerning the certainty of the senses, from several of the ancients: Cicero in Lucullus says: "Eo rem dimittit Epicurus, si unus ē sensibus semel in viā mentitus sit, nulli unquam esse credendum:" Epicurus went so far as to say, That if any one of the senses had but once mistaken, no credit ought ever to be given to any of them. And in the first book, de Finibus: "Judicia rerum in sensibus ponis [Epicurus] quibus si semel aliquid falsi pro vero probatum est; sublatum esse omne iudicium veri et falsi putat." Empiricus explains this opinion of Epicurus to this purpose. They are mistaken, who say, that some of the images are true, some false; inasmuch as they cannot distinguish that opinion from certainty: For, as to what relates to Orestes, when he seemed to himself to see the furies, the sense itself, that was moved by the images, was true: for the images were really present: But the mind was deceived in believing them to be real furies. Thus Tertullian, lib. de Animā, cap. 17. says, "Epicurei constantius parem omnibus atque perpetuam defendunt veritatem, sed aliā viā: non enim sensum mentire, sed opinatum; sensum enim pati, non opinari." Thus Gregor. Nyssenus, lib. iv. de Phil. c. 3. speaking of the sight, after he has mentioned those examples of the oars that seem broken in the water, and of a square tower that appears round, adds: "neque est hic error visus sed mentis: nam ille videt et renunciat quidem: verum mens ad ea quæ exhibentur non attendit." Nor is this an error of the sight, but of the mind; for the sight indeed sees, and makes its report, but the mind does not give due attention to the things that are represented to her. You may consult farther Empr. adv. Logic. but above all Macrob. Saturn. lib. vii. c. 14. where he argues admirably well of all these matters. Our translator has omitted the two last verses of this passage, which run thus in the original:

Nam nihil egregius, quam res secernere apertas
A dubiis, animus quas ab se protinus abdit.

The meaning of which seems to be this: For nothing is more excellent, than to distinguish things that are clear and plain from such as are doubtful, which the mind immediately hides from herself, that is, from her own knowledge. However, several of the interpreters, as Lambinus, Faber, and some others, absolutely reject them, as foolish and unworthy of Lucretius. But Creech, in his Latin edition, blames their severity, and says, that some copies, and that truly too, read "Nam nihil ægrius est," &c. and that, if instead of *abdit*, we read *addit*, the sense will be plain and easy. He goes on, that the poet has taught, ver.

467, "non addere opinatus animi," not to add the judgment of the mind: For we are deceived in all those examples which he but now enumerated; and that too, even though we were forewarned of it: For it is indeed difficult not to add the opinion and assent of the mind to things imparted to us by the senses.

Ver. 478. "Opinatus animi," the opinion of the mind, of which Epicurus, writing to Herodotus, gives this definition, *κίνησις ἐν ἡμῖν αὐτοῖς συνημμένη ἑμὲν τινὶ φανταστικῇ ἐπιβολῇ διάληψιν δὲ ἔχουσα.*

Ver. 480. In these ten verses, the poet takes occasion to fall upon the modern academics, of whom Arcefilas was author, and introduced, says Lactantius, an incoherent kind of philosophy; for something must of necessity be known, otherwise it could not be known that nothing can be known: For if you know nothing at all, then how can you know that nothing can be known? But if it be known that nothing can be known, then it is false to say that nothing can be known. "Arcefilas introduxit genus philosophiæ ἀσύστατον, quod Latine instabile sive inconstans possumus dicere. Ut enim nihil sciendum sit, aliquid scire necesse est. Nam si omnino nihil scias, id ipsum nihil sciri posse tolletur. Itaque qui velut sententiæ loco pronunciat, nihil sciri, tanquam perceptum profitetur et cognitum: ergo aliquid sciri potest." Lactantius, lib. iii. de falsâ sapientiâ, cap. 6. And for this reason Metrodorus of Chios, in the Lucullus of Cicero, says, "Nego scire nos, sciamus ne aliquid an nihil sciamus; ne id ipsum quidem nescire, aut scire nos nec omnino sitne aliquid, an nihil sit:" I deny that we know whether we know any thing, or know nothing; nay, that we either know, or not know even this, whether any thing be, or nothing be. But such men cannot be disputed with who know not what is true, what false, what certain, what doubtful, nor what it is to know, or not to know; and who glory in their ignorance. But Lucretius overthrows this sophism at first attack; for, says he, if you know for certain that nothing can be known, you know at least that you know nothing. Socrates, whom the ancient academics followed, was more wary, and said only: This one thing I know, that I know nothing.

Ver. 482. This may perhaps in some measure express the implied meaning of Lucretius, though the words of the text be very different:

Hunc igitur contra mittam contendere causam,
Qui capite ipse suo instituit vestigia retro.

All the copies acknowledge these two verses: But Lambinus suspects them not to be genuine, and at length reads,

Hunc igitur contra quidnam contendere curem?

Faber, however, is of another opinion, and says, this passage is very plain and elegant. They who walk on their hands, with their head prone to the earth, as most mountebank's boys do, can go no other-wise than backwards; which you may easily apply to explain the meaning of Lucretius. Thus Faber. Let us then apply it to that purpose, and

let his meaning be this. There is no disputing with a man who perverts all things, as it is certain the new academics did.

Ver. 490. In these twenty-five verses, he attacks the ancient academics, and establishes the senses as the sole arbitrators and judges of truth. For, says he, whatever can correct and confute what is false, must of necessity be the criterion of truth: And this is done by the senses only. But what can correct and confute the senses? Can reason? Reason itself entirely depends upon the senses: Shall one sense convince and confute another? This can never be; for each sense has its proper objects: nor does it care, or know what the other senses do: Shall the same sense then correct itself: Impossible: For we must always give equal, or no credit at all to the senses. Therefore we ought to believe the senses infallible, and to trust only to what they represent and lay before us. Now the ancient academics held the mind to be the sole arbiter and judge of all things; but that the senses are dull and heavy, and cannot thoroughly perceive the things that are subject to them; for some are so small, as not to be visible to the eye, others so swift, as never to seem the same, nor like what they were before. But Epicurus taught, *Κριτήρια ἀληθείας εἶναι τὰς αἰσθήσεις, ὅδ' εἶναι δυνάμενον αὐτὰς διελέγχει*. That the senses are the criterions of truth, and that it is not possible to confute them.

But he that would establish a criterion, is certain to have the sceptic for his enemy; and, what is more uncomfortable, to be unable to confute him. He is an animal incapable of conviction; his folly may be exposed; but to endeavour to bring him to sense and reason is as wild a design,

—ut si quis asellum

In campum doceat parentem curere frænis.

As would be his who went to train an ass
T' obey the bridle, and to run a race.

Pyrrho would venture on a precipice in spite of his senses; and though the more sober are careful of their lives, yet they are as proof against convictions; a perverse sort of creatures, born to contradict, and instructed in all the studied methods of foolery. Scepticism, according to their own definition, is, *δύναμις ἀντιβητική φαινομένων καὶ νοημένων* its effect is freedom from assent, and its end serenity. The principle of the sect is, *παντὶ λόγῳ λόγον ἴσον ἀντικείσθαι*, yet this is not proposed as a dogma, for that is an assent, *τινὶ πράγματι τῶν κατὰ τὰς ἐπισήμας ζητούμενων* nor is it laid down as so in itself, and a real truth, but only in appearance; and therefore Empiricus prefaces his discourse with these words: *προείπων ὅτι περὶ ὁδὸς τῶν λειψομένων διαβιβάζεται ὡς ἕτως ἔχοντες πάντως*. Καθάπερ λέγω. And yet they follow their natural appetite for their preservation, seek the good and profitable, and fly the bad and hurtful according to appearance: for they do not deny but that they may be warm and cool, and are capable of pain and pleasure; yet none, like a dog-

matist, affirms it is as *ὑπάρχον*, but *τὸ αὐτῶν φαινόμενον καὶ πάθος ἀπαγγέλλει τὸ ἑντὺ ἀδοξάσας*. The law of their country is the rule of just and right, and the custom of the nation determines their religion.

This is the face of a sceptic, as it is drawn by his own hand; and since we find him condemned to diffidence, there are some reasons sure of this unsettledness, this *ἰσχυρὴ* and some propose ten, others fifteen, and others increase the number; but one will comprehend them all, and that is enough to ruin every science in the world. It is taken from the variety of opinions about the same thing; for there can be no appeal for a decision, because he that would judge acts by the same faculties that those do, that are at strife, and so he that loses the cause will be still dissatisfied: And to invert Seneca, "*Citius inter horologia quam philosophos convenit*," clocks will agree sooner than philosophers. This difference rises from the various tempers of mens bodies, the dispositions of their organs, and situation of the object: Thus melancholy and sanguine take different notices from the same impression, young and old, sick and healthy, drunk and sober, do not agree; nor is it enough to answer, that some of these are indisposed, whilst the others are in order; for, since that change is nothing but an alteration of the humours, they demand a reason why such and such a disposition should be more capable of receiving impressions from objects that are agreeable to the nature of the things than another: Besides, they observe, that the complexions of animals are various, and the texture of their organs different; so that there cannot be the same refractions in their eyes, the same windings in their ears, and therefore not the same notices from the same objects: And, indeed, did the sceptics proceed no farther than sensible qualities, we must acknowledge them to be very happy in the discovery; for it is certain, that those are phantasms alone; and they that think honey sweet, and they that think it bitter, have equally true representations of the object, because the little parts of honey act upon both their organs, according to their figure.

Hence they proceed to deny all first principles, and so are put beyond all possibility of conviction; for still demanding proof after proof, they must reel on to eternity without satisfaction: But this is too long a journey, and too fruitless a trouble to pursue, and so we must take our leaves of these contradicting animals, who have no other reason to deny the clear light of science, but because some mens eyes are too weak to look steady upon it.

Ver. 495. Thus too Epicurus in Laertius, *Πᾶς γὰρ λόγος ἀπὸ τῶν αἰσθήσεων ἡρτῆται, πᾶσα δὲ αἰσθησις ἄλογος ἐστίν*. For all reason depends upon the senses; but every sense is void of reason.

Ver. 499. Epicurus in Laertius says, *Οὔτε ἡ ὁμοιογενὴς αἰσθησις ὁμοιογενῇ διελέγχει δύναται διὰ τὴν ἰσοσθίνειαν, ὅτι ἡ ἀνομοιογενὴς τὴν ἀνομοιογενῆ, ἡ γὰρ τῶν αὐτῶν κριμαί*. For it is not possible that a sense of the same kind should confute a sense of the like kind with itself, because of the

equality of their strength and power: Neither can one of an unlike kind confute another of an unlike kind: Because the senses of a different kind have not the power nor means to judge of them.

Ver. 515. But since we are often deceived by the senses; for example, a square tower, seen at a great distance, seems round, what are we to do? Lucretius answers, in these twelve verses, that it is better to have nothing to do with those problems, nor concern ourselves about them: Or to assign any cause of them, rather than distrust the certainty of the senses, on which our safety, our all, our life depends: For without the senses we could not choose nor discern good things from bad, nor healthful from hurtful: Nay, nor avoid precipices, flames, or other things of the like nature. But here the poet chiefly lashes the sceptics, of whose founder, Pyrrho, Diogenes Laertius says, *Μηδὲν ἐκίστατόμενος, μηδὲν φυλασσόμενος ἦν, ἅπαντα ὑφίσταμενος, ἀμάζας, εἰ τύχοι, καὶ κρημνὺς, καὶ κύνας, καὶ ὅσα τοιαῦτα, μεῖδεν ταῖς αἰσθήσεσιν ἐπιτρέπων.*

Ver. 528. In these eight verses, he concludes this long disputation concerning sight. We examine all things, says he, by the truth of the senses, and therefore if they are erroneous, farewell to all certainty and knowledge. Nor should we err less than a carpenter, who works by a false rule, line, and level.

Ver. 536. Hitherto he has been arguing of sight and of images. Now, to ver. 621. he treats of sound, and of hearing, which certainly, next to sight, deserves the preference before any of the other senses; since the ear, the instrument of hearing, is the entrance or inlet of voice and sound, and consequently of knowledge and discipline. First, therefore, in these eleven verses, he teaches what hearing is. Now we hear, says he, when any sound reaches the ears, and, by means of its body, moves and affects that sense, which is appointed to perceive it. But now it is manifest, that even voice is a body, because it scrapes and rakes the jaws, makes them rough, and hurts them: Therefore it must of necessity touch them: And whatever touches, or is touched, is a body. This is his first argument. Epicurus, writing to Herodotus, says, *Ἀλλὰ μὲν καὶ τὰ ἀκρόειν γίνεσθαι ῥιυμαῖός τινος φερόμεν ἀπὸ τῆ φωνῆς, ἢ ἡχῆς, ἢ ψοφῆς, ἢ ὅπως ὅποις ἀκρωτικὸν πάθος παρασκευάζοντες.* And in Plutarch de Placitis Philosoph. lib. iv. cap. 19. he teaches to the same purpose, that voice or sound is a flux emitted from things either speaking, sounding, or making a noise by any means, or in any manner whatsoever; and that that flux consists of minute fragments figured alike; or, as he teaches in Laertius, this effluxion is like little drops of water, and that, therefore, it is no wonder that the same voice or sound strikes the ears of several persons at once, because the sounds or voices they receive are exactly like little drops of water that resemble one another.

But not Epicurus only held the voice to be a body, for the Stoics too were of the same opinion, and held every thing to be a body that either acts or suffers: Now the voice both acts and suffers:

It acts when it strikes the ears, and the air that is in the head, and imprints hearing, as the seal marks the wax: It suffers, when falling upon smooth and solid places, it is reflected and repelled. But Pythagoras and Plato held voice and sound to be incorporeal: For, say they, every stroke of the air is not a voice; for the wagging of a finger strikes the air, and yet makes neither voice nor sound. Therefore they took voice and sound abstractedly, as they call it, for the figure only in the surface of the air, which is evidently incorporeal, because it is void of all profundity. Plato in A. Gellius, lib. v. cap. 15. defines sound and voice, an air and strong percussion of the air. Aristotle too seems to incline to the same opinion; for he defines sound to be a local motion of some bodies, and the medium which is applied to the organ of hearing. This definition some of his followers have endeavoured to interpret otherwise than the words will bear, and imagine sound to be different from local motion. And these are the chief opinions of the ancients concerning sound, which is the undoubted object of hearing, and generally believed to consist in, and to be caused by a tremulous motion of the air, vibrated and forced on by a motion produced in other bodies; which motion of the air must necessarily be made in an undulatory manner, that being the sole motion the air is capable of receiving: For, since all places are replete and filled with air, no particle of air can receive any motion, without immediately imparting that motion to its adjoining particle, and that again to the next, and so on successively: And this motion must be granted, unless we could suppose that the particles of air were able to penetrate into one another, which is the greatest absurdity imaginable: Now that this undulation of the particles of air is caused by the motion of bodies, is evident, because of themselves they tend to rest.

Moreover, sound may be taken in two different acceptations: I. For the sensation we have when sonorous bodies make their impression on our organs. II. We may consider it as a power peculiar to sonorous bodies, of producing in us this sensation. If we understand it in the first signification, experience will be our best instructor, and explain it best to us: But we may observe, that all are not alike moved and affected with the same sounds; and that one hears perfectly what another cannot, or at least does but faintly perceive. If we consider sound in the second meaning, that is to say, as a power peculiar for example, to a bell, a cannon, or the like, of exciting in us the sensation of hearing, we shall find it comprehended under the description given above. Besides, that all sound is produced by motion, reason and experience both evince: For sound consists in that, the existence of which being granted, sound exists, and without whose existence sound can have no being: Now, grant a motion of the air, sound exists; but without that motion there can be no sound: For daily experience teaches, that motion alone is capable of causing sound, and by the same experience we are as cer-

tain, that where there is no motion there is no sound: for we may easily observe a sound caused by many bodies, that have received no other modification than that of motion; as if a man, for instance, moves the inside of his ear, he instantly perceives a sound; besides, hold a hat in your hand, near a bell that is ringing, you will perceive the motion the bell gives the ambient air, by the motion of the hat, which motion ceases when the bell ceases to ring. And many other experiments are produced of the like nature.

Sound, therefore, is caused by motion. Let us now consider how, and by what means, it affects our organs, and causes in us the sensation of hearing. I. When solid bodies are struck against one another, they cause a sound, by stirring up a trembling motion in the air, which is moved around the surface in manner of an orb: For the air being forced from that side the bodies move on, drives naturally to another, where it meets less resistance; but it finds less resistance on that side the bodies come from, therefore it goes that way; and there it still receives more motion from the air that rushes in on all sides to fill the void spaces which the bodies left: And therefore the air is moved in an orbicular or vortigenous motion. II. From this motion of the air, next the surface of the agitated bodies, the air is vibrated by its undulatory motion, as far as the moving force, the *vis movens* carries it. III. This agitated air, meeting with an ear in its passage, insinuates itself into the *meatus auditorius*, auditory duct or channel, and impels the *tympanum*, or drum of the ear; which being thus moved, moves the innate air, and the three little bones that are in the cavity of the drum (called the hammer, the anvil, and the stirrup; in Latin, "maleolus, incus, stapes"), and they the auditory nerve. IV. This nerve being compressed, excites a reflux of the spirits contained in it; and these moving the fibres of the brain, do, by that motion, give the soul occasion to perceive sounds, and to judge of them. And this is the general belief of the nature of sound, of its manner of formation, and how it moves and affects our organs, and causes in us the sense of hearing.

Ver. 547. These seven verses contain the second argument, which is taken from experience. Let a man speak loud, and with great earnestness, he becomes faint and weary: Who then can doubt but that voice is material, since it discomposes the body, and even takes away some part of it?

Ver. 554. These six verses contain his third argument, which he has taken from the pleasure, or the pain with which we are affected by sounds, as they are either grateful or displeasing: Now Epicurus held, that the little bodies which enter into the ear, and affect the organ of it, are of different figures; and that the sweetness and harshness of sounds proceeds only from the smoothness or roughness of those corpuscles, which, as they enter into the organ, either touch it gently, or rudely grate and scrape it, according to their different configurations, either of roughness or smoothness.

This was the opinion of Epicurus: but indeed the wondrous variety of sounds proceeds from the great diversity of sonorous objects. The higher the strings of an instrument are screwed up, they cause the sharper sound; and, on the contrary, the more they are relaxed, the flatter. The reason of which is, because the more the strings are extended, the shorter the interruptions will be between each stroke, and they strike the air the more suddenly, and with greater violence. Thus an acute sound is caused by the quick and uninterrupted motion of the air, continually imparting its vibrations to the organ of the ear. A flat or dull sound is made when the ear is not so frequently impelled, or receives but slow impressions from the vibrations of the air: whence it follows, that the more or less equal the vibrations are, the more or less pleasant will the sounds from thence resulting be; for if the vibrations of the air be equal, the impressions they make on the organ will be all alike; and consequently the reflux of the spirits to the brain will be so too, from whence always proceeds a grateful sensation and harmony: but if the motion of the air be uneven and ill-timed, it causes, for the contrary reason, a harsh sound, and an ungrateful sensation. Besides, a sound from a rough surface is harsh and unpleasant, because the air does not come at the same time from all the parts of the object, and therefore excites a grating impression by its reiterated and unequal impulses: and so much for the harshness and softness of sounds. To which I add, that the more or less violent the force of the impelled air happens to be, the sound will proportionably be more or less loud, by reason of the stronger or weaker impression of the vibrated air on our organs of hearing.

Ver. 557. This and the two following verses run thus in the original:

Cum tuba depresso graviter sub murmure mugit,
Et reboant raucum retrocita cornua bombum:
Vallibus et cycni gelidis orti ex Heliconis
Cum liquidam tollunt lugubri voce querelam.

Which verses have not a little puzzled the interpreters. Some in the second of them, read *barbara* instead of *cornua*; but Lambinus is for expunging it altogether: Upon which Faber says, that if Lucretius were living, he would appeal to some other judge; for that interpreter, as well as many others, did not comprehend the meaning of *retrocita barbara*, or *cornua*: but I, continues he, think I can prove it to be a musical instrument, first invented in Syria, which the French call *Sacbut*, or *Saquebout* (in English *Sackbut*), from the old French words *Saquer*, which signifies to draw, and *bouter*, to beat. They who are acquainted with that instrument, will readily understand why Lucretius calls it *retrocita*: thus far Faber. Yet Vossius on these verses of Catullus, "de Nupt. Pelei et Thetidis."

Multaque raucifonos efflabant cornua bombos,
Barbaraque horribili stridebant cornua cantu.

takes occasion to cite this verse of Lucretius; and

says, that the common lection *retrocita* is foolish and erroneous; and he reads

Et reboat raucum Berecynthia barbara bombum :

Then he interprets "Berecynthia barbara," to be the Phrygian pipe, αὐλὴς Βερεκύνθιος, as Hesychius has it in βερεκύνθια, &c. In other copies nevertheless it is read.

Et reflexa retro dant cornua barbara bombum :

This, at least, is certain, that the *tuba* was straight; the *buccina* crooked; like the French post-horn that is made of brass, and by them called *Une cornette*; and that the *cornu* was a very bugle-horn. See Vegetius, lib. iii. c. 5. The next verse Vallibus, &c. has yet a greater variety of reading, Some copies have,

Vallibus et valida ne tortis ex Heliconis,

Which, whoever understands, says Faber, I will hold him to be an Œdipus, or a Tiresias. In others it is read,

Et gelida cycni nece torti ex antro Heliconis.

In others,

Vallibus et cycni nece torti ex Heliconis.

In others,

Vallibus et cycni nece detorti ex Heliconis.

Lambinus,

Vallibus et cycni gelidis orti ex Heliconis.

All which several readings are condemned, for reasons too tedious to repeat. Faber corrects Lambine's reading; and in the place of *orti* substitutes *corti* for *coorti*. Lastly, Vossius, on the before cited passage of Catullus, reads it thus,

Et validis, cycni torrentibus ex Heliconis.

For several streams, as well as the river Helicon, flowed from the mountain of that name. Creech having summed up all these various readings, gives sentence as follows: In a word, "nece torti," or "nece detorti," must be absolutely rejected; for the meaning of those words, if they have any, is contained in the following verse; but follow Faber or Vossius, no matter which of the two. Helicon, a mountain of Bœotia, sacred to the muses, had its name, according to Plutarch, de Nominib. Fluvior. et Mont. from Helicon, brother of, Cythæron, a fordid, covetous wretch, who, having killed his own father, a miserably poor old man, precipitated himself from the mountain; dragging his brother Helicon, because he had nourished his father, down with him. Thus Plutarch: but Casaubon, on the prologue to Persius, judges, that this mountain had its name from the Hebrew word, Halike, i. e. "ambulatio," because the ancients used to take their walks, and to confer and discourse there of natural and divine matters: and Athenæus, l. 14. Deipnosoph. reports, on the authority of Amphion Thespiensis, that there was a college on that hill, instituted for all musical exercises, in which the young men in those days were carefully instructed. But Bocharus conjectures the name to be derived from the Arabic, Halic, or Halics, which, in that tongue, signifies,

a high mountain: for such it is described to be by Strabo, lib. viii. & ix. Of the singing of swans before their death. See book ii. ver. 479. Book iii. ver. 5. and above, ver. 188.

Ver. 560. In these four verses, he teaches, that the tongue forms and articulates this corporeal voice; and thence proceed words: he says, indeed, that the palate and the lips help the tongue in making the illisions. Nor ought we to look on this as a very contemptible opinion; since we find in Plutarch de Plac. Philos. lib. 4. cap. 20. that both Plato and Aristotle approve of it, by asserting τὸ σχῆμα, that the figure which is in the air and in the surface of it, does, by a certain stroke; κατὰ πῶαν πλῆξιν, become a voice. And Aristotle, second problem, 33. et 52. yet more plainly asks the reason why the voice, since it is a certain figured air, that in its motion for the most part loses its figure, does nevertheless preserve it safe and unchanged, when it is reverberated from any solid body? Cicero, in the second book of the Nature of the Gods, says, "Deinde in ore sita lingua est, finita dentibus: ea vocem immoderatè profusam fingit, et terminat: Sonosque vocis distinctos et pressos efficit, cum et ad dentes et ad alias partes pellit oris. Itaque Plectro similem linguam nostri solent dicere, chordarum dentes, nares cornibus iis, quæ ad nervos resonant in cantibus." The tongue is placed in the mouth, and circumscribed by the teeth: this tongue fashions and proportions the voice immoderately uttered, and renders the sounds of it distinct and articulate, while it strikes against the teeth, and against the other parts of the mouth. Therefore, some have compared the tongue to the bow of a musical instrument, the teeth to the strings, and the nostrils to those pipes that sound in consort with the strings.

Most, if not all animals, have the faculty of causing a sound, or a trembling motion in the air, by modifying it whilst it is breathing from the lungs: and from the difference of these modifications proceed all the several sounds observable in animals. Thus the lion roars, the dog barks, the sheep bleats, the ox bellows, &c. But among all animals, man alone has the faculty of articulating his words, and of modifying each breath of air, in such a manner as is necessary for the forming an intelligible language, by which he communicates his thoughts to others of his own species. Moreover, the voice of animals is nothing but a sound, caused like other sounds, by the undulatory motion of the air; for the air, by the falling of the lungs, and by the contraction of the diaphragm, being expelled from the place it was in, does, by driving forward the external air, put it into motion; and, therefore, even when we but fetch our breath, we cause some sort of noise, which grows louder, the greater is the expiration, or the inspiration. Now, voice is only sound articulated, and this articulation is caused by the air's being more peculiarly modified in speech than in other sounds. And the tongue is the chief instrument in this modification; which, nevertheless, the tongue alone could not perform, without

the assistance of the motion of the lips, and of the whole mouth; insomuch that the tongue is moved sometimes upwards to the palate of the mouth, sometimes downwards, other times another way, and others another, according as the letters, syllables, and other accidents of the word to be articulated, require. For one motion of the air necessarily causes one certain sound; and one certain sound causes one certain perception. And this assertion is so infallible, that many people born deaf, have learnt to speak, by being made to observe the motions of the mouth and tongue, and by knowing the motions for such words, to know when they were uttered.

The several distinctions of one voice from another proceed, either from the various structure of the subservient parts, according as they are more or less relaxed or firm, and from their particular formation and configuration, in regard to the proportion they bear to one another. Besides, there is a certain motion of the parts that cause the voice; which motion is peculiar and natural to each of us, even from our infancy, from whence proceeds a difference in voices: sometimes too, certain affectations that may be observed in several persons, alter the natural sound of the voice, for some have an affected way of speaking through the nose, others in the throat, &c. Lastly, The voice is higher or lower, louder or softer, according as the contraction or extension of the lungs and of the diaphragm are more or less strong or weak: for a violent expulsion of the air causes a violent motion of it, and by consequence a great or loud sound; and, in like manner, on the contrary: and this is the reason why such as have a quicker and livelier spring in those parts, have a stronger voice than others.

Ver. 564. He subjoins several problems; the first in these eight verses. The voice, by going far, grows weak; and though it was distinct, when first uttered, it becomes confused; because the small parts, or little voices of which it was composed, are disordered by the air, and lose the form and figure which they had received from the tongue and lips. And hence the voice comes to be either distinct or confused.

Ver. 572. In these four verses, he teaches the reason, why if but one man speaks, the ears of many who are present hear the voice. You are to know, says he, that there is one whole, or rather general voice, which, being pronounced from the mouth, divides itself into innumerable little voices, which are wholly like one another. Thus when the voice is uttered by the speaker, the formation of the bodies that burst out of the mouth, is compressed, broken, and as it were, ground to pieces in such a manner, that it divides and goes away into minute parts, or little voices, altogether alike, and of a like figure, which instantly leap abroad, and diffuse themselves through the air or ambient space, and still preserve that likeness, till they reach the ears of all that are within hearing. And thus the same voice is at once heard by many, even as all drink of the same water who drink out of the same river. This, too,

was the opinion of Democritus, as Plutarch witnesses, lib. iv. de Placitis Philosoph. cap. 20.

Ver. 576. In these twenty-seven verses, he says, that all the little voices that reach the ears are heard; the others are diffused through the air, and vanish away. Some strike on very porous bodies, which afford them a passage through: some on very rough, where they are broken and dispersed. And others striking upon solid, and in some measure smooth bodies, are reverberated from them, and thus are the cause that the same voice is heard again: and this is an echo. Hence, too, proceed, says he, those sounds by night, which the superstitious impute to rural deities.

Ver. 579. An echo, which is only a restoring, rejection, or repercussion of the voice, which is made in smooth, tortuous, and hollow places; as in valleys, caves, and walls, especially in old vaulted buildings. Hence Virgil, Georg. iv. ver. 50.

—Aut ubi concava pulsu
Saxa sonant, vocisque offensa resultat Imago.
And Horace to Aug. l. i. Od. 12.

—Cujus recinet jocosa
Nomen Imago,
Aut in umbrosis Heliconis oris,
Aut super Pindo, gelidove in Hæmo.

We have an admirable description of an echo translated by Mr. Addison, from the third book of Ovid's Metamorph. where see the fable at length.

Echo in others words her silence breaks;
Speechless herself, but when another speaks,
She can't begin, but waits for the rebound,
To catch the voice and to return the sound.
Hence 'tis she prattles in a fainter tone,
With mimic sounds, and speeches, not her own.

Ver. 585. An echo is formed by the reverberation of the vibrated air when it meets with a smooth and solid body. For the air, as well as other mediums, must glance and reflect from objects if it cannot pass through them. Thus it changes its first determination, and is variously reflected, according to the various situation of the object upon which it strikes. Therefore if the object be situated opposite to the place from whence the sound proceeded, the sound will be heard twice in that place; because, being carried from the centre to the circumference, the trepidations of the air meeting the solid body, must be restored and sent back, according to the rules of reflection, which it must of necessity observe: and for this reason, if the object from whence it is reverberated, stands directly opposite to the moved air, that air will be reflected again to the centre. But if the object stand sideways, the echo will not be again heard in the place where it was first formed; because the air will, in that case, receive a side reflection, and consequently glance another way. But the reason why the same sound is several times reflected, is, because there sometimes happens to be several places disposed among themselves in such a manner, and at such distances,

one beyond the other, that the circular undulations of the air in different places, and at different distances, meeting with bodies solid and impenetrable, the same sound will be often rebounded, according to the number and site of the objects; insomuch, that after we have received the sound reflected from the nearest, we receive it returned likewise from those that are more remote from us: and this sometimes happens when the places are opposite to one another, and reflect the voice by turns. Of this nature there was one formerly at Athens, which, as Pausanias witnesses, returned the voice seven times, whence the place itself was called *Ἐπὶ ἄφρονος*. And not long ago at Charenton, a village near Paris, in a ruinous building, and without any roof, where the monastery of the Carmelites now stands; it was observed that the same syllable pronounced at either end of it, was returned no less than seventeen times; and when pronounced in the middle, as often from each end: nay more, it would return a very strong voice, no less than six and twenty times, the reflected sound still growing weaker, before it quite ceased to be heard. This was more wonderful than what Plutarch relates of the pyramids of Egypt, where the voice was returned four or five times; or of the Portico at Olympia, where it was reflected seven. There are some who write, that in the great hall of the palace at Pavia, the image of the voice is repeated thirteen times. Moreover, you may observe, that no echo will be made, or at least not perceived, if you stand too near the reflecting body. The reason of which is, because the voice pronounced, and the image of it that is restored, enter into the ears of both of them at the same time: and in this case it only happens, if the repercussion be made from hollow and vaulted bodies, that a certain confused and humming sound follows after the voice, because many reflections of it are reiterated one upon another. Such is the sound of a bell when it first ceases to ring. But if you stand at a good distance from the reflecting body, you will distinctly hear the reflection of the voice; and the nearer you stand (but still at such a distance, that the reflected voice may be discerned from the pronounced), the fewer syllables you will distinctly hear returned: and the farther you are off, the more you will hear: because the interval of time between the cessation of the speaker, and the perception of the reflected voice, is less in the first case, and greater in the last. Hence, it is no wonder that an entire hexameter verse is sometimes returned: but then the voice must be very strong, that it may be able, from a great distance, to reach the reflecting body, and to return from it. It has been sometimes observed, that more notes of a trumpet have been distinctly returned, than would have been necessary syllables, to compose an hexameter verse, if a human voice could have been pronounced from that instrument. But the reason we hear only the latter part of the sound echoed, may be because the air that was moved by the first part of the sound, arriving first at the solid body, is first reflected from it; so that in its reflection, it must meet with the

TRANS. II.

air that was put in motion by the latter part of the sound; and consequently, not being strong enough to resist its motion, must communicate its own to it. And for this reason, besides the echo of the end of the sound is as loud as, nay, sometimes louder than when it was first formed; because it has a double force, i. e. its own, and that with which it was repelled by the forerunning circles.

Ver. 589, Nympha, as it were *νῆα φαίνουσα*, and the word signified as well a bride, or new married woman, as those female deities, who, according to Pausanias, were not held to be immortal, but to live extremely long; almost an innumerable succession of years. The poets gave them several names: I. The Naiades, or Naides, from *ναίειν*, to flow, who presided over fountains and rivers. II. The Nereides, who were daughters of Nereus and Doris; and were set over the waters of the sea. III. The Oreades nymphs, or goddesses of the mountains, from *ὄρος*, a mountain. IV. The nymphs of the woods, who were called Dryades, from *δρῦς*, a tree, or rather an oak. V. The Hamadryades, who presided over each tree, from *ἅμα*, together with, and *δρῦς*, a tree, because they fell and died with their trees. VI. The Napeæ, the nymphs of the groves, gardens, valleys, and pleasant abodes, so called from *νάπη*, a grove. VII. The Limoniades, or nymphs of the meadows, from *λειμῶν*, a meadow. And, VIII. Limniades, the nymphs of the ponds, and standing waters, from *λίμνη*, a pond.

These were a sort of rural gods, so called from Faunus, king of Italy, the father of king Latinus; and who, for having been the first who introduced agriculture into his country, was recorded in the number of their gods: though others say, they had their name *a fundo*, from speaking, because in woody places they were wont to speak and converse with men. An instance of which they allege in the voice that was heard from out the woods, during the battle between the Etrurians and the Romans, for the restoration of the Tarquins, and which bid the Romans take heart. Now the peasants, to make these gods of theirs more terrible, gave them horns on their heads, hoofs instead of feet, prick-ears, and the shape of a goat.

The satyrs were believed to be gods of the woods; like the sylvans and fauns, with a human head, but horned; with the feet of a goat, their bodies all hairy, and to delight in the coverts of woods. They were part of the train of Bacchus, and notorious for their lasciviousness. Horat. lib. ii. Od. 19.

Bacchum in remotis carmina rupibus
Vidi docentem (crediti posterum),
Nymphasque discentes, et aures
Capripedum satyrorum acutus.

Plutarch, in the life of Sylla, relates, that a satyr was brought to Sylla. And St. Jerome, in the life of Paul the Hermit, says, that St. Anthony had seen one of them likewise: And that another was seen by all the people of Alexandria in the

K k

days of Constantine. He says, besides, that there are indeed in Ethiopia, a sort of quadrupedal animals, with the feet of goats, but a human shape of body, except only that they have horns on their heads; and that when he asked them what they were, they answered, that they were men doomed to wear those bodies, as a punishment for the crimes of which they had been guilty. But others reckon them among spectres, and the monsters of nature, and believe the whole race of satyrs to be merely fabulous. They were called *satyri*, as *Ælian* says, ἀπὸ τῆς σισυρήναις, which signifies, to have a mouth like a dog when he grins. *Casaubon* derives it from the Doric word, σατυρή, to be merry; and others from σάβη, "quod significat membrum virile, quia ad libidinem proni sunt satyri."

Ver. 593, 594. Thus the goatherd in *Theocritus*:

Οὐδέ μιν, ὦ ποιμάν. τὸ μισαμυρινόν, ἢ Δίμιν ἄμυν
Συρίσδιν, τὸν Πᾶνα διδοίκαμις ἢ γὰρ ἄσ' ἔγας
Τάνακα κυμακῶς ἀμπαύνται' ἐντ. γι πικρὸς,
Καὶ εἰ μὲν δριμύνα χολὰ ποτὶ βῖνι κάθηται.

Pan was the chief of the rural gods, and presided chiefly over pastoral affairs; therefore said to be the god of the shepherds. "Pan curat oves oviumque magistros." *Virg.* He was represented with a garland of pine leaves on his head, upon which there grew a goodly pair of horns, and his feet were like those of goats: In one hand he bears a pipe made of seven reeds, joined together with wax, of which he was the first inventor. *Virg. Eclog. ii. ver. 32.*

Pan primus calames cerâ conjungere plures
Instituit

In the other a shepherd's crook: He was believed to delight in solitary places, and to frequent chiefly near the sea, whence the Greeks call him, ἀλίπ[ι]λαρχος. And he was thought to be in love with Echo. Whether he was son of Mercury or not, is uncertain: but the name of Pan, Πᾶν, all, was given him, according to Homer in Hymn. Because, when he was but newly born, he touched the harp so artfully, that he delighted all the gods with the harmony; but, according to others, because he represented the whole nature of things. By his horns, the beams of the sun, and horns of the moon, by his jolly red face, the air, by his goats feet, the solidity of the earth, by his bristly hair, the trees of the earth, and the beasts, &c.

Ver. 595. The pipe, which the ancients called *fistula*, was made of seven unequal reeds joined together with wax; (*Theocritus*, *Idyl. viii.* mentions one made of nine) that it might imitate so many different notes of the voice. *Virg. Ecl. ii. ver. 36.*

Est mihi disparibus septem compacta cicutis
Fistula.

Now the reeds, that were joined together, decreased in this proportion; at the top, where they received the breath, they were all of the same height; but at the bottom, where the breath went out, they were all gradually one shorter

than the other. *Scaliger*, on the verse of *Virgil* above cited, will have the *cicuta* to be hemlock, the venomous plant, with the juice of which the Athenians were wont to punish criminals with death, and says, that of the hollow stalk of it they made their instruments of wind music. *Servius*, but without authority, says, the pipe was made of the joints of any reed or stalk whatever. But the musical instruments of the shepherds, were first made of the stalks of oats or wheat, compacted together with wax; next of reeds, and joints of box made hollow; then of the legs of cranes, of the horns of animals, of metals, &c. Whence the words, "avena, stipula, calamus, arundo, fistula, buxus, tibia, cornu, æs," &c. were used for musical instruments.

Ver. 598. *Genus agricolûm.*] The peasants, who were wont to boast of their conversation with the gods. "Jactant miracula dictis." *Lucret.*

Ver. 603. Since, therefore, we receive the sounds of the voice, expressed and formed by him that speaks, even as we do the images that flow from the surface of things, how comes it to pass that we hear him whom we cannot see? Why are things pervious to sounds, and not to images? This *Lucretius* answers in these nineteen verses. The voices or sounds, says he, that are formed in speaking, pass whole and unhurt through the oblique passages, and tortuous pores and holes of bodies, by which the images, as he taught before, are broken. Or rather, goes he on, the reason of it is, because the voice divides itself, and leaps abroad into little voices, which diffuse and scatter themselves on all sides round, upwards, downwards, forwards, backwards, to the right, to the left, in short, in all manner of obliquities, as many little sparkles leap abroad from one shaken spark; and thus they light into the ears that are all around, and not only into those that are placed in a direct line from the speaker. But no such thing can happen to the images. Yet the voice itself, by penetrating through such mazes and windings, becomes weak, indistinct, and breaks into murmurs.

Ver. 607. Here our translator seems to me to have mistaken the sense of his author, who says,

Vox per flexa foramina rerum
Incolumis transire potest, simulacra renutant.

that is to say, voice or sound, that strikes the ears, can pass whole and unchanged through the crooked and tortuous pores of bodies; but *simulacra renutant*, the images of things that strike the eyes cannot. This is consonant to the doctrine of *Lucretius*, who positively asserts that we see by the incurfion of images into the eyes, not by the emission of rays from them. Nor, indeed, will the word *simulacra* bear that interpretation; and yet, he renders it again, ver. 617. visive rays; erroneously in both places, and even contrary to the doctrine, as well as express words of his author.

Ver. 609. This instance is not true; for in the first place, there are oblique pores or passages in glass, by which the images of things are refring-

ed, because the things seen do not appear to be in their places; and even when the refraction is made, the images cease not nevertheless to tend directly into the eye: Besides, the whole or entire image does not fly through the glass; for of the rays that constitute the image, they only pass through, that happen to fall into the pores or void spaces of the glass: but the others, that chance to light upon the solid parts of the glass, are reflected. In this, therefore, consists not the difference between an image and a voice.

Ver. 622. The problems, relating to the taste, are not in greater number, nor more difficult to explain, than those that concern the sight and hearing: For we taste, says the poet, when the juice that is squeezed out of sapid bodies, like water out of a sponge, penetrates the palate and the tongue. Which juice, if it consist of seeds figured in such a manner, that when they are poured upon the organ of the taste, and enter into the pores of it, they exactly fit those little pores, and thus gently tickle, and pleasingly affect the organ, seems sweet: But if the figuration of the seeds be such, that when they come to enter into the little pores of the organ, they bear no due proportion and commensuration with them, they then prick, hurt, tear, offend, and roughly move and affect the organ; and then the juice seems not sweet to the taste, but either bitter, salt, acid, sour, harsh, biting, &c. Epicurus took this opinion, as well as many others, from Democritus, who gave to every sort of taste or flavour, its particular figure: as may be seen in Theophrastus de causis Plant. lib. vi. cap. 2. in these words: Δημέκριτος δὲ χῆμα περιτρίβεις εἰςάτω Γλυκὺν μὲν τὸν στρόγγυλον, δὲ ἰσχυρόν πεισί, Στεφυρὸν δὲ τὸν μεγαλόχημον, Τραχὺν δὲ τὸν πολυγώνιον καὶ ἀπεριφειρῆ· Δριμὺν δὲ τὸν περιφειρῆ, δὲ λιπρὸν, καὶ γωνοειδῆ, δὲ καμπύλον· Ἀλμυρὸν δὲ τὸν γωνοειδῆ, δὲ σκόλιον, δὲ ἰσοσκελῆ· πικρὸν δὲ τὸν περιφειρῆ, καὶ λεῖαν ἔχοντα σκολιότηθα, μίγνθος δὲ μικρὸν· Λιπαρὸν δὲ τὸν λιπρὸν, καὶ στρόγγυλον, δὲ μικρὸν.

Ver. 632. For this reason Nigrinus, in Lucian, makes a scoff at those who were too curious in the fauces of their meat; and accused them of giving themselves a great deal of trouble, for the sake only of a very short and transient pleasure; since the throat, through which the meat sliding down, would move them with any delight, is not above four inches in length: Nor did they find any pleasure in dressing the meat, nor could they, after it was swallowed; but only in that instant of time, while the meat is passing through the throat. This made the voluptuous Polixenus ask of the gods to make his neck like a crane's, that he might receive the greater pleasure in eating, by the longer stay of the food in the jaws and throat.

Ver. 637. To this, and the two following verses, we may join what Epicurus writes to Menæceus in these words: Τὸ συνθίζειν ὅν ἐν ταῖς ἀπλῆς, καὶ ἡ πολυτέλειαι διαίταις καὶ ὑγιείας ἐστὶ συμπληρωτικόν, καὶ πρὸς ἀναγκαιὰς τῆ βιωχρήσεως ἐκόντων ποιεῖ τὸν ἄνθρωπον.

Ver. 640. In these forty-two verses the poet explains the reason, why the same meat is not

only pleasant, but healthful also to one; and not only nauseous, but hurtful to another. The organ of the taste is different in some men, and in some animals, from what it is in others; either in its texture, or configuration of the atoms; or of the spaces that intervene between them; even as the other parts of men or animals are different, especially the outward. But the different passages or pores must necessarily admit, and receive different corpuscles of juice: and every thing, out of which juice is squeezed, contains seeds of different figures: and the corpuscles of all juices, by reason of their various figuration, do not agree with, and fit the organs of all animals. Hence it is, that what is nourishment to one animal, is poison to another; and what is grateful to this, is distasteful to that. Nay, when by age, or by reason of any disease, the temper, or the frame of the organ is changed, the same thing seems to have changed its taste, even though nothing be changed in it. Thus a man in a fever thinks those things bitter, which a man in health takes to be sweet; because the texture of the organ being altered, those corpuscles, that fitted it before, are no longer fit for it; and therefore tear and hurt the organ.

Ver. 645. Of this assertion our translator has omitted an instance, which Lucretius expresses in these words:

Est utique, ut serpens hominis contracta salivâ
Disperit, at sese mandendo conficit ipsa

And that serpents cannot suffer, but fly from the spittle of a man, we have the authority of Pliny, lib. vii. cap. 2. who there says, "Et tamen omnibus hominibus contra serpentes inest venenum: feruntque eas ictum salivæ, tanquam aquæ ferventis contactum, fugere." But that it makes them so furious, as to eat their own bodies, we have only the authority of Lucretius, that I know of: And Faber says, it is commonly reported, and believed by many; but that, having often made the experiment of it, he could never find it to be true.

Ver. 646. *Veratrum*, in the original, signifies the plant which the Greeks call hellebore, as Pliny witnesses, lib. v. c. 14 where he says, there are two sorts of hellebore, one white which the Latins call *veratrum album*, white hellebore; the other black, by some called *polyrhizon*, by others, *entomon*, and by others *melampodium*, either from Melampus, a shepherd, the son of Amythaon, and who was the first that discovered the virtues of that plant, by which he cured of madness the daughters of Prætus, king of the Argives, having first observed that goats used to purge themselves with it; or from its black root; the root of a plant may, not very improperly, be called the foot of it; whence the Latins call it, *veratrum nigrum*, black hellebore; Mart. will have it to be called so, because it is *verè atrum*, truly black: Scaliger derives it, à *verare*, to speak the truth, or to foretel, "quod eo purgarentur veratores et veratrices, qui pro infans habebantur." The same Pliny, lib. x. cap. 12. says, that the taking of either of them is dangerous to men; though both

of them fatten goats and quails; which is again confirmed by Lucretius, lib. v. ver. 897.

Quippe videre licet pinguescere sæpe cicuta
Barbigeras pecudes, homini quæ est acre ve-
nenum.

Where we see the word, *cicuta*, is taken for hellebore: In which sense too Horat. lib. ii. epist. 2. ver. 53.

Quæ poterant unquam fatis expurgare cicuta.

And Avicenna calls the herb, *cicuta*, black hellebore: whence it is probable, that our hemlock is neither the *viratrum* nor the *cicuta* of the ancients. Therefore, instead of hemlock-juice, we may read hellebore.

Ver. 657. For the different formations of the intervals of the pores answer to the various figurations of the atoms, of which they are composed: so that as some atoms are trigonical, others quadrangular, others polygonical, &c. in like manner, some of the intervals of the pores are trigonical, others quadrangular, others polygonical, &c.

Ver. 661. The meaning is: since what is sweet to some, is bitter to others, it is credible, and so far true, that the most sleek and smoothest atoms, which are in the meat and drink, that affect the tongue and palate with sweetness, do, as they enter into the pores, sooth and tickle them: And, that, on the contrary, the rough atoms exasperate the tongue and palate of those, to whom the meat is bitter; but that the same meat is sweet to some, and bitter to others, proceeds from the disturbed or altered contexture of the atoms.

Ver. 670. In these twelve verses, he confirms the foregoing doctrine by an example. He has taught, that the bitterness of the same meat and drink to some, and the sweetness of it to others, proceed from the perturbation of the atoms in the bodies of animals: which perturbation or commutation is caused in sick persons by the predominating bile, or some other cause, be it this or that, no matter. But then the whole body is disturbed and disordered; the fire and position of the atoms is changed; whence those, that before produced a sensation of sweetness in the taste, now produce a bitterness, by reason of the change that is made in their site and order; and so on the contrary.

Ver. 682. Having finished his disputation of taste and flavours, he now enters upon the subject of smell and odours. And first, in these ten verses, he teaches, that as images flow as sound is emitted, and as savoury juices are squeezed out of things, so odours are breathed from things likewise. Now, the variety and dissimilitude of the figures (see Book ii. ver. 398.) which do not move and affect the organs of all animals alike, are the cause that all animals do not equally perceive these odours that are continually exhaled and sent from bodies. Thus bees smell from far the odour of honey; vultures of dead bodies; dogs of wild beasts; and geese of a man. And yet these odours affect very weakly, or not at all, the nostrils of human kind. Epicurus, writing to

Herodotus, delivers the same doctrine in these words, ἡ ὁσμὴ ἢ ἀν' αὐτῷ πάθος ἢ ἐν ἰσχυρίσιν, ἐν μὲν ὄγκοις τινὲς ἦσαν ἀπὸ τῆς πρᾶγματις ἀποφρομένης, οἱ μὲν τοῖς τεταρασμένους, καὶ ἀλλοτριῶς, οἱ δὲ τοῖς ἀταράχως καὶ οἰκίως ἔχοντες. Thus both Epicurus and Lucretius ascribe the sole cause why some odours are grateful to some men, or to some of the other animals, and nauseous to others, to the various figurations and contextures of the organs that compose the sensorium of smell. Plutarch, too, is of the same opinion, lib. i. advers. Color. where he makes mention of two women, Berenice and another Spartan, who had an equal aversion, one of them for the smell of butter, the other for that of ointment.

Ver. 686. All creatures have an innate fondness for things with which they support their life: and nature has bestowed on each of them an instinct and sagacity, to go in search of, and readily to find their nourishment. Thus the bee, more easily than other animals, discovers the hordes of honey, that her fellow-bees have gathered and laid up for their support, and so eager is she in pursuit of it, that she avoids no danger to come at it. This is excellently described by Virg. Georg. iv. ver. 203.

Sæpe etiam duris errando in cotibus alas
Attrivère, ultroque animam sub fasce dederè,
Tantus amor florum, et generandi gloria mellis.

Thus rendered by Dryden:

Oft on the rocks their tender wings they tear,
And sink beneath the burden which they bear,
Such rage of honey in their bosom beats,
And such a zeal they have for flow'ry sweets.

Ver. 687. Pliny, lib. x. cap. 46. says, that vultures fly three days before to the place where dead bodies are to be, as if they perceived long before the odour of the carcases. Thus Plutus in Trucul. "Jam quasi vulturii triduo prius prædivinabant, quo die esuturi fient." In which they are both mistaken; for the vultures do not assemble themselves together to the places where any great slaughters are to be made by any natural and prophetic instinct; and, in all appearance, this tradition took rise from their having been observed to follow and keep with marching armies; not as foreseeing the day of battle, but because in the march of an army, there are always some men, some horses, and other beasts that drop here and there by the way. Job says the same thing of the eagle, chap. ix. ver. 30. And where the slain are, there is she. The vultures, from their devouring of dead bodies, were called τάφοι ἑμψυχῶν, living sepulchres.

Ver. 688. This is neither better nor worse than a downright barbarism. We say not the train of a stag, but the trail, to trail the stag, &c. This our huntsmen know. Mr. Addison has given us so fine a description of a hound in pursuit of a deer, that it well deserves to be transcribed.

So the staunch hound the trembling deer pursues,
And smells his footsteps in the tainted dews;

The tedious track unrav'ling by degrees :
But when the scent comes warm in ev'ry breeze,
Fir'd at the near approach, he shoots away
On his full stretch, and bears upon his prey.

Ver. 689, 690. In the year, U. C. 364. when the Gauls, under their leader Brennus had beaten the Romans at the river Allia, taken the city of Rome, and laid siege to the capitol, as they were one night climbing up the precipices in order to scale the walls, some geese, that were consecrated to Juno, and which, for that reason, they had spared during the famine they had suffered in the siege, fell a gagging, and waked the soldiers, who, under Marcus Manlius, repulsed the Gauls : and these last, after a siege of seven months, were at length forced to buy their peace with a great weight of gold, and were all slain, or driven out of the city by M. Camillus, who was afterwards dictator. For this service which the geese had rendered the republic, the censors ordered them to be nourished at the public expence. This is attested by Pliny, lib. x. in these words : "Est et anseris vigil cura Capitolio testata defenso, per id temporis canum silentio proditis rebus : Quamobrem cibaria anserum Censores imprimis locant." Cicero takes notice of this story in his oration for Roscius Amerinus. And T. Liv. lib. v. in these words : "Galli nocte sublustri tanto silentio in summum evasere, ut non custodes solum fallerent, sed ne canes quidem, sollicitum animal ad nocturnes strepitus, excitarent : anseres non fefellerent," &c.

Ver. 690. In these two verses the poet teaches, that odour is of a twofold advantage to man, and to the other animals : For, I. We discern by their odours, the aliments that are fit and proper for us. II. By the same means of odour, we avoid those that are hurtful to us. But were this generally true, poison would not have made the havoc that it has done in the world.

Ver. 692. In these eighteen verses, he treats of the motion of odours, and affirms, that it moves more slowly through the air than sound, that it is more easily divided and dissipated, and that it is not diffused and spread so far : the reason of which is, because it flows from the most inward parts of an odorous body, or from the lowest profundity of the subject (for odorous bodies, the more they are bruised, broken, &c. smell the more), and also because the principles of which it is composed, are larger than the principles of sound : since those passages, through which sound penetrates, are too narrow for odours, and will not allow them a way. And, therefore, odour must necessarily move more slow, and be more easily dissipated by the air it meets in its passage. And this too is the reason why, though we can easily judge from what part a sound comes to us, we cannot, with like facility, distinguish on what side of us the body is that diffuses an odour.

Plato, in his *Timæus*, teaches, that odours are smoke and mist : that that part of odours which is changed from air into water, becomes mist ; but that which is changed from water into air, turns into smoke : whence he argues, that odour is more rare than water ; but more dense than air. One

proof of which is, that if any one stops his nostrils, he will, together with his breath, draw in air, but not odour. Aristotle, lib. ii. de Anim. teaches, that the power and quality of odour is hot ; and that the power and faculty of smelling is placed in hot and dry. Hence it is not strange, that cold and frost render odours dull and spiritless. And he farther teaches, that, for that reason, odours contribute nothing to the nourishment of the body, nor ever excite an appetite of eating and drinking, but rather create a loathing of food : but that sweet odours are conducive to health, because they temper and dry the brain, which, of itself, and from the vapours of our food and nourishment, is moist and humid.

Ver. 710. It is not in the least to be doubted, but that the same taste, and the same smell is pleasing to some, and ungrateful to others. Now Lucretius, in these twelve verses, teaches, that even the very images of things make different impressions on the eyes of the beholders. The lion himself is terrified at the sight of a cock (for Lucretius does not mean what some interpreters make him say, that it is the crowing of the cock that terrifies that wild animal), because the image of the cock is composed of seeds that pierce into, and wound the eyes of the lion, so that he is not able to fix his sight against them. Plin. Nat. Hist. lib. viii. cap. 18. says, that it is the comb of a cock that chiefly frights the lion.

Ver. 712. It is certain that cocks generally crow at certain hours of the night, chiefly between midnight and break of day. Dryden says,

More certain was the crowing of this cock,
To number hours, than is an abbey clock ;
And sooner than the matten-bell was rung,
He clapp'd his wings upon his roost, and sung.

The naturalists assign several reasons of this, but none that are convincing : the safest is to say, that the cock, like other animals, has certain times of sleeping and waking ; and that when he is waked, either of himself, or by the crow of another, or by the noise of any thing, he fixes himself that he may not drop off his perch, claps his wings, and falls a crowing, which is natural and familiar to him, as well at certain hours of the night, as often likewise of the day. Shakspeare calls this animal,

———— The trumpet of the morn,
Who with his lofty and shrill sounding throat,
Awakes the God of day. [Hamlet.

And Milton,

———— The crested cock, whose clarion sounds
The silent hours.————

And the Romans, who began their natural day of twenty-four hours at midnight, named and distinguished some parts of it by the crowing of the cock. The first part they called, "*Media nox*," which, as Censorinus calls it, was indeed "*Principium et Postremum Diei Romani*:" the second, "*de mediâ nocte*:" the third, "*Gallicinium*," when the cocks began to crow : the fourth, "*Conicinium*," when they left off crowing : the fifth,

"ante lucem;" the sixth, "diluculum:" the seventh, "mane," &c. But in this computation there is but one cock-crowing mentioned in all; but Juvenal mentions different times of it, Sat. ix. ver. 106.

Quod tamen ad cantum Galli facit ille secundi.

And, indeed, experience teaches us, that the cocks naturally crow at three particular times in the night especially: of which three seasons, one is about an hour before day, as our old Tuffer observes in his Poetical Husbandry, page 123. where he particularly distinguishes the several seasons of the cock's crowing in the night, in these old fashioned verses:

Cock croweth at midnight times few above six,
With pause to his fellow to answer betwixt:
At three a clock thicker, and then as you know,
Like all into mattins, near day they do crow.
At midnight, at three, and an hour yet day,
They utter their language as well as they may.

Ver. 722. Thus he has concluded his disputation concerning the senses: but since, when the senses are asleep we imagine many things, imagination is a subject not unworthy a philosopher to treat of: He, therefore, to ver. 829. explains what imagination is, and the cause of it. And first, in these twenty six verses, he asserts, that many most subtle images, some flowing from bodies, others formed in the air of their own accord, and others differently mixed of different things, are wandering up and down on all sides in the air: That these images penetrate into the mind; and, gently moving it, are the cause of imagination. Hence we think we see Centaurs, Scyllas, and other monstrous things that never had a being: and likewise the ghosts and shadows of the dead. Cicero, in the fifteenth book of his Epistles, ad Familiam, writing to Cassius, who had newly embraced the Epicurean doctrine, tells him, "Fit nescio quid, ut coram, adesse videaris, cum scribo aliquid ad te, neque id *καὶ εἰδόμενον φαντασίας*, ut dicunt amici tui novi, qui putant etiam *τὰς ἀνεοικήτους φαντασίας*, spectris Catianis excitari.

Ver. 730. Tully, examining this opinion, says, "Tota res, Vellei, nugatoria est." This whole affair, "Velleius," is a trifle: and adds farther, "Quid est quod minus probari potest, quam omnium in me incidere imagines, Homeri, Archilochi, Romuli, Numæ, Pythagoræ, Platonis, nec eâ formâ quâ illi fuerint? quomodo ergo illi?" What is there that can less be proved, than that the images of all men offer themselves to me, of Homer, Archilochus, Romulus, Numa, Pythagoras, Plato, and yet not in the form in which they were? How then was it they? Let us consider our dreams, where the powers of fancy and imagination are most observable. These our poet explains, by entering images which pass through the body, and strike the soul. How deficient this is, any one may be satisfied from his own observation; for that will tell him that he dreams of things at a vast distance, and not thought on for some months. What then? Can the image pass

through those large tracts of air whole and undisturbed? Are they not as thin a substance as the Epicurean soul, and as easily dissolved? Can they enter the pores of the body, and still preserve their order, and the mind be accounted mortal for the same way of passage, and this be used as an argument against its infusion? Strange power of prejudice! that can blind the sharpest eyes, make them dull and unfit to be moved by these thick and almost palpable errors; but, perchance, there is no image of an absurdity, and therefore we must excuse the Epicurean: Beside, some things are presented to our imaginations, of which there can be no image; a harp seems to sound, when it lies silent in the case, when there is no brisk vibration of the strings to impel the ambient air, and create a sound; for sound does not consist of parts that fly from the body (as Lucretius imagines); it is only an agitation of the rigid parts of the air, as a thousand experiments can evince; but two may suffice. One is taken from common observation. For, touch the sounding wire of virginals at one end, and the noise ceases, though the touch cannot hinder the flux of atoms from any part but that which it immediately presses. The other is known to all who have heard, that a bell will not sound in the exhausted receiver, though the parts might there fly off with greater ease, they being not troubled with any ambient resisting air.

Ver. 732. That is to say, in our dreams we see with the mind, and when awake, we believe the vision true: Yet never any Centaur, Scylla, Cerberus, or any monster of the like nature, had a being: But the images of such things come and show themselves to our minds, from the several images of several things joined in one image.

Ver. 733. The Centaurs were feigned to be monsters with a human face, and the body of a horse. They were indeed, as some say, people of Thessalia, that inhabited the mountain Pelion, and the first that fought on horseback; which gave rise to the fable. Hence they were called *semiferi* and *bimembres*; and *nubigenæ*, cloud-begotten, because they were begot by Ixion on a cloud. See more of them, Book V. ver. 930.

Scylla was feigned to be a monster, whose upper parts resembled a woman, and her lower a company of dogs. Now Scylla was the daughter of Phorcus, with whom Glaucus fell in love; and, being despised by her, he applied himself to the witch Circe, to procure a spell to make her love him. But Circe, who was herself in love with Glaucus, and enraged that he preferred Scylla before her, infected a fountain in which Scylla used to bathe, with poison of so noxious a nature, that Scylla, going into it, instantly found all the lower parts of her body transformed into the mouths of barking dogs: Scared at this deformity, she immediately threw herself into the neighbouring sea, on the opposite coast, of which they likewise feigned Charybdis to be changed into a rock. And there are now two dangerous whirlpools in the Sicilian sea, called by the name of these two fabulous monsters. See Book i. ver. 740. But

there was another Scylla, daughter of Nisus, king of Megara, who betrayed her father, having first cut off his fatal hair to his enemy Minos, with whom she was in love: and was changed into a heron. And Virgil says, that it was she who was transformed into this monster.

Quid loquar? aut Scyllam Nisi, quam fama secuta est,

Candida succinctam latrantibus inguina monstribus,
Dulichias vexâsse rates, et gurgite in alto,
Ah timidos nautas canibus lacerâsse marinis.

Eclog. vi.

But many accuses Virgil of confounding the two fables, and for giving to the Scylla of Nisus what belongs to the Scylla of Phorcus, and read, "quid loquar? aut Scyllam Nisi, aut quam," &c. But Cerdanus justifies the common reading, by the example and authority of Ovid, who, *Amor. lib. iii. Eleg. xii. ver. 18.* gives dogs likewise to the Scylla of Nisus:

Per nos, Scylla patri cano furata capillos,
Pube promit rabidos inguinibusque canes.

And of Propertius, *L. iv. El. iv. v. 4.*

Quid mirum in patrios Scyllam sævisse capillos,
Candidaque in sævos inguina versa canes?

This too was feigned to be a monstrous dog with three heads, who guarded the gates of hell; from whence Hercules is said to have dragged him, having first bound him in chains. See Book III. *ver. 1015.*

Ver. 736. The poet here mentions three sorts of images. I. Those that fly from real things: Such are the images of a man, of a lion, of a horse, of a house, in a word, of all things that strike our eyes, and are the cause of sight. II. Those which of their own accord are bred in the air and clouds: as the images of giants, mountains, huge beasts, and the like, which sometimes appear to us in the clouds. III. Those that are composed of the conjoined figures of these images: And such are the images of Centaurs, Scyllas, Cerberus's, and the like. Of the two first sorts he has already treated at large in the beginning of this book, and is going to treat of the third.

Ver. 740. Here the poet teaches how the third sort of image is made, that is to say, those that are composed of several images of things, joined in one image. For never Centaurs, Chimæras, or monsters of like nature lived, or had a being. But the image of a Centaur is made partly of the image of a man, partly of the image of a horse. The image of a Chimæra is made of the image partly of a man, partly of a goat, partly of a lion. And in like manner of all other monsters.

Ver. 748. In these seven verses, he proves, that imagination is caused by images; because a lion, for example, which we think we see, is exactly like a lion that we see with our eyes: And as sight is made by images, so too is imagination, which is equal to sight, and differs from it in this only, that the mind sees objects that are invisible to the eye. Though our translator has in

this passage fully enough expressed the doctrine of Lucretius, yet he has omitted the example the poet brings to illustrate his argument: Let us fancy, says he, that we see a lion rather than any other animal. Certainly a lion is not seen by the eyes any otherwise than by his image: But cogitation is made in the same manner as sight is: Therefore cogitation is made by the appulsion of an image, which image, nevertheless, is indeed of a more tenuous nature, by reason of the more tenuous nature of the mind.

Ver. 755. In these fifteen verses, he observes, that the images of the dead seldom offer themselves to men who are awake, but generally to those who sleep: The reason of which, he tells us, is, because the images that are continually wandering to and fro in all places, rush with such violence upon the sleeper, that, penetrating into his very mind, they shake and disturb it to such a degree, as begets in it an imagination of the very things whose images they are. And the reason why we believe persons long since dead to be actually present with us, is, because the senses, by which alone we distinguish between true and false, being lulled and stupified in sleep, cannot perform their functions: Besides, the memory too is stupified, and we do not at that time even recollect that the person who seems to be present with us is dead.

Ver. 770. But these images which appear to us in our sleep, run, leap, and dance up and down; of which the poet, in these ten verses, gives this reason: Because, since we continue some time in the same imagination, it is not all that while the same image that is before our mind; but many images that offer themselves successively, image after image, in a never-ceasing and continual flow. Now, if all these images remain in the same posture, the thing we imagine with ourselves to see will seem without motion, but if the posture of the images vary, it must of necessity seem to move.

Ver. 775. This and the following verse are rendered from three verses, which some copies have, but the interpreters generally reject them. They are these:

Tanta est mobilitas, et rerum copia tanta,
Tantaque sensibili quovis est tempore in uno
Copia particularum, ut possit suppeditare.

Creech has omitted them in the text of his Latin edition, but says, nevertheless, that a probable meaning, and such a one too as is very proper to this passage, may be drawn from them. The first of them, "Tanta est," &c. is a little below in the original, *ver. 800.* and in this translation, *ver. 802.*

Ver. 788. From hence to *ver. 831.* the poet proposes and explains some difficulties that may be started against this doctrine of thinking, by the means of images. The first difficulty is contained in ten verses, to this effect. Since the mind perceives by images, how comes it to pass that we can think on any object we please? For it seems ridiculous to pretend that the images ob-

serve our will, and are always ready at hand to obey it. The second is in six verses, to this purpose. Since the images seem to move with gracefulness, and even to observe time and measure in their motions, are we to believe that they have learned to dance? A thought truly worthy of a philosopher! To these two objections, Lucretius answers, in twenty-four verses, that what we take to be one single moment of time, is indeed many moments; so that the images being, as they are extremely subject to motion, a multitude of them present themselves to us every moment, and among them the image of the thing, of which we please to think. Besides, though all kinds of images are continually at hand, yet they being most tenuous and subtle, the mind cannot perceive them, unless she watch with great diligence, and endeavour to do so: for subtle things will escape unheeded from a negligent mind, even as they do from a careless and unwatchful eye. Thus Cicero Tuscul. Quæst. lib. i. says admirably well, "Itaque sæpè aut cogitatione, aut aliquâ vi morbi impediti, apertis atque integris oculis et auribus, nec videmus, nec audimus." But the same author derides and confutes this opinion of Epicurus concerning images, and the cause of thinking by their appulsion, Epist. lib. ad Cass. Epist. xv. De Natur. Deor. lib. i. And de Divinat. lib. ii.

Ver. 804. It being demanded, why any man could think on what he pleased? The answer is, That images are constantly at hand, but being very thin and subtle, they cannot be perceived, unless the mind endeavours, which, though pressed by all the difficulties proposed concerning images, yet may receive a farther examination. For, first, the mind must think on the object before this endeavour, else why should she strive, why apply herself particularly to that? And that this argument is strong against the Epicureans, is evident from that question which Lucretius proposeth in his fifth book, about the beginning of ideas in his deities, which I have already reflected on. But more: This endeavour of the mind is a motion, nothing being to be admitted in the Epicurean hypothesis but what may be explained by matter variously figured and agitated: Now Epicurus hath settled but three kinds of motion, κατὰ σάβμην, κατὰ περίγυλιν, and κατὰ πλῆγην, by weight, by declination, and by stroke; and the two latter necessarily suppose the former, and therefore if that κατὰ σάβμην, by weight, cannot belong to the soul, it is absurd to conclude this endeavour to be either of the latter: And here it must be considered, that the Epicurean soul is material, and therefore weight is a property of all its parts, which will necessitate this soul to subside in all the vessels of the body, as low as possible; and therefore it cannot actually enjoy this motion, and consequently no endeavour.

Here I might be copious (for it is an easy task) in laying open the weakness of the arguments, by which he endeavours to prove, that our limbs were not made and designed for proper offices and employments; it would be an endless trouble to pursue him through all the absurdities which

lie in his opinions concerning sleep, and spontaneous motion: for every man hath his own constant experience to confute them, and therefore, as Lactantius thinks a loud laughter the only suitable reply to the former, let the others be contented with the same answer, nor hinder me in the prosecution of the proposed argument.

And here it must be confessed, that a thousand of these stories are the genuine productions of fear and fancy: Melancholy and inadvertency have not been unfruitful; and we owe many of them to superstition, interest, and design: But to believe all counterfeit, because some are so, is unreasonable, and shows a perverseness as faulty as the greatest credulity. For when such are attested by multitudes of excellent men, free from all vanity, design, or superstition, who had the testimony of their senses for their assurance, and would not believe it till after curious search and trial; we must assent, or sink below scepticism itself: for Pyrrho would fly a threatening dog, and make his excuse, χαλεπὸν, μὴν ὅλον τὸν ἀνθρώπου ἐκδύναι. It is hard to put off the whole man. And that there are such stories delivered, with all the marks of credibility, I appeal to the Collection of Mr. Glanvil. Let any one look on that which is recorded by the learned Dr. Gale, in his notes upon the fifth chapter of the third section of Jamblichus de Mysteriis, and then I shall give him leave to use his atoms and his motion to the greatest advantage, but for ever despair of an explication. The story speaks thus in English: 'In Lambeth lives one Francis Culham, an honest man, and of good credit; this man lay in a very sad condition four years and five months: 'The first symptom was unusual drowsiness, and 'a numbness for three days, which forced him 'to take his bed: In the first month, he took 'little or no meat or drink; the second, he fasted 'ten days, and often afterward five or seven, 'He fed on raw and boiled meat with equal 'greediness; never moved himself in the bed, 'and waked constantly for the first years, at least 'never closed his eyes, but kept them fixed and 'steady. He made no articulate sound, nor took 'any notice of his wife and children, nor seemed 'to feel the knives and lances of the surgeons. 'At last, given over by all, he thus unexpectedly 'recovered: In the Whitsun week, 1675, he 'seemed to be wakened out of a very sound 'sleep, and (as he relates it) his heart and bowels 'grew warm, and his breast freed from that 'weight which before oppressed it, and he heard a 'voice which bid him go to prayers, and then he 'should be well. Paper and ink being brought, 'with a trembling hand, he writ these words: "I desire that prayers be made for me." Two 'ministers came, and when they had sufficiently 'examined the matter, and found it free from 'all cheat, they began those prayers which the 'English liturgy appoints for the sick, and when 'they were come to "Glory be to the Father," &c. the sick man spake with a loud voice, "Glory be to God on high." And in two days 'time, his feet, hands, and other limbs, were

perfectly restored; but he could not remember any thing that was done to him during all the four years. And this relation I assert to be very true. Now, though such as these do not directly prove the immortality of the soul, yet they sufficiently take off all pretensions of the Epicureans against it; since they evidently prove, that there are some subtle unseen substances permanent and durable, and consequently immaterial; for they cannot imagine that any material substance, thinner than smoke or air, can be less subject to dissolution than those, though they contradict themselves, and grant the eternal bodies of their deities to be such.

Ver. 820. These two verses our translator has omitted. They run thus in the original:

Deinde deopinamur de signis maxima parvis:
Ac nos in fraudem induimus, frustramur et ipsi.

In these two verses the poet adds a third difficulty, concerning the distraction or absence of the mind: for often, even when we are awake, we lead ourselves into errors and deceptions: as when we conceive a small object to be a great one. Thus Aristotle lib. de Insomn. says: That we are easily deceived in matters relating to the senses, especially when our mind is any ways moved and disturbed: as men in love have always in their mind, and seem to see the likeness of the object of their flame: Thus cowards fancy to themselves that the enemy is coming to attack them, &c. Of which Cæsar gives us an instance in his Commentaries, de Bello Gall. lib. i. where he relates of one Cœdicius, a man otherwise very expert and knowing in military affairs, that being sent to get intelligence of the motions of the enemy, he was struck with such a terror, that when he came back, he reported he had seen things that he never saw.

Ver. 822. A fourth difficulty, if it be another from the former, is contained in these ten verses. Why the same image appears to us in our sleep, in different kinds and forms: for example, now a male, now a female, now young, now old, &c. But he answers, That we ought not to admire at this, since a man who sleeps is deprived of the use of his external senses, nay, even of his memory; insomuch that he forgets the greatest part of his dreams.

Ver. 832. To the foregoing disputation, he subjoins, in these twenty-seven verses, another of Epicurus's opinions: viz. The eyes were not made to see, nor the ears to hear, nor the tongue to speak, nor the feet to walk, &c. because these members were prior to seeing, hearing, speaking, walking, &c. For Epicurus taught, that the members of our body were not made designedly for proper uses, but being made by chance, the use that first offered itself, was laid hold of by each member: For if any thing was made for a certain future use, that use must have been known before; or something must have pre-existed, that signified, that such a use would be convenient or necessary: For example, if there had not been a previous use of fighting, sleeping and quenching the thirst, armour, beds, cups had never been

thought of. Thus the eye could not be made for the sake of seeing, since nothing had been seen before there was an eye to see with, nor was it known what sight was to be; nor the ear for the sake of hearing, since nothing had been heard, and it was unknown what hearing was to be. And in like manner of the other members of the body.

This was the opinion of the Epicureans concerning the members of the bodies of animals. And certainly if there be any thing in the Physics of Epicurus, that can be said to be most improbable, not to use a harsher term, it is what Lucretius in this place asserts. But why was Epicurus of this opinion? The reason is as evident as the opinion is extravagant: because he saw that otherwise he must have allowed a Providence, which is not more visible in any thing than in the wonderful mechanism of the parts of a human body. But all the ancient philosophers were not of this wild opinion; and Aristotle blames Anaxagoras for this belief, when at the same time he owned, that man was the most prudent of all animals, because of all of them, he alone had hands: since his hands were evidently given him, that he might use them. The Stoics too were of a contrary opinion; witness Cicero, lib. 3. de Finibus, where we find these words: "Jam membrorum, id est, partium corporis alia videntur propter usum à naturâ esse donata, ut manus, crura, pedes, et ea, quæ sunt intus in corpore, quorum utilitas quanta sit à medicis disputatur; alia autem nullam ob utilitatem, quasi ad quemdam ornatum, ut cauda pavoni, plumæ versicoloris columbis, viris mammæ atque Barba." Of the members, that is, of the parts of the body, some seem to be given us by nature for use, as the hands, the legs, the feet, and those that are within the body, of which how great is the utility the physicians are still in dispute: Others for no service, but rather for ornament, as the tail to the peacock, the changeable feathers to pigeons, and the nipples and beard to man. Galen proves by a long discourse, and many examples in his excellent treatise, De usu Partium, that every animal, without the help of any teacher, preconceives the faculties of his own soul, and to what use to put the parts of his body; as for example, the harp taught not the musician, nor a pair of tongs the smith to make them. And Lactantius too confutes this doctrine of Epicurus, in his book De Opificio Dei, cap. vi. where he argues in these words: "Quid ais, Epicure? Non sunt ad videndum oculi nati? Cur igitur vident? Postea, inquit, usus eorum apparuit. Videndi ergo causâ nati sunt; siquidem nihil possunt aliud quam videre: Item membra cætera cujus rei causâ nata sint, ipse usus ostendit: Qui utique nullo modo posset existere, nisi essent membra omnia tam ordinatè ac providenter effecta, ut usum possent habere. Quid enim si dicas, aves non ad volandum esse natas, neque feras ad sæviendum, neque pisces ad natandum, neque hominis ad sapiendum, cum appareat ei naturæ officioque servire animantes, ad quod est quæque generata. Sed videlicet qui sum-

mam veritates amittit, semper erret necesse est. Si enim non Providentiâ, sed fortuitis Atomorum concursibus nascuntur omnia, cur nunquam fortuito accidit, sic coire illa principia, ut efficerent animal ejusmodi, quod naribus potius audiret, oderetur oculis, auribus cerneret?" &c.

Ver. 842. This has been the constant reading of all the former editions, and therefore I would not alter it in this: Lucretius says,

Non fuit ante videre oculorum lumina nata.

where I take *videre* to mean not the light by which we see, but the use of seeing: which is better expressed by, No sight before the eye, than by, No light, &c.

Ver. 852. "Ex ufa quæ sunt vitæque repertâ," says Lucretius: upon which Faber observes, that the word *vita* is used in the same sense as the Greeks use τὸν βίον, not ζῆν that is to say, for experience, and ἀπὸ ζῆτος τῶν ἐν τῷ βίῳ. which the word convenience does not fully express. Manilius, lib. i. v. 61.

Per varios usus, artem experientia fecit,
Exemplo monstrante viam.

Ver. 859. If any one start any difficulty concerning hunger and thirst, Lucretius fully solves it in these eighteen verses. Many bodies, says he, exhale and flow from all things but most of all from animals, many through the pores of the body, many through the mouth: now these parts being withdrawn, and gone away, the rest cleave not so close and firm together, and therefore the whole body must, of necessity, be the weaker. To fill up these intervals and empty spaces, we take in meat and drink, which repair the decays of the body, and make it whole again: and thus it recovers its strength. Drink too serves to refresh us, and cools that heat, which, for want of it, would dry too much, and parch up all the inward parts of the body.

Hunger and thirst are by many ranked among the number of senses: and indeed it cannot easily be conceived, how a sensible appetite can be incited and stirred up to a desire unless some object be presented to it, on which it may settle and fix its desire: And in this case, it will be hard to deny, that they are senses as well as appetites: For certainly if hunger and thirst induce a desire of meat and drink, they doubtless suppose beforehand a sense of the want of them: And thus, when we have once conceived a sense of those things, and reflected on the good they will do us, we are necessarily induced to a desire of having them, in order to remove the troublesome sensation, that the want of them has brought upon us.

Ver. 869. This and the five next verses are so excellent, that I cannot but bespeak the readers particular attention. Where can hunger with his wide-gaping jaws be more properly lodged, than in the almost parched up veins? And what can be more aptly expressed, than that panting and short-winded thirst is washed from the body by the infusion of moisture? Thus Lucretius be-

lieves that thirst is caused by hot vapours that kindle a flame in the bowels, and all philosophers agree that thirst is an appetite of cold and moisture.

Ver. 877. In these twenty-eight verses, he briefly inquires into the cause of the voluntary motion of animals, which he explains in this manner. Certain seeds, by which the will to move may be stirred up in the mind, strike the mind: This causes the mind to will; and that she may execute what she wills, she rouses up the soul that is annexed to her, and diffused through the whole body, (see Book II. v. 249.) And hence the whole frame is moved and thrust forward: But because the soul, that thin and subtle substance, may seem insufficient to move so great a weight, he tell us, that the air from without comes to her assistance; and entering into the pores of the body, as it is rarefied by motion (for bodies exercised with motion, become rare), helps to drive on the burden: And thus the body is moved and shoved forward by the soul labouring within, and by the air that enters from without, even as a ship is driven with sails and oars: These indeed seem to be but weak instruments: but so too is a gentle gale that drives the stoutest vessel before it; and weak too is the hand that governs the rudder, yet it twists the ship about, and makes it change its course, even in its full career: Thus too there are small engines that will heave up mighty weights.

Ver. 883. In like manner, Book II. v. 249. he taught, that the will is the principle of motion, In animals the will moves first, and thence
The motions spread to the circumference,
And vigorous action through the limbs dispense.

And ver. 258. That the beginning of all motion is within the heart,

—All motions rise within the heart,
Beginning by the will, then run through ev'ry part.

Thus too Aristotle, lib. v. de Animal. asserts, that the will and the mind are the two causes of motion.

Ver. 892. The body of animals, who are exercised with motion, grows rare. See the reason, ver. 863.

Ver. 895. *Both these things, &c.* i. e. The will to move, and the air that enters into the rarefied body: which is as much as to say, the first cause of motion, and the cause that advances and helps on that motion. For the poet says, that not only an internal but an external cause likewise contributes to animal motion.

Ver. 896. "Lucret. Ut navis velis ventoque." But Creech has followed the judicious conjecture of Gassendus, who thinks it ought to be read, "remis ventoque;" For sails and wind are in effect but one and the same thing.

Ver. 899. But because it may seem strange, that the minute corpuscles of images should move the whole body, he confirms the truth of his assertion, by an example. Now Aristotle, Mechan. cap. 7. gives the reason, why the higher the sail-

yard is, the ship sails the faster, even with the same sheet, and the same wind. But to comprehend the reason of it aright, it will do well to know in the first place, why a lever will move a weight of so great a burden as we daily see it does. A lever is a bar of iron, or of wood, a little crooked at one end: The Greeks call it *μυχλος*, the Latins, *velis*, and the crooked end *rostrum*: from whence perhaps comes our rostile, by which name it is known in some places, though it be generally called a lever. Vitruvius, lib. 8. cap. 10. teaches, That if we put the *rostrum* of a lever under a weight, which a multitude of hands cannot move; if but one man weigh down, or depress the handle, or other end of the lever, it will easily lift up the burden: The reason of which is, because the foremost part, or *rostrum* of the lever, which is shorter from that pression, that is in the place of the centre, undergoes and bears the burdens; and because the head or handle of the lever, being farther distant from that pression or centre, does, when it is weighed and pressed downward, make a motion of circination, as they call it; and by that motion causes the pression by a few hands to heave up a weight of the greatest burden. For always, by how much more the hindmost part of the lever, that is to say, the part from the centre to the lever's handle, which is weighed down by the mover, is longer than the foremost, that is to say, than that part, which, from the centre, belongs to the *rostrum* of the lever; so much the more easily will the burden be moved.

This being premised, it is easy to understand why a sail, swelled with wind, makes a vessel move very swiftly, though the sail-yard be not far distant from the top of the mast: For the mast is, as the lever; the foot or bottom of the mast supplies the place of the pression or rowler; and the wind which fills the sail, is as the mover. Therefore the farther distant the sail-yard is from the foot of the mast, the faster the ship will be driven: For the line, that is farthest removed from the centre draws the largest circle: and the larger each circle is, the swifter it is moved.

Ver. 902. Of this Vitruvius, lib. viii. cap. 10. and Aristotle 6. Mechan. gives this reason: Because the rudder supplies the place of the lever; the ship, of the burden, the pilot, of the mover, and the hinges on, and to which the rudder hangs and is fastened, the place of the pression or roller.

Ver. 905. Lucretius having made his animal perform all the operations of the senses, puts him to bed; yet leaves him not even there, but considers him while he is asleep; and disputes of sleep to ver. 970. and from thence to ver. 1031. of dreams. In the first place he tells us, that sleep is caused by the soul's being grown so weary and feeble, that she can no longer support the limbs (for the soul is the foundation of the body); and thence proceeds a weakness of the joints, and a remission of the senses. Now the reason why the soul is thus oppressed, is evident: For the body is incessantly weakened by the external air, and by that which it inspires and draws

in: for that air does not only brush and rake the surface of the body, but entering into the pores and passages, is admitted and received into the inmost parts, and strikes and grates them likewise: This causes a disjunction or separation, of the first bodies, and the dissolution of the soul itself of necessity follows that separation, inasmuch, that part of it is thrown out, part, to use the words of Pliny, recedes into the middle, and the remaining part, that is overmuch disjoined, is dispersed and scattered through the members: And from hence we may understand, why a most profound sleep ensues after labour and eating: For food chokes up and stuffs the passages through which the soul ought to move freely: and thence proceeds a greater dissipation, or a greater constipation of the soul: And by weariness and lassitude the body grows weaker, and that weakness produces the same effects as repletion. Ὅτι πῶς τε γίνεται πονομένων τῶν τὴν ψυχῆς μερῶν, τῶν καὶ ἄλλῃ τὴν σύγκρισιν παρισταμένων, ἢ ἰσχυροτέρων ἢ διαφορομένων, ἢ τε καὶ συρραπτόντων τινῶν τοῖς ἰσταμένοις, τὰ μὲν ἐξοθέντων, τὰ δὲ συναρπάζοντων. Epicurus ad Herodotum.

Ovid. Metam. II. v. 623.

Somne quies rerum, placidissime somne Deorum,
Pax animi, quem cura fugit, qui corda diurnis
Fessa ministeriis mulces, reparasque labori.

—O sacred rest!

Sweet pleasing sleep! of all the powers the best!
O peace of mind, repairer of decay,
Whose balm renew the limbs to labours of the }
day; }
Care shuns thy soft approach, and sullen flies }
away.

Dryd.

And Shakespeare deserves to be here remembered,
Sleep, that locks up the senses from their care:
The death of each day's life: tir'd nature's bath!
Balm of hurt minds! Great nature's second
course,
And her best nurse: Chief nourisher in life's feast:
Death's counterfeit!

And Sir. W. Davenant in Gondibert.

—The weary world's best med'cine, sleep!
Sleep shuts those wounds where injur'd lovers
weep,
And flies th' oppressors to relieve th' oppress'd.
Sleep loves the cottage, and from court abstains;
It stills the seamen, though the storm be high;
Frees the griev'd captive in his closest chains,
Stops want's loud mouth, and blinds the treach-
'rous spy.

Ver. 907. These four verses we have had already in this book, v. 186. See there the notes upon them.

Ver. 916. First in these sixteen verses he teaches, that sleep is caused in us, when by reason of the power of the soul's being impaired and weakened, the members of the body are, in a manner, loosened and dissolved. Our senses, says he, are

locked up, and hindered by sleep from performing their functions: But our senses proceed from the operation of the soul: Therefore it necessarily follows, that when the animal is asleep, his soul must partly be gone out of him, partly be retired into the inmost recesses of the body, and partly be dispersed through the members. But he will not allow, that when the animal sleeps, the soul is entirely retreated from the body; for unless some part of it remained alive, neither the animal, nor his senses could awake, or revive again after his sleep. This he illustrates by an example: For as fire, buried in ashes, is not wholly extinguished; so neither is the whole soul extinct in a sleeping animal.

Ver. 918. Aristotle almost to the same purpose, in his book de Somn. where he says, that sleep is a coition of heat in the inmost parts of the body, and a natural compression of it, by the circumfusion of its contrary, cold; because the humidity of the exhalation repels and drives the heat into the interior region of the body.

Ver. 932. In these four verses, he says, that he will now tell what causes this change and alteration of the soul: How it is possible that she can be divided in such a manner as to be ejected partly out of the body, as to retire partly into the inmost parts of it, and as to be partly dispersed through the members, and to languish and become dull and stupified together with the whole body.

Ver. 936. In these twenty-three verses, he explains the causes of the body's growing weary, and falling into slumber. He begins by the air, as well that which externally strikes the body on all sides, as that which is drawn in and breathed by animals in their respiration. For the first must necessarily very often strike the utmost parts of bodies, which it always surrounds: and the air that is inspired or drawn into the body must likewise strike the interior parts of it: Now these twofold strokes are the cause that disturbs the sites and orders of the atoms, and of the ensuing weakness of the whole body and soul: For part of the soul is forced out of the body part of it retreats inwardly, and part of it is dispersed through the limbs; so that its parts being thus disjoined and disunited, it can no longer perform its due functions: And, therefore, the motions of sense being changed, the sense too goes away. And thus what was the body's prop and support being absent, the body must necessarily grow weak and fall.

Ver. 939. That is, that things may be safe and the better protected from the injuries of the air, they are covered with skins, barks, &c. Cicero lib. ii. de Nat. Deor. pursues this yet farther: "Animantium," says he, "aliæ coriis tectæ sunt, aliæ villis vestitæ, aliæ spinis hirsutæ: plumæ alias, alias squamæ videmus obductus," &c. Some animals are covered with hides, some clothed with hair, and some are horrid with bristles: We see others wrapt up in feathers, others in scales, others in shells, &c. Thus Pliny, lib. vii. in Proœm. "Ante omnia unum animan-

tium cunctorum alienis velat opibus: Cæteris vero tegumenta tribuit, testas, cortices, coria, spinas, villos, fetas, pilos, plumam, pennas, squamas, vellera, &c.

Ver. 951. Thus Pliny, lib. xi. cap. ult. says, "Somnum esse animi in sese medium recessum."

Ver. 957. Milton, in Paradise Lost:

—The timely dew of sleep
Now falling, with soft slumb'ring weight, inclines
My eyelids—

And again:

Then gentle sleep with soft oppression seiz'd
My drowfed sense.—

Ver. 949. In these eleven verses, the poet gives a reason why we are most inclined to sleep, and sleep most soundly after eating or labour. Because, says he, the aliment, as it distributes itself through the body, affects it in the same manner as the two sorts of air mentioned in the foregoing argument: Nay, the strokes it gives are the greater, because its body is more firm and solid than that of air. And we sleep the sounder after labour, because more atoms being agitated and put into motion by the hard labour of the wearied body, they mutually disturb and disorder one another: And thence it proceeds, that the soul retires farther into the interior parts; that a greater part of it is thrown out; and that the particles of the soul that remain within, are the more separated, and the farther disjoined from one another. Aristotle, lib. de Somn. et expergef. says to the same purpose, that the humid vapours of meat and drink ascend, and are borne upwards; that when they are mounted as high as they can go, they then, because they are heavy and corporeal, fall down again; and drag along with them, and detrude into the interior parts, the native vital heat, which of its own accord is borne upwards; by which means sleep is produced: And, therefore, after meat sleep is generally the most profound. Likewise after labour; because labour dissolves, and in a manner corrupts the body. But that which wears off from a wasting body, is as meat undigested. Thus Aristotle: But our physicians give us another reason: They tell us, that we are disposed to sleep after we have eaten, because the ventricle being then full, the blood has not so free and open a passage down the aorta, which, since it lies behind the stomach, must therefore be compressed by it, when it is filled and turgid with aliments: Thus this repletion of the ventricle hinders the blood from descending in the same quantity as it did before when the stomach was empty: Nay, on the contrary, it forces it to ascend in greater plenty toward the head, which, for this reason, seems more stuffed after a plentiful meal than it was before, and the face too grows redder and hotter, as do likewise the hands: And this any man may discern by experience in his own person: Now, the blood thus rushing to the head, compresses the glands of the brain, and hinders the free separation of the animal spirits by them: To this we may add the

mixture of the thick chyle with the blood; which mixture intricates the volatile parts of it, that otherwise would be secreted by the glands of the brains. We are inclined to sleep after hard labour, walking, and the like; for this reason: There is a certain quantity of spirits necessary for every muscular motion; now all motion dissipates the spirits, and consequently the more violent the motion is, the greater will be the dissipation; and this dissipation must of necessity produce a relaxation of the parts and members of the body: Among the rest, of the brain, which then, according to some, subsides, and thus hinders animal secretion. For the same reason too, we are sleepy after having been long awake; as also, because the brain being relaxed for want of spirits, which, keeping the fibres turgid, are the cause of all the stiffness and straitness of the body, the dull and heavy serum inundates in the brain.

Sleep, therefore, is a thing which the frailty of human nature makes necessary: and since all our motions and actions depend on parts that are so easily dissipated as the spirits are, it is of absolute necessity that we allow some time to recruit, by sleeping, what we lose by being awake. Thus sleep may properly be defined, a certain cessation of the external senses, that is to say, a total cessation of all sensation and voluntary motion, proceeding from a defect of, or an impaired and diminished motion in the animal spirits, not from any fault in the blood, or in the brain: Or otherwise: Sleep is a suspension of action, and an impotence in which the soul is in a manner disjoined from the body, at least so far as not to perceive or know any thing that passes in it: And thus the cause of sleep must be the defect or fault of that part by which the soul is united to the body, i. e. of the animal spirits, which, by their motion to the brain, excite in the soul the perception of all such things as occasioned their reflux to the brain: For the operations of the exterior senses are performed when we are awake, and in this manner: The nerves of the organs of sensation being extended and turgid with spirits, that are transmitted to them from the brain, are struck by the species of things; then the spirits themselves, by a certain refutation towards the brain, make an impression on the faculty that resides within it: Whence it follows, that unless the interior faculty be moved, and perceive, there can be no sensation. This being granted, it necessarily follows, that the cessation of the exterior senses, of which we were speaking, therefore happens, because the orifices of the nerves grow weak and flag; and by that means are stopped up: And thus the nerves being no longer turgid by the afflux of the spirits, but rather relaxed, the members begin to fail, the spirits no longer resort towards the brain, nor can propagate or carry on to the interior faculty the strokes they receive from exterior objects. But these things require a longer disputation than this interpretation will permit.

Ver. 970. Here the poet begins to treat of dreams. Now Epicurus, as was said before, was of opinion, that the minds of sleeping animals are

struck and moved by external and adventitious images, and that these are the causes of dreams. And the reason, says Lucretius, why we chiefly dream of those things about which we are mostly taken up and busied in the day, notwithstanding that images of all kinds are constantly at hand, is, because the passages through which the images had so often entered, are not closed up, and therefore more easily receive and admit the images that belong to the actions in which we have been employed, than those that appertain to other things. And not only the dreams of men, but of other animals, may be explained in this manner. Nor is it to be wondered at, that some dreams fright us more than others; for they whose images are composed of rough seeds, that rudely grate and wound the mind upon which they strike, must of necessity be the most frightful. This is the account Lucretius gives of the cause of dreams in general; and he enumerates several dreams that are most usual to men, and ascribes the chief cause of them to the various desires, employments, and diversions with which they have been taken up and busied when they were awake, and in which their thoughts were principally employed. Aristotle says, that dreams are the relics of those things which the senses, when awake, perceive; and that, since the objects of our waking senses do not immediately vanish, as soon as the senses cease to be affected with them, but remain some small time, and at least leave behind them a strong impression on our thoughts, it is nothing strange that the images of those things which, when we were awake, we either did or spoke of, or thought of, should offer themselves to us when we are asleep: Macrobius, in *Somn. Scip. lib. i. cap. iii.* enumerates five several sorts of dreams which the ancients had observed, and distinguished by as many several names. The Greeks called them, *ὄνειρος, ὄραμα, χρηματισμός, ἰνύπνιον, and φάντασμα.* The Latins, "Somnium, visio, oraculum, insomnium," and "visus," which last is the word Cicero always uses when he has occasion to express the *φάντασμα* of the Greeks. It would be too tedious to give an account of each of them, and of the superstitious credulity of the ancients concerning dreams: We therefore refer the reader to Macrobius, in the place above cited, where he will abundantly find wherewith to satisfy his curiosity. Chaucer, in his tale of the Cock and the Fox, gives us a physical reason of dreams: We will be obliged to Dryden for his thoughts, which, as he has translated them into modern words, are as follows:

———All dreams

Are from repletion and complexion bred,
From rising fumes of undigested food,
And noxious humours that infect the blood:
When choler overflows, then dreams are bred
Of flames, and all the families of red:
Red dragons, and red beasts, in sleep we view;
For humours are distinguish'd by their hue.
From hence we dream of war, and warlike things,
And wasps, and hornets, with their double stings.

Choler adust congeals our blood with fear;
Then black bulls tofs us, and black devils tear.
In sanguine airy dreams aloft we bound:
With rheums oppress'd, we sink in rivers drown'd:
The dominating humour makes the dream.

And the same author, in another part of the same poem, sums up the whole affair of dreams in a few lines, which are likewise thus rendered by Dryden:

Dreams are but interludes which fancy makes;
When monarch reason sleeps, this mimic wakes;
Compounds a medley of disjointed things,
A court of cobblers, and a mob of kings.
Light fumes are merry; grosser fumes are sad;
Both are the reasonable soul run mad:
And many monstrous things in dreams we see,
That never were, nor are, nor e'er can be.
Sometimes we but rehearse a former play:
The night restores our actions done by day,
As hounds in sleep will open for their prey.
Sometimes forgotten things, long cast behind,
Rush forward to the brain, and come to mind:
The nurses legends are for truth receiv'd,
And the man dreams but what the boy believ'd:
In short, the farce of dreams is of a piece;
Chimæras all, and more absurd, or less.

Ver. 979. The meaning is, that they who go to see plays for some days together, are apt to dream of them at night, and in their dreams fancy they see the actors, hear them repeating their parts, and the music playing; as also that they see the audience and the decorations of the stage. This is the sense of Lucretius, which I the rather take notice of, because the words sport and play, in the first line of this paragraph, express but ill the comedies and tragedies of which the poet is speaking.

Ver. 1005. Here the poet begins to treat of frightful dreams, and teaches, that they are caused by images that flow from things which are composed of rough seeds.

Ver. 1007. The words of the text are,

At variæ fugiunt volucres, pennisque repente
Sollicitant divum nocturno tempore lucos, &c.

In which we may observe a scoff even worthy of Lucretius: Lucus, a grove, is thus described by the Scholiast upon Homer: *πᾶς τόπος συνδιδόσκει δῶκε ἔχειν, καὶ θεοῖς ἀφιερῶμενος*. Every place planted with trees, having water, and consecrated to the gods. Now Lucretius impiously insinuates, that the gods cannot protect their inmate birds from the image of a hawk.

Ver. 1012. Dreams of this nature, which are of the sort the ancients called *insomnia*, are elegantly described by Petronius, in these verses:

Somnia quæ mentes ludunt, volitantibus umbris,
Non delubra Deum, nec ab æthere numina mit-
tunt,
Sed sibi quisque facit. Nam quum prostrata sopore
Urget membra quies, et mens sine pondere ludit,
Quicquid luce fuit, tenebris agit: oppida bello
Qui quatit, et flammis miserandas sævit in urbes,

Tela videt, versasque acies, et funera regum,
Atque exundantes perfuso sanguine campos, &c.

To which I add these two excellent verses of the author of the Dispensary, in a description of night:

The slumb'ring chiefs of painted triumphs dream,
While groves and streams are the soft virgin's theme.

Ver. 1026, 1027. These four verses are omitted by Creech.

He was, according to some, the son, according to others, the servant of Somnus, the god of sleep, and father of dreams. Morpheus was so called, because his province was to imitate τὰς μορφάς, the looks and forms of men. He is described by Ovid, Metam. xi. ver. 364, where, speaking of Somnus the god of sleep, he says, that

Excitat artificem, simulatoremque figuræ
Morphea. Non illo jussus solertior alter
Exprimit incessus, vultumque, modumque lo-
quendi:

Adjicit et vestes, et consuetissima cuique
Verba: sed hic solos homines imitatur——

Thus rendered by Dryden:

——Somnus, the drowsy god,
Excited Morpheus from the sleepy crowd:
Morpheus, of all his num'rous train, express'd
The shape of man, and imitated best:
The walk, the words, the gestures could supply,
The habit mimic, and the mien bely:
Plays well, but all his action is confin'd,
Extending not beyond our human kind.

But Mr. Rowe, in his Ulysses, extends his power much farther, nay, even makes him a god, but, I think, without authority: However, the passage is well worth the transcribing:

Still, when the golden sun withdraws his beams,
And drowsy night invades the weary world,
Forth flies the god of dreams, fantastic Mor-
pheus:

Ten thousand mimic fancies fleet around him,
Subtle as air, and various in their natures:
Each has ten thousand thousand diff'rent forms,
In which they dance, confus'd, before the sleeper;
While the vain god laughs to behold what pain
Imaginary evils give mankind.

This Morpheus had two brothers, or fellow-servants, Phobator or Icelos, and Phantafus, who likewise had their peculiar offices allotted them: This too we learn from Ovid, in the place above cited. I omit the original, and will give it only as translated by Dryden:

Another birds, and beasts, and dragons apes,
And dreadful images, and monster-shapes:
This demon, Icelos, in heav'n's high hall,
The gods have nam'd, but men Phobator call:
A third is Phantafus, whose actions roll
On meaner thoughts, and things devoid of soul:
Earth, fruits, and flow'rs, he represents in dreams,
And solid rocks unmov'd, and running streams.

According to this distinction of their several offices, this last, Phantafus, would, if the translator of these verses had thought fit, have been more proper to represent his sink, or lazy pool.

Ver. 1027. "Lacum ac dolia curta." For it was the custom at Rome, to set tubs, or earthen pots, in the corners of the streets, for the passengers to make water in. This we learn from C. Titius, who lived in the same age with Lucilius, and who, in an oration he made in behalf of the Fannian law, has this passage, as we find it cited by Macrobius, Saturnal. lib. ii. cap. 12. "Inde ad comitium vadunt, ut litem suam faciant: dum eunt, nulla est in angiporto amphora, quam non impleant, quippe qui vesicam plenam vini habent." Faber says, positively, that these vessels were not of wood, but of earth, and made by the potters; yet *dolium*, I think, always signifies a wooden vessel.

Ver. 1029. "Babylonica magnifico splendore." Babylon was a city of Asia, and the making of hangings, carpets, &c. with figures, and of divers colours, was first invented there, and from thence they were called *Babylonica*. Plin. lib. viii. cap. 48. "Colores diversos picturæ intertexere Babylon maxime celebravit, et nomen imposuit." See above, ver. 25. Plautus in Stichus.

Tum Babylonica peristromata consutaque tepetia
Advenit minimum bonæ rei.

And in Pseud. he calls them,
Alexandria belluata conchyliata peristromata.

Martial lib. viii. Epig. xxviii.

Non ego prætulero Babylonica picta superbè
Texta Semiramidæ quæ variantur acu.

For Semiramis reigned at Babylon. And Cowley,
David. iii.

The room with golden tap'stry glitter'd bright,
At once to please, and to confound the sight.
Th' excellent work of Babylonian hands.

But purple coverlets or counterpoints seem to
have been anciently most in use, especially among
great persons. Homer, Il. ix.

Εἶναι δ' ἐν κλισίῃσι τέκνῃσι τε πορφύρεσσιν.

And Virgil, Georg. ii. ver. 506.

—Et sarrano indormiat ostro.

That is, Tyrian purple. Thus too Stat. The-
baid. i.

—Pars ostro tenues, auroque sonantes
Emunire toros.—

And Plato the comedian, in Athen. ii. says, they
lie ἐν κλίνῃσι ἐλαιοῦσι καὶ εἰρώμασι πορφύρεσσιν
αἰσιν, &c.

Ver. 1030. Some accuse Lucretius of immodesty in this passage; but I, says Creech, discover a great deal of art. For he would never have treated of dreams of this nature, unless the explanation of them had been absolutely necessary, in order to the natural introduction and connection of the subsequent disputation of lust, and of love.

Ver. 1034. "Quasi transactis omnibus rebus," says Lucretius; that is, τὰν Ἀφροδίτῃν τελίσαντις, as I, says Faber, know an excellent author, who is very skilful in these matters, expresses himself. But Theocritus expresses it otherwise,

Ἐπράχθη τὰ μέγιστα. Idyl. ii.

Ver. 1036. Here Creech has omitted fourteen verses of his author, which these fifteen supply. In them the poet gives us a lively image of all manner of concupiscence, and explains the whole affair of lustful love, as well in regard to the mind as to the body. Beautiful images, says he, move the mind; the mind brings the seed from all the members of the body into the genitals, which parts swell to an erection, and after that the action is consummated.

Ver. 1039. Lucretius says,

Ex homine humanum semen ciet una hominis
vis:

Creech interprets the last words, "una hominis vis," to mean either the image of a beautiful body moving the mind, or the mind itself bringing the seed from all the parts of the body.

Ver. 1040. Lucretius,

Quod simulatque suis ejectum sedibus exit,
Per membra, atque artus decedit corpore toto
In loca, &c.

Upon which Faber observes, that the word *sesto* is not used without reason, but means an entire body, that has not lost any of its members; for it often happens, that mutilated parents get mutilated children; which is confirmed by many indisputable examples: therefore the seed comes from all the members. It is certain too that Tertullian was of the same opinion, when he said, that in the fury of the act, when the seed is ejected, something seems to go out even from the very soul. "Denique, ut adhuc verecundia magis periclitetur quam probatione, in illo ipso ultimo voluptatis æstu, quo genitale virus expellitur, nonne aliquid de animâ quoque sentimus exire." Tertull. de Animâ. All this is true, says Creech; but Lucretius meant something else, which others may better conjecture than I express.

Ver. 1048. This and the two following verses run thus in the original?

Namque omnes plerumque cadunt in vulnus, et
illam

Emicat in partem sanguis, unde icimur ictu:

Et, si comminus est, hostem ruber occupat humor.

These verses, Lambinus, Faber, &c. expunge; yet they seem to carry a meaning very proper to the matter in hand, and not to be unworthy of Lucretius. Lambinus confesses, that he could not see any connection between them and the foregoing verses, and therefore was for rejecting them: And this is the point I am going to examine. The verses that precede them, run thus:

Inritata tument loca semine, sitque voluntas
Ejicere id, quo se contendit dira libido;

Idque petit corpus mens, unde 'st faucia amore:
Namque omnes, &c.

Which I thus interpret: Those parts being enraged by the seed, swell; and thence arises a desire of ejecting the seed on that part to which the raging lust is striving to attain: and the mind tends to that body from which she received her wound of love. "Namque omnes," &c. For all men, for the most part, fall upon their wound; and the blood gushes with violence towards the part from whence we are wounded; and if the murderer be near us, the red liquor will spout upon him. What follows, makes the connection appear yet more plain:

Sic igitur veneris qui telis accipit ictum,
Unde feritur, eo tendit.—

That is to say, in like manner, he who is wounded by the darts of Venus, tends to the place from whence he was struck. But Nardius gives another interpretation to the last of these verses, and says, the poet speaks of a dead body that bleeds afresh if the murderer approach it; of which I the rather disapprove, because even he himself will not allow the fact to be true; but that the wounded fall upon the side on which they are wounded, is not only confirmed by experience, but a natural reason may be given, why, in all probability, it cannot be otherwise: for all things bend, and incline to fall on the side on which is their imbecility, and whatever is supported by a certain force, when that force comes to be impaired, from whatever cause it happens to be so, must of necessity incline to the side on which is its weakness; and when the weak part gives way, it drags along with it into ruin the parts that are annexed to it, and which, together with it, make the whole. This we may observe daily of buildings, and of cripples. Now, the wounded part must grow weak, not so much by reason of the dissolution of its contexture, as because of the loss of blood and animal spirits, which Hippocrates himself, lib. de Aliment. allows to be the causes of strength; therefore wounded animals must naturally fall on the side on which they receive their wound. "Corruit in vulnus," says Virgil of Pallas, whom Turnus slew. *Æn.* x. ver 488. And this I presume sufficient to justify the retaining these verses, notwithstanding the censure of those learned interpreters who have absolutely rejected them, since it proves them to have a visible and natural connection, not only with what went before, but likewise with what follows, which Dryden has thus rendered:

So likewise he who feels the fiery dart
Of strong desire transfix his am'rous heart;
Whether some beauteous boy's alluring face,
Or lovelier maid, with unresisted grace,
From her each part the winged arrow sends,
And whence he first was struck, he thither tends:
Restless he roams, impatient to be freed,
And eager to inject the sprightly seed.

For, stung with inward rage, he flings around,
And strives t' avenge the smart on that which
gave the wound.

Ver. 1057. Some copies read *frigida*, others *fervida cura*: Creech, in this place, takes notice of neither. Faber is absolutely for *fervida*, and says, every man will approve that reading, who can truly say from his heart, "Nunc scio quid sit amor—." The care that is caused by love, is hot, it glows, it burns: *μαλαρόν βέλος, πυρρόν τε βέλος, πυρὶ πάντ' ἐβόηται.* Creech also, in his Latin edition, is of the same opinion, and says, he too will approve of it, who observes, that Lucretius is explaining the rise and increase, or progress of love: First, A drop of it distills upon the heart, thence proceeds a vehement desire, which is nourished by the images that are continually presenting themselves to the wounded lover, in so much, that though the object of his flame be absent, yet her name is always sounding in his ears. But Dryden seems to approve of *frigida cura*, as we may judge by his translation of this passage:

For fierce desire does all his mind employ,
And ardent love assures approaching joy.
Such is the nature of that pleasing smart,
Whose burning drops distil upon the heart:
The fever of the soul shot from the fair,
And the cold ague of succeeding care.
If absent, her idea still appears,
And her sweet name is chiming in your ears.

Ver. 1063. In all the Latin authors, says Faber, numerous as they are, there is not, in my opinion, any thing that equally ought, or deserves to be read, as the following verses. And yet there have been some men heretofore, and at this day many of the same sort are to be found, who strenuously contend, that they ought, if possible, to be concealed from the eyes of mankind, as abounding with manifest abominable impurities. Hard fate of our poet! whose so useful counsels, whose so salutary advices have been thus ill received, and met with so prosperous success: For though he cry out with all his might,

Sirenas, hilarem navigantium pœnam,
Blandasque mortes, gaudiumque crudele,
Effugete, ô miseri, tortumque ab littore funem
Rumpite;—

Though he prove, by many arguments, that lust incontinence, and debauchery, are the direst roads that lead to inevitable ruin and perdition, and that we ought therefore to have in abomination, and to avoid and fly from, more than we would from the jaws of devouring serpents and wild beasts, those infamous prostitutes, who lead by the nose their inconsiderate admirers: though he shows, that estates, reputation, and the health and welfare, both of the mind and body, are ruined that way, notwithstanding all this, I say, there are some so superciliously tender of their own and other's modesty, as to exclaim against, and as to give us warning to avoid these obscene expres-

sons, these bawdy verses, that are not fit to be read, nor worthy to be remembered. I, for my part, confess, that I discover in this disputation nothing of impurity, nothing obscene, nothing unfit to be read, or unworthy to remember: and if any thing of such nature appear to others, the reader is in fault, not the poet. If nothing of this kind may be read, physicians must leave off to study nature, and anatomies must no longer be exposed to view. At least, this I think I may affirm for a truth not to be controverted, that, if what Lucretius has here written must be deemed impure and obscene, yet expressions, far more impure and obscene, may be found in a certain book which no man will dare to blame. I know it will be objected, that that holy writer, whom it is no matter to name in this place, handled that subject, even though it be of a most filthy nature, so plainly, and with such open broadness, that he might, by the perspicuous turpitude of the description, create the greater abhorrence of that vice, and render it the more detestable. I own it; nor was I ever of another opinion. But to what end, or in what design did Lucretius write in this manner? Was it that he might instruct in the art of playing the bawd, and thus make his fortune by the vilest commerce? Other poets have, indeed, in many ages, followed that trade, and found their account by it; and perhaps too some do so at this day: But the integrity of his life, the severity of his manners, and the many most salutary precepts that are scattered here and there throughout this whole poem, leave us no room to suspect any such base design in Lucretius. Let us see at one view the wholesome advice he gives us in the affair of love.

*Sed fugitare decet simulacra et pabula amoris,
Absterre sibi, atque aliò convertere mentem,
Nam certa et pura est sanis magis inde voluptas,
Quam miseris: Etenim potiùdi tempore in ipso
Fluctuat incertis erroribus ardor amantùm;
Nec reperire malum id possunt quæ machina vincat.*

*Usque adeo incerti tabescunt vulnere cæco.
Adde quod absumunt vires, pereuntque labore:
Adde quod alterius sub nutu degitur ætas.
Labitur interea res, et vademonia fiunt;
Languent officio, atque ægrotat fama vacillans.
Si nescis, etiam medio de fonte leporum
Surgit amari aliquid, quod in ipsis floribus angat:
Aut quod conscius ipse animus se forte remordet,
Desidiosè agere ætatem, lustrisque perire;
Aut quod in ambiguo verbum jaculata reliquit,
Quod cupido affixum cordi vivescit ut ignis:
Uti sit, ut melius multo vigilare sit ante,
Quà docui ratione, cavereque ne inlaqueeris.*

Of which the English reader will not be displeased to see Dryden's interpretation.

But strive those pleasing phantoms to remove,
And shun th' aerial images of love,
That feed the flame——
For on one object 'tis not safe to stay;
Force then the tide of thought some other way:

TRANS. II.

For purer joys in purer health abound,
And less affect the sickly than the sound.
When love its utmost vigour does employ,
Ev'n then 'tis but a restless wand'ring joy.
All ways they try, successful all they prove,
To cure the secret sore of ling'ring love.
Besides——

They waste their strength in the venereal strife,
And to a woman's will enslave their life.
Th' estate runs out, and mortgages are made;
All offices of friendship are decay'd;
Their fortune ruin'd, and their fame betray'd;
And in the fountain where the sweets are sought,
Some bitter bubbles up, and poisons all the draught.
For guilty conscience does the mirror bring,
And sharp remorse shoots out her angry sting:
And various thoughts within themselves at strife,
Upbraid the long mis-spent luxurious life.
Perhaps the fickle fair one proves unkind,
Or drops a doubtful word that pains his mind,
And leaves a rankling jealousy behind.
Therefore, far better is it to prevent,
Than flatter the disease, and late repent:
Because to shun th' allurements is not hard
To minds resolv'd, forewarn'd, and well prepar'd:
But wondrous difficult, when once beset,
To struggle through the streights, and break th'
involving net. Dryd.

Is this the language of a man, who intended to corrupt his readers, or rather of one who designed usefully to instruct and advise them: Thus Faber, concerning the poet's intention in this discourse of love. Creech, too, subscribes to his opinion, and adds, that the poet has in this place been as careful of his diction, and that it is at least as pure and correct as in any other part of the whole poem; and so plain and significant likewise, as not to need an interpreter.

Ver. 1065. Dryden has rendered this passage otherwise; and, indeed, more close to the sense of Lucretius than our translator.

——When one molests thy mind,
Discharge thy loins on all the leaky kind:
For that's a wiser way than to restrain
Within thy swelling nerves that horde of pain:
For every hour some deadlier symptom shows,
And by delay the gathering venom grows,
When kindly applications are not us'd:
The scorpion love must on the wound be bruis'd,
On that one object 'tis not safe to stay,
But force the tide of thought some other way:
The squander'd spirits prodigally throw,
And in the common glebe of nature sow.

Ver. 1075. Dryden.

Nor knows the lover in that wild excess,
With hands or eyes, what first he would possess;
But strains at all, and fast'ning where he strains,
Too closely presses with his frantic pains.
With biting kisses hurts the twining fair;
Which shows his joys imperfect, unsincere;
For, stung with inward rage, he flings around,
And strives to avenge the smart on that which
gave the wound.

L. I

Ver. 1078. Dryden, in *All for Love* :

But when I have you fast, and all my own,
With broken murmurs, and tumultuous sighs,
I'll say you were unkind, and punish you,
And mark you red with many an eager kiss.

Ver. 1087. Dryden.

For ardent hope still flatters anxious grief,
And sends him to his foe to seek relief :
Which still the nature of the thing denies,
For love, and love alone, of all our joys,
By full possession does but fan the fire ;
The more we still enjoy, the more we still desire.
And, to the same purpose, in the Tragedy of *All for Love*, he says finely,
There's no satiety of love in thee !
Enjoy'd thou still art new : perpetual spring
Is in thy arms : the ripen'd fruit but falls,
And blossoms rise to fill its empty place,
And I grow rich by giving.

And in *Amphitryo*.

Your fruits of love are like eternal spring
In happy climes, where some are in the bud,
Some green, and rip'ning some, while others fall.

Ver. 1089. Here the poet teaches how the appetites of hunger and thirst come to be satisfied, though that of love can never be so. Meat and drink, says he, go down into the stomach, where they fill certain places, whose emptiness excited the desire of them. And

Hence thirst and hunger may be satisfy'd :
But this repletion is to love deny'd.
Form, feature, colour, whatsoe'er delight
Provokes the lover's endless appetite,
These fill no space, nor can we thence remove
With lips, or hands, or all our instruments of love.
In our deluded grasp we nothing find,
But thin ærial shapes that fleet before the mind.
As he, who in a dream with drought is curs'd,
And finds no real drink to quench his thirst,
Runs to imagin'd lakes his heat to steep ;
And vainly swills, and labours in his sleep :
So love with phantoms cheats our longing eyes,
Which hourly seeing never satisfies :
Our hands pull nothing from the parts they strain,
But wander o'er the lovely limbs in vain.

Ver. 1099. Dryden.

And when the youthful pair more closely join,
When hands in hands they lock, and thighs in
thighs they twine :
Just in the raging foam of full desire,
When both press on, both murmur, both expire :
They gripe, they squeeze, their humid tongues
they dart,
As each would force their way to t'other's heart.
In vain : they only cruize about the coast ;
For bodies cannot pierce, and be in bodies lost :
As sure they strive to be, when both engage
In that tumultuous momentary rage.
So tangled in the nets of love they lie,
Till man dissolves in that excess of joy :

Then when the gather'd bag has burst its way,
And ebbing tides the slacken'd nerves betray,
A pause ensues ; and nature nods a while,
Till with recruited rage new spirits boil,
And then the self-same violence returns :
With flames renew'd, th' erected furnace burns :
Again they in each other would be lost,
But still by adamant bars are cross'd.
All ways they try, successless all they prove,
To cure the secret sore of ling'ring love.

Ver. 1113. Here the poet enumerates the many inconveniences that are the inseparable attendants of love ; which, at best, is a wretched slavery, obnoxious to suspicions, and fantastical surmises : In a word, an uneasy passion, which all but downright madmen will avoid.

[*They waste their strength, &c.*] This is most certainly true, if we may give credit to some physicians, mentioned by Dr. Brown in his *Pseudodox. Epidemic.* lib. iii. c. 9. and who, though they agree in the generally received opinion, that the seed is only a more perfect concoction and preparation of the blood ; yet assert, that it receives so great a quantity of spirits by that preparation, that to lose but one drachm of it weakens a man as much as the loss of sixty ounces of blood. And hence persons addicted to venery are generally pale : whence Juvenal, Sat. i. ver. 41.

Accipiat sanè mercedem sanguinis, et sic
Palleat, ut nudis preffit qui calcibus anguem.

Where *sanguis* is taken for the seed itself ; and in that sense too, Plautus likewise uses it. "Apage à me istas sorores, quæ hominum sorbent sanguinem."

Ver. 1117, 1118. "Lucret. Pulchra in pedibus Sicyonia rident." Sicyon was a city of Peloponnesus, whose inhabitants are often represented by Cicero to be very effeminate ; and lib. i. de Oratore, he particularly mentions their shoes. "Si mihi calceos Sicyonis attulisset, non uterer, quamvis essent habiles, et apti ad pedes, quia non essent viriles." Athenæus, lib. iv. and Lucian in Rhetore, mention them likewise. See also Julius Polux.

Ver. 1118. Lucret.

Teriturque Thalassina vestis
Assiduè, et Veneris sudorem exercita potat,

Which Dryden has rendered more fully than our translator,

And the blue coat that with embroidery shines,
Is drunk with sweat of their o'erlabour'd loins.

Moreover, the colour which the Romans called Thalassinus, was a Cerulean, and had a cast of green. See above, ver. 75.

Ver. 1119. Lucretius.

Et benè parta patrum fiunt anademata, mitræ,
Interdum in pallam ac Melitensia, Cæaque vertunt.

The *anadema* was an ornament that women wore on their heads, made of ribbands, and almost like a coronet. The *mitra* was a cap which women likewise wore ; it was set with pearls, and tied

under their chin with ribbands and chains. Virg. *Æn.* iv. ver. 216.

*Mæoniâ mentum mitra crinemque madentem
Subnexus.*——

Melitenſia and *Cea*, were garments ſo called from the iſlands Melita and Cea, whence they were brought. Melita lay in the African Sea, between Sicily and Africa. Heſychius *Μελίτια ἱθὺμα τῖνα διάφορα ἐκ Μελίτης τῆς νήσου*. Cicero in 2 cont. Verr. often mentions the Melitenſian garments: And in 4 cont. Verr. he ſays, that Melita, the town where Verres was born, “*Textrinum per biennium ad muliebrem veſtem conficiendam fu- iſſe.*” And of all the artiſans of Melita Diodo- rus Siculus chiefly commends τὴν ὁδομα ποιῶν τῇ τε λεπτότητι τῇ μαλακότητι δια ηρεσῆ. Cea was an iſland in the *Ægean* Sea of which Pliny, lib. iv. cap. 9. ſays, “*Ex hac proſectam delicatiorẽm fæminis veſtem auctor eſt Varro. Propert.*” lib. i. Eleg. 2.

Et tenues Cea veſte movere finus:

Ver. 1123. The cuſtom of the ancients, both Greeks and Latins, to adorn their heads with chaplets of flowers, and to anoint themſelves with fragrant ointments, when they ſet down to drink and be merry, is frequently mentioned in the au- thors of theſe days. See Book iii. ver. 896. It is thought by ſome, that this cuſtom came origi- nally from the Hebrews: They ground their conjecture on Ezekial, chap. xxiii. where Sama- ria and Jeruſalem are deſcribed under the meta- phor of whores: Incenſe and oil are mentioned ver. 41.; and in ver. 42. it is ſaid, that their lovers put beautiful ornaments on their heads: Which Fortunatus Scacchus, in his *Myrothecium*, lib. i. cap. 26. underſtands in this ſenſe of gar- lands of flowers, and of ointments: Moreover, they arrived at length to an exceſs of curioſity in regard to their ointments, that was indeed won- derful: For Athenæus, lib. xv. cap. 11. reports out of an old poet, that they grew ſo nice as to require ſeveral ſorts of ointments for one ſingle unction, namely, Egyptian for the feet and thighs, Phœnician for the cheeks and breasts, Syſimbian for the arms, Amaracine for the eyebrows and hair, and Serpylline for the neck and knees; but, above all the reſt, we may obſerve, that the an- cients made uſe of one ſort of oil, or ointment, of great value and ſingular excellency: it was called *oleum ſuſinum*, and made of lilies, which, in the Phrygian tongue, are called *εύσα*, but chiefly of that ſort of lily which the Greeks call *χρίνον*, and to which, it is believed, alluſion is made, Cantic. [v. ver. 13. where the church ſays of Chriſt, his lips are like lilies; which would ſeem a ſtrange compariſon, according to the common acceptation of that flower; I mean, if we ſhould underſtand in that place the white lily; eſpecially ſince the beauty of the lips conſiſts in being red: And therefore our Saviour, deſcribing his ſpouſe the church, according to that notion of a beauti- ful lip, ſays, “*Thy lips are like a thread of ſcar- let,*” Cantic. iv. 3. Wherefore we may conclude,

that there were ſeveral ſorts of lilies: And Pliny deſcribes the lily that is called *χρίνον*, to be of a ruddy colour: “*Eſt et rubens lilium quod Græci χρίνον vocant,*” ſays the author in his *Natural Hiſt.* lib. xxi. cap. 5. and which, as Athenæus, lib. ii. cap. 2. ſays was the ſame with *εύσα*. And of this ſort of lily was made that admirable *oleum ſuſinum*, mentioned by the ſame Pliny, lib. xiii. cap. 1. Scacchus, in the book before cited, chap. xxvii. takes this to be the ſame oil which the prophet calls the oil of gladneſs; but that critic might better have called it the figure of this, which, as he himſelf ſays, ſignifies the high grace of the hypſtatical union. Beſides, what is ſomewhat ſtrange, we may obſerve that the learned Cordus makes no mention of this *oleum ſuſinum* in his *Diſpenſatorium*, though p. 301 of that book he deſcribes the *olenum lilinum*: But it is evi- dent that he means only the oil of the white lily.

Ver. 1125. The original of this paſſage deſerves to be tranſcribed.

*Nequicquam: quoniam medio de fonte leporum
Surgit amari aliquid, quod in iſtis floribus angat.*

where, by “*in iſtis floribus,*” the poet means, ſays Creech, then chiefly when love reaches to lovers his vaſt delight: when he gives them to drink of his nectar: Dryden has tranſlated it finely:

In vain:——

For in the fountain where the ſweets are ſought,
Some bitter bubbles up, and poisons all the draught.

The two next verſes of Lucretius, our tranſlator has taken no notice of. They are theſe:

*Aut quod conſcius ipſe animus ſe forte remordet;
Deſidioſe agere ætatem, luſtrisque perire:*

But I have inſerted them, as tranſlated by Dryden in four verſes.

Ver. 1135. This Lucretius calls “*amor pro- prius:*” which is, ſays Faber, when a man is ſo well beloved by the perſon on whom he has fixed his paſſion, that ſhe forſakes all company for his: To which the poet oppoſes, the love which he calls “*amor adverſus,*” that is to ſay, diſ- aſtrous love, in which a man meets with many croſſes, and above all, with a miſtreſs that ne- glects and ſcorns him.

Ver. 1144. But the wretch is already caught, and lies ſtruggling in the ſnare: Who will de- liver and ſet him free? This our poet pretends to do in the following fifty-two verſes.

Ver. 1154. In this place, Creech has omitted the three next verſes of his author, which are theſe:

*Atque alios alij inident, veneremque ſuadent
Ut placent quoniam fœdo adſiſtantur amore:
Nec ſua reſpiciunt miſeri mala maxima ſæpe.*

Lambinus is for having them expunged, yet Fa- ber will not give his conſent: On the contrary, he ſays, they are truly Lucretian, and carry a very good ſenſe; then he explains them as fol-

lows: Some lovers persuade their friend, who is in love with a deformed dowdy, to appease Venus, and render her propitious to him in his amours, because it is she has sent him so ugly a mistress: Meanwhile they themselves are in love with others, who are less lovely and less beautiful. Dryden too has omitted them: And, indeed, allowing of the interpretation that Faber has given them, I cannot well see what they have to do in this place. Creech, in his Latin notes, has transcribed Faber's opinion, but says nothing of his own; however, having printed the interpretation of them in a different character, I am apt to believe he rather inclined to the opinion of Lambinus.

Ver. 1156. Lucret. *Cælia παλλὰδιον*. "Cæli oculi," are the blueish gray eyes, such as cats have; or rather, such as owls, which have a reddish cast. These animals can see by night, and their eyes generally look very fierce. Now such eyes were never esteemed; and therefore the lover called his mistress, who had such eyes, a little Pallas. Pallas was the goddess of wisdom, and Homer often calls her *γλαυκῶπις* which signifies, having eyes that sparkle, or that are of a fiery redness, like the eyes of a lion.

Ver. 1157. *Χαρίτων*, one of the graces, who were three in number, Aglaia, Thalia, and Euphrosyne the daughters of Jupiter and Autonoe, or of Jupiter and Eurynome. They are said to be very beautiful, extremely witty, and always gay and merry.

Ver. 1159. "Balba, loqui non quit," *τραυλίζει*. If any stammer to that degree that she cannot speak, they say she lisps; for lisping is but a slight imperfection in speaking, in comparison of stammering: The first falters only in the pronunciation of a letter, and chiefly of *r*, as *aulola* for *aurora*: And Aristophanes, and Plutarch, tell us, Alcibiades had such an impediment. But he that stammers often murders whole syllables: Moreover, the last part of this verse, and all the next, is an addition to Lucretius.

Ver. 1163. "*Ραδίη* vero est, jam mortua tuffi:" Because a cough, when it is become a habit, or at least continues for some time, wastes the body, and brings it, as we say, to nothing but skin and bone; therefore, that they might extenuate this fault, they called the consumptive girls *ραδίνας*, thin or slender. Theocritus too says of the Cyparissians, that they are *ραδίνας*, which the Scholiast interprets, *επιμήκεις*, *λίπας*, which signify likewise thin and slender. Ovid had this expression of Lucretius in his mind, when he said,

Sit gracilis, macie quæ modo viva sua est.

And this of Lucilius is something like it: "*Vix vivo homine ac monogrammo.*"

Ver. 1165. Ceres, the goddess of corn, of whom see Book ii. ver. 516, and Book v. ver. 16. She was always painted with large swelling breasts, and therefore the epithet *τρόφος*, well fed, is commonly given her. "Ceres est ipsa ab Iaccho," says Lucretius: which expression Arnobius, lib.

iii. "contra gentes," thus explains: "Ceres ab Iaccho, id est, Ceres ἢ τῷ 'Ιάκχῳ," that is to say, Ceres, whom Iacchus or Bacchus loved. For Bacchus was called Iacchus, from *ιαχὴ*, a clamour, because of the bawling drunken women that were in his train. But let us see how Dryden has rendered this passage:

For thus the bedlam train of lovers use
To enhance the value, and the faults excuse:
And therefore 'tis no wonder if we see
They doat on dowdies and deformity:
Ev'n what they cannot praise, they will not blame,
But veil with some extenuating name:
The fallow skin is for the swarthy put,
And love can make a flattern of a slut:
If cat-ey'd, then a Pallas is their love:
If freckled, she's a party-colour'd dove:
If little, then she's life and soul all o'er;
An Amazon, the large two-handed whore:
She stammers? Oh what grace in lisping lies!
If she says nothing, to be sure she's wise:
If shrill, and with a voice to drown a choir,
Sharp-witted she must be, and full of fire:
The lean consumptive wench, with coughs decay'd,
Is call'd a pretty, tight, and slender maid:
Th' o'ergrown, a goodly Ceres is express'd,
A bed-fellow for Bacchus at the least:
Flat-nose the name of satyr never misses;
And hanging blubber lips but pout for kisses.

Where, among many other things well worth taking notice of, we may observe, the last verse save one, "Flat-nose," &c. which Creech has totally omitted: "*Simula, (σῆληνη, ac Satyra 'it.*" Lucret. For the Sileni and the Satyrs, who were the companions of Bacchus, were generally painted with flat noses. The Sileni were the oldest, and masters of the Satyrs, as we learn from Pausanias in Attic. See Casaubon, lib. de Satyricâ, &c. See also above, ver. 589. Moreover, Cowley seems to have had this passage of Lucretius in his mind, when he said,

Colour or shape; good limbs or face;
Goodness or wit in all I find;
In motion, or in speech a grace;
If all fail, yet 'tis womankind:
If tall, the name of proper flays;
If fair, she's pleasant as the light;
If low, her prettiness does please;
If black, what lover loves not night:
The fat with plenty fills my heart;
The lean with love makes me too so;
If strait, her body's Cupid's dart
To me; if crooked, 'tis his bow.

Ver. 1171. This in nowise expresses the thought of Lucretius, who says,

*Nemque eadem facit, et scimus facere omnia,
turpi.*

Dryden much more to the purpose,

She does no more in that for which you woe,
Than homelier women full as well can do.

Ver. 1184. This is not in Lucretius, nor do I think he would have said it. Neither has our translator any authority for ver. 1190. I take such thoughts to be unworthy of his author.

Ver. 1193. Lucretius.

Et si bello animo 'st, et non odiosa vicissim,
Prætermittet te humanis confedere rebus.

Which Faber thus explains: And unless she be downright morose and untoward, you will easily be able to discover her failings and defects. Nay, she will not so much as endeavour to conceal them from you, hoping you will not be offended at them, since they are not peculiar to one woman only, but common to the whole sex.

For common sense brings all their cheats to view,
And the false light discovers by the true:

Which a wise harlot knows, and hopes to find
A pardon for defects, that run through all the kind.

Dryd.

Ver. 1196. Here Creech had skipped over seventeen verses of Lucretius, which are supplied by these nineteen verses taken from Dryden. The poet supposes he has said enough to create in his readers a loathing of those common harlots, who prostitute themselves only for gain, and who do all they can to hinder conception. And, therefore, being now going to show how it comes to pass that children are sometimes like their fathers, sometimes like their mothers, and sometimes like both their parents; nay, that they sometimes too resemble their grandfathers, and more remote progenitors; he premises these nineteen verses, in which he teaches, that some women do it with all their heart, for the sake of the pleasure, of which they are no less sensible than the males: For, that the joys of coition are common to both sexes, the copulations of brute animals abundantly evince.

Ver. 1202. Thus too Virg. Georg. iii. ver. 242.

Omne adeo genus in terris hominumque ferarumque;

Et genus æquoreum, pecudes, pictæque volucres,
In furias, ignemque ruunt: Amor omnibus idem.

Thus ev'ry creature, and of ev'ry kind,
The secret joys of sweet coition find;
Not only man's imperial race, but they
That wing the liquid air, or skim the sea,
Or haunt the desert, rush into the flame:
For love is lord of all, and is in all the same.

Dryd.

Ver. 1215. In these nineteen verses Lucretius teaches, that if, when the seed of both parents mixes and incorporates into one mass, the seed of the male prevails, the child, whether male or female, will resemble the father; and, on the contrary, that if the seed of the female prevail, the child, be it of either sex, will resemble the mother. And from this prevailing power of the seed, it most frequently happens, that the child resembles but one of its parents. But if there be an equal mixture of the seed of both parents, and

neither of them prevail, in that case the child's figure and features too are mingled; inasmuch that that common offspring may seem to favour either neither of them both, because it derives not its all from any one of them; or else it may seem to resemble both of them, because it has borrowed a part from each. But the reason, why children sometimes resemble their grandfathers, or any other of their more remote ancestors, is because the seed consists, and is composed, of many molecules, or very minute particles, which not being always all of them dissolved into atoms, neither in the first generation or descent next to them, nor in the other next to that, come afterwards in one of the succeeding generations, to discover themselves in such a manner, that what they might have done in the next, or first generation, they do only in one that is more remote. Lactantius, lib. de Opificio Dei. cap. 12. seems to be of the same opinion, and tells us besides, that the reason why the seed of the male sometimes prevails, and sometimes that of the female, is, because there is a greater quantity, sometimes of the seed of one of them, sometimes of that of the other: By which means the prevailing seed comes in a manner to surround and shut up the other. His words are as follows: "Similitudines autem in corporibus filiorum sic fieri putant. [Varro scilicet et Aristoteles] cum semina inter se permixta coalescunt, si virile superaverit, patri similem provenire, seu marem, seu feminam. Si muliebri prævaluerit, progeniem cujusque sexus ad imaginem respondere maternam. Id autem prævalet è duobus, quo id fuerit uberius: alterum enim quodammodo amplectitur ac includit. Hinc plerumque fieri solet, ut unius tantum lineamenta prætendant. Si vero æqua fueris ex pari semine permixtio, figuras quoque misceri, ut soboles illa communis aut neutrum referre videatur, quia totum ex altero non habet; aut utrumque, quia partem de singulis mutuata est. Nam in corporibus animalium videmus, aut confundi parentum colores, ac fieri tertium neutri generantium similem; aut utriusque sic exprimi, ut discoloribus membris per omne corpus concors mixtura varietur." All which is so exactly the doctrine of Lucretius, that Dryden's translation of this passage of the poet shall serve to explain the sense of that father.

Now when the woman's more prevailing juice
Sucks in the man's, the mixture will produce
The mother's likeness; when the man's prevails,
His own resemblance in the seed he seals.
But when we see the new begotten race
Reflect the features of each parent's face,
Then of the father's and the mother's blood,
The justly temper'd seed is understood:
When both conspire, with equal ardour bent,
From ev'ry limb the due proportion sent,
When neither party foils, when neither's foil'd,
This gives the blendid features of the child.
Sometimes the boy the grandfire's image bears;
Sometimes the more remote progenitor he shares
Because the genial atoms of the seed
Lie long conceal'd, e'er they exert the breed

L l ij

And, after sundry ages past, produce
The tardy likeness of the latent juice.
Hence families such diff'rent figures take,
And represent their ancestors in face and hair, and
make.

Because of the same seed, the voice, and hair,
And shape, and face, and other members are ;
And the same antic mould the likeness does
prepare.

Thus oft the father's likeness does prevail
In females, and the mother's in the male.
For, since the seed is of a double kind,
From that whence we the most resemblance find,
We must conclude the strongest tincture sent,
And that was in conception prevalent.

Macrobius, Saturnal. lib. vii. cap. 16. defines the
seed of all animals in these words: " Semen ge-
neratio est ad ejus ex quo et similitudinem pergens.

Ver. 1230. The words in Lucretius are,

*Et muliebre oritur patrio de femine sæculum,
Maternoque mares existunt corpore creti.*

It is not so great a paradox, says the poet, that
the child should chiefly resemble in face, hair,
voice, &c. either its father or its mother, accord-
ing as the seed of either most prevails; as it is,
that a child of the female sex should spring from
the seed of the father, and a male child from that
of the mother: However, he ascribes this effect
to the same cause, viz. to the prevalence of the
seed. But Lactantius, in the place above cited,
gives another reason of it: and after having de-
scribed the interior parts of the womb, and said,
that the right part is the male, and the left the
female, he continues, that if the seed of the male
happen to fall into the left part of the womb,
then indeed a male child is begot; but because it
is conceived in the female part of the womb, it
will have something more womanish than the
manly comeliness requires; as a beautiful face,
too fair a complexion, a weak shrill voice, &c. In
like manner, if the seed of the female flow into
the right part of the womb, then indeed a female
child is begot; but because it is conceived in the
male part, it will have something manly in it,
more than properly belongs to the female sex; as
strong limbs, a swarthy complexion, a robust
voice, &c. But if the male seed happens to lodge
in the right, and the female in the left, then
the fruit of either is brought forth as it ought to
be; insomuch that the female offspring will have
all the tenderness and beauty that are natural to
their sex, and the male all the manliness and
strength both of body and mind. " *Disparis quo-
que naturæ hoc modo fieri putantur: cum forte in
lævam uteri partem masculinæ stirpis semen inci-
derit, marem quidem gigni opinatio est: sed quia
fit in femininâ parte conceptus, aliquid in se ha-
bere fœmineum, suprâ quam virile decus patia-
tur: vel formam insignem, vel nimium candorem,
vel corporis lævitatem, vel artus delicatos, vel sta-
turam brevem, vel vocem gracilem, vel animum
imbecillum, vel ex his plura. Item si in dex-
tram partem semen fœminini sexûs influxerit,*

fœminam quidem procreari: sed quoniam in
masculinâ parte concepta sit, habere in se ali-
quid virilitatis, ultrâ quam sexus ratio permittit:
aut valida membra, aut immoderatam longi-
tudinem aut fuscum colorem, aut hilpidam fa-
ciem, aut vultum indecorum, aut vocem robustam,
aut animum audacem, aut ex his plura. Si
vero masculinum in dexterum, fœminam in si-
nistram pervenerit, utrosque fœtus rectè prove-
pire, ut et fœminis per omnia naturæ suæ decus
constet et maribus, tam mente, quam corpore,
robur virile fervetur. *Lact. de Opif. Dei, cap. 12.*

Ver. 1234. The poet being now going to dis-
pute of the causes of barrenness, he first in these
eight verses, according to his usual custom, falls
foul upon the gods, and tells us, it is to no pur-
pose to make supplications to them to give us
children: because they never curse with barren-
ness, either the man or the woman. Nor does it
deserve our admiration, that he excludes the gods
from concerning themselves with the nuptial bed,
since according to the doctrine of Epicurus, he
places them in the intermundia, the spaces be-
tween his many worlds, where they indulge
themselves in uninterrupted repose, and have no
manner of concern for the affairs here below: It
is in vain, therefore, to importune them with
prayers, to fly to their oracles, or to have recourse
to magic numbers: as if we believed that

—————The vain decrees of pow'rs above
Deny production to the act of love;
Or hinder fathers of that happy name,
Or with a barren womb the matron shame;
As many think, who stain with victim's blood
The mournful altars, and with incense load,
To bless the show'ry seed with future life,
And to impregnate the well-labour'd wife.

Ver. 1242. The causes of sterility, which Lu-
cretius in these twenty-six verses ascribes to the
temperament and quality of the seed, are true,
and related as modestly as the nature of the sub-
ject would permit. He tells us,

That barrenness of sexes will proceed
Either from too condens'd, or wat'ry seed:
The wat'ry juice too soon dissolves away,
And in the parts projected, will not stay.
The too condens'd, unsoul'd, unwieldy mass,
Drops short, nor carries to the destin'd place,
Nor pierces to the parts; nor though injected
home,

Will mingle with the kindly moisture of the womb:

Then he tells us, that this undue quality and dif-
ference of the seed is the reason why some wo-
men, who are barren to a first husband, have
children by a second; and on the contrary, why
some men, who had no children by a first wife,
when they are married to another, come to have
many:

For nuptials are unlike in their success:
Some men with fruitful seed some women bless:
And from some men some women fruitful are,
Just as their constitutions join or jar;

And many seeming barren wives have been,
Who, after match'd with more prolific men,
Have fill'd a family with prattling boys:
And many, not supply'd at home with joys,
Have found a friend abroad to ease their smart,
And to perform the sapless husband's part.

Ver. 1266. In these two verses he tells us, that what we eat and drink is of great moment, either to promote or hinder barrenness: because some sorts of food produce seed, while others diminish and waste it. And to this opinion of the poet our physicians subscribe.

Ver. 1268. The cause of sterility, alleged in these seventeen verses, from the wanton motions of females in the act of generation, can neither be accused of absurdity, nor of chastity. Whoever would see this passage of our poet explained at large, may consult Donatus, ad Eunuchum Terentii, Act v. Sc. I. Martial. lib. I. Epig. 68. et Schioppius ad Priapeia, Ep. 18.

Ver. 1285. Lastly; since love is caused by images; and since the images, that flow from beautiful persons, chiefly excite that passion, how comes it to pass that some men doat on dowdies and deformity? Take care how you say that this comes from above; for the proverb lies: No marriages are made in heaven, nor do the gods any more concern themselves about them, than men who have been long since dead. No, but it is good nature, easiness of temper, modesty, and cleanliness, that renders homely women charming; and sometimes too a long acquaintance and familiarity beget love. Epicurus to Herodotus: *ἡ συνουσία ἀνὴρ μὲν ὑδέποισι, ἀγαπήσει δὲ, εἰ τι μὴ ἰβλάψῃ.*

Cupid, the god of love, so called à *cupiendo*. Some feign two of them; one honest, the other base. The honest was born of Jupiter and Venus; but some assign Mercury for his father; the base was the son of Erebus and Nox. Cupid is painted blind, and armed with two darts or arrows, one tipped with gold, the other with lead: that causes love, and this drives it away. Ovid Metam. i. ver. 568.

*Equæ sagittiferâ promittit duo tela pharetrâ
Diversorum operum: fugat hoc, facit illud amo-*
rem: [cutâ;

Quod facit, auratum est, et cuspidē fulget a-
Quod fugat, obtusum est, et habet sub arundine
plumbum.

Dryden, from the Knight's Tale of Chaucer, describing the Temple of Venus, says of Cupid,

Hard by his mother stood an infant love;
With wings display'd; his eyes were banded
o'er;

His hands a bow, his back a quiver bore,
Supply'd with arrows bright and keen, a deadly
store.

Ver. 1293. See the note on book i. ver. 363. And thus Lucretius concludes his discourse concerning the nature of love; some whole passages of which I have purposely avoided to explain: not for the reason which some perhaps may ima-

gine; but rather, because I take the subject itself to be of such a nature, that scarce the dullest capacity needs an interpreter to understand it.

ANIMADVERSION,

BY WAY OF RECAPITULATION, ON THE FOURTH
BOOK OF LUCRETIIUS.

IN this book are contained but very few assertions that a philosopher will approve of: For within the whole extent of philosophy, there is not a weaker, or more trifling opinion than that of Epicurus concerning images: For let it be granted, That such subtle *exuvia*, or minute membranes are continually getting loose, and flying off from the surface of things, yet, when they fly to and fro on all sides, they must of necessity mutually break and tear one another, till at length they will be so mixed and blended together, that we should not be able to see or imagine any thing, but Centaurs, Scyllas, and such like monsters.

Nevertheless we must confess, that Lucretius has to ver. 480. disputed of these spectres and images with great sharpness of wit, and elegance of style, and that he has adorned the fable with all the embellishments of art.

From thence to ver. 556. the poet treats the sceptics with the scorn, severity, and indignation, which they justly merit: for those animals ought to be contemned and suppressed: Nor would I blame his great indulgence for the senses, had he not allotted them a more extensive authority than they are well able to execute: I acknowledge the senses not to be fallacious; but am I therefore to measure and determine the magnitude of the sun, moon, and stars, by my eyes? This opinion, to say no worse of it, favours too much of rusticity.

What Lucretius urges to ver. 722. that sound, flavour, and odour are corporeal, and that all sensation is made and performed by bodies, none will offer to deny, except such only as are seduced into error by the qualities and other unwarrantable opinions of brain sick Aristotle.

In the next place, as to what he asserts to ver. 832. concerning imagination, why need we give our opinion, since there are no such things as images? And his foolish assertion to ver. 859. which teaches, That our several members, which are so artfully, and with so great wisdom composed, and compacted together, were not made to the end we might use them; but that when they were already made, they laid hold of that office and function, which first offered and presented itself to each of them, deserves no other answer, than a most profound laughter and derision.

We may bear with what he advances to ver. 877. concerning hunger and thirst: but from thence to ver. 905. in which is contained the Epicurean doctrine of the motion of animals, we

discover nothing but what is weak and foolish. And since sleep, according to Lucretius, is occasioned by a dispersion of the soul, why do not we, who are endowed with a soul that is immor-

tal, wake eternally? All that he says of dreams, to ver. 1036. is downright trifling. We have given our thoughts of the rest of this book in the note on v. 1063.

PREFACE TO THE SECOND VOLUME.

HAVING in the preface to the first volume given the public so full and ample an account of my design in publishing these notes and animadversions on this English translation of Lucretius, as likewise of the helps I made use of, and of the method I have observed in this undertaking, which I take to be the chief business of a Prefacer, I shall not long detain my reader by way of introduction to this second volume, that contains only the two last books of my author; who, having in these two books treated of a great variety of noble subjects, has afforded me a just occasion of swelling this volume to almost an equal number of sheets with the former, though computing the number of verses, it contains but little more than one third of the whole poem of Lucretius: The length, however, if I may judge of the readers satisfaction in the perusal, by my own in the compiling, will not, I hope, seem tedious to him; and I flatter myself, that I shall not weary and grow irksome to those whom it has been my principal study and design at once to instruct and divert.

When the subject of which my author was treating was naturally crabbed and abstruse, as in the two first books, in which he disputes chiefly of the nature and properties of his atoms; I thought it not convenient to dwell too long upon it; but endeavoured only to render it plain and intelligible with as much brevity as the province of an interpreter, which I had undertaken, would allow. But when he came to treat of things, which I judged would be more entertaining, as of the origin of the world; of the motion of the heavens; of the sun, moon, and stars; of the first men, and of their manners and way of life; of the first institution of kings, magistrates and laws; of the first invention of arts and sciences; of the things we call meteors, as thunder, lightning, whirlwinds, earthquakes, &c. Of the causes of rain, wind, hail, snow, and frost; of the flames that are ejected from the bowels of Mount Ætna; of the annual increase of the river Nile; of the Averni; of certain miraculous fountains; of the loadstone; and of the cause and origin of plagues and diseases; of all which, as well as of many other subjects of the like nature, Lucretius has disputed in these two last books: when he came, I say, to treat of these matters, he afforded me a wider field to enlarge and expatiate upon; and I have laid hold of the opportunity he gave me, to illustrate all those several

subjects, with the opinions of all the most celebrated, as well ancient, as modern philosophers, concerning them: In which I presume I shall not be deemed to have transgressed the bounds, which were formerly prescribed to an interpreter, who, as Ammonius allows, "*Neque benevolentia ductus conari debet, quæ perperam dicuntur consentanea facere, eaque veluti a tripode excipere, neque rectè prodita pravo sensu per odium corpore sed eorum esse incorruptus iudex, atque auctores sensum aperire imprimis, illiusque placita interpretari; tum quod alii, et ipse sentiat afferre.*" Besides, I cannot apprehend, but that it will be acceptable to the public to see at one view the different opinions of the learned men in all ages, on the above subjects; and this is what I have endeavoured to oblige my readers with in the following sheets.

I will conclude this preface with a few lines in my own vindication, and then take my leave.

I foresee that I have rendered myself liable to be carped at, and that I shall be censured by some critics, on account of some particular words, and certain ways of expression, which I have constantly observed and made use of through the whole course of this work; contrary to the generally received custom and practice of many, nay, perhaps of most of our present writers.

I need not be told, that, in matter of speech, when custom has once prevailed, we are absolutely obliged to submit to whatever it has imposed upon us; and that it is not lawful, on any pretence whatsoever, to resist the laws of that sovereign, I had almost said tyrant of languages.

Cui penes arbitrium est et jus norma loquendi.

Horat.

But on the other hand, in language, as in most things else, there is a good custom and a bad: the good ought to be the standard of propriety and correctness of speech; and the bad ought carefully to be avoided, as the corrupter of it: so that the main difficulty lies in discerning rightly between them: But how this may be done is not our present business to inquire.

Dr. Swift, in his letter to the Lord High Treasurer, with good reason complains, that our language is extremely imperfect, that its daily improvements are by no means in proportion to its daily corruptions, and that the pretenders to polish and refine it have chiefly multiplied abuses and absurdities; and so far he is certainly in the

right: but I cannot agree with him when he goes on, and says, That in many instances it offends against every part of grammar. He seems to impute to the language itself the faults of our uncorrect writers. All languages, but more especially the modern, and ours amongst the rest, have certain idioms and properties of speech peculiar to each of them, in which nevertheless they offend against the general rules of grammar. Of this so many instances might be given, that it is needless to give any.

Modern and living languages are not to be fixed by the standard, nor ascertained by the maxims and rules of the ancient and the dead; and their chief beauties consist in frequent emancipations from the servile laws of ancient grammar. A man may write ungrammatically, and yet write very good English; according to this excellent saying of Quintillian, "*Aliud est grammaticè, aliud Latine loqui.*"

I now return to what gave occasion to these reflections, and, among several other instances that my readers may observe, will mention only one or two, in which I have varied from some other writers of these days. Phenomenon is a word that has been introduced into our language: Necessity brought it in to avoid a circumlocution: For it is originally Greek, and signifies an appearance in the heaven, or in the air. Now, some instead of phenomenon, leaving out the two final letters, make it phenomen, and say in the plural, phenomens; both which I take to be altogether absurd: Others who write phenomenon in the singular number, when they have occasion to use it in the plural, say phenomena, which, in my opinion, is contrary to the analogy of our language; and others again, in the same number, phenomena's, which I almost dare pronounce to be a monster in speech: For my own part, whenever I have been obliged to use it in the plural, I have not stuck to say, phenomenons, rather than the phenomena, as it is the original; and this I am sure is more conformable to the analogy of our language, in which the difference between the singular and the plural number, even in the words borrowed from the learned languages, consists not in any variation of the final syllable, but in the addition of the letter *s* to the singular number. Thus, in the following words, idea, anathema, chimera, compendium, epithalamium,

which, together with many other, we have taken from the learned languages, and naturalized in our own, we say not in the plural, ideæ, anathemata, chimerae, compendia, epithalamia, even though we have retained their original terminations in the singular, but ideas, anathemas, chimeras, compendiums, epithalamiums. Besides, since there is no method yet proposed, nor any rules yet agreed upon, and settled among us, for the ascertaining and fixing our language for ever, why has not every man an equal share of liberty, not only to introduce and set up a new word, if there be occasion for it, but even to use one that is already introduced, in a different manner from the rest of his contemporary writers, especially since they themselves use it differently from one another? "*Licuit, semperque licebit.*" This, I hope, is sufficient to excuse, if not to justify, my having used the word phenomenons in the plural number; at least it will make it appear to be an error, not of ignorance, but of judgment, and which I declare myself always ready to recant and rectify, whenever I can be better informed, and convinced by good reasons that I am in the wrong.

Again: nothing is more frequent with our present writers than the following way of expression: They greedily embrace that doctrine, be it never so erroneous. This example is taken from one of our most celebrated authors for correctness of style: nevertheless I take the word never in that place to be a barbarism in speech: It ought to be ever; be it ever so erroneous: This way of expression is an idiom of our language; partly elliptic, partly a transposition of the words; which, when placed in due order, and without any word understood, will run as follows: How erroneous soever it be. I have not room in this place to undertake the disquisition of this doubt, nor to give my reasons at large, why, whenever I have had occasion to make use of the like expression, I have dissented from most of our other writers, and employed the word ever, rather than never: But this, together with some hundreds of observations, relating to our native language, and which I have been many years digesting in my thoughts, I intend to publish in a short time, as an essay towards the correcting, improving, and ascertaining of it, under this title, *Remarks upon the English Tongue.*

BOOK V.

THE ARGUMENT.

THE beginning of this book, to ver. 60. contains, I. The praise of Epicurus, who, because he was the first that instructed mortal men in the art of true wisdom, the poet says, ought deservedly to be reckoned among the number of the gods, rather than either Ceres, or Bacchus, or Hercules, whose inventions were less beneficial to human life, than that true and wise philosophy, which Epicurus taught. II. From ver. 59. to ver. 100. he proposes the argument of this book, and shows the connection between these subjects he is now going to handle, and those of which he has already disputed.

in the four preceding books; and being now about to treat of the first rise, and future dissolution of the world, he teaches, III. That the earth, the sea, the heavens, the stars, the sun and the moon, are mortal; and that they are not animated, nor endowed with a divine body, nor are parts of God himself, as the Stoic philosophers believed them to be: then he asserts, that neither the heavens, as the general opinion is, nor indeed any part or parts of the world, are the mansions or abodes of the gods. IV. From ver. 99. to ver. 266. That none may believe that the world was made by the gods, and is therefore immortal; he heaps up several reasons, drawn as well from the nature of the gods, as from the defectiveness and ill contrivance of this vast frame of the universe, by which he endeavours to prove, that it was not the workmanship of a Deity. V. From ver. 265. to ver. 461. he argues, that the four elements, earth, water, air, and fire, of which the world consists, are, nevertheless, generated and mortal; and, consequently, that the world itself once had a beginning, and will have an end. And he confirms and proves, by several other arguments, that this universal frame has not existed from all eternity, nor will be immortal, and remain undissolved to all futurity. VI. From ver. 460. to ver. 551. he treats of the first beginning of the world, and of each of the different parts that compose the whole, and assigns them their proper and respective seats and places, according as they are more or less heavy or light. VII. From ver. 550. to ver. 655. he proposes many difficulties concerning the motions of the heavens and of the planets; but determines nothing for certain: then he teaches, why the whole frame of the earth, which is a heavy body, hangs in the air, without being supported by any foundation: And, at length, takes the dimensions of the sun, the moon, and the stars, and pronounces them neither bigger nor less than they seem to us to be. VIII. From ver. 654. to ver. 824. he gives several reasons of the summer and winter solstices: tells what causes night: why Aurora, or the morning, precedes the sun: why the nights and days mutually overcome and chase away each other by turns: why the moon changes her face and figure; and why the sun and moon are sometimes eclipsed. IX. From ver. 823. to ver. 894. he descends from the heavens, and describes the first rise of herbs, trees, birds, beasts, and man; and tells the order in which each kind of things was produced out of the earth, one after another: to wit, first the grass, then the trees, next the birds, then beasts, and last of all man. X. From ver. 890. to ver. 979. he grants, That monsters, certain maimed and imperfect animals, were born in the beginning of the world; but asserts, that nature gave them not the power to propagate their kinds: Hence he takes occasion to deride and explode all Chimeras, Centaurs, Scyllas, and the other fabulous and monstrous productions, which the poets feign that nature brings forth; and asserts, that there never were, nor could be any such prodigies of nature, neither at the beginning of the world, nor at any time since to this day; and also, that no such things can be produced hereafter. XI. From ver. 978. to ver. 1156. the poet describes the strength of the first men, their robust constitution of body, their poorness of living, their food, wit, manners, houses, and marriages. XII. From ver. 1155. to 1223. he teaches, That, after fire was thrown down upon earth by lightning, men began to be more civilized; and, having invented how to dress meat, fared more deliciously than before. That they then first established societies, entered into leagues and alliances, shared the land among themselves, and chose kings to govern them who were either the most strong, the most beautiful, or the most witty among them; and were elected for one or more of these three reasons: but that at length, gold being found out, the richer commanded the poorer; and, envy springing up among them, a sedition arose, the kings were deposed, republics instituted, and laws established, to secure every one in his property. XIII. From ver. 1232. to ver. 1326. he treats of the fear of the gods, and of the first rise of religion; which he ascribes merely to ignorance of the Divine Nature, and of natural causes. XIV. From ver. 1325. to the end of the book, he teaches how the several metals, gold, silver, brass, iron, and lead, came first to be discovered; mentions the first arts of war, and the weapons then used; and concludes with the invention and progress of spinning, weaving, agriculture, sailing, music, poetry, and other arts.

WHAT verse can soar on so sublime a wing,
As reaches his deserts? What muse can sing
As he requires? What poet now can raise
A stately monument of lasting praise,
Great as his vast deserts, who first did show
These useful truths; who taught us first to know
Nature's great pow'rs? 'Tis more than man can
do!

For, if we view the mighty things he show'd,
His useful truths proclaim, he was a god!
He was a god who first reform'd our souls, 10
And led us by philosophy and rules.
From cares, and fears, and melancholy night,
To joy, to peace, to ease, and show'd us light.

For now, compare what other gods bestow:
Kind Bacchus first the pleasing vine did show;
And Ceres corn; and taught us how to plough.

Yet men might still have liv'd without these two,
They might have liv'd as other nations do. 18
But what content could man, what pleasure find,
What joy in life, while passions vex'd the mind?
Therefore, that man is more a god than these,
That man who show'd us how to live at ease;
That man who taught the world delight and
peace.

His useful benefits are rais'd above
Alcides acts, the greatest son of Jove!
For, tell me how the fierce Nemæan roar [boar,
Could fright us now? How could th' Arcadian
The Cretan bull, the plague of Lerne's lakes,
The pois'nous hydra with her num'rous snakes?
How could Geryon's force, or triple face? 30
How Diomed's fiery horse, those plagues of
Thrace?

How could the birds that o'er th' Arcadian plains
With crooked talons tore th' affrighted swains,
Offend us here? Whom had the serpent struck,
Mighty in bulk, and terrible in look,
That, arm'd with scales, and in a dreadful fold,
Twin'd round the tree, and watch'd the growing
gold?

Remov'd as far as the Atlantic shore,
Deserts untrod by us and by the Moor. 39
Those others too that fell and rais'd his fame, }
That gave him this diffus'd and lasting name, }
And made him rise a god from Oeta's flame: }
Had they still liv'd, what mischief had they done?
Whom had they torn? Whom frighted? Surely
none:

For now, ev'n now, vast troops of monsters fill
Each thick and darksome wood, and shady hill.
Yet who complains, yet who their jaws endure?
For men may shun their dens, and live secure.

But had not his philosophy began,
(What had not man endur'd, ungrateful man?) 50
And cleans'd our souls, what civil wars, what cares
Would fierce ambition raise, what pungent fears?
How pride, lust, envy, sloth, would vex the mind?
Therefore, the man who thus reform'd our souls,
That slew the monsters, not by arms, but rules,
Shall we, ungrateful we, not think a God?
Especially since he divinely show'd

What life the gods must live; and found the cause
And rise of things, and taught us nature's laws.

His steps I trace; and prove, as things begun,
By the same laws, and nature they live on, 61
And fail at last, loose all their vital ties;
But chiefly, that the soul is born, and dies:
And that those shadows which in dreams appear, }
And forms of friends, and perish'd heroes bear, }
Are but loose shapes, by fancy wrought in air. }

Now I must teach, the world, as years prevail,
Must die; this noble frame must sink and fail;
And how at first 'twas form'd; what curious
blows [compose: }
Made seed, earth, seas, sun, heav'n, and stars }
What living creatures did, what never rose. 71 }

How leagues, and how society began;
What civiliz'd the savage creature, man. [above,
Whence sprung that mighty dread of pow'rs
That reverence, that awful fear and love,
Which first religious duties did engage;
And now secures their holy things from rage.

How tow'rd both poles the sun's fix'd journey
bends,

And how the year his crooked walk attends:
By what just steps the wand'ring lights advance;
And what eternal measures guide the dance; 81
Lest some should think their rounds they freely
Scatt'ring their servile fires on things below, [go, }
On fruits and animals, to make them grow. }

Or that some god does whirl the circling sun,
And fiercely lash the fiery horses on:
For ev'n those few exalted souls, that know
The god, must live at ease, not look below,
Free from all meddling cares, from hate and
love;

If they admire, and view the world above, 90
And wonder how these glorious beings move, }

They are entrapp'd, they bind their slavish chain,
And sink to their religious fears again;
And then the world with heav'nly tyrants fill,
Whose force is as unbounded as their will.
Deluded ignorants! who ne'er did see
By reason's light, what can, what cannot be:
How ev'ry thing must yield to fatal force;
What steady bounds confine their nat'ral course.

But now to prove all this; first cast an eye, }
And look on all below, on all on high, 101 }
The solid earth, the seas, and arched sky,
One fatal hour (dear youth) must ruin all;
This glorious frame, that stood so long, must fall.

I know that this seems strange, and hard to
prove,

(Strong harden'd prejudice will scarce remove)
And so are all things new and unconfin'd
To sense, nor which through that can reach the
mind,

Whose notice, eye, nor hand, those only ways,
Where science enters, to the soul conveys. 110

And yet I'll sing: perchance the following fall
Will prove my words, and show 'tis reason all.
Perhaps thou soon shalt see the sinking world
With strong convulsions to confusion hurl'd;
When ev'ry rebel atom breaks the chain,
And all to prim'tive night return again.

But chance avert it! rather let reas'n show [true.
The world may fall, than sense should prove it

But now before I teach these truths, more sure
And certain oracles, and far more pure [ears;
Than what from trembling Pythia reach'd our
I'll first propose some cure against thy fears; 122
Lest superstition prompt thee to believe,
That sun and moon, that seas and earth must live;
Are gods eternal, and above the rage
And pow'rful envy of devouring age:

And, therefore, they whose impious reasons try }
(More bold than those fond fools that storm'd }
the sky) }

To prove the world is mortal, and may die,
That orbs can fall, the sun forsake his light, 130
And bury'd lie, like meaner things, in night,
Calling that mortal which is all-divine,
Must needs be damn'd for their profane design.

For these are so unlike the gods, the frame
So much unworthy of that glorious name,
That neither lives, nor is in animal;
That neither feels; dull things, and senseless all.
For life and sense, the mind and soul refuse 138
To join with all; their bodies must be fit for use.
As heav'n does bear no trees; no stars below; }
As stones no blood, and fish no mountains know; }
But each has proper place to rise and grow: }
So neither souls can rise without the blood,
And nerves, and veins, and bones; for grant they
could,

Then through each single part, as arms, or head,
'Twould first be fram'd, thence o'er the other
As water into vessels pour'd will fall [spread;
First to one part, then rise and cover all.
But since 'tis certain that a proper place
Is settled for the life, and the increase 150
Of mind and soul; 'tis folly to believe
That they can rise without fit limbs, or live;

Or be in flitting air, or chilling seas,
Or earth, or scorching flames. Fond fancies these!
Therefore, they are not gods, their sense divine;
For they are made unfit for that design,
Since none with minds in vital union join.

Nor must we think these are the blest abodes,
The quiet mansions of the happy gods,
Their substance is so thin, so much refin'd, 160
Unknown to sense, nay, scarce perceiv'd by mind.
Now since their substance can't be touch'd by
man,
They cannot touch those other things that can;
For whatsoe'er is touch'd, that must be touch'd
again.

Therefore, the mansions of those happy pow'rs
Must all be far unlike, distinct from ours;
Of subtle natures, suitable to their own:
All which, by long discourse, I'll prove anon.

But now, to say this spacious world began, 169
By bounteous Heav'n contriv'd to pleasure man;
And, therefore, this vast frame they toil'd to raise,
And fit for us, should meet with equal praise;
Or be esteem'd eternal, all secure
From ruin, or the teeth of time endure;
And that 'tis impious to design to prove
What was contriv'd by the wise pow'rs above,
And fix'd eternal for the man they love.

That this can die, that this to fate can bow,
And with bold reason strive to overthrow,
And make that mortal they design'd not so. 180
'Tis fond: For what could man return again?
What profit to the gods for all their pain, [rest,
That they should work for him? Why break their
In which they liv'd before, secure and blest?
What coming joy, what pleasure could they view,
To leave their former life, and seek a new?

For they delight in new, whose former state
Was made unhappy by some treach'rous fate:
But why should they, who liv'd in perfect ease,
Who ne'er saw any thing but what did please,
Be tickled thus with love of novelties? 191
Perhaps they lay obscure, and hid in night,
Till things began, and day produc'd the light.

Besides, what harm, had the sun idly ran,
Nor warm'd the mud, nor kindled it to man,
What harm to us, if we had ne'er began?
True: those that are in being once, should strive
As long as pleasure will invite to live;
But they, who ne'er had tasted joys, nor seen
What hurt to them, suppose they ne'er had been?

Besides: whence had the gods their notice,
whence their mind, 201
Those fit ideas of the human kind?
What image of the work they then design'd?
How did they understand the pow'r of seed?
That they, by change of order, things could breed;
Unless kind nature's pow'rs at first did show
A model of the frame, and taught them how to
know?

For seeds of bodies from eternal strove, [move,
And us'd by stroke, or their own weight to
All sorts of union try'd, all sorts of blows, 210
To see if any way would things compose:
And so, no wonder they at least were hurl'd
Into the decent order of this world;

And still such motions, still such ways pursue,
As may supply decaying things by new.

For were I ignorant how beings rise,
How things begin; yet reasons from the skies,
From ev'ry thing deduc'd, will plainly prove,
This world ne'er fram'd by the wise power's
above; 219

So foolish the design, contriv'd so ill!
For first; those tracts of air what creatures fill?
Why beasts in ev'ry grove, and shady hill?
Vast pools take part, and the impetuous tide,
Whole spreading waves the distant shores divide;
Two parts in three the torrid zone does burn,
Or frigid chill, and all to deserts turn.

And all the other fields, what would they breed,
If let alone, but briars, thorns, and weed?
These are their proper fruits, this nature would,
Did not laborious mortals toil for food; 330
And tear, and plough, and force them to be good.
Did not they turn the clods with crooked share,
By frequent torments forcing them to bear;
No tender fruits, none of their own accord
Would rise to feed proud man, their fancy'd lord.

Nay, often too, when man with pains and toil,
Has plough'd, and overcome th' unwilling soil;
When flow'rs put forth, and budding branches
shoot,

Look gay, and promise the much long'd-for fruit,
The scorching sun, with his two busy beams, 240
Burns up, or clouds destroy the fruits with streams.
Or chill'd by too much snow they soon decay,
Or storms blow them and all our hopes away.

But farther; why should parent nature breed
Such hurtful animals? why cherish, feed
Destructive beasts? Why should such monsters
grow,

Did the kind gods dispose of things below?
Why plagues to all the seasons of the year belong?
And why should hasty death destroy the young?

A man, when first he leaves his prim'tive night,
Breaks from his mother's womb to view the light:
Like a poor carcase, tumbled by the flood,
He falls all naked and besmear'd with blood,
An infant, weak, and destitute of food.

With tender cries the pitying air he fills;
A fit presage for all his coming ills: [ease;
While beasts are born, and grow with greater
No need of sounding rattles them to please;

No need of tattling nurses busy care [wear
They want no change of garments, but can
The same at any season of the year. 261

They need no arms, no garrison, or town,
No stately castles to defend their own,
Nature supplies their wants; whate'er they crave
She gives them, and preserves the life she gave.

But now, since air, and water, earth, and fire
Are bodies all produc'd, and all expire;
Since these are such, these that compose this frame,
The nature of the whole must be the same: 269
For those, whose parts the strokes of fate controul,
If those are made, and die, so must the whole.
Now, since the members of the world we view,
Are chang'd, consum'd, and all produc'd anew;
It follows then, for which our proofs contend,
That this vast frame began, and so must end.

But lest you think I poorly beg the cause;
And that it disagrees with nature's laws,
That water, air, that earth, and fire should cease,
And fail; that they can die, and can increase;
Consider; earth when parch'd with busy beams,
And trodden much, flies up in dusky streams:
And little clouds of thick'ning dust arise, 282
Dispers'd by winds through all the lower skies:
And gentle rivers too, with wanton play,
That kiss their rocky banks, and glide away,
Take somewhat still from the ungentle stone,
Softens the parts, and make them like their own.

And by what thing another's fed, and grows,
That thing some portion of its own must lose.
Now, since all spring from earth, and since we call,
And justly too, the earth, the source of all; 291
Since all, when cruel death dissolves, return
To earth again, and she's both womb and urn:
The earth is chang'd, some parts must sometimes
cease,

And sometimes new come on, and she increase.

Besides, that seas and rivers waste and die,
And still increase by constant new supply,
What need of proofs? This streams themselves
do show,

And in soft murmurs bubble as they flow.
But lest the mass of water prove too great, 300
The sun drinks some to quench his nat'ral heat:
And some the winds brush off; with wanton play,
They dip their wings, and bear some parts away.
Some passes through the earth, diffus'd all o'er,
And leaves its salt behind in every pore;
For all returns, through narrow channels spread,
And joins where'er the fountain shows her head;
And thence sweet streams in fair meanders play,
And through the valleys cut their liquid way;
And herbs, and flow'rs on ev'ry side bestow, 310
The fields all smile with flow'rs where'er they
flow.

But more; the air, through all the mighty
frame, [same;
Is chang'd each hour, we breathe not twice the
Because, as all things waste, the parts must fly }
To the vast sea of air; they mount on high,
And softly wander in the lower sky.
Now, did not this the wasting things repair,
All had been long ago dissolv'd, all air.

Therefore, since all things waste their vital
chain }
Dissolv'd; how can the frame of air remain?
It rises from, and makes up things again. 321

Besides, the sun, that constant spring of light,
Still cuts the heav'n's with streams of shining white;
And the decaying old with new supplies: }
For ev'ry portion of the beam that flies,
Is but short-liv'd, it just appears, and dies.
And thus 'tis prov'd.—

For, when an envious cloud stops up the stream,
The constant stream of light, and breaks the beam,
The lower part is lost, and dismal shade [vey'd.
O'erspreads the earth where'er the cloud's con-
Therefore, there must be constant streams of rays,
Since ev'ry portion of the beam decays: 332
Nor should we see, but all lie blind in night,
Unless new streams flow'd from the spring of light.

So from our lights, our meaner fires below,
Our lamps, or brighter torches, streams do flow,
And drives away the night: they still supply }
New flames, as swiftly as the former die,
New beams still tremble in the lower sky. 340
No space is free, but a continu'd ray
Still keeps a constant, though a feeble day;
So fast, ev'n hydra-like, the fruitful fires
Beget a new beam as the old expires.
So sun and moon, with many a num'rous birth,
Bring forth new rays, and send them down to
earth,

Which die as fast: lest some fond fools believe,
That these are free from fate, that these must live.

Ev'n strongest towns and rocks, all feel the rage
Of pow'rful time: ev'n temples waste by age: 350
Nor can the gods themselves prolong their date,
Change nature's laws, or get reprieve from fate:
Ev'n tombs grow old, and waste, by years o'er-
thrown,

Mens graves before, but now become their own.
How oft the hardest rock dissolves, nor bears
The strength but of a few, though pow'rful years!
Now if that rock, for infinite ages past,
Stood still secure, if it was free from waste; }
Why should it fail, why now dissolve at last?

Lastly, look round, view that vast tract of sky,
In whose embrace our earth and waters lie. 361
Whence all things rise, to which they all return,
As some discourse; the same both womb and urn.
'Tis surely mortal all: for that which breeds
That which gives birth to other things, or feeds,
Must lose some parts; and when these things do
cease,

It gets some new again, and must increase.

But grant the world eternal, grant it knew
No infancy; and grant it never new;
Why then no wars our poets songs employ, 370
Before the siege of Thebes, or that of Troy?
Why former heroes fell without a name?
Why not their battles told by lasting fame?
But 'tis as I declare; and thoughtful man,
Not long ago, and all the world began:
And, therefore, arts that lay but rude before,
Are polish'd now, we now increase the store, }
We perfect all the old, and find out more.
Shipping's improv'd; we add new oars and wings;
And music now is found, and speaking strings.
These truths, this rise of things we lately know;
Great Epicurus liv'd not long ago: 382
By my assistance young philosophy
In Latin words now first begins to cry.

But if you think successive worlds, the same
They now appear, but earthquakes shook the
frame,

Or fire destroy'd, or floods swept all away; }
Grant only this, and you the cause betray:
This strongly proves the world will once decay: }
For what can sicken thus, can waste and fall, 390
And perish all, if stronger strokes prevail.
For thus, since we can feel the same disease,
Same harms that other per'ishing things do seize, }
We think that we shall die as well as these.

Besides, whate'er's immortal, must be so,
Because 'tis solid 'bove the pow'r of blow;

Whose parts no wedge divides, which know no
 And such are seeds as I explain'd before : {pore :
 Or else because, like empty space, 'tis such 399
 As is secure from stroke, and free from touch !
 Or else, because it can admit no bound,
 'Tis infinite, and knows no place beyond,
 To which the seeds may sink. This makes the all
 Eternal ; there's no place where seeds may fall,
 And breed confusion here. No space does lie
 Without the whole to which the parts may fly,
 And leave the mighty all to waste and die. }
 But now the world's not solid, ev'ry mass
 Contains between the seeds some empty space :
 Nor is't like void ; for thousand things, if hurl'd
 With mighty force, can strike and break the world.
 Seeds rushing on, may bear some parts away, 412
 Like v'ilent streams, and so the world decay.
 Besides, there's space beyond, to which the tie
 Of union loos'd, the scatter'd parts may fly : }
 Therefore, these heav'ns and earth can waste
 and die ;
 And, therefore, once began ; for what can fail,
 And waste : o'er what the strokes of fate prevail,
 Must be unable to endure the rage
 Of infinite past time, and pow'r of age. 420
 But, lastly ; since th' elements at jars,
 Still fight, are still engag'd in civil wars,
 Cannot their battles cease, their wars be done,
 And all the other parts submit to one ?
 The fire prevail, and with destructive beams
 Dry seas, the thirsty sun drink up the streams ?
 Which now he seems to try, but all in vain ;
 For rivers still bring new supplies amain ;
 So fast, so great, as if design'd to raise
 A flood, and o'er the centre spread the seas : 430
 But that's in vain ; the waters still decay,
 The winds brush off and bear some parts away ;
 The sun drinks some ; the stars take some for food,
 And seem to threaten more a drought than flood.
 Thus they still fight, with equal force maintain
 The war ; now conquer, and now yield again.
 Yet fire, as stories go, did once prevail,
 And once the water too was spread o'er all.
 The fire prevail'd, when the sun's furious horse,
 Disdaining Phaëton's young feeble force, 440
 Ran through the sky in an unusual course ;
 And, falling near the earth, burnt all below,
 Till angry Jove did dreadful thunder throw,
 And quench'd the hot-brain'd fiery youth in Po. }
 But Phœbus gather'd up the scatter'd ray,
 And brought to heav'n again the falling day.
 The horses too that ran through heav'n's wide
 plain,
 He caught, and harness'd to the coach again.
 They ever since, in due obedience, drew 449
 The flaming car. This Greece reports as true,
 Yet 'tis absurd : but all may yield to flame,
 If great supplies of rapid matters came
 From the vast mass : for then those seeds must fail,
 And sink again, or fire must ruin all. [stand
 Seas once prevail'd, nor could the towns with-
 The raging waves : they spread o'er all the land.
 But when the num'rous seeds, the mighty mass
 Supply'd, were turn'd from this into another
 place,

The water ceas'd, and the continual rain :
 And rivers ran within their banks again. 460
 Now I will sing, how moving seeds were hurl'd,
 How toss'd to order, how they fram'd the world :
 How sun and moon began ; what steady force
 Mark'd out their walk ; what makes them keep
 their course :
 For sure unthinking seeds did ne'er dispose
 Themselves by counsel, nor their order chose :
 Nor any compacts made, how each should move,
 But from eternal, through the vacuum strove,
 By their own weight, or by eternal blows,
 All motions try'd, to find the best of those, 470
 All unions too : if, by their various play,
 They could compose new beings any way :
 Thus long they whirl'd, most sorts of motion past,
 Most sorts of union too, they join'd at last
 In such convenient order, whence began
 The sea, the heav'n, and earth, and beasts, and
 man :
 But yet no glitt'ring sun, no twinkling star,
 No heav'n, no roaring sea, no earth, no air, }
 Nor any thing like these did then appear,
 But a vast heap ; and from this mighty mass 480
 Each part retir'd, and took its proper place :
 Agreeing seeds combin'd ; each atom ran,
 And sought his like, and so the frame began :
 From disagreeing seeds the world did rise,
 Because their various motion, weight, and size,
 And figure, would not let them all combine,
 And lie together : nor friendly motions join :
 Thus skies, and thus the sun first rais'd his head,
 Thus stars, thus seas o'er proper places spread.
 For first the earthly parts, a heavy mass, 490
 And closely twin'd, possess'd the middle place.
 Now as these heavy parts combin'd more close,
 Descending still, they vex'd with constant blows
 The lurking parts of sea, of stars, and skies,
 And sun ; and squeez'd them out, and made them
 rise ;
 Because those seeds are subtle, more refin'd,
 And round, and smooth, and of a lesser kind
 Than those of earth ; and so can freely pass
 The subtle pores of the descending mass.
 And thus the parts of heav'n did first retire, 500
 And bore up with them num'rous seeds of fire :
 As when the sun begins his early race,
 And views the joyful earth with blushing face, }
 And quaffs the pearly dew, spread o'er the
 grass ;
 From earth he draws some mists with busy beams,
 From wand'ring waters some, and running
 streams : [high,
 These thin, these subtle mists, when rais'd on
 And join'd above, spread clouds o'er all the sky :
 Just so the parts of heav'n did upward move,
 The subtle ether, thus combin'd above : 510
 And vastly wide, and spread o'er ev'ry place,
 Contains the rest within her kind embrace :
 Thus heav'n : then rose the moon, and stars, and
 sun ;
 Which through the sky with constant motions run :
 Because their seeds were all too light to lie
 In earth, nor light enough to rise on high, }
 And pass the utmost limits of the sky ;

But, plac'd between them both, the midst controul,

Certain, but moving portions of the whole :
Just as in man, some parts refuse to cease 520
From motion, some still lie dissolv'd in ease.

These things retir'd, the heavier parts of clay }
Sunk farther down, and made an easy way
For flowing streams, and caverns for the sea. }
And as by constant blows, the vigorous sun
Did strike the upper parts, and press them down,
More moisture rose; and then did streams increase:
More parts were still squeez'd out, and swell'd
the seas:

More ether then, of air more parts did rise, 530
And borne on high, there thicken'd into skies :
The mountains rais'd their heads; the humble
field

Sunk low; the stubborn stones refus'd to yield;
The rocks did proudly still their height maintain,
Nor could all sink into an equal plain.
Thus earth at first was fram'd; and thus did fall
The lowest, as the sediment of all.

Thence seas, thence air, thence ether, ev'ry
mass,

Distinct from others, took its proper place;
All fluids and all differently light, 539
And therefore reach'd the less, or greater height.

Then liquid ether did the farthest rear,
And lies on softest beds of yielding air :
But yet its parts ne'er mix, whilst winds did blow,
And rapid storms disturb all here below,
They undisturb'd move round the steady pole;
And sun, and stars, with constant motion roll :
For that by constant turns the sky may move,
The constant motions of the waters prove.

This thing the mighty mass, the ocean shows;
For that, at settled hours, still ebbs and flows. 550

Now learn what moves the stars, what mighty
force [course.

Does drive them on; what laws confine their
First, If the orb is mov'd, and whirls, and draws
The sun about; then this may be the cause :
Vast tracts of air the distant skies do bound,
And with a close embrace encircle round;
The upper part of that drives down the skies
From east to west; the under makes them rise;
And so the whirl's perform'd. Thus oft a flood
Turns round a wheel, and whirls the weighty
wood. 560

Or else the orbs may lie at rest above,
Steady and fix'd, and only stars may move;
Because the fires, confin'd to little space,
Grow fierce and wild, and seek a larger place, }
And thus through the vast heav'n begin their
race.

Or else external air, or subtle wind
May whirl them round: Or they may move to
find

Their nourishment; and run where food invites,
And kindly calls their greedy appetites. 569
For true, what single force makes stars to rise
And set; what governs these our single skies
Is hard to tell:—

And therefore I, how stars may move, propose
A thousand ways, and numerous as those:

And what may whirl the sun, and pale-fac'd
moon,

In all the worlds; but cannot fix on one,
Although but one rules here; but which that is
'Tis hard to point; it may be that or this.

And that the heavy parts should end their race,
And rest: and earth possess the middle place, 580
Its weight decay'd; that pow'r did weaker grow,
Because convenient things were plac'd below,
That rose with it, to which 'tis closely join'd,
By nat'ral ties, and strongest bands confin'd:
And thus it softly rests, and, hanging there,
Grows light, nor presses down the lower air.

Just as in man, the neck the head sustains,
The feet the whole; yet not one part complains }
Of pressing weight; neither is vex'd with pains. }
Yet other weights impos'd we straight per-
ceive, 590

Though lighter far, contract our limbs and grieve.
[Such vast import from sim'lar parts does spring,
When one is aptly join'd t' another thing.]

So earth was fashion'd in its proper place:
Not made, then thrust into the strange embrace
Of diff'rent air, but with the world began;
A certain part of it, as limbs of man.

Besides, the shaking earth does often move
The upper air, disturbing all above;
Which could not be, unless the strongest tie 600
Did closely join the earth, the air, and sky.

Thin subtle souls 'cause closely join'd, do prop
The mighty weight of limbs, and bear it up.
What raise the limbs in leaping, what controul,
And guide their motion, but the subtle soul?
Which shows the weighty force of things refin'd, }
When ty'd to others of a grosser kind; }
As air to earth, to our gross limbs the mind.

But farther on, the sun and moon do bear
No greater heats, nor figures than appear; 610
Because that space, through which the rays can
fly,

The heat can reach our touch, the light our eye:
Can lessen nothing, nor contract the frame,
Nor make the fire appear a milder flame:
Now since the vigorous rays do freely flow
As far as us, and visit all below! }
Their fires and figures are the same they show: }
Nor greater all, nor less.—

—And thus the moon,
Whether with borrow'd rays, or with her own,
She view the world, carries no larger size, 620
No fiercer flames than those that strike our eyes.
For objects far remov'd, at distance seen,
When too much hind'ring air is plac'd between,
No certain figure show: no eye can trace
Each line, each figure of the distant face:
But since the moon presents a certain size,
A certain shape, and figure, to our eyes, }
'Tis plain that it appears as great as 'tis. }

But farther on, since all our flames below,
At distance seen, do various sizes show: 630
Now lower sink, now raise their lofty head,
And now contracted seem, now farther spread:
We may conclude the stars, when seen from far, }
Or somewhat greater than the figures are, }
Or somewhat, though but little, less appear.

But more, no wonder that such vast supplies,
Such streams of rays from this small sun should
rise,

As cherish all with heat, and fill the skies.
For we may fancy this the spring of fire,
To which the vapours of the world retire; 640
There gather into streams, and thence they fall,
As from the fountain's head, and spread o'er all.
Thus have we seen a little fountain yield
Vast spreading streams, and flow o'er all the field.

Or else the sun might kindle neighb'ring air,
And raise surprising heat and fervour there.
Perchance the air is of convenient frame,
And may be kindled by a little flame;
As oft in straw and corn fierce flames prevail,
From one poor falling spark, and spread o'er
all. 650

Or else the sun has secret stores of heat,
Dark, and unshining stores, but vastly great;
And these increase the warmth, these move the
sense,

And these united, make the heat intense. [bends,

How tow'rd's both poles the sun's fix'd journey
And how the year his crooked walk attends,
Why from the summer's height he soon declines,
And falls to visit the cold winter signs,
And then returns. And why the nimble moon
Does drive her chariot faster than the sun; 660
And in one month through all the zodiac go,
While the grave sun's a year in walking through.
For this a thousand reasons may be shown;
But yet 'tis hard, nor safe, to fix on one.

For first, Democritus has found the cause
Perhaps, and rightly settled nature's laws;
For thus he says: Great orbs are whirl'd above,
And by that whirl the lower circles move;
And so the distant orbs that lie below, 669

Far from this spring of motion, move but slow,
Because the pow'r still lessens. Thus the sun
Is far outtripp'd by nimble stars, that run
In higher rounds; much more the lower moon.
Now since she's plac'd so low, since weak the
force,

She cannot have an equal nimble course
With stars; so these may overtake the moon,
And pass beyond her oft'ner than the sun.
Thus she may seem to move, her walk appear
Through all the signs, 'cause they return to her.

Besides, by turns a constant stream of air, 680
At fix'd and certain seasons of the year, [decline,
Might rush from either part, and make the sun
And fall from summer to the winter sign;
Or drive it up again, and bring the rays
And heat to us, and show us longer days.
And thus the moon, thus other stars may rise,
And sink again into the winter skies.

Driv'n by these two constant streams of air. —
For clouds in storms two diff'rent ways do move,
The lower opposite to those above. 690

What wonder then the sun with vig'rous beams,
And stars are driven by two constant streams?

And day may end, and tumble down the west,
And sleepy night fly slowly up the east;
Because the sun having now perform'd his round,
And reach'd with weary flames the utmost bound

Of finite heav'n, he there puts out the ray,
Weary'd and blunted all the tedious day
By hind'ring air, and thus the flames decay.
Or else that constant force might make it move 700
Below the earth, which whirl'd it round above.

And so the constant morning still may rise,
And with pale fires look through the lower skies;
Because the sun rolls round with constant ray,
And, rising upwards, shows approaching day;
Or else because the fires, dissolv'd at night,
There join again, and scatter vig'rous light.

Thus when the morning sun begins to rise,
Its flames lie scatter'd o'er the eastern skies,
Then gather to a ball: And this we view 710
From Ida's top; this fame reports as true.
Nor is it strange that common seeds of fire
Should to the eastern quarter still retire,
Still ev'ry day return, and make a sun;
Because a thousand other things are done
At set, and constant times, and then alone.

Thus trees, at certain times, thus shrubs do shoot
At certain times, and bud, and bear their fruit.
Thus teeth in boys begin, and thus they fall;
Thus beards in youth; at certain seasons all: 720
Thus thunder, snow, and storms, and winds appear
At fix'd and certain seasons of the year.
As things first happen'd, they continue on;
The course that chance first gave them, still they
run.

The days may longer grow, and vig'rous light
Unwillingly give place to drowsy night;
And sometimes sleepy night may longer stay,
And slowly wake before approaching day:
Because the sun might walk the constant rounds
In crooked paths, and in uneven bounds; 730
Nor into equal parts the globe divide,
Now longer here, and now on th' other side,

Until it comes, and warms with neighb'ring rays
The line, and measures equal nights and days,
The line lies just between the north and south,
And leaves an equal distance unto both,
Because the zodiac is oblique, —
Through which the sun his yearly walk does go,
And views obliquely all the world below;
Thus teach astronomers; and this confess'd 740
A fair opinion: probable at least.

Or else the air is thick, and stops the ray,
Nor gives the sun a free and easy way.
And this prolongs the tedious winter night,
The darkness slowly yields to ling'ring light.

Or else at certain seasons of the year,
The flames meet slowly in the eastern air,
And frame the sun, and make the day appear.

But more: the moon may shine with borrow'd
rays,

Her various light increasing with the day's, 750
As she the farther from the sun retires,
And with full face receives his scorching fires:
When full, oppos'd, she, climbing up the east,
Views him below fall headlong down the west.
And so her light decrease as she goes on
Through diff'rent signs, approaching near the
sun.

And thus the phases are explain'd by all
That think her shape is round, the moon a ball,

And place her circling orb below the rest;
A fair opinion, probable at least. 760
Though proper light the moon's pale face
should fill,

Yet it might show the diff'rent phases still:
Because, as that bright body rolls above,
Another dark, unseen, thick thing might move
Beneath, and stop the rays, divert the streams
Of falling light, and turn away the beams.

Or else, it like a ball, half dark, half bright,
Roll'd round its axle, may affect the sight
With diff'rent phases, and show various light. }
Now turn that half, which the full light adorns,
A quarter now, now dwindle into horns. 771

And this the latter Babylonian sect
Asserts, and the Chaldean schemes reject:

As if it could not either way be done,
But powerful reasons fix'd our choice on one.

But why the moons a monthly round pursue?
Why one so long, not ev'ry day a new?
Why are they fram'd, endure, and always cease
At this set time? The cause is told with ease;
Since other things at certain times appear, 780

And only then: Thus seasons of the year.
First, Spring, and Venus' kindest pow'rs inspire
Soft wishes, melting thoughts, and gay desire; }
And warm Favonius fans th' amorous fire;
Then mother Flora, to prepare the way,
Makes all the field look glorious, green, and gay;
And freely scatters with a bounteous hand
Her sweetest, fairest flowers o'er the land:
Next heat, and dusty Harvest take the place,
And soft Etesia's fan the sun-burnt face. 790

Then sweaty Autumn treads the noble vine,
And flowing bunches give immortal wine.
Next roars the strong-lung'd southern blast, and
brings

The infant thunder on his dreadful wings.
Then cold pursues, the north severely blows,
And drives before it chilling frosts, and snows.
And next deep Winter creeps, gray, wrinkled, old,
His teeth all shatter, limbs all shake with cold:
Therefore no wonder sure the moon should rise
At certain times, and that again she dies 800
At certain times; since thousand things are shown
At fix'd and constant times, and then alone.

Eclipses may be solv'd a thousand ways;
For if the moon can stop descending rays
By thrusting her dark self between, and so
Bring sudden shade, and night on all below;
Then give me reasons why there cannot be
Another thing, too dark for us to see, }
And fit to stop the rays as well as she?
Or, why the circling sun, in passing by 810
Some venomous places of the neighbouring sky, }
May not grow sick, and pale, and almost die?
Those past, grow well, regain his former light?
Thus sometimes make us day, and sometimes
night.

And whilst the moons their monthly courses run,
Within the reach of earth's dark shadowing cone,
If then revengeful earth can stop the light,
If she can hide the sick'ning moon in night;
Why cannot other things divert the streams, 819
The falling streams of light, and stop the beams?

TRANS. H.

Or if the moon shines with a nat'ral ray,
As through infectious air she cuts her way, }
Why may not she grow sick, her flames decay?
Since I've the motions taught of stars above,
How sun, and moon, and by what cause they
move;

And how, eclips'd, they lose their gaudy light,
And spread o'er all an unexpected night,
As if they wink'd, and then with open eyes
View'd all again, and clear'd the lower skies.
Now let's descend again to new-born earth, 830
And find to what she gave the soonest birth:
What sort of beings, which of all the kinds
She first durst venture to the faithless winds.

She, first of all, green herbs, and flow'rs did
yield,

And spread a gawdy green o'er all the field.
And next the tree, with spreading branches, shoots,
But closely fix'd, and bound with steady roots.

As bristles, hairs, and plumes are first design'd
O'er limbs of beasts, and o'er the winged kind;
So new-born earth with herbs and trees began, 840

And then by various ways bore beast and man:
For Heav'n, 'tis certain, did not fashion all;
Then let the various creatures downwards fall: }
Nor seas produce an earthly animal.

And therefore parent earth does justly bear
The name of mother, since all rose from her.
She now bears animals, when soft'ning dew
Descends; when sun sends heat, she bears a thou-
sand new.

Then who can wonder now, that then she bore
Far stronger, bulky animals, and more, 850
When both were young, when both in nature's
pride;

A lusty bridegroom he, and she a buxom bride?
First, of all animals, in teeming spring,
The feather'd kind peep'd forth, and clapp'd their
wing:

As even now our tender insects strive
To break their bags, get forth, and eat and live.
Next beasts, and thoughtful man receiv'd their
birth;

For then much vital heat in mother earth,
Much moisture lay: And where fit place was
found, [ground:

There wombs were form'd, and fasten'd to t
In these, the yet imperfect embryos lay, 861
Through these, when grown mature, they forc'd
their way, [day:

Broke forth from night, and saw the cheerful
Then nature fashion'd for the infant's use
Small breasts in earth, and fill'd with milky juice:
Such as in women's breasts she now provides
For future infants: thither nature guides
The chiefest parts of food, and there they meet
Fit ferment, there they grow both white and
sweet:

Earth gave the infants food; thin mists were
spread 870

For clothes; the grassy meadows gave a bed.
The earth, when new, produc'd no raging cold.
No heats, nor storms: These grew, as she grew old.
Therefore our parent earth deserves to bear
The name of mother, since all rose from her.

M m

Thus for a certain time mankind she bore, roar,
And beasts, that shake the wood with dreadful
And various kinds of birds; and as they flew,
The sun, with curious skill, the figures drew 879
On all their plumes: he well the art might know,
He us'd to paint the same on his fair bow.

But weary'd now, and tir'd by length of time,
The earth grows old, and weak, as women past
their prime.

Time changes all; and as with swiftest wings }
He passes forward on, he quickly brings }
A diff'rent face, a diff'rent sight of things : }
And nature alters: this grows weak, this strong,
This dies, this newly made, is firm and young :
Thus alt'ring age leads on the world to fate ;
The earth is diff'rent from her former state ; 890
And what in former times with ease she bore, }
Grown feeble now, and weak, she bears no more, }
And now does that she could not do before. }

Besides, the earth produc'd a num'rous train
Of monsters: Those her labour wrought in vain:
Some without hands, or feet, or mouth, or eyes;
Some shapeless lumps, nature's absurdities;
Dull, moveless things, and destitute of food,
Which could not fly the bad, nor choose the good.
A thousand such in vain arose from earth; 900
For nature, frighted at the ugly birth,

Their strength, and life to narrow bounds confin'd;
Deny'd them food, or to increase their kind:
For that one pow'r a thousand things requires;
Almost as many as its own desires:

There must be food, and seed, and organs fit }
For flowing seed, whilst all the happy night }
The body lies dissolv'd in soft delight; }
That male and female may their pow'rs employ,
They must have organs fit for mutual joy. 910

But more: these years must num'rous kinds
deface;

They could not all preserve their feeble race:
For those we see remain, and bear their young,
Craft, strength, or swiftness, has preserv'd so long.
Many their profit, and their use commends;
Those species man preserves, kind man defends.
Wild beasts, and lions race, their native rage
Preserves secure through all devouring age.
Swiftness preserves the deer, and craft the fox, }
The vig'lant, faithful dog, the horse, the ox, }
We men defend; we keep the tender flocks. }
They shun wild beasts, they fly the dreadful
wood; 922

They seek for peace, and much, and easy food;
Gotten without their toil: and this we give
For the vast profits we from them receive.
But those to whom their nature gave no force,
No courage, strength, nor swiftness to the course;
Whom neither profit could, nor use commend,
Those man refus'd to feed, or to defend: 929
Thus, doom'd by chance, they liv'd an easy prey
To all, and thus their kinds did soon decay.

But never centaurs; these were never known;
That two such natures should combine in one,
Such disagreeing pow'rs; absurd and vain!
Plain nonsense! These are creatures of the brain:
A fool knows this: For horses oft enjoy
Full growth at three years old; not so a boy;

He scarce forgets his teat, and oft at rest,
As dreams present, he seeks his nurse's breast:
Then, when the horse grows old, his limbs de-
cay, 940

And loosen'd life begins to fly away: [growth,
The boy grows strong, he feels the pride of
A sturdy, vig'rous, gay, and bearded youth:
Lest you should think such monsters apt to grow,
A thoughtful man above, a horse below.

Or Scyllas, whom a num'rous train entwines
Of half sea-dogs, and barks above their lions:
Or such that live, nor grow an equal time,
And which at equal years not reach their prime;
Whom equal years not fill with youthful rage,
Nor lose their strength again at equal age; 951
Whom neither the same kinds of beauty fire,
Nor raise soft thoughts, gay wishes, warm desire;
Or those that seek and live by diff'rent food:
Thus hemlock kills a man, for goats 'tis good.

Besides, since flames will scorch the lion's breast,
And burn as well as any other beast;
How could chimeras rise, or how contain
Three kinds; a lion's head, a serpent's train,
A goat, the middle of the fancy'd frame, 960
And still with scorching nostrils breathing flame?

Then he who thinks that new-made heav'n and
Did give to such prodigious monsters birth, [earth
Yet brings no cause to prove the fancy true,
But still relies on the poor shift, 'twas new;
May fancy too that streams enrich'd the seas,
With golden waves, that jewels grew on trees:
That man of such vast force and limbs did rise, }
That he could stride the ocean, whirl the skies; }
Or any thing mad fancy can devise. 970 }

For though much seed lay hid when thoughtful
man

And all the various kinds of beasts began;
Yet nothing proves, that things of diff'rent kind,
That disagreeing natures should be join'd;
Since now the grass and trees, and all that grows
And springs from earth, are never join'd like those;
But each arising from its proper cause
Remains distinct, and follows nature's laws.

Then man was hard, as hard as parent-stones;
And built on bigger, and on firmer bones. 980
The nerves that join'd their limbs were firm and
strong;

Their life was healthy, and their age was long:
Returning years still saw them in their prime:
They weary'd even the wings of meas'ring time:
No colds, nor heats, no strong diseases wait,
And tell sad news of coming hasty fate;
Nature not yet grew weak, nor yet began
To shrink into an inch, the larger span.
Like beasts they lay in ev'ry wood and cave,
Gath'ring the easy food that nature gave: 990
No impious ploughman yet had learn'd to tear
His parent's bowels with his crooked share;
None planted fruitful trees, none dress'd the vine,
None prun'd decaying boughs, none press'd the
wine;

Contented they with the poor easy store, [more:
That sun and earth bestow'd, they wish'd no
Soft acorns were their first and chiefest food,
And those red apples that adorn the wood.

And make pale winter blush; such nature bore,
More num'rous then, besides a thousand more,
Which all supply'd poor man with ample store.

When thirsty, then did purling streams invite
To satisfy their eager appetite: 1003

As now in murmurs loud the headlong floods,
Invite the thirsty creatures of the woods:

And then by night they took their rest in caves,
Where little streams roll on with silent waves;
They bubble through the stones, and softly creep,
As fearful to disturb the nymphs that sleep:

The moss, spread o'er the marbles, seems to
weep. 1010

Whilst other streams no narrow bounds contain,
They break such banks, and spread o'er all the plain.

They knew no use of fire to dress their food;
No clothes, but wander'd naked in the wood:
They liv'd to shady groves and caves confin'd,
Mere shelter from the cold, the heat, and wind.

No fix'd society, no steady laws;
No public good was sought, no common cause,
But all at war, each rang'd and fought his food,
By nature taught to seek his private good. 1020

Then to renew frail man's decaying race,
Or mutual lust did prompt them to embrace;
Or else the greater vigour of the male,
Or some few treach'rous presents did prevail;
Some acorns, apples some, some pears bestow;
The thing the same, the price was less than now.

Then strong, and swift, they did the beasts pursue;
Their arms were stones and clubs; and some they
slew.

And some they fled: from those they fear'd to fight
They ran, and ow'd their safety to their flight.

When drowsy night came on, they naked lay, 1031
Spread o'er the ground like bears, and rough as they:
Their sleep was sound, they wak'd not all the
night, [fright,

Nor wander'd here and there whilst shades af-
Nor view'd the east with longing eyes for light:
But all dissolv'd in sweetest slumbers lay,
Till the bright sun arose and broke the day.

For since they had beheld, e'er since their birth,
The day and night by turns spread o'er the earth;
They never fear'd the sun should lose his light,
And all lie bury'd in eternal night. 1041

The most they dreaded was the furious beast;
For he, in dead of night did oft molest,
And lengthen into death their slumb'ring rest.
Sometimes they left their caves by night and fled,
Rous'd from their softest sleep, all pale, half dead,
While boars and lions came, and seiz'd their bed.

Yet fewer dy'd than now: for singly then
Each caught within the limits of his den, 1049
While the beast tore the living, trembling food,
And revell'd in full draughts of reeking blood,
With dreadful cries he fill'd each wood and cave,
To see his limbs go down a living grave
Others that 'scap'd with life, but wounded,
groan'd,

Holding their hands on the corrupting wound,
While trembling echoes did restore the sound.
Not skill'd in herbs, and now grown desperate,
With horrid cries they call'd on ling'ring fate,

Till worms increas'd; and eating through the clay,
Made passage for the soul to fly away 1060

But then no armies fell at once, no plain
Grew red, no rivers swell'd with thousands slain:
None plough'd the floods, none shipwreck'd made
their graves

In seas, none drank cold death among the waves,
But oft the furious ocean rag'd in vain:

No mischief done, the waves grew mild again:
No ships were found, nor could the treach'rous
smile [toil.

Of smooth-fac'd waves tempt one poor man to
Then want, now surfeits bring a hasty death;
Our bellies swell so much they stop our breath.

Then pois'nous herbs, when pluck'd by chance,
did kill; 1071

Now poison's grown an art, improv'd by skill.

But when they built their huts, when fire began,
And skins of murder'd beasts gave clothes to man:
When one to one confin'd in chaste embrace,
Enjoy'd sweet love, and saw a num'rous race:
Then man grew soft, the temper of his mind
Was chang'd from rough to mild, from fierce to
kind;

For, us'd to fire, his limbs refus'd to bear
The piercing sharpness of the open air; 1080
And lust enfeebled him; besides the ch'd,
Softened by parent's love, grew tame and mild.

Then neighbours, by degrees familiar grown,
Made leagues and bonds, and each secur'd his
own:

And then by signs and broken words agreed,
That they would keep, preserve, defend and feed
Defenceless infants, and the women too,
As nat'ral pity prompted them to do.

Though this fix'd not an universal peace,
Yet many kept their faith, and liv'd at ease; 1090
Or else, almost as soon as it began,
The race had fall'n, this age ne'er seen a man.

Kind nature pow'r of framing sounds affords
To man; and then convenience taught us words:

As infants now, for want of words, devise
Expressive signs; they speak with hands and eyes;

Their speaking hand the want of words supplies.
All know their pow'rs; they are by nature shown:

Thus tender calves with naked front will run,
And fiercely push before their horns are grown.

Young lions show their teeth, prepare their paws;
The bears young cubs unsheath their crooked
claws, [jaws.

While yet their nails are young, and soft their
The birds straight use their wings, on them rely;
And soon as dangers press, they strive to fly.

Besides, that one the names of things contriv'd,
And that from him their knowledge all deriv'd,
'Tis fond to think: for how could that man tell
The names of things, or lisp a syllable,
And not another man do so as well? 1110

Nay more: if others us'd not words as soon,
How was their use, and how the profit known?
Or how could he instruct another's mind?
How make them understand what was design'd?
For his being single, neither force nor wit,
Could conquer many men, nor they submit
To learn his words, and practise what was fit.

How he persuade those so unfit to hear?
Or how could savage they with patience bear
Strange sounds and words still rattling in their
ear. 1120

But now, since organs fit, since voice and tongue,
By nature's gift bestow'd, to man belong,
What wonder is it then that man should frame,
And give each diff'rent thing a diff'rent name?
Since beasts themselves do make a diff'rent noise,
Oppress'd by pains and fears, or fill'd with joys
This plain example shows: when dogs begin
To bend their backs, and show their teeth, and
grin.

When hollow murmurs show deep rage within;
Their voice is diff'rent when they bark aloud,
And with strong roarings fright the trembling
crowd; 1131

Or when they lick their whelps with tender
tongue,

Or when they play, and wanton with their young,
Now seem to bite, but never chop their jaws,
Now spurning, but with tender fearful claws;
Then flatt'ring, soft and tender is their voice,
Far diff'rent from that grating, howling noise,
They make when shut alone, or creeping low,
Whine, as they strive to shun the coming blow.

The horse with diff'rent noises fills the air, 1140
When hot and young, he neighs upon his mare,
Rous'd by strong love: or when by fierce alarms,
He snorts, and bears his rider on to arms.

Thus birds, as hawks, or those that cut the flood,
Make diff'rent noises as they eat their food;
Or when they fiercely fight; or when pursue
The trembling prey: each passion has a new.

Sometimes at change of air they change their
voice; [noise,

Thus daws, and om'nous crows, with various
Affright the farmers, and fill all the plain, 1150
Now calling for rough winds, and now for rain.
Therefore, since beasts and birds, though dumb,
commence

As various voices as their various sense;
How easy was it then for man to frame,
And give each diff'rent thing a diff'rent name?

Now for the rise of fire: swift thunder thrown
From broken sulph'rous clouds, first brought it
down.

For many things take fire when lightning flies,
And sulph'rous vapours fill the lower skies:
And trees, when shaken by a southern blast, 1160
Grow warm, then hot, and so take fire at last;
Their branches mingling with a rude embrace,
Burst into flames —

And thus our fires might rise from either cause.

The sun first taught them to prepare their meat;
Because they had observ'd his quick'ning heat,
Spread o'er the hills and ev'ry shady wood,
Ripen'd the fruits, and made them fit for food.
Hence various methods they did still pursue,
And chang'd their former life to take a new. 1170

The wiser and the wittier left the field;
And towns for safety did begin to build;
By nature, kings —

Then cattle too was shar'd, and steady bounds
Mark'd out to ev'ry man his proper grounds:

Each had his proper share, each what was fit,
According to his beauty, strength, or wit:
For beauty then and strength had most command;
Those had the greatest share in beasts and land;
But when once gold was found, the pow'rful
ore 1180

Saw light, and men gap'd after glitt'ring store;
Then wit and beauty were esteem'd no more.
But wealth enjoy'd their honour, seiz'd their place,
The wise and beauteous bow to fortune's ass.

But if men would live up to reason's rules,
They would not scrape and cringe to wealthy fools
For 'tis the greatest wealth to live content
With little: such the greatest joy resent:
And bounteous fortune still affords supply,
Sufficient for a thrifty luxury. 1190

But wealth and pow'r men often strive to gain,
As that could bring them ease; or make a chain
To fix unsteady fortune: all in vain!

For often when they climb the tedious way,
And now in reach of top where honours lay;
Quick strokes from envy or from thunder thrown,
Tumble the bold, aspiring wretches down.

They find a grave, who strove to reach a crown.
And thus 'tis better, than proud sceptres sway,
To live a quiet subject and obey. 1200

These former kings now murder'd, they o'er-
thrown,

The glory of the sceptre and the crown
Decreas'd: The diadem, that sign of state,
Now wept in drops of blood the wearer's fate;
Spurn'd by the common feet: who fear'd no
more;

'Tis sweet to spurn the things we fear'd before.
Thus monarchy was lost. — — —

That sun once set, a thousand little stars
Gave a dim light to jealousies and wars:
While each among the many sought the throne,
And thought no head, like his, deserv'd the
crown. 1211

This made them seek for laws, this led their choice
To rulers: pow'r was giv'n by public voice:
For men, worn out, and tir'd by constant strife,
At last began to wish an easy life;
And so submitted of their own accord
To rigid laws, and their elected lord.

For when each single man, led on by rage,
Grew bloody in revenge, and strove t' engage
His enemy, 'twas an unpleasant age. 1220

Hence men grew weary of continual wars,
Which sour'd the sweet of life with constant fears;
Because diffusive wrong can spread o'er all;
No state secure; nay, oft the wrongs recoil,
With double force on the contrivers fall.

Nor can those men expect to live at ease,
Who violate the common bond of peace.
Though now they lie conceal'd from man and
God,

They still must fear 'twill some time come a-
broad;

Since some diseas'd, and some by night be-
tray 1230

The wicked actions they have done by day;
Though hid in night; scarce hell so deep as
they.

Now sing, my muse, for that's my next design,
 Why all do bow to somewhat as divine?
 Why ev'ry nation has its proper shrine?
 Why all do temples build, why altars raise?
 And why all sacrifice on sacred days?
 How this diffus'd, this lasting fame was spread
 Of pow'r's above? Whence came that awful dread,
 That parent of religion through the rout, 1240
 Which forces them to bow, and grow devout?
 This is an easy task: For new-born man,
 Just sprung from earth, when first this frame began,
 Divine and glorious forms descending came,
 And struck his mind by day, by night the same:
 But then increas'd, their working fancies show'd
 Great limbs and strength, and fit to make a god:
 And these they thought had sense, because they
 shook
 As fancy told, their limbs, and proudly spoke;
 Their words were all majestic, as their look.
 Eternal too, because a new supply, 1251
 A constant stream, where'er they turn'd their
 eye,
 Of forms came in, and show'd the deity.
 Nor could they think such mighty things could
 fail,
 Or pow'rful blows on so much strength prevail.
 And happy too, because no fear destroys,
 Nor dread of sudden death corrupts their joys.
 Besides, in dreams they often seem'd to do
 A thousand various things, and wonders show:
 Yet never weary they, but vig'rous still; 1260
 Their strength as much unbounded as their will.
 Besides, they saw the heav'n's in order roll
 Their various motions round the steady pole:
 The seasons of the year by constant laws
 Run round, but knowing not the nat'ral cause:
 They therefore thought, that gods must rule
 above,
 Poor shift! and all at their devotion move.
 In heav'n they plac'd their seat, their stately
 throne,
 For there the sun, the stars, and various moon,
 And day, and night, their constant courses run:
 And hail, and rain, and, through a broken
 cloud, 1271
 Swift lightning flies, and thunder roars aloud.
 Unhappy man, who taught, the gods engage
 In these; that they are subject unto rage:
 A curse to theirs, to ours, and future age!
 What grief they brought themselves, to us what
 fears?
 To poor posterity what sighs, what tears?
 Alas! what piety? Alas! 'Tis none,
 To bend all cover'd to a senseless stone,
 Lie prostrate, or to visit ev'ry shrine, 1280
 Or, with spread arms, invoke the pow'r's divine
 Before their temples, while the altar flows
 With blood of beasts, and we make vows on vows.
 But sure 'tis piety to view the whole,
 And search all nature with a quiet soul.
 For when we view the heav'n's, and how the sun,
 And moon, and stars their constant courses run;
 Then doubts, that lay oppress'd with other cares,
 Begin to raise their head, and bring new fears.

We doubt: What, are there gods, that rule a-
 bove, 1290
 At whose direction the bright stars do move?
 For ignorance in causes troubles man;
 And hence we doubt, if e'er the world began,
 If e'er shall end: how long the orbs shall roll;
 How long the stars run round their steady pole;
 Or if preserv'd by gods, can stand the rage,
 And pow'rful envy of devouring age.
 What mind's unshaken and what soul not aw'd,
 And who not thinks the angry gods abroad,
 Whose limbs not shrink, when dreadful thunder
 hurl'd 1300
 From broken clouds, shakes the affrighted world?
 What, do not cities, do not nations fear,
 And think their dismal dissolution near?
 Why, do not tyrants then, and mighty lords,
 Recal their wicked deeds, and boasting words,
 And fear, that now revenge is surely come?
 Do they not tremble at approaching doom?
 Besides, when winds grow high, when storms
 increase,
 And scatter warlike navies through the seas;
 When men, for battle arm'd, must now engage
 A stronger foe, and fight the water's rage; 1311
 Does not the trembling gen'ral prostrate fall,
 And beg a calm o' th' gods, or prosp'rous gale?
 In vain: the storms drive on; no off'ring saves:
 All, shipwreck'd, drink cold death among the
 waves:
 And hence we fancy unseen pow'r's in things
 Whose force and will such strange confusion
 brings,
 And spurns, and overthrows our greatest kings.
 Besides, when earthquakes shake this mighty
 ball,
 And tott'ring cities fall, or seem to fall; 1320
 What then if men, defenceless men, despise
 Their own weak selves, and look with anxious
 eyes
 For present help, and pity from the skies?
 What wonder, if they think some pow'r's con-
 troul,
 And gods, with mighty force, do rule the whole?
 But farther; pow'rful gold first rais'd his head,
 And brass, and silver, and ignoble lead,
 When shady woods, on lofty mountains grown,
 Felt scorching fires; whether from thunder thrown,
 Or else by man's design the flames arose, 1330
 Who burnt the neighb'ring woods to fright their
 foes:
 Or else, delighted all with fruitful grounds,
 They sought more meadows, and enlarg'd their
 bounds:
 Or, greedy to increase their store of food,
 And take the beasts, they fir'd the shelt'ring wood:
 For thus men hunted, whilst no nets were found,
 Nor forests trembled at the barking hound;
 Whatever 'twas that gave these flames their birth,
 Which burnt the tow'ring trees, and scorch'd the
 earth,
 Hot streams of silver, gold, and lead, and
 brass, 1340
 As nature gave a hollow proper place,
 Descended down, and form'd a glitt'ring mass.

This when unhappy mortals chanc'd to spy,
 And the gay colour pleas'd their childish eye;
 They dug the certain cause of misery.
 And then observing, that it shew'd the frame,
 And figure of the hollow whence it came; [ceive
 They thought, these, melted, would with ease re-
 Whatever shapes the artist pleas'd to give: 1349
 Or drawn to breadth, or take the keenest edge;
 And so the hook be fram'd, or subtle wedge,
 Or other instruments, all apt, and good
 To cut, or cleave, or scrape, or hollow wood;
 But gold they try'd in vain; the metal broke,
 Or the soft edge was turn'd at ev'ry stroke:
 This they contemn'd, the blunted gold despis'd,
 And feeble silver; brass alone was priz'd.
 But now the feeble, and the useless ore
 Gets all the honour: Brass is priz'd no more.
 Thus time does change the dignity of things: 1360
 For some he bears away with swiftest wings,
 And hurls into contempt; brings others forth,
 And gets them new, and still preserves their
 worth.

Whilst cruelty was not improv'd by art,
 And rage not furnish'd yet with sword nor dart;
 With fists, or boughs, or stones, the warriors
 fought;
 These were the only weapons nature taught:
 But when flames burnt the trees, and scorch'd the
 ground,
 Then brass appear'd, and iron fit to wound.
 Brass first was us'd, because the softer ore, 1370
 And earth's cold veins contain'd a greater store:
 Thus brass did plough, and brazen trumpets
 sound,
 Their weapons brass, and brass gave ev'ry wound:
 Thus arm'd, they strait invade their neighbours
 field,
 And take his beasts: to arm'd the naked yield:
 At last, they, melting down the rigid mass,
 Made iron swords, and then despis'd the brass.
 They then began to plough with iron shares,
 And iron weapons only serv'd in wars.

Thus men first learn'd to ride a single horse:
 And whilst their steady left hands rul'd the
 course, 1380
 Their stronger right hands fought: before they
 knew,
 Or brought to wars, a chariot drawn by two:
 Then four were join'd, and then the armed cars,
 And catted elephants were brought to wars;
 The Moors first taught them to endure the blows,
 And break the ranks, and order of the foes.
 Thus rage invented still new arms for fight;
 New dreadful weapons still, and fit to fright;
 Some train'd the furious bull, and some the boar;
 Before the Parthian ranks did lions roar, 1391
 With armed guides sent out to scour the plain,
 And fright their foes: but these designs were
 vain:

Because when hot in fight they fiercely fall
 On either side, and, common foes to all,
 Confus'dly enemies, or friends engage,
 Shaking their dreadful heads, and fir'd with rage:
 The horses, frightened with the dreadful roar,
 Ran o'er the plain, and would obey no more:

The beasts leap'd on their friends, and tore their
 face, 1400
 Or seiz'd behind, and with a rude embrace,
 They bore their wond'ring frightened friends to
 ground;
 Whilst teeth and cruel paws did doubly wound.
 The bulls grew wild, and with destructive force
 They toss'd, or trod the men, or gor'd the
 horse:
 Whole ranks and troops fell by the furious boar;
 Their arms, yet whole, blush'd with their master's
 gore:
 For though the horses turn'd, though oft did rear,
 And stand aloft, and paw'd the yielding air;
 Yet all in vain they strove to shun the wound,
 Their nerves all cut, they struck the shaking
 ground: 1411
 Thus what seem'd tame at home, grew wild again,
 And fierce, when scouring o'er the warlike plain:
 Their rage was fir'd by tumult, wounds, and
 noise,

Refus'd to hear their former master's voice.
 But fled, much mischief done, as furious bulls,
 When the weak axe descends, nor breaks their
 skulls;
 They start, and fright the priest, and bell'wing
 loud,
 Run frantic round, and gore the pious crowd.
 'Tis safer far to say that this was done 1420
 In some of all the worlds, than fix on one:
 Yet I can scarce believe but that they knew,
 Before their sad experience prov'd it true,
 The ills of these; but that the weaker side
 The various methods of confusion try'd,
 Nor hoping to subdue, but bring fierce woes
 And grief, and pain upon the stronger foes.

But more: The garments, by the ancients worn,
 Were sew'd with tender twigs, or pinn'd with
 thorn,
 Before they learn'd to weave: the wheel, the
 round; 1430
 Whilst rigid iron lay within the ground,
 Were all unknown; those things did first begin
 When that appear'd; and men learn'd first to
 spin:
 Because the wits of men are finer far,
 And fitter to invent than womens are;
 Till laugh'd and jeer'd at by the ruder swains,
 They taught the women, and manur'd the
 plains,
 And harden'd all their limbs with rougher pains.
 Nature first taught them how to plant and
 sow, 1439

For they observ'd that falling seeds did grow;
 They saw them fix'd, and bound to steady roots,
 Then rise, and spread, and promise noble fruits:
 Then some began to graft: and till the field,
 And found the trees a better burden yield,
 When dress'd with care, and in a richer soil;
 The fruits increas'd, and did reward their toil:
 They forc'd the cumb'ring wood to narrow
 bounds,
 Enlarging still their corn, and pasture grounds:
 The tyrant wood, that all the plains did fill,
 Was now confin'd unto the barren hill: 1450

And left the vales to olive, corn, and vine,
Through which smooth streams in fair meanders
twine;

Now kiss the tender roots with wanton play,
Now flow again, enriching all their way;
Such beauteous pride did all the vallies show,
So taking pretty as our gardens now,
Where fruitful trees in decent order grow.

Through all the woods they heard the charm-
ing noise

Of chirping birds; and try'd to frame their voice,
And imitate: The birds instructed man, 1460
And taught them songs, before their art began:
And while soft ev'ning gales blew o'er the plains,
And shook the sounding reeds, they taught the
swains:

And thus the pipe was fram'd, and tuneful reed;
And whilst the tender flocks securely feed,
The harmless shepherds tun'd the pipes to love,
And Amaryllis sounds in ev'ry grove.

Thus time, and thus sagacious men produce
A thousand things, or for delight, or use.

These charm'd the swains, and these were wont
to please 1470

When feasts were done; for then all seek for ease:
Then underneath a loving myrtle's shade,
Close by a purling stream sopinely laid,
When spring with gaudy flow'rs the earth has
spread,

And sweetest roses grow around their head;
Envy'd by wealth and pow'r, with small expence,
They oft enjoy'd the vast delight of sense:
Then laughing, merry jests, and country play,
And tales began; as, once upon a day!

Then pleasant songs they sung, and wanton grown,
Each pluck'd and bound his flow'rs, and made a
crown, 1481

And with uneven steps they danc'd around;
Their heavy leaps still shook the trembling ground:
While all the idle crowd, that flock'd to view,
Laugh much, because the tricks seem strange and
new:

And thus they pass'd the day in gay delight;
And watch'd and fed their tender flocks by night.
No need of sleep: that want the songs supply:
The noise chas'd Morpheus from their willing
eye.

These now our wantons use; with toil and
pain, 1490

They learn to dance in measure: all in vain:
For these can reap no joy, no more content,
Than what those earth-born swains did first resent.
For while we know no better, but possess
A present good, it does extremely please;

The later good our various thoughts employs;
And we condemn the gust of former joys.

Thus man despis'd their ancient easy food,
Their acorns, and their apples of the wood:
When clothes were found, and other cov'rings
spread, 1500

They scorn'd their skins of beasts, and grassy
The skins of beasts; which sure the first that
found,

Not long enjoy'd, but by a treach'rous wound
He fell: so highly then, the now despis'd,
Contemn'd, neglected skins of beasts were priz'd.

Thus men did fight for skins: Those rais'd their
cares;

But gold and purple now are cause of wars:
The fault is ours; for they could only find
Those skins, as clothes against the cold and wind:
But now what harm, if none go proudly drest
In cloth of gold, or an embroider'd vest: 1511
Since meaner garments yield as much defence
'Gainst wind and cold, as much preserve the
sense.

Then wretched man's endeavours are in vain;
They fruitlessly consume their years in pain,
Not knowing how to use, or how to measure
Their boundless wish, nor height of real plea-
sure:

This drives them on into a sea of cares,
And the destructive rage, and storms of wars.

The sun, still running round his yearly
race, 1520

Show'd all the seasons turn'd by constant cause,
By certain order rul'd, and steady laws:
Some liv'd in castles then, some built a town,
And land divided, each enjoy'd his own;

Then mighty ships, driv'n by the lab'ring
wind,

Flew o'er the seas, and distant nations join'd;
Whilst leagues and bonds the neighb'ring towns
combin'd:

Then letters found; and the poetic rage
First told the noble actions of the age:
But all beyond lies hid in dismal night, 1530
And only seen by searching reason's light.

Thus ships, thus clothes, thus wine, and oil
began;

And towns, the comforts and support of man;
But better'd all, to due perfection brought
By searching wits, from long experience taught.

Thus time, and thus sagacious men produce
A thousand things, or for delight, or use;
For one thing known does vig'rous light im-
part

For farther search, and leads to height or art.

NOTES ON BOOK V.

LUCRETIVS begins this book with the praise of Epicurus, and not only makes him equal to the gods, but even proclaims him a god; because, says he, his divine discoveries have been more beneficial to mankind, than the inventions of Ceres, or of Bacchus, or than the many glorious

exploits of Hercules : since men might have lived happily enough without them. But true wisdom, which Epicurus first discovered and taught, is of the greatest utility to mankind, because it chases away all uneasiness from the mind, and instructs us aright in the nature of all things, and concerning the immortal gods.

Ver. 10. Lactantius, lib. iii. cap. 14. "de falsa sapientiâ:" and many others, pretend from this expression of Lucretius, that he did not mean Epicurus, but one of the more ancient philosophers, as Pythagoras, or Socrates, or Thales, or some other of the seven sages : But they are evidently mistaken, as appears by verse sixty of this book, where he says,

Cujus ego ingressus vestigia——

His steps I trace——

And Cicero certainly had his thoughts on this passage, when in *Tuscul.* 4. he says: "Quæ quidem cogitans soleo sæpe mirari nonnullorum insolentium philosophorum, qui Naturæ cognitionem admirantur, ejusque inventori et principi gratias exultantes agunt, eumque venerantur ut Deum; liberatos enim se per eos dicunt gravissimis Dominis." When I reflect on these things, I often wonder at the insolence of some philosophers who admire the knowledge of nature, and give thanks with transport of mind to the inventor and first author of natural philosophy; owning that he has delivered them from most tyrannous lords. Thus our grateful poet confesses to whom he owes his knowledge in the Nature of Things: And indeed, if Epicurus did deliver the minds of men from cares, and fears, and superstition, he justly deserved to be revered preferably to any of the heathen gods. The words of this passage run thus in the original,

Qui primus vitæ rationem invenit eam, quæ
Nunc appellatur sapientia——

For wisdom was the name which the Epicureans, who were a sort of men not burdened with too much modesty, gave only to their own philosophy. *Horat. lib. i. Od. 33.*

Parcus Deorum cultor, et infrequens
Insipientis dum sapientiæ
Consultos erro——

But the other philosophers were content to call their doctrine by the name of the love of wisdom: for so the word philosophy signifies.

Ver. 15. The son of Jupiter and Semele: He is said to have been the first that planted vines, and made wine of the grapes: For which reason the poets made him the god of wine: He travelled over the whole earth, conquered the Indies, and was the first who triumphed, which he did, riding upon an elephant. The chief badges and emblems of his power were tygers and the thyrsus: The tygers were harnessed to his car; and thus he was wont to be carried about. *Virg. Æneid. vi. v. 804.*

Nec qui pampineis victor juga flectit habentis,
Liber, agens cello Nisæ de vertici tigres.

Nor Bacchus, turning from his Indian war,
By tygers drawn, triumphant in his car,
From Nisæ's top descending to the plains,
With curling vines around his purple reins.

The thyrsus, was a spear or javelin, wrapped about with vine branches and ivy; whose point ended in the shape of a cone: Bacchus, and the mad drunken women, his companions, who were called Bacchæ, always carried a thyrsus in their hands: Moreover, Lucretius in this place, calls Bacchus by the name of Liber:

Namque Ceres fertur fruges, Liberque liquoris
Vitigeni laticem mortalibus instituisse.

Virg. Georg. i. v. 5.

——Vos, O clarissima mundi
Lumina, labentem cælo quæ ducitis annum,
Liber et alma Ceres; vestro si munere tellus
Chaoniam pingui glandem mutavit arillâ,
Poculaque inventis Acheloiâ miscuit uvis.

Upon which the interpreters say, that the poet calls Liber and Ceres the lights of the world, either because they were esteemed to be the inventors of, and to preside over the harvest and the vintage, which are the chief parts or seasons of the year, and the chief ornaments of the world, since they supply mankind with meat and drink: or because by them he means the sun and moon. And indeed Prætextaus, in *Macrobius Saturnal. lib. i. cap. 18.* evidently proves, that not only Liber and Dionysius, which is another of the names of Bacchus; but that Jupiter, and Mars, and Mercury, and Hercules too, were the sun; who was called Liber, says he, "quod libetè vagetur." He adds, likewise, that Ceres was the moon, and that some derive her name "à creando," because she conduces very much to the production of things. Bacchus was called Liber, either because he made free, and restored to liberty the country of Boeotia, where he was born, as we learn from *Plut. in Quæst. Cent.* or because wine delivers the mind from cares, inspires with courage, and occasions a liberty or freeness of speech. Thus *Horace, Carm. lib. iii. Od. 21.* speaking to a cask of wine:

Tu lene tormentum ingenio ad moves
Pierumque duro: tu sapientium
Curas, et arcanum jocosum
Consilium retegis Lyæo.
Tu spem reducis mentibus anxiiis,
Viresque: et addis cornua pauperi,
Post te neque iratos trementi
Regum apices, neque militum arma.

Of Bacchus see more, *Book ii. v. 616.* and *Book iv. v. 1165.*

Ver. 16. *Ceres.*] She was daughter of Saturn and Ops, and mother of Proserpine. She was believed to be the first that sowed corn, and found out the art of using it. *Virgil, Georgic i. v. 147.*

*Prima Ceres ferro mortales vertere terram
Instituit.*——

For which reason they made her the goddess of corn; and hence too, as Varro, Cicero, and Arnobius, witness, she was called Ceres, as it were Geres, because, to use the very words of Arnobius, lib. iii. "Salutarium feminum fruges gerat." See more, Book II. v. 616. and Book IV. v. 1163.

Ver. 18. Diodorus Siculus, Book III., says, That the inhabitants on the coast of the Gulf of Arabia, and of the countries of Troglodytia and South Ethiopia, know not the use of corn or wine; but that some of them live upon fish and snails, others upon roots, others upon the leaves, seeds, and fruits of trees, and others upon locusts. Mela witnesses, that the Troglodytes live in dens, and feed upon serpents: some of which, says Pliny, Nat. Hist. lib. xxxi. cap. 2. are twenty cubits in length. And Faber, in his note on this passage of our author, says, that scarce the sixth part of mankind do yet know what wheat is. Therefore we may well, says Lucretius, live without corn and wine, but not without wisdom: "Sapientia enim," says Cicero, lib. i. de Fin., "est una quæ mœstitiam pellat ex animis, quæ nos exhorrescere metu non sinat, quæ præceptricem in tranquillitate vivi potest, omnium cupiditatum ardore restincto." For wisdom only it is that drives away sorrow and uneasiness from the mind, that suffers us not to stand aghast with fear; and by whose advice we may extinguish the flame of all inordinate desires, and lives in tranquillity, and exempt from all manner of passion.

Ver. 19. Lucretius:

At bene non poterat sine puro pectore vivi.

Where by *puro pectore* the poet means a mind undisturbed by ignorance, and not obnoxious to errors; a heart sincere, and free from all anxiety: for, as Horace says,

*Sincera est nisi vas, quod cunque infundia,
accipit.*

In like manner, without sincerity of heart and purity of mind, it is impossible to lead a happy life, or to pass our days in tranquillity: And Cicero teaches us, that the only way to acquire this purity of mind is by the help of wisdom, which, by delivering us from all terrors and desires, and from the temerity of all false opinions, is the surest guide to pleasure. "Mentem autem puram ut habeas, adhibenda est sapientia, quæ, et terroribus cupiditatibusque detractis, et omnium falsarum opinionum temeritate direptâ, certissimam se nobis ducem præbeat ad voluptatem," I. de Fin.

Ver. 24. In these twenty-four verses the poet enumerates some of the labours of Hercules, which, he tells us, fall as far short of the discoveries of wisdom, made by Epicurus, as the soul is more excellent than the body: For Hercules did indeed deliver men from monsters, that were destructive to the body; but Epicurus, who first instructed men in the art of wisdom, delivered

their minds from all vain anxieties, and restless desires: He chased from our souls the terrors at which we were startled and stood aghast, and dissipated the darkness of errors which clouded the happiness of life.

Ver. 25. Hercules: he was called Alcides from his grandfather Alcæus, who was father of Amphitryo of Thebes: For Hercules was the son of Jupiter, by Alcmena the wife of Amphitryo. Now, before either Hercules or Eurystheus, king of Mycenæ, were born, Juno, who knew that the fates had decreed, that whether of them came into the world last, should serve the other, contrived the matter so, that Hercules was born after Eurystheus, who, at her instigation, commanded Hercules to go upon many dangerous exploits; but he proved successful in all of them, therefore was called Hercules, from *Ἡρα*, Juno, and *κλῆος*, glory, because she was the cause of all his renown, though sore against her will. Virgil. *Æn.* 8. v. 291.

——— *at duros mille labores
Rege sub Eurystheo, satis Junonis iniquæ
Pertulerit.*———

Ver. 26. That is the Nemæan lion. "Nemæus magnus hiatus leonis," says Lucretius. This is the fifth of the labours of Hercules, according to the order in which the chief of them, which are thirty-four in number, are enumerated. Now there haunted in the Nemæan wood, near Cleonæ, a city of Achaia, in the country of Peloponnesus, a vast and terrible lion, that did a world of mischief: Hercules not being able to kill him, either with his club or with his darts, laid hold of him, and tore him to pieces with his nails; then took his skin, which neither stone nor iron could penetrate, and wore it on his shoulders, as a badge of honour. Diod. Sicul. lib. iii. Plaut in *Perf.* Virg. *Æn.* 8. This gave occasion to the institution of the Nemæan games, which were celebrated every third year, in honour of Hercules. But some, particularly Statius, will have this solemnity to have been first instituted to celebrate the funeral of Opheltes, son of Lycurgus, and who was killed by an adder.

Ver. 27. This was his seventh labour; for Lucretius does not observe the order, and mentions only the chief of them. He speaks here of the dreadful boar that haunted upon the mountain Erymanthus in Arcadia, and laid waste all the country round. Hercules took him, and carried him to Eurystheus, king of Mycenæ.

Ver. 28. This was his ninth labour. A bull that infested the country about Crete: Hercules brought him alive likewise to Eurystheus. Some say this bull was sent into Crete by Neptune, whom Minos, king of Crete, had offended: others, that it was the same bull which brought Europa, the mother of Minos, into Crete; and others, that it was the bull, for love of which, Pasiphaë, the wife of Minos, run mad.

Ibid. This was his third labour. It was a serpent that lived both upon land and in the water, and was called Hydra, from *ὑδωρ*, water. It kept

for the most part in the lake Lerna, between Mycenæ and Argos; and was dreadful for having seven heads; and Virgil says, fifty, if, as many believe, it be the same Hydra that Æneas saw when he descended into hell;

Quinquaginta atris immanis hiatibus Hydra
Sævior intus habet sedem.— *Æn. vi. ver. 576.*

and others an hundred; and no sooner was one of them cut off than two sprouted out in its place; but Hercules killed him at length, by searing the wounds as fast as he cut off each of his heads.

Ver. 30. This was the sixteenth labour of Hercules. Geryon was a king of Spain, said to have three bodies, either because he governed three islands of Spain, the Greater and Lesser Balears, now called Majorca and Minorca; and Ebusus, now Ivica: or because he and his two brothers, who were united in the strictest ties of friendship, were all slain by Hercules, who took away their herds of cattle, and brought them into Italy. Pausan. lib. i. and Diodor. lib. 4. Virg. *Æn. 8. ver. 201.*

— Nam maximus ultor,
Tergemini nece Geryonis, spoliisque superbus,
Alcides aderat; Taurosque hac victor agebat
Ingentes; vallemque boves amnemque tenebant.

Ver. 31. This was the sixth labour. Diomedes was a king of Thrace, who, to make his horses the more fierce and wild, fed them, as the above-cited Diodorus says, not with oats and barley, but with human flesh. Hercules took him, and gave him to his own horses to eat.

Ver. 32. This was the eighth labour. These birds were called Stymphalides, from Stymphalus, the name of a town, mountain, and lake, in Arcadia, where these birds haunted: they were of the size of cranes; in shape, like the bird called Ibis, which we generally interpret a snipe; and had beaks so hard, that they would enter into iron: These Hercules killed with his darts, as Pausanias and Catullus testify; but Diodorus Siculus, lib. 4. says, he frightened them out of the country with a great brass rattle.

Ver. 34. The fourteenth labour. Hesperus, the brother of Atlas, had three daughters, Ægle, Arethusa, and Hesperethusa, who are said to have had gardens planted with trees that bore golden fruit. These gardens were guarded by a vigilant dragon, whom Hercules slew by the command of Eurystheus, and took away the apples. Besides the dragon, Virgil adds a priestess, and a temple, perhaps of Venus, to whom the apples were consecrated.

Hinc mihi Massylæ gentis monstrata Sacerdos,
Hesperidum templi custos, epulasque draconi
Quæ dabat, et sacros servabat in arbore ramos.

Æneid. iv. ver. 483.

And the same poet, according to the common opinion, describes the situation of the gardens to be in the Mauritania Tingitana, now the kingdoms of Fez and Morocco, about the town of Lixa, in the extremest western part of Africa: According to some, they were in the continent; according

to others, in an island. Others place these gardens of the Hesperides in the quite opposite parts of Africa, that is to say, in the very east of Africa, and on the eastern shore of the Syrtes Major, near Cyrenaica: but this error is fully confuted by Salmasius to Solinus. Moreover, some will have it, that the apples of these gardens were only sheep, whose fleeces are very valuable, and which the Greeks call *μῆλα*, as well as they do *mala*, apples. Others believe them to have been what we call citrons or lemons, and that Hercules first brought them from thence into Greece. They likewise believe the gardens to have been the Fortunate Islands, now the Canaries, which lie below Lixus indeed, but very near to Mount Atlas, and not far from the shore. Lastly, Others will have them to be the islands which the ancients called Hesperides and Gorgades, or Gorgones, now the islands of Cape Verd: but these lie more to the south, at a great distance from Atlas, towards the mouths of the river Niger, and at least an hundred and fifty leagues distant from them. And these last believe the dragon to be the tortuous sea that divided the gardens from the continent. Milton, describing the garden of Eden, gives it trees,

— Whose fruit, burnish'd with golden rind,
Hung amiable: Hesperian fables true;
If true, here only, and of delicious taste.

Ver. 38. The west of Mauritania, which is washed by the Atlantic Ocean, so called from Mount Atlas, which, under several names, extends itself even to Egypt; and dividing all Africa into north and south, that is to say, Mauritania from the Inner Libya, ends in the Western Ocean. For which reason, the ancient poets comprehended all the people that lay to the south of Atlas, under the name of Ethiopians, and distinguished them by Oriental and Occidental. The Spaniards call all this extent of mountains, *Montes Claros*. Atlas, brother of Prometheus, son of Japetus, and king of Mauritania, being admonished by Themis, that he was in danger of being killed by a certain son of Jupiter, would, for that reason, receive no stranger into his house: and having denied the rights of hospitality to Perseus, the son of Jupiter by Danae, daughter of Acrisius, king of the Argives, this Perseus, by showing him Medusa's head, changed him into this mountain, which bears his name. This fable is related at large by Ovid. *Metam. iv. ver. 621. et seq.* Now Atlas was very skilful in astrology, which gave occasion to the fiction of supporting heaven on his shoulders. And Virgil describes the mountain as still retaining the figure of a man, *Æneid. iv. ver. 246.* where speaking of Mercury, he says,

— Jamque volans apicem et latera ardua cernit
Atlantis duri, cœlum qui vertice fulcit:
Atlantis, cinctum assidue cui nubibus atris
Piniferum caput et vento pulsatur et imbri:
Nix humeros infusa tegit: tum flumina mento
Præcipitant senis, et glacie riget horrida barba.

Thus translated by Dryden.

—And flying thence he spies
Atlas, whose brawny back supports the skies :
Atlas, whose head, with piny forests crown'd,
Is beaten by the winds, with foggy vapours bound.
Snows hide his shoulders; from beneath his chin
The founts of rolling streams their race begin :
A beard of ice on his large breast depends.

Ver. 39.

Quo neque noster adit quisquam, nec barbarus
audet. *Lucret.*

i. e. Whither none of us Romans go, nor any foreigners dare to go: For the ancients, as well Greeks as Latins, called all that were not of their own country barbarians. But I think our translator can hardly justify this expression, untrod by the Moor, since the Moors are the people that inhabit the country of which Lucretius is speaking. Be that as it will, Cicero asserts for certain, that even in his days, there was no sailing practised any farther than from the mouths of the Euxine Sea, to the Columns of Hercules: i. e. than Abayle, now Ceuta, on the African coast, and Calpe, now Gibraltar, on the coast of Spain. For Hercules, after he had laid waste the garden of the Hesperides, fixed two pillars on the mountains Abayle and Calpe, as the bounds of his travels: which two mountains were before contiguous; but he is said to have parted them, and by that means letting in the ocean, to have opened the sea of Cadiz, now called the Straits of Gibraltar.

Ver. 40. For many other notable exploits are recorded of Hercules. He killed Bulyris, the son of Neptune and Libya, an Egyptian tyrant, of such incredible strength, that he could draw an ox about at his pleasure: and who, as well as Diomedes of Thrace, fed his horses with human flesh. And Antæus, the son of Neptune and Terra, a giant sixty-four cubits high; who, as often as he was faint or weary, if he but touched the earth, recovered his full strength again. And Augeas the king of Elis, who refused to give him what he had agreed for cleansing his stables of the filth they had gathered in thirty years. And Eryx, the son of Venus, with whom he fought at the Cæstus, or Hurl-bats: besides, he slew several of the centaurs, &c. and was of signal service to the gods, in their wars with the giants, who durst attack their heaven: for the earth had pronounced an oracle, at Phlægra, a town in Thrace, and the place of the battle, that the giants could not be destroyed, without the help of two heroes or demigods: Upon which the gods made choice of Hercules and Bacchus; and by their assistance got the victory: Thus Apollodorus. And hence we see the vainness of the fables, in teaching that the same Hercules who flourished about the age of Theseus and Eurystheus, was already among the gods in the time of the giants war.

Ver. 42. Lucretius says nothing of the death of Hercules, nor his rising a god from Oeta's flame; but since our translator has thought fit to take notice of it, it will not be improper for us to explain it. Deianira, growing jealous of her husband Hercules, who, she heard, was fallen in love with

Iole, sent him a garment that had been dipped in the poisonous blood of the Centaur Nessus; and which, she had been informed, had a virtue to make any one that wore it in love with her. Hercules had no sooner put it on, than all his limbs began to burn to that degree, by the force of the poisonous dye, that unable to resist the violence of the torment, he tore up trees by the roots, and built himself a pile upon the mountain Oeta in Thessaly, then having set fire to it, threw himself into the flames: and being thus purged from all the filth he had contracted here below, he was believed to go directly to heaven; and thus, as Creech says,

—He rose a god from Oeta's flame.

Milton, in *Paradise Lost*, B. ii.

As when Alcides, from Æchalia crown'd
With conquest, felt the envenom'd robe, and tore,
Through pain, up by the roots Thessalian pines,
And Lichas from the top of Oeta threw
Into th' Euboic sea, &c.

Ver. 55. Epicurus, in his writings, treated not only of physics, but ethics likewise. The first by the care of Laertius have escaped, most of them, from the rage of time: but of his ethics, the little that remains, is in his three epistles to Herodotus, Mœnecæus and Pythocles.

Ver. 57. Faber says, that Lucretius here speaks of the treatise that Epicurus composed *περί δεισιπνίας*, of holiness.

Ver. 60. In these forty verses the poet gives us the argument of this book, in which he will endeavour to prove, that the world had once a beginning, and will one day have an end. Then he will describe the rise of the world, and of animals; will teach what animals were actually produced; and what the vainness of the poets, and the superstition of the generality of men have feigned and believed. He will tell how names come to be given to things, and how mutual society arose from speech; and whence first proceeded religion, and the fear of the gods. Lastly, He will explain the motion of the heavens, the courses and revolutions of the sun, the moon, and other planets and stars, and will demonstrate, that they are whirled about by the force of nature only, without the help or assistance of Providence: For unless he can make out such a motion of the heavens, and prove it to be merely natural, he owns he shall not be able to take away all belief of Providence: For, as he observes in the first book, ver. 84.

Long time man lay oppress'd with slavish fear;
Religion's tyranny did domineer:
And, being plac'd in heaven, look'd proudly down,
And frighted abject spirits with her frown.

Ver. 64. Which the ignorant vulgar mistake for souls separated from the body; but Epicurus has shown them their error, by proving that the soul dies with the body. See Gaserellus, in his *Collection, de Talismannis*.

Ver. 70. The atoms, which Lucretius held with Epicurus to be the principles of all things.

Ver. 71. He means chimæras, scyllas, centaurs, hermaphrodites, &c.

Ver. 77. Lucret.

Fana, lacus, lucos, aræ, simulacraque divum.

The temples, lakes, groves, altars, and images of the gods.

Ver. 81. Lucretius says, "natura gubernans," and means what he calls afterwards, "fortuna gubernans," ver. 108, which our translator there calls chance: And indeed Lucretius means nothing else in this place. Pliny, it is true, calls nature the parent and maker of all things. And Seneca, lib. iv. de Benef. makes her the god by whom all things are made and governed. "Quid enim," says he, "aliud est natura, quam Deus, et divina ratio toti mundo ac partibus inserta?" But Lucretius was of another opinion, and makes her other than God, and means in effect nothing more by ruling nature, than the power and motion of the atoms, that fortuitously and without design huddled and joined themselves together into this frame of the world.

The motions of the planets may well be compared to a dance, from the regular measures of them.

Ver. 85. Epicurus himself to Herodotus: *Τὴ δὲ θεῶν δυνάμει πρὸς ταῦτα μὴ περυσινῶν, ἀλλὰ ἀλειτουργῶν διαίρεσιν, καὶ ἐν τῇ πάσῃ μακαριότητι ὡς εἰ μὴ τῶτο παραχθήσεται, ἑπασα πρὸς τῶν μετιώρων αἰτιολογία πάντα ἔσται.*

Ver. 86. The horses of the sun are said to be four in number: Pyroëis, so called from πῦρ, fire; Eous, from ἥως, the morning; Æthon, from αἶθω, I burn, or I heat; and Phlegon, from φλέγω, I burn. Lucretius mentions them not, but owes this verse to his translator.

Ver. 87. This and the twelve following verses are repeated in Book vi. ver. 51. and seq. And in Book i. ver. 78. and Book ii. ver. 606, he teaches almost the same doctrine.

Ver. 90. Horace, the Epicurean, manifestly drew from this fountain, when he said:

Nil admirari prope res est una, numici,
Solaque quæ possit facere et servare beatum:
Hunc solem, et stellas, et decedentia certis
Tempora momentis, sunt qui formidine nullâ
Imbuti spectent.—

Explain that passage of Horace by this of Lucretius, and you will be more in the right than the other interpreters. Moreover, this is exactly the doctrine of Socrates; and therefore this saying, The things that are above us are nothing to us, which is commonly ascribed to Socrates by others, is by Tertullian ascribed to Epicurus: "Sed Epicurus qui dixerat, quæ super nos nihil ad nos, cum et ipse cælum aspicere desiderat, solis orbem pedalem apprehendit," &c. lib. ii. ad Nationes.

Ver. 94. In the second book, he calls them, "Dominos superbos," proud, imperious lords. And Velleius, in Cicero, lib. i. de Nat. Deor. says the same thing: "Dum Deum rerum auctorem

facitis, imposuistis in cervicibus nostris Dominum sempiternum, quem dies et noctes timerimus. Quis enim non timeat omnia providentem, et cogitantem, et animadvertentem, et omnia ad se pertinere putantem, curiosum et plenum negotii Deum?" By making God the author of all things, you set over us an eternal Lord, of whom we must day and night stand in awe. For who cannot but dread a God, who oversees all, provides for all, thinks of all, takes notice of all, and believes that all belongs to him, in short, a meddling, inquisitive, and never idle God?

Ver. 100. In these nineteen verses, he at length falls upon his subject; which, he says, is a noble one indeed, but intricate, and to which he shall find it difficult to gain belief; for men do not easily give credit to what they are unwilling to believe; and who would willingly regard the ruin of the world, of which he cannot be a witness without his own destruction? The poet himself seems to commiserate so great a misfortune:

— tria talia, texta

Una dies dabit exitio— ver. 95.

Which he did certainly dread, when he said,

Quod procul à nobis flectat fortuna gubernans.

Ver. 108

All-ruling chance, avert it far from us.

Moreover, upon the words of Lucretius cited above, "Tria, talia," &c. Faber observes, that Ovid pays him a compliment in his own coin:

Carmina sublimis tunc sunt peritura Lucreti
Exitio terras cum dabit una dies.

Ver. 104. This is denied by Aristotle, lib. i. de Cælo, and by Plato in Timæus, though they disagree in the manner of it: For Plato says the world had a beginning, and that God created it; but denies it will ever have an end; not that it is immortal in its own nature, but because it would be unworthy of the wisdom of God, whose workmanship it is, to dissolve so glorious a frame, or to suffer it to be dissolved! But Aristotle holds, that whatever has had a beginning, may, and will have an end; but that the heavens never were created, and will never be dissolved: Nor ought Aristotle alone to boast that he asserted a world uncreated and eternal; for before him Xenophanes, Parmenides, Melissus, Philolaus, Ocellus, Aristæus, the Chaldeans, and others, taught the same doctrine. In like manner, not Epicurus alone of all the ancient philosophers gave the world a beginning, for Empedocles, Heraclitus, Anaximander, Anaximenes, Anaxagoras, Archelaus, Diogenes, Leucippus, Democritus, the Brachmans, the Egyptians, and others, were of the same opinion, to which Pliny too subscribes, in these words: "Numen esse mundum credi par est, æternum, immensum: neque genitum, teque interitum unquam." Nat. Hist. lib. ii. cap. 1. Thus Epicurus agreed with us, that the world had a beginning; but he erred in teaching that God was not the creator of it: And we know for certain, that, "in princi-

pio creavit Deus cœlum et terram." And both Epicurus, and the other philosophers with him, were mistaken, when they taught, that the world was not created out of nothing, but made of a pre-existing matter. Lucan, in *Pharsal. lib. i. ver. 73.* describes the future dissolution of the world, in the following verses:

—Sic cum, compage solutâ,
Sæcula tot mundi suprema coegerit hora,
Antiquum repetens iterum chaos, omnia mistis
Sydera syderibus concurrent: ignea pontum
Astra petent; tellus extendere littora nolet,
Excutietque fretum: fratri contraria Phœbe
Ibit, et obliquum bigas agitare per orbem
Indignata diem poscet sibi: totaque discors
Machina divulsi turbabit fœdera mundi.

Which May has not amiss interpreted in the following verses:

So when this knot of nature is dissolv'd,
And the world's ages in one hour involv'd
In their old chaos; seas with skies shall join,
And stars, with stars confounded, lose their shine.
The earth no longer shall extend its shore,
To keep the ocean out: the moon no more
Follow the sun; but, scorning her old way,
Cross him, and claim the guidance of the day:
The falling world's now jarring frame, no peace,
No league shall hold, &c.

Ver. 109. For all men give most credit to those things which they see or touch, and sight is the chief inlet of knowledge: Therefore, Milton, complaining of his being blind, says finely,

—Thus with the year
Seasons return, but not to me returns
Day, or the sweet approach of ev'n and morn,
Or sight of vernal bloom, or summer's rose,
Or flocks, or herds, or human face divine:
But cloud instead, and ever-during dark
Surround me, from the cheerful ways of man
Cut off, and for the book of knowledge fair
Presented with an universal blank
Of nature's works, to me expung'd and raz'd;
And wisdom at one entrance quite shut out.

Ver. 119. But because the folly of the Stoics, the ignorance of others, and the superstition of the generality of men had opposed many objections to this opinion, Lucretius removes them all, and first, in thirty-nine verses, confutes the Stoics, who held, that the sun, the sea, the earth, in short, the universe, being animated by a spirit infused through the whole, is God. Thus Manilius, lib. i. ver. 238.

Hoc opus immensi constructum corpore mundi,
Membræque naturæ diversâ condita formâ
Aeris, atque ignis, terræ, pelagique jacentis
Vis animæ divina regit, sacroq. meatu
Conspirat Deus, et tacitâ ratione gubernat.

Which Creech thus renders:

To this vast frame in which four parts conspire,
Of diff'rent form, air, water, earth, and fire,

United God, the world's almighty soul,
By secret methods, rules and guides the whole;
By unseen passes he himself conveys
Through all the mass, and ev'ry part obeys.

But these men the poet despises, and treats them and their foolish doctrine with the utmost contempt and indignation.

Ver. 121. See the note upon ver. 758, Book i. from whence this and the foregoing verse are repeated. And to what is there said on them, I will here add some farther particulars concerning the oracle of Apollo, who was called Pythius, from his killing the python, a huge serpent, which had its name *ἀπὸ τοῦ πυθῶνος*, because he was engendered of the putrefaction of the earth, and sprung from the filth that the flood of Deucalion had left behind it. Ovid *Metam. i. ver. 438.*

—Te quoque, maxime Python,
Tuæ genuit; populisque novis, incognite serpens,
Terror eras: tantum spatii de monte tenebas:
Hunc Deus arciteneus, —
Mille gravem telis, exhaustâ pene pharetrâ,
Perdidit, effuso per vulnera nigra veneno.

Now the person, or prophetess, who, instead of Apollo, pronounced the oracle, and gave answer to those that came to consult the god, was a maid, and the first that performed it was Phemonœ, the daughter of Apollo. The oracle was delivered from a place in the temple, called the Adytum, which was the most secret and retired part of it, and into which none but the prophetess was permitted to enter; and, according to the description Strabo gives of it, it was a deep and crooked cave, with a mouth or entrance, but indifferently large, and out of which the answer of the god was thought to ascend, and inspire the prophetess. Over the mouth of this cave stood the tripod, upon which, when the prophetess got up, she was immediately transported with a spirit of divination, and then gave the answer, sometimes in prose, sometimes in verse. Du Choul, in his treatise de la Religion des anciens Romains, gives us the form of the tripod, with a crow sitting on it, as a bird sacred to Apollo, and with a harp and laurel at the feet of it. To which we may add, that in Constantine's oration, ad Sacrorum Cœtum, in Eusebius there is mention made, cap. xviii. of a serpent also twining about the tripod, and of a diadem with which the prophetess was adorned. Lee, in the tragedy of Mithridates, describes the agony of the Pythian, when, inspired by the god, she was about to pronounce the oracle.

—At Delphi, when the glorious fury
Kindles the blood of the prophetic maid,
The bounded Deity does shoot her out,
Draws ev'ry nerve, thin as a spider's thread,
And beats the skin out like expanded gold.

And Dryden, in *Œdipus*, makes the old Tiresias say,

Now the god shakes me! he comes! he comes!
—I feel him now

Like a strong spirit, charm'd into a tree,
That leaps, and moves the wood without a wind :
The roused god, as all this while he lay
Entomb'd alive, starts, and dilates himself :
He struggles, and he tears my aged trunk
With holy fury ; my old arteries burst ;
My rival'd skin, —
Like parchment, crackles at the hallow'd fire :
I shall be young again, &c.

To both of whom Virgil showed the way, in his description of the convulsive rage of the Cumæan Sybil. *Æneid. vi.*

Ver. 124. Pythagoras, Plato, Trismegistus, and many others of the ancient philosophers, imagined the world to be endowed with a rational soul, and to partake of the nature of the God that made it. They were induced to this belief, by considering the admirable order and connection of all the parts of the universe, which, they were persuaded, could not be sustained but by a soul intrinsically informing, ordering, disposing, and connecting them. This soul Plato, indeed, did not believe to be God himself, but the work of the supreme God ; but Pythagoras and Thales, as we learn from Minutius Felix, asserted it to be God himself : To this opinion the Hermetic philosophers seem likewise to subscribe, and explain it in this manner : They tell us, that the Divine Spirit, which produced the world out of the first water, being infused, as by a continual inspiration, into all the works of nature, and largely diffused through them, by a certain secret and continual act, moving the whole, and every individual part of it, according to its kind, is the soul of the world. Plato, and the old academics, as we find their opinion delivered by Cicero, in *Acad. Quest. lib. i.* say thus of it : The several parts of the world, and all things contained in them, are kept together by a sensitive nature, which is endowed likewise with perfect reason : It is also sempiternal ; because there is nothing more strong, by the power or force of which it can be dissolved. And this nature is the power which is called the soul of the world. Plutarch, de *Placitis Philosoph. lib. iv. cap. i.* teaches, that Heraclitus affirmed the soul of the world to be an exhalation of the humid parts of it. Varro, on the contrary, would have it to be fire, but means, perhaps, the same thing with Chalcidius in the *Timæus*, where he calls Vesta the soul of the universal body ; or with Pliny, who asserts the sun to be the soul of this world : “ Hunc mundi totius esse animam, ac plane mentem, hunc principale naturæ regimen, ac numen credere decet,” says he, *lib. ii. cap. 6.* But the Stoics went yet farther, and held, that every one of the celestial bodies that have motion, is to be esteemed in the number of the gods ; and this opinion they grounded on the constancy they had observed in the revolutions of the heavens, and in the courses of the stars, whence they concluded their motion to be voluntary, and, consequently, that they are gods. Thus the Stoic Lucilius, in Cicero, says, “ Hanc igitur in stellis constantiam, hanc tantam

in tam variis casibus, in æternitate convenientiam temporum, non possum intelligere, sine mente, ratione, consilio : Quæ cum in syderibus esse videamus, non possumus ea ipsa in deorum numero non ponere.” De *Natur. Deor. lib. iii.* And a little higher, he says, “ Restat ut motus astrorum sit voluntarius : quæ qui videat, non indocte solum, verum etiam impie faciet, si deos esse neget.” But Lactantius retorts their very argument upon these philosophers, and says, that the constant and fixed revolutions, and courses of the celestial bodies, are an evident argument that they are not gods ; for, if they were, they would not be determined to, nor prescribed any certain motions, but, like animals upon earth, whose will is free, would move wherever they list. “ Quid, quod argumentum illud, quo colligunt universa cœlestia deos esse, in contrarium valet ? Nam si deos esse idcirco opinatur, quia certos et rationabiles cursus habent, errant : ex hoc enim apparet deos non esse, quod exorbitare illis, à præstitutis itineribus non licet. Cæterum si dii essent, huc atque illuc passim sine ullâ necessitate ferrentur, sicut animantes in terrâ ; quorum quia liberæ sunt voluntates, huc atque illuc vegantur, ut libuit ; et quò quemque mens duxerit, eò fertur.” De *Orig. Error. cap. 5.* Now the reason why Lucretius lashes the authors of these opinions, and treats them with so much scorn and indignation, is, because their belief of the soul of the world, presses hard his impious hypothesis, concerning the Divine Providence : For, release but the soul from that union, which these philosophers have thus foolishly assigned, and then to hold a soul of the world, and an all-ruling Providence will be all one and the same thing.

Ver. 128. The giants, who fought against the gods at Phlegra, and attempted to scale heaven, by heaping one on another the hills of that country, and of Thessalia. Virgil, *Georg. iii. ver. 281.* See likewise the note on Book i. ver. 243. To which I add, that Phlegra was so called *ἄρε τὴν φλέγοντα*, to burn, perhaps, because of the giants being destroyed there chiefly by lightning ; or, as others, from baths of hot water that arise thereabouts. Eustathius says, it was likewise called *Pallene* ; and that the wickedness of the inhabitants gave occasion to the fable of the giant's fight. Now, what Lucretius here says, is this : Lest you should think that all those, who by their arguments endeavour to prove the world to be mortal, equally deserve to be punished for their impiety, as were the impious giants of old, who, in their way, did likewise all they could to destroy heaven, and durst to wage war with the gods. Whoever desires to be fully instructed concerning giants, may consult the learned Cassarion, who has treated of them at large. I will only add, that the ancient heathens drew the occasion of this, and of many of their other fables, from the Mosaical history, which they wretchedly profaned and depraved by their childish fictions : And that too the rather, if it be true what Bouldue, a French capuchin, in a treatise printed not long ago, and intitled, *De Ecclesiâ ante legem,*

tells us, in lib. i. cap. 9. that the names Raphaim, Emim, Zuzin, and others, as he says, commonly in scripture taken for giants, ought not to be expounded in that sense. Then he affirms, that the title of giant was anciently a name of honour, by which they distinguished such persons as in those days were restorers of piety; and that the assemblies of giants, were colleges of instruction, in that age of the world. Thus he endeavours to prove, that Nimrod was, in that sense, a giant, a man instructed by God himself; and this he would make good out of Methodius. But these assertions of his, and the curious proofs he alleges from their Hebrew titles, are new and daring flights of fancy.

Ver. 130. That the heavens are immutable and incorruptible, nay, even immaterial, and consequently no ways obnoxious to the catastrophe which Lucretius here asserts has always been the vulgar opinion, as well as the belief of Aristotle, Xenophanes, Averroes, Cicero, and indeed of most of the philosophers. And though experience itself of the visible mutations that sometimes happen in them, for example, the new star that appeared in Cassiopeia, in 1573, and vanished the year following, are abundantly sufficient to convince them, by natural reason, of the erroneousness of that opinion; yet some men are so given up, even to the most reprobate sense of Aristotle, that not the Divine Authority itself can draw them from it, as in this point particularly, Suarez, and many others, are so far from believing the heavens to be corruptible and mutable, that they will allow them to be changed only accidentally, as they call it, and not substantially, at the last day: Upon which Maldon, on St. Matthew says very well, that he had rather believe Christ, who affirms it, than Aristotle, who denies it.

Ver. 134. In these twenty-four verses, he says, that it is so far from being true, that what he is about to teach of the future dissolution of the world, will derogate from the power and divinity of the immortal gods, that, on the contrary, it will evince their dignity, and the excellence of their nature, because it will help us to distinguish between what is endowed with a divine body, and what is not: for what can be more disrespectful and injurious to the gods, than to declare aloud that the heavens, the earth, the sea, the sun, the moon, and the stars, are endowed with their immortality, eternity, and divine understanding, as they most manifestly do who hold them to be immortal? Especially, since they are incapable even of being animated with the breath of life: For a soul can no more be in them, than a tree in the air, a cloud in the sea, or a fish upon dry ground. And as every thing has a proper place assigned it, to be produced and live in, so neither can the soul be produced or exist without a body. This opinion is both impious and repugnant to true reason; but since we have already fully answered, in the third book, all the Epicurean objections against the immortality of the soul, we will not trouble our reader with the repetition of them. Besides, the drift of Lucre-

tius is, to prove, that heaven, earth, sea, &c. are mortal, and consequently will be dissolved, and perish.

Ver. 136. *Neither*] None, not one of them: we generally say neither of them, when we speak but of two.

Ver. 140. You will find this and the following eleven verses, Book iii. ver. 755.

Ver. 144. This and the four following verses are rejected by Faber, who imagines they were by mistake brought to this place, together with the five preceding verses, from the third book, where we find them all together; but his supposition is without reason; for they seem to be a part of this argument, and as much to the purpose as the other verses of it. For, says the poet, if even in our bodies, which are composed of veins, nerves, blood, &c. there be certain and appointed places, where the mind and soul are born, and exist apart by themselves, it is in vain for any one to pretend that there is a mind and a soul in the heavens, the earth, the sea, and other bodies that have no organs whatever.

Ver. 156. To this purpose, Velleius, in Cicero, lib. i. De Nat. Deor. says, "*Qui mundum ipsum animantem sapientemque esse dixerunt, nullo modo animi naturam intelligentes viderunt, in quam naturam cadere possit.*" They who said that the world is an animal, and endowed with understanding, did not in the least know the nature of the mind, nor into what nature it can be infused.

Ver. 158. Since the gods are immortal and eternal, they must of necessity have abodes that are so too; therefore, all men place the gods in the heavens, which, for that reason, say they, can never be destroyed. To this the poet answers, in these eleven verses, that this is only the invention of poets, or of the ignorant vulgar: For the nature of the gods is too subtle to touch such thick bodies as the heavens; and therefore we must not believe them to be the mansions of the gods. Nay, says he, no part of the universe is, or can be their abodes; for whatever has an abode, or is in any place, both touches and is touched: for place, and the thing placed, as they call them, are bodies; and body can both touch and be touched; but the gods neither touch nor are touched. They are not touched, because their nature is so subtle that it is wholly imperceptible to our senses, and therefore we ought to believe, that their abodes are answerable to their nature, and far different from ours, that is, from those that are commonly assigned to the gods; that is to say, that they are of so subtle a nature as renders them wholly imperceptible likewise to our senses. But all the parts of the world are perceivable to our senses, therefore none of them can be the abode of the gods. And since the gods are not touched, it necessarily follows, that they do not touch:

Tangere enim non quit, quod tangi non licet ipsum.

Lucr.

For nothing can touch but what may be touched

again. Therefore you must look out for some other mansions for the gods than those you have hitherto assigned them.

Nardius takes occasion, from this argument, to prove, that Lucretius contradicts his own doctrine, and that even, according to his own assertions, there can be no gods. He argues to this purpose: If the gods, says he, of Lucretius are no where, then Lucretius has no gods; for they must certainly be nothing at all; or they must be the void: This is evident from his own principles; for Book i. ver. 550, he says,

Two sorts of beings reason's eye descry'd,
And prov'd before their diff'rence vastly wide:
Body and void, which never could agree
In any one essential property;
For body, as 'tis matter, is from place
Distinct; and void from body, as 'tis space.

Therefore, whatever is, is either place, or a thing placed.

———And to afford a place,
Is the peculiar gift of empty space.

Book i. ver. 490.

Thus, if the gods are not bodies, they are empty space, and altogether nothing, as was said before. That they are not bodies, Lucretius himself cannot deny: What can neither touch, nor be touched, is not body: The gods of Lucretius neither are touched, nor touch; therefore they are not bodies; for nothing but body can be touched or touch. He has confirmed the minor proposition in this argument:

Now since their substance can't be touch'd by
man,
They cannot touch these other things that can;
For whatsoe'er is touch'd, that must be touch'd
again.

The supine idleness and inaction of his gods, made him aware how he placed them among bodies. And Book i. ver. 486, he says,

———Whatever is, a pow'r must own,
Or fit to act, or to be acted on;
Or be a place, in which such things are done;
Now body only suffers, and acts——

And yet he allows them a body, but so subtle as not to fall under the perception of sense. Perhaps he will say, with Epicurus, that his gods have not a body, but as it were a body: And thus he will set up a third nature, in contradiction of his own doctrine, when he taught, that

A third diff'rent nature in vain is sought,
And ne'er can be found out by sense or thought.

Book i. ver. 491.

Certainly he will not pretend that his gods are conjuncts, or events of concrete bodies. What then can they be, but a mere fiction, an empty word to sooth the credulous ears of unthinking men? And since he is contriving some most tenuous abode for them, what can be more tenuous than the void, which is wholly destitute of body?

But he is officiously about to invent something more subtle, and not unlike their own nature, that is to say, nothing.

Ver. 167. The same difference of tenuity as there is between us and the gods, there ought to be likewise between their abodes and ours: and thus, by suitable to their own, he means, that the seats and mansions of the gods, consist of the same principles as the gods themselves.

Ver. 169. But, say they, the gods made this world, and decreed it to be eternal. To which Lucretius answers in thirty-two verses. Did they make it for their own sake, or out of love to man? Whoever says for their own, may as well pretend, that to be adored and worshipped by men is of advantage, and adds to the happy state of a god, who is entirely blessed, and wants nothing: And if any one say for the sake of man, let him tell me what trouble it would have been to us if we never had had a being, not to have a being?

To make good his assertion in this place, Lucretius chiefly labours to prove, that the gods did not make the world for the benefit of man. Therefore, says he, there is no reason why any of us should, as in gratitude for so great a favour, extol this mighty work, believe it eternal, and that it will be immortal: For of what advantage could our acknowledgements be to the gods, that that consideration only should induce them to make the world for the sake of us, or for our benefit? Besides, what new thing was there to allure the gods, who enjoy the most perfect tranquillity, to change, either for their own sake or ours, their former life of happy and uninterrupted repose, and to take upon themselves the care of man, and of all created beings, they, who, till then, lived in undisturbed delights and happiness? Farther, what could it have been the worse for us, if we had never been created? For he, who has once tasted the sweets of life, with good reason desires to live on: but they who never had a being, how can they be in love with the pleasures of living? Moreover, how could the gods fabricate the world for the sake of man: of man, I say, of whom they had no previous notice, no model to work by? For nothing can be made without an idea. And whence had the gods first their idea of creating the world? Whence had they their innate notions of the world, by which they might see in their mind what they purposed and resolved to make? For since the world was to be created of atoms, the gods could by no other means come to the knowledge of the power of those atoms, nor of what they would be able to effect by the change of their sites, orders, and positions; unless nature, by creating the world from the fortuitous coalition of atoms, had afforded them a specimen of it, and unless they had experimented by the very rise of things, how great was the efficacy of the atoms. Thus, so far is it from being true, that the gods make this world for the sake of man, that indeed they had no hand in the creation of it, but by the guidance of nature, it was made by a fortuitous concurrence of atoms.

Thus Lucretius begins his impiety anew, and

endeavours to raise a dust; and blind mens understandings. And, to secure his former opinion, pretends objections intermixed with scoffs, against all those, who, upon sober principles, and a strict search into the order and disposition of things, were forced to confess this frame to be the contrivance of some intelligent Being, and the product of wisdom itself. And here, agreeable to the Epicurean principles, he supposes interest to be the cause of all good nature, and the only spring of action, and then peremptorily demands what suitable returns man could make the gods for all their labour, or what additional happiness they could receive? Where he makes another wild supposition, which will never be granted, viz. That to create or dispose, is toil and trouble to Omnipotence; for such I have proved every eternal and self-existent to be. Now, let us look a little on the immoderate praises he bestows on his Epicurus, and ask him, what rewards could posterity give him for his philosophy, how could he receive any benefit from their praises and commendations? What then, was his god Epicurus a fool, who lost his own ease, opposed himself to so many philosophers, and laboured to write almost infinite volumes, when he had no motive to engage himself in all this trouble? No, Lucretius highly esteems him for the benefits he bestowed on mankind; and thus answers himself, whilst he allows single benevolence to be a strong motive to action: And this is allowed by general consent, he being hated, who looks only on his own interest, and makes that the measure of all his designs. And that the Deity is benevolent in the highest degree, is as evident as that it is a perfection to be so; for it is already proved, that infinite perfection is a necessary consequence of self-existence. But when he endeavours to prove, that to be is no good to man: what but laughter can be returned to such an idle opposition of common sense? For if to be continued in being is so great a good, and so desirable, as all mens wishes and endeavours sufficiently evince, then surely to bestow that being, is at least an equal blessing. And to answer his impudent question, How the Deity could have his knowledge? It is sufficient to return, That his method of knowing is not to be measured by ours, that he is Omniscient, that being a perfection, needs not any external impulse from images.

Ver. 185. Cicero, lib. ii. de Nat. Deor. speaks to the same purpose in these words: "*Quid autem erat, quod concupisceret Deus mundum signis et luminibus, tanquam Ædilis, ornare? Si, ut Deus ipse melius habitaret, antea, videlicet tempore infinito, in tenebris, tanquam in gurgustio habitaverat? Post autem, varietate ne eum delectari putamus, quod cælum et terras exornatas videmus? Quæ ista potest esse oblectatio Deo? quæ si esset, non eâ tam diu carere potuisset.*" Why was it that God was so desirous to adorn this world with luminaries and constellations, like the gawdy cockack of a herald? Was it that he might live himself the better? And had he lived till then, that is to say, an infinite space of time, in the dark, as in a cabin? Or do we imagine, that

TRANS. II.

at length he took delight in novelties, and, therefore, clothed the heavens and the earth in all that glorious array in which we now behold them? What delight can that be to God? Were it any, he would not have been so long without it.

Ver. 201. The notice, or knowledge of all things, proceeds from the images of things that offer themselves to the mind. Besides, the gods do nothing inconsiderately; but foresee whatever they resolve to do. Now, no images of things could come into the Divine Mind, since the things themselves did not yet exist. It is idle, therefore, to pretend, that the gods created the heavens, the earth, the animals, and all things. This argument is contained in fifteen verses.

Ver. 208. In these eight verses, the poet delivers the opinion of Epicurus concerning the creation of the world, which he denied to be the work of the gods; but taught, that all things are effected by nature, or rather by chance and fortune, that is, by a fortuitous concourse of atoms: For he would not allow fortune or chance to be any thing, that, of itself, tempered and disposed the atoms to work these effects we now behold, but that the atoms themselves are that very chance: forasmuch, as without any premeditation, they meet, and mutually cleave to one another; and thus make all concrete things, just as it happens, without any preconceived design. And thus, as Dryden finely expresses this opinion of Epicurus,

The various atoms interfering dance
Leap'd into form, the noble work of chance.

Lucretius, too, explains it in the same words, as here, book i. ver. 1021. and in this book, ver. 470, he repeats these verses again.

Ver. 216. To prove the world not to have been made by the gods, the poet, in these thirty-four verses, brings some arguments from the ill-contrived frame, disposition, and make of it. The work of an all-wise artist, says he, ought to be perfect in all points; not like the earth with mountains, woods, lakes, &c. hideous and dreadful to behold. Some parts of it should not be chilled with perpetual frost, nor others parched with continual heat: it should produce fruits of all sorts, rather than thorns, briars, and other useless, nay, noxious plants. It should be disturbed with no storms nor tempests: It should breed no wild beasts, nor other animals that are dangerous and destructive to man: nor should various diseases attend the various seasons of the year, and shorten our days: but all things should have been made pleasant and beautiful, accommodated only to the ease and pleasure of man: and thus it would indeed have been a work worthy of a wise and bounteous God.

Thus our presumptuous and daring poet takes upon him to find fault with the contrivance itself, and, like that proud king of Arragon, could, no doubt, have mended the design. And here, though it is unreasonable to demand a particular cause and motive for every contrivance, since we are not of the cabinet-council of Nature, nor assisted at her project, yet his exceptions (no doubt the

N 2

best his labouring wit could invent) are so weak, so often answered, and so easily (on principles grounded on certain history, and infallible record) to be accounted for, that there is no need to frame a particular answer, nor reason to fear, that any, the meanest reader, can ever be surpris'd with such trifles.

Ver. 221. In these six verses is contained his first argument, in which he proves, that far the greatest part of the earth is useless to man; forasmuch as it consists partly of mountains, woods, and rocks; and that the sea and vast lakes take up another part of it: as also because a third portion of it is uninhabitable by reason of the violent heat of the sun; and a fourth on account of its being extremely cold; that is to say, under the torrid zone, and under the two frigid zones. How then can it be pretended, that this earth, which abounds with so many defects and inconveniencies, was created by the gods for the sake of man?

Ibid. Lucretius.

— Quantum cœli tegit impetus ingens,
Inde avidam partem montes, &c.

Which our translator has not rightly, or at least, has doubtfully rendered. For what Lucretius says is this: That as much of the world as the heavens surround or cover, by which he means the orb of the earth, is partly taken up by mountains, &c. and therefore is of no use to man. But Creech seems to make him complain, that no creatures are produced in the air, as well as in the water, and on dry ground. His mistake proceeded from not enough considering what the poet means by "Cœli impetus ingens;" the violent whirl of the heavens. Cicero, de Naturâ Deorum, lib. ii. "Cum autem impetum cœli admirabili cum celeritate moveri, vertique videamus," &c.

Ver. 226. The astronomers divided the heavens, according to latitude, into five parts, each of which the Greeks called *Ζώνη*, and the Latins *Cingulum*, *Fascia*, *Plaga*. Cicero calls the zones, *Macula*, and *Ora*; the zone, that is in the midst, between the two tropics, beyond which the sun never passes, is called the torrid zone. Polybius divides this zone into two, parted by the equator; but in this opinion he is not followed by any. The two zones that are extended, the one from the right of the torrid zone, towards the ætic or north pole, and the other from the left of the torrid zone, towards the antarctic or south pole, are called the temperate zones. The other two, included within the polar circles, are called the frigid zones. Thales is believed to have been the inventor of them; but Possidonius, as cited by Strabo, ascribes the invention, though without reason, to Parmenides. These zones are described by Virgil, Georg. i. ver. 233.

Quinque tenent cœlum Zonæ: quarum una corusco
Semper sole rubens, et torrida semper ab igni:
Quam circum extremæ dextrâ lævæque trahuntur,
Ceruleæ glacie concretæ, atque imbribus atris.
Hæc inter mediæque, duæ mortalibus ægris
Munere concessæ Divum. —

Five girdles bind the skies: the torrid zone
Glow with the passing and repassing sun.
Far on the right and left, th' extremes of heav'n,
To frosts and snows, and bitter blasts are given.
Betwixt the midst and these, the gods assign'd
Two habitable seats for human kind. Dryden.

And the same astronomers likewise assigned five zones on earth, to answer to those of the heavens: and of these Ovid takes notice, Metam. i. ver. 45.

Utque duæ dextrâ cœlum, totidumque sinistrâ
Parte secant Zonæ, quinta est ardentior illis:
Sic onus inclusum numero distinxit eodem
Cura Dei; totidemque plagæ tellure premuntur:
Quarum quæ media est, non est habitabilis æstu;
Nix tegit alta duas: totidem inter utramque locavit,
Temperiem dedit, mistâ cum frigore flammâ.

Which the same Dryden thus interprets:

And as five zones th' ethereal region bind,
Five correspondent are to earth assign'd.
The sun, with rays directly darting down,
Fires all beneath, and fries the middle zone.
The two beneath the distant poles complain
Of endless winter, and perpetual rain.
Betwixt th' extremes two happier climates hold
The temper that partakes of heat and cold.

Nor was it amiss observed by these astronomers, that the parts of the earth answered to the opposite parts of the heavens, and partake of their qualities: though so great has been the wisdom of God in attemping all things, that even directly beneath the sun, and where the heats are most violent, both men and cattle may live a pleasant and easy life: but of this the ancients were ignorant.

Ver. 227. In these nine verses is contained his second argument, in which he observes, that the other parts of the earth that are cultivated, will not produce the fruits, unless the ground be tilled by men with great toil and labour: but if the earth were created by the gods, for the service of man, why does it not bear them fruits of its own accord?

Ver. 236. These eight verses contain the third argument, and say, that even when we expect to reap the fruits of our labours in the tillage of the earth, we are often deceived in our hopes, either by rains or droughts, by storms, blights, &c. which is finely expressed by Sir R. Blackmore:

The verdant walks their charming aspect lose,
And shrivell'd fruit drops from the wither'd boughs:
Flow'rs in their virgin blushes smother'd die,
And round the trees their scatter'd beauties lie.
Infection taints the air; sick nature fades;
And sudden autumn all the fields invades;
So when the plains their flow'ry pomp display,
Sooth'd by the spring's sweet breath and cheering ray;
If Boreas then, designing envious war,
Musters his swift-wing'd legions in the air;

And, bent on sure destruction, marches forth
With the cold forces of the snowy north.
Th' op'ning buds, and sprouting herbs, and all
The tender first-born of the spring must fall;
The blighted trees their blooming honours shed,
And on their blasted hopes the mournful gard'-
ners tread.

Ver. 244. In these six verses is contained the fourth argument, in which the poet observes, that noxious animals are produced and fed, as well on dry ground as in the sea: that the seasons of the year bring diseases; that untimely death snatches many away: To which evils they ought not to be subject, if all things were created for their sake.

Ver. 250. In these sixteen verses he brings his fifth argument. If the gods, says he, had made the world, the condition of man would have been better than that of other animals; yet we plainly see it is much worse: and, to weigh the matter aright, nature seems a kind parent to them, and a cross step-mother to us. Why, says Epicurus, in Lactantius, lib. iii. cap. 5. did God make man whom he loved, obnoxious to so many evils? Why did he make him frail and mortal? "Cur ergo Deus omnibus malis hominem, quem diligebat, objecit? Cur mortalem, fragilemque constituit?" Man, indeed, comes into the world naked, helpless, and unarmed: but nature has given him the advantage of hands, which are called the organ of organs. Besides, let us suppose that a great estate were given gratuitously, and for no previous consideration, to a man that were lame, mutilated, infirm and diseased, would it not be unjust to call the donor to account for the infirmity of the object of his liberality, and to blame him that he gave no more?

Ver. 255. Pliny, lib. vii. speaking of the imbecility of human nature, says, "Hominem tantum nudum, et in nudâ humo natali die objecit ad vagitus statim et ploratus, nullumque tot animalium pronius ad lachrymas, atque has protinus vitæ principio." Nature produces man only naked, nor of the great number of animals is any more prone to tears, and that too in the very moment of his birth. But let us hear Dryden's translation of this passage.

Thus, like a sailor by the tempest hurl'd
Ashore, the babe is shipwreck'd on the world:
Naked he lies, and ready to expire,
Helpless of all that human wants require:
Expos'd upon unhospitable earth,
From the first moment of his hapless birth;
Straight with foreboding cries he fills the room,
Too sure presages of his future doom.
But flocks and herds, and every savage beast,
By more indulgent nature are increas'd:
They want no rattles for their froward mood,
No nurse to reconcile them to their food
With broken words; nor winter blasts they fear,
Nor change their habits with the changing year:
Nor for their safety citadels prepare,
Nor forge the wicked instruments of war.

Unlabour'd earth her bounteous treasure grants,
And nature's lavish hands supply their common wants.

Ver. 258. Martial. lib. xiv. Epig. 54.

Si quis plorator collo tibi vernula pendet,
Hæc quatiat tenerâ garrula fistra manu.

Hence we may observe, that the rattles which our nurses use to quiet their froward children, are not of modern date: especially if the *crepitaculum*, which is the word our poet here uses, be the same with the *fistrum*, that the Egyptians used in the service of the goddess Isis, as, by the description Apuleius, Metam. lib. xi. gives of it, it seems to be: "Dexterâ quidem ferebat," says he, "æreum crepitaculum, cujus per augustam laminam in modum baltei recurvatam, trajectæ mediæ paucae virgulæ crispante brachio tergeminos jactus reddebant angustum sonorem." And the figure of Isis, holding a *fistrum* in her hand, which Hieronymus Boslius, de Sistro, p. 22. gives us, from some ancient coins of Adrian, represents it to be very much of the same form with our common rattles.

Ver. 266. Having solved the objections which the weakness of the Stoics, and the superstition of the vulgar had raised against his opinion; he now, in these ten verses argues to this purpose. The nature of the whole is the same with that of its parts; and since we see that the parts of the world, the earth, sea, air, and fire, are continually changed, sometimes diminished, sometimes renewed, it must be confessed, that the whole mass is equally and alike mortal.

Ver. 268. *This frame.* i. e. Of the earth, which is composed of the four elements, that are called by Manilius, lib. i. ver. 137. "Quatuor mundi artus;" the four limbs or members of the world; as they are likewise by Lucretius, ver. 272. of this book.

Ver. 276. Here the poet demonstrates at large, in seventy-three verses, that the chief parts, and largest members of the world, earth, water, air, and fire, are produced, and die. And first, in these twenty verses he begins with the earth: many of whose particles, says he, are borne aloft, and compose the air: the rivers wash off many more, and roll them into the sea. Then, in sixteen verses, he says, that new water is produced every day; but part of it is changed into air by the force of the sun: and in the subterranean passages, another part of it condenses, and puts on the form of earth. Then in ten verses he says, that no man will pretend, that the air which receives all the particles that are continually flowing to it from all things, and that repairs and renews all those things, is eternal and immortal. And lastly, in twenty-seven verses, he asserts, that we ought to conclude the like also of fire, since the rays of the sun, who is the sole fountain and source of all light and fire, flow out from his orb, and perish every moment. And, therefore, we must be forced to allow, that the sun himself is repaired, as we supply a lamp with oil to keep the flame alive.

Ver. 280. Here the poet proves, I. That the earth wastes away, and is renewed: for, says he,

N a ij

the sun, by continually shining upon it, bakes and dries it up : it wears with being trampled on : the force of the winds blows some of it into the air : rains dissolve it : rivers wash it away : it is wasted by its own productions, and again renewed by them. For, as the earth is the great mother of all things, so too she is their common sepulchre. The earth therefore decays, and is renewed.

Ver. 284. Our translator is not so much obliged to his author for this thought, as to Cowley, who, in the first book of his *Davideis*, says,

———— The stream, with wanton play,
Kisses the smiling banks, and glides away.

Ver. 296. In these sixteen verses the poet proves, 2dly, That the water wastes away, and is again repaired : for the sea, the rivers, and the fountains, are continually supplied with new waters ; and the reason why the sea does not overflow, is, because the winds brushing over the surface of its waves, take away some part of its flood, and because the heat of the sun commonly licks up its waters. Besides, some parts of the waters of the sea dives beneath into the pores and channels of the earth, where, leaving behind its bitterness and salt, it gropes out its blind passage to a second birth ; and starting up in fountains, creeps from them into rivers, and from the rivers works its way, and returns again into the sea, gliding backwards and forwards with a never ceasing course.

Ver. 305. Lucretius himself gives the reason of this, book ii. ver. 451.

For when salt streams through winding caverns pass,
They rise up sweet, and bubble o'er the grass ;
Because those pungent parts they roll'd before,
Now stay behind, and lodge in every pore.

Ver. 308. Mæander is a great river of the Lesser Asia, flowing from the fountain Aulocrene, in the Greater Phrygia. It divides Caria from Ionia ; and, at the city Heraclea, falls into the Myrtoan sea, which is a part of the Ægean, and now called Mare di Mandria. This river is now the Madre, and flows in so many windings, that it often seems to run back toward its head. Ovid. *Metam.* lib. ix. ver. 449.

Hic tibi, dum sequitur patriæ curvaminaripæ,
Filia Mæandri, toties redeuntis eodem,
Cognita Cyanæe, &c.——

Whence, not only all turnings and windings are metaphorically called meanders : but likewise all crafty and wily counsels : in which last sense, Cicero in *Piso*, uses the word meander ; and Prudentius, in the hymn, ante *Sonn.*

O tortuose serpens,
Qui mille per Mæandros,
Fraudesque flexuosas,
Agitas quieta corda.

Dion Prusæus says, that this river makes no less than six hundred windings towards the spring where first it rises. Thus,

Its wanton tide in wreathing volumes flows,
Still forming reedy islands as it goes :
And in meanders to the neighb'ring main,
The liquid serpent draws its silver train.

Sir Richard Blackmore.

Moreover, the four verses that conclude this argument, are paraphrastically rendered ; and the two last of them seem to be imitated from these of Cowley :

Th' innocent stream, as it in silence goes,
Fresh honours, and a sudden spring bestows,
On both its banks to ev'ry tree and flow'r.

Ver. 312. In these ten verses, he proves, 3dly, Of the air, that it sometimes wastes, and then again increases : for the air is changed every moment : because, whatever flows from bodies, is carried into the vast tract of air. But minute corpuscles are continually flowing from all things, and are conveyed into the air, where they fly to and fro without ceasing. Now, unless the air constantly restored these corpuscles to the bodies from whence they came, all things would by this time have been wasted to nothing, and totally destroyed. Therefore, bodies are perpetually changed into air, and the air returns again into bodies.

Ver. 315. This seems a bold metaphor ; and yet has the authority of Lucretius ; " *Aeris in magnum fertur Mare :*" and he of Ennius, who, in *Festus*, says, " *Crassa pulvis oritur ; omne per-volat cœli Fretum.*" And our Cowley not only calls the air a trackless ocean ; but the sea the low sky : for which, he tells us, he has the authority of the scripture itself : *Genes. i. ver. 6.* " Let there be a firmament in the midst of the waters, and let it divide the waters from the waters." The passage of Cowley, of which I am speaking, is in that incomparable Pindaric ode, which he calls the *Muse* ; and the rather deserves to be transcribed, because he reclaims the authority of our poet, to justify one part of his allegory :

Where never fish did fly,
And with short silver wings cut the low liquid sky,
Where bird with painted oars did ne'er
Row through the trackless ocean of the air, &c.

Ver. 322. In these twenty-seven verses he proves, 4thly, That fire perishes, and is again renewed : Of this he brings an instance of the sun, whose first light, says he, totally perishes, and a new light is created in its place : This truth we know by experience, as often as any mist interposes between the sun's orb and us. He farther teaches, that the like happens in our lamps and candles, in lightning, in the moon, and in the other planets ; of all which the first light dies, and a new light is continually substituted in its room : Therefore light, in which there is always some fire, dies, and is renewed in all luminous bodies, and consequently the fire itself must perish, and be renewed likewise. And, indeed, as to our lights, which are supplied and fed with something fat and humid, as oil, no man disputes but that they are continually changed. But Aristotle, lib. ii. *Meteor.* denies that the light of the sun is like

our terrestrial lights; and will have it to be always one and the same, as being never fed with humidity; for otherwise a new sun would rise every day, and be daily new, which is both false and absurd. Lucretius, indeed, in this place, does not pretend to say, that the sun or the stars are of a fiery nature, or that they are fire; but is satisfied that light, which always contains some fire, perishes and is renewed daily. He will prove by and by, whether the sun be fire or not; and according to the doctrine of Epicurus, will teach, that the celestial bodies, that is to say, the stars, are either fire, or consist of fire; which he has likewise often insinuated elsewhere.

Ver. 328. Sir Richard Blackmore, describing a storm:

A sudden storm did from the south arise,
And horrid black begun to hang the skies:
Low-bellying clouds soon intercept the light,
And o'er the sailors spread a noon-day night.

Ver. 343. See the note on verse twenty-eight of this book.

Ver. 349. In these eleven verses he confirms the preceding arguments. The things that seem most solid, feel the strength of time, and moulder away. Who does not every day see towers, temples, and the images of the gods falling to decay, and dropping to the ground? The deities themselves cannot support them. Even rocks crumble with age, and come tumbling piecemeal down from the mountains. Who then will pretend, that things which are unable to resist the injuries of a finite time, have existed from all eternity?

Ver. 351. For some are of opinion, that the ancients believed, that not only man and all created things, as well animate as inanimate beings, but that even the gods themselves were subject to fate. And the words of Lucretius, in this place, are,

*Nec sanctum numen fati protollere fines
Posse, neque adversus naturæ sædera niti.*

But if the decrees of fate were unalterable, how came Venus to fear, that the mind of Jupiter would change, in regard to the Trojans? Virgil, *Æn. i. ver. 241.*

— *Quæ te, genitor, sententia vertit?
Hoc equidem occasum Trojæ, tristesque ruinas
Solabar, fatis contraria fata rependens.*

Fate therefore seems to have been nothing else, than an immutable series of things and events, existing in the mind, or in the decrees of Jupiter, and which, for that reason, he alone knew, and alone revealed to the gods by his own mouth, and to men by oracles. Thus the fortune-telling harpy, *Æn. iii. ver. 251.*

*Quæ Phœbo pater omnipotens, mihi Phœbus
Apollo
Prædixit.*—

To which I add, that the ancients did indeed hold fate to be unalterable; and unavoidable; "*Fata viam invenient*:" but in such a manner nevertheless, that they believed, I. That the event of fate,

though it could not be wholly prevented, might nevertheless be somewhat retarded: Thus Juno *Æn. vii. ver. 315.*

*Non dabitur, esto, regnis prohibere Latinis:
At trahere, atque moras tantis licet addere rebus.*

II. That the event often depended on certain conditions, which being eluded, fate was eluded likewise. III. That the declaration of any fate whatever, whether by Jupiter himself, or by the oracles, might be ambiguous: whence it happened, that the gods, as well as men, often struggled against adverse fates. And this it was that Venus feared, that Jupiter had not spoken sincerely of the future happiness of Æneas; because, if he had, she knew that it was unalterable, and must of necessity happen. For as Dryden, in Palemon and Arcite, says after Chaucer,

The pow'r that ministers to God's decrees,
And executes on earth what he foresees,
Call'd providence, or chance, or fatal sway,
Comes with resistless force, and finds, or makes
its way.

Ver. 353. Juvenal, Satyr. x. ver. 142. to the same purpose, says,

— *Patriam tamen obruit olim
Gloria paucorum, et laudis titulique cupido
Hæfuri in saxi cinerum custodibus, ad quæ
Discutienda valent sterilis mala robora ficus:
Quandoquidem data sunt ipsis quoque fata sepulchris.*

Which Dryden has finely paraphrased:

Yet this mad chase of fame, by few pursu'd,
Has drawn destruction on the multitude:
This avarice of praise in times to come,
These long inscriptions crowded on the tomb,
Should some wild fig-tree take her native bent,
And heave below the gawdy monument,
Would crack the marble titles and disperse
The characters of all the lying verse:
For sepulchres themselves must crumbling fall
In time's abyss, the common grave of all.

Moreover, that the graves of men should come to be their own graves, is a thought added to Lucretius by his translator.

Ver. 360. In these eight verses he confutes those who hold that all things proceed from ether, or heaven, and are resolved again into heaven, and yet assert, that heaven itself is immortal and eternal. For whatever is changed into other things, and is repaired and renewed by those things, when they are dissolved, must be born, and mortal.

Ver. 363. He means the poets, who feigned that Cælus was the most ancient of all the gods, and that he married his sister Terra, the earth, whence he was believed to be the father of all things.

Ver. 368. In these seventeen verses, he asserts, that the world is new because the most ancient of all histories reach not farther than the Theban, or Trojan wars; and certainly, if the world, far from being eternal, were much older than we know it to be, we should have had some records

of a much older date: and farther, because all the arts are but of late invention, since mention is made of the founders of all of them. And if the world had had no beginning, all arts, but especially those useful to life, would have existed from all time. Macrobius, on the dream of Scipio, book ii. chap. 10. argues to the same purpose, in these words: "Quis non hinc existimet mundum quandoque coepisse, nec longam retro huges ætatem, cum abhinc ultra retro duo annorum millia de excellenti rerum gestarum memoria ne Græca quidem extat historia? Nam supra ninum, à quo Semiramis secundum quosdam creditur procreata, nihil præclarum in libris relatam est: Si enim ab initio, imo ante initium fuit mundus, ut philosophi volunt, cur per innumerabilem seriem sæculorum, non fuerat cultus, quo nunc utimur, inventus? Non literarum usus, quo solo memoriæ fulcitur æternitas? Cur denique multarum rerum experientia ad aliquas gentes recenti ætate pervenit? Ut ecce; Galli vitem, vel cultum olæ, Roma jam adolescente, didicerunt: aliæ verò gentes adhuc multa nesciunt, quæ nobis inventa placuerunt. Hæc omnia videntur æternitati rerum repugnare, dum opinari nos faciunt, certo mundi principio paulatim singula quæque coepisse." Who can believe but that the world had a beginning, and that not too long ago, since, of what happened above two thousand years past, we have no history, not even of any great actions: For before Ninus, who, according to some, was father of Semiramis, nothing memorable is recorded in our books. And if the world was from the beginning, or, as philosophers say, before the beginning, why, during a succession of innumerable ages, was not the method and way of life which we now follow invented? Why not even the use of letters, which alone secures and eternizes the memory of things? And why have some nations had but a late knowledge of many things? For instance, the Gauls, who knew not to till the vine, nor the olive, till Rome was in her age of adolescence. And other nations are still ignorant of many arts and inventions, that have long been in use, and of great advantage to us. All which seems to contradict the eternity of things, and gives us great ground to believe, that all things began by degrees, after the world had its beginning.

Ver. 371. Which, says Macrobius, was before the siege of Troy. However, it could be but a little time before, because it is certain, that some leaders were at the destruction of Troy, whose fathers had been at the siege of Thebes. *Faber*. There were several cities called by the name of Thebes; but *Lucretius* speaks of that in Bœotia, which, as *Isidorus* says, was built by Cadmus, and of the war between the two brothers, Etocles and Polynices, the sons of Oedipus, by his own mother Jocasta. Of the Trojan war, see book i. ver. 519.

Ver. 372. Horace seems to give the reason of this, when he says, that in the ages those heroes lived, there wanted poets to record their fame:

Vixere sortes ante Agamemnonas
Multi: sed omnes illacrymabiles
Urgentur, ignotique longa
Nocte; carent quia vate sacro.

And therefore Cowley excellently well says:

Not winds to voyagers at sea,
Nor show'rs to earth more necessary be,
Than verse to virtue, which can do
The midwife's office; and the nurse's too:
It feeds it strongly, and it clothes it gay;
And when it dies, with comely pride
Embalms it, and erects a pyramid,
That never will decay,
Till heaven itself shall melt away,
And nought behind it stay.

And Dryden in like manner:

For ev'n when death dissolves our mortal frame,
The soul returns to heaven, from whence it
came;
Earth keeps the body; verse preserves the fame.

Ver. 374. It is not strange that arts are new, that they are but lately improved and refined, that is to say, sailing, poetry, music, &c. since the world itself is but of late standing, and was not from eternity, as the Stoics and Aristotle erroneously believed.

Ver. 383. *Lucretius* has several times already been telling us this of himself; but more particularly, book i. ver. 933. and at the beginning of the fourth book.

Ver. 385. To these arguments some philosophers give this answer. The same arts flourished heretofore that do now; but sometimes fire destroyed mankind, sometimes deluges swept them away, or earthquakes swallowed them up; and hence those arts seem to be new. The poet retorts this answer upon them, in these ten verses, and says that no man of sound judgment will pretend that the world, whose parts are sometimes consumed by fire, sometimes overwhelmed with waters, and sometimes shaken and swallowed up by earthquakes, can be eternal. For the reason why we believe a man to be mortal, is, because he is subject to, and attacked by those diseases, which having seized upon others with greater violence, have swept them away. But Aristotle, on the contrary, says that there is no fear of the world's being dissolved; nay more, that the deluges and conflagrations of the earth conduce to the safety of the whole universe; for he held the world to be eternal; which doctrine of his is not only repugnant to the Christian faith, but likewise to the opinion of almost all the philosophers.

Ver. 387. The poet alludes to the known stories of Phaëthon, who is fabled to have set the world on fire; and of the flood, that happened in the days of Deucalion. The first of them may be seen at large in *Ovid. Metam. lib. ii.* and the other in the same author, lib. i. See likewise below, ver. 440. and ver. 455.

Ver. 395. In these twenty one verses he brings the same argument against the immortality of the

world, which, book iii. ver. 776. he brought against the immortality of the soul; consult the notes upon that place. Nothing, says he, is eternal, or immortal, except bodies perfectly solid, as the atoms; except the void, and the *τὸ πᾶν*, universe. But the world is not a body perfectly solid; nor is it void or empty space; nor since there are infinite worlds, can it be pretended, that it is the universe.

Ver. 406. As if, for the dissolution of any thing, it were requisite, that it should go from place to place, or that bodies should come from some exterior place, and strike it with so great violence, as to dissolve the thing itself.

Ver. 416. In these five verses he draws, from the arguments he has brought already, this conclusion; that since the world will have an end, it had a beginning; and has not existed from all eternity; for what is mortal, must of necessity have been born.

To make this disputation of our author more easy to be understood, it will not be improper to observe, that there are two sorts of eternity; from the present time backwards, and from the present forwards; which the schoolmen call "*æternitas à parte ante*, and *æternitas à parte post*." These two make up the whole circle of eternity, which the present now cuts as a diameter. Boetius de Consolat. Philosoph. lib. v. defines eternity, "*interminabilis vitæ tota simul et perfecta possessio*." The whole and perfect possession at once, of a being with beginning or ending. And this definition is followed by Thomas Aquinas, and all the schoolmen, who therefore call eternity *nunc stans*, a standing now, to distinguish it from that now, which is a difference of time, and always flowing.

Ver. 421. In these forty verses he brings another argument from the continual fighting of the elements, which are the four chief parts of the world: For, says he, since fire engages with water, and sometimes the flame, sometimes the flood prevails, what should hinder, but that this contention will at last end in the destruction of the whole world: And that great conflagrations and deluges have happened, the stories of Phaëthon and Deucalion sufficiently evince: for then the earth was destroyed by fire, and overwhelmed with water; and though the poets foolishly fable, that the fire, and the deluge, broke out and ceased at the intervention of the gods, yet they were indeed only the effects of natural causes.

Ver. 435. Milton describes admirably well this fighting of the elements, and perhaps took the hint from Lucretius.

For hot, cold, moist, and dry, four champions
fierce,

Strive here for mastery; and to battle bring
Their embryon atoms: They around the flag
Of each his faction, in their several clans,
Light-arm'd, or heavy, sharp, smooth, swift, or
slow,

Swarm populous; unnumber'd as the sands

Of Barca, or Cyrene's torrid soil,
Levy'd to side with warring winds and poise
Their lighter wings. To whom these most ad-
here,

He rules a moment, &c.

Which a late author has happily imitated:

The heavier seeds rush on in num'rous swarms,
And crush their lighter foes with pond'rous arms:
The lighter strait command with equal pride,
And on mad whirlwinds in wild triumph ride:
None long submits to a superior pow'r;
Each yields, and, in his turn, is conqueror.

Ver. 440. *Phaëthon*.] He was the son of Clymene and Sol, the sun: And with much importunity obtained of his father, to drive his chariot for one day; but not being able to guide the horses, they went out of the road of their daily course and set fire to the world. Jupiter struck him with his thunder, and he fell into the river Eridanus. The fable is related at large by Ovid. Metam. 2. Plato, in his *Timæus*, explains the meaning of this fable, in words to this effect: What is commonly reported among us, says he, that in times long since past, Phaëthon, the son of Sol, having obtained permission to drive his father's chariot, and mistaking the right road, set fire to the earth, and that he was struck down, and killed with lightning, is said only figuratively, or by way of fable; but signifies the mutation or decay, as well of earthly things, as of those that are in the heavens, and are moved with the heavens: As also that destruction, which in a long interval of time, is made of all bodies that are on the earth, by the violent assaults of the element of fire. And thus too Aristotle, lib. 4. de Mundo.

Ver. 444. *Po*.] The Greeks called it *Ἡριδανός*, the Latins, *Padus*, now the *Po*, a river of Italy, that rises in the Alps, at the foot of the mountain Vesulus, now Monte Viso, and dividing the Cisalpine Gaul, which is now a part of Italy, into the Transpaduan and Cispaduan Gauls, discharges itself, at several mouths, in the Adriatick sea. Virgil calls it the king of rivers, because it is the largest river of Italy. Georg. i. v. 481.

*Proluit infano contorquens vortice sylvas
Fluviorum rex Eridanus*——

And G. 4. v. 372, he describes it at the spring from whence it flows:

*Et gemina auratus taurino cornua vultu
Eridanus: quo non alius per pingua culta
In mare purpureum violentior influit amnis.*

There Po first issues from his dark abodes,
And awful in his cradle, rules the floods:
Two golden horns on his large front he wears,
And his grim face a bull's resemblance bears:
With rapid course he seeks the sacred main,
And fattens, as he runs, the fruitful plain.

Ver. 445. Of *Phœbus*, see B. I. v. 816.

Ver. 447. The horses of the sun, of which we have spoken above, v. 86.

Ver. 451. What Lucretius here says, is this: The old Greek poets report this for truth, though indeed it is but an idle fiction: Not but that it is possible that fire may destroy all things, if an immense quantity of corpuscles, of a fiery matter, were brought down upon the earth, out of the infinite space: for in that case, unless the power and force of that igneous matter be weakened, repressed and kept under by some means or another all things will be burnt, and perish with too much heat.

Ver. 455. Here the poet alludes to the fabulous flood of Deucalion, which, no doubt took its rise from the true flood of Noah, related in the Mosai- cal history, of which it cannot be questioned, but some copies were got among the heathens; and as they drew the occasion of many of their fables from those sacred writings, so too they wretchedly profaned them by their foolish fictions: but none has suffered more in passing through their hands, than this flood of Noah: which having furnished matter of speculation to many of our Christian philosophers, who have puzzled their brains to give a rational and intelligible account of it; I presume it will not be taken amiss, that I here make a short digression, to give our translator's opinion concerning that deluge: He observes, in the first place, that the author of the theory of the earth, pleads for a universal flood, it being inconsistent with the demonstrated nature of a fluid, that water should stand up in heaps, fifteen cubits above the tops of the highest mountains: This, says Creech, I am willing to admit, though there is no reason why Omnipotence might not be immediately concerned in it; since the author of the theory himself confesses, that the forty days rain cannot, according to his hypothesis be explained by any natural cause that he can discover. In the next place, that author compares the height of the mountains, and the depth of the sea; and having, as to both, made allowable suppositions, though the course of the largest river, even the Nile itself, will not prove its head to be above three feet higher than its mouth, he infers that eight oceans will be little enough to make an universal deluge: The waters above the firmament are exploded, the rain would afford but the hundredth part of such a mass of water, unless the showers were continual, and over the face of the whole earth, and the drops came down ninety times faster than usually they do: Though a man would be apt to think from the expressions in Genesis, "The windows of heaven were opened," that there was something very extraordinary in this rain, and that all those required conditions were observed. The caverns of the earth, if they threw out all the water they contained, would afford but little, in comparison of the great store that was required: And if the whole middle region of the air had been condensed, still there had not been enough; because air, being turned into water, fills only the hundredth part of the space which it formerly possessed. Though all the other ways by which some have endeavoured to explain the flood, were demon-

strably insufficient, yet this last, which gives an account of it from so natural and easy a cause of the condensation of the air, deserved to be considered a little more: But it is the art of a disputer, to touch that least which presses most on the opinion he would advance. For it being allowed that air, by natural causes, may be changed into water; and a vacuum being explained, it necessarily follows, that as much air as rises fifteen cubits higher than the tops of the mountains, is sufficient to make such a deluge, as is described to have been in Noah's time: Because where there is no vacuum, there can be no contraction into a less space: and every particle of matter, whatever form or schematism it puts on, must, in all conditions, be equally extended, and therefore take up the same room. But suppose a vacuum, or, as it happens in our imperfect condensations, that a hundred cubical feet of air would make but one foot of water; yet sure the region is large enough to make amends for this disproportion. Now, since nature is sufficient for condensation, and since its powers may be considerably invigorated for the execution of the Almighty's wrath, why must it be thought so difficult to explain a deluge! And why should an excellent wit waste itself in fashioning a new world, only to bring that about, which the old one would permit easily to be done? It is above the province of philosophy to make a world: let that be supposed to have been formed as it is revealed; it is enough for us to search by what laws it is preserved; and a system, erected on this foundation, will be agreeable both to reason and religion. It is above the province of philosophy likewise, to assign a natural cause of a supernatural effect: But the prying minds of some men will, with their short-lined plummets, be sounding into the unfathomable depths of the divine dispensations: How much better they, who, firmly believing that there was such a flood as that of Noah, described to us in holy writ, ascribe it merely to Omnipotence?

Commanded by whose breath, th' obsequious
main

Stood still, and gather'd up its flowing train:

Th' Almighty did the sea divide,

And, as he rends the hills, he split the tide:

Benumb'd with fear, the waves erected flood,

O'er-looking all the distant flood:

Mountains of craggy billows did arise,

And rocks of stiffen'd waters reach'd the skies;

Remoter waves came rolling on to see

The strange transforming mystery:

But they approaching near,

Where the high crystal ridges did appear,

Felt the divine contagion's force;

Mov'd slothfully awhile, and then quite stopt
their course.

Sir R. Blackmore.

Ver. 461. In these twenty-nine verses the poet, being about to explain how the world began, excludes the gods and Providence from having any hand in it; and ascribes the whole work to matter, from whence proceeded chaos

a rude and undigested heap of particles, which being driven to and fro, at length came together, like with like, and thence arose the heaven, the earth, the sun, the stars, and whatever else this world contains. This doctrine of Epicurus is delivered by Plutarch, de Placit. Philosoph. lib. I. c. 4. in these words: 'Ο τοίνυν κόσμος συνέστηκε περι-
 κικλασμένω ἰχθήματι ἰχθυημένω τὸν τροπὸν τῆτον, τῶν Ἀτόμων σωμάτων, ἀπρονοήτων, καὶ τυχαίαν ἔχόντων κίνησιν, συνεχῶς τε, καὶ τάχιστα κινημένων εἰς τὸ αὐτὸ πολλὰ σώματα συνθροίσθη, καὶ διὰ τῆτο ποικιλίαν ἔχοντα καὶ σχημάτων καὶ μεγεθῶν.

Ver. 477. Macrobius, Saturnal. lib. vi. cap. 2. compares this passage of Lucretius with the following verses of Virgil, in Silenus, v. 31.

Namque canebat uti magnum per inane coacta
 Semine, terrarumque, animæque, marisque fuisset,

Et liquidi simul ignis: ut his exordia primis
 Omnia, et ipse tener mundi concreverit orbis.
 Tum durare solum, et discludere Nerea Ponto
 Cæperit, et rerum paullatim sumere formas:
 Jamque novum ut terræ stupeant lucescere solem;
 Altius atque cadant submotis nubibus imbres:
 Incipiant sylvæ cum primum surgere, cumque
 Rara per ignotos errent animalia montes.

Which is thus interpreted by Dryden:

He sung the secret seeds of nature's frame:
 How seas, and earth, and air, and active flame,
 Fell through the mighty void; and in their fall
 Were blindly gather'd in this goodly ball!
 The tender soil, then stiff'ning by degrees,
 Shut from the bounded earth the bounding seas:
 Then earth and ocean various forms disclose,
 And a new sun to the new world arose:
 And mists, condens'd to clouds, obscure the sky;
 And clouds, dissolv'd, the thirsty ground supply:
 The rising trees the lofty mountains grace;
 The lofty mountains feed the savage race,
 Yet few, and strangers in the unpeopled place.

Ver. 480. The poet here teaches, that so long as the atoms were jumbled confusedly one among another, neither earth, nor heaven, nor stars, had yet a being: But when the chief parts of the world began to disjoin, and get clear from each other, then the heaven shone with splendour, the dry ground appeared, the waters were gathered into one, &c. Thus Lucretius will have all things to have begun by little and little, not only by reason of the sundry impediments of the concourse of the atoms, but also because of their different figures: Whence, says he, it is evident, that the world has not existed from all eternity. He is now going to dispute, separately, of the first rise of each part of it.

Ver. 490, 491. In these thirty-two verses, he discourses of the rise of the earth, of the heaven, and of the sun, moon, and stars. And since the confused and unfashioned mass of matter must have been brought into order by motion, and since all motion proceeds from weight, the poet is in the right to inquire what the heaviest atoms

must do. Now Epicurus believed, that the atoms, being embroiled, and confused in a heap together, did, by their innate motion, roll and tumble up and down, among one another, till at length all the more dense atoms jumbled towards the middle, and all the more rare, being extruded and squeezed away by the thicker, flew towards the circumference. Moreover, that of these thicker atoms the body of the earth was compacted, and that it contained within its bulk some seeds of water, which had not been able to disentangle themselves, and get away, at the same time with the others: But that some of those that had disentangled themselves, did, by reason of their various degrees of tenuity, retire to several distances; thus some of them stopt not far from the mass of earth, and made the air; that others mounted yet more aloft, and composed the sky; and that the fiery corpuscles, that were extruded with the rest, getting clear of all of them, combined into those bodies that shine in the sky, and are called stars. Lastly, That the lesser, round, smooth corpuscles were so determined, limited, and confined to that motion towards the circumference, that was made by elision, or by expression from the more dense corpuscles, that, forasmuch as they went not out of the mass by parallel ways, they did, in the very progression, variously encounter one another, and mutually repelled the violence they received; which violence at length ceasing, those that were got farthest, or most remote from the centre, became entangled with one another, and mutually compressing each other, and holding fast together, did, by that means, create a certain species of the walls of the world: And whatever corpuscles came to them there, were turned back, and repressed from them in such a manner, that still new supplies coming up, the whole ethereal or celestial region was aptly made and fabricated by them. This perhaps will be better understood by the comparison Lucretius himself uses to explain it, when he shows that this might very well happen, in like manner as when vapours and exhalations steam out of the earth and water, and being carried aloft, are there condensed, and grow into one body of clouds, so as to make, as it were, a ceiling, under which the air, that remains visible to us, is contained. See Plutarch de Placit. Philosoph. lib. I. c. 4.

Ver. 491. Though Epicurus and Lucretius placed the earth in the midst of the world, yet they denied the earth to have any centre, or middle place, as we have seen, Book i. ver. 1071, & seqq. Thus too Manilius, speaking of the earth, lib. I. ver. 167. places it in the midst of the universe:

Imaque de cunctis mediam tenet undique sedem;
 Idcircoque manet stabilis, quia totus ab illâ
 Tantundem refugit mundus, fecitque cadendo
 Undique, ne caderet: medium totius et imum
 est:

Itaque contractis consistunt corpora plagis,
 Et concurrando prohibent in longius ire,

Lowest of all, and in the midst it lies,
 Compass'd by seas, and cover'd by the skies:
 The place does fix it, for, still rising higher,
 The other el'ments equally retire,
 And that, by falling, stops its farther fall,
 And hangs the midst and lowest of them all:
 Its parts to no one point press jointly down,
 And meet, and stop each other from moving on.

Creech.

See the note on Book ii. ver. 562.

Ver. 502. Dryden, in one of his descriptions of the morning, has expressed this thought of Lucretius:

—The sun arose, with beams so bright,
 That all th' horizon laugh'd to see the joyous light:

He, with his tepid rays, the rose renews,
 And licks the dropping leaves, and dries the dews.

Palam. et Arc.

Ver. 513. Having made the earth, as the foundation of the whole world, and the sky the walls of it, as he himself calls it, he, in these nine verses, places the sun and moon, which are of a middle nature, between the sky and the air, as being composed of principles lighter than those of the air, and heavier than those of the sky, in the very confines of the air and sky, where, he tells us, they are in perpetual motion, as the lungs and hearts in animals. He takes no notice of the other planets or stars, though his translator does. But let us hear the best of poets, and a Christian philosopher, describing this part of the creation. He speaks in the person of an angel:

—I saw the rising birth
 Of nature from the unapparent deep;
 I saw, when, at God's word, this formless mass,
 The world's material mould, came to a heap:
 Confusion heard his voice, and wild uproar
 Stood rul'd: stood vast infinitude confin'd;
 Till, at his second bidding, darkness fled,
 Light shone, and order from disorder sprung:
 Swift to their sev'ral quarters hasted then
 The cumbrous elements, earth, flood, air, fire;
 And the ethereal quintessence of heaven
 Flew upward, spirited with various forms,
 That roll'd orbicular, and turn'd to stars:
 Each had his place appointed, each his course.
 Thus God the heav'ns created, thus the earth,
 Matter uniform'd and void: darkness profound
 Cover'd th' abyss: but on the wat'ry calm
 His brooding wings the spirit of God outspread,
 And vital virtue infus'd, and vital warmth
 Throughout the fluid mass; but downwards

purg'd
 The black, tartareous, cold, infernal drugs,
 Adverse to life, then founded, then conglob'd
 Like things to like; the rest to several place
 Disparted, and between span out the air;
 And earth, self-balanc'd, on her centre hung.

Milton.

Ver. 522, 523. But the work is not yet perfect: we have hitherto neither fire, air, nor wa-

ter. He tells us, therefore, in these fifteen verses, first, That that feculent mass, that sunk together to the bottom, being pressed on all sides by the beams of the sun, and the heat of the sky, contracted itself: Thence exhaled the sea like sweat; but the lighter particles, mounting higher, composed the elements of fire and air. In the next place, that some of the particles of this mass being more hard and stiff than the others, they did not all subside alike, and hence the hollow places to receive the sea, and the channels for the rivers; and hence too the level of the plains, and the ruggedness of the mountains:

—The mountains huge appear
 Emergent, and their broad bare backs upheave
 Into the clouds; their tops ascend the sky:
 So high as heav'd the tumid hills, so low
 Down sunk a hollow bottom, broad and deep,
 Capacious bed of waters; thither they
 Hasted with glad precipitance, up roll'd,
 As globes on dust, conglobing from the dry;
 Part rise in crystal walls, or ridge direct;

—As armies, at the call
 Of trumpet, —
 Troop to their standard; so the wat'ry throng,
 Wave rolling after wave, where way they found;
 If steep, with torrent rapture, if through plain,
 Soft ebbing: nor withstood them rock or hill:
 But they, or under ground, or circuit wide,
 With serpent error wand'ring found their way,
 And on the wat'ry ooze deep channels wore,
 Within whose banks the rivers now —
 Stream, and perpetual draw their humid train.

Milton.

Ver. 523. Lucret.

Succidit et falso suffudit gurgite fossas.

Plutarch. de Placit. Philosoph. lib. iii. καὶ αὖτε τὸ ὕδωρ ἐκείναι ἐκείναι τὰς ἀποκαταστάσεις τούτους. And the same author, lib. i. cap. 4. de Placit. Philosoph. expresses this opinion of Lucretius more at large: Of those bodies, says he, which sunk down, and settled below, was made the earth; that part of it which was most subtle, and of a thinner form and consistence, gathered round together, and engendered the element of water, which, being of a liquid and flowing nature, ran downwards to hollow places, that lay low, and were capable to receive and hold it.

Ver. 529. The firmament, the celestial spheres, the heavens. They were called ether, ἀὴρ τῷ αἰὲρ θείῳ, from their being in perpetual motion.

Ver. 537. That he may the better explain the motions of the stars, he previously teaches, in these fourteen verses, that the most resplendent and liquid ether, having mounted higher than the inconstant and turbulent air, is wholly undisturbed by any manner of storms, and rolls in a constant and like motion; which motion of the ether is not in the least incredible, since the Euxine sea does the like, and is continually flowing into the Propontic, without changing its course.

"Lucr. inde ether ignifer ipse." For the ancients believed the stars to be either very fire, or

of a fiery nature, and therefore called the ether *ignifer*, fire-bearing; as they did likewise *signifer*, or *stellifer*, that bears the signs, or stars. Or else the poet, in this place, describes the region of elementary virtue, which lies next under the heaven, as Manilius sings, in these excellent verses:

Ignis in ætheræas volucer se sustulit auras,
Summaque complexus stellantis culmina cœli,
Flammarum vallo naturæ mœnia fecit.

Lib. i. ver. 144.

Upward the flame on active pinions fled,
To heav'n's high arch it rais'd its shining head;
There stopp'd, as weary grown, and round the
frame,
For nature's bulwark rais'd a wall of flame.

Greech.

Ver. 545. The point of the axle-tree, on which astronomers imagine the heaven to be turned. There are two poles, the north pole, known by a star called *polus arcticus*, and the south, called *antarcticus*, which is invisible to us. The word pole, comes from *πολεῖν*, to turn. They are likewise called *cardines cœli*, the hinges of the heaven; because it being hung upon them, like a door on its hinges, is rolled and turned about.

Ver. 547. Here our translator has mistaken the sense of his author, who speaks not of the flux and reflux of the ocean, but of the course of the Euxine sea. For how can that motion of the ocean be alleged as a parallel instance to confirm the one, regular, and constant motion of the spheres? The words in the original, are as follows:

Nam modicè fluere, atque uno posse ethera nisu,
Significat ponti mare, certo quod fluit æstu,
Unum labendi conservans usque tenorem.

Now, what led our translator into his error, was, in all appearance, his having followed the reading of this passage in the first edition of Lambinus, in which we read *magnum*, instead of *ponti*: "Significat magnum mare," &c. but that critic corrected it in his subsequent editions, and reads, "ponti mare." Fayus, however, retains the other lection, and ridiculously pretends to justify it: But certainly, whatever that interpreter alleges to the contrary, the constant course of the celestial circles, is better proved by the constant motion of the Euxine sea into the Bosphorus of Thrace, thence into the Propontis, the Hellespont, &c. without any reflux, than by the ebbing and flowing of the ocean. This is so obvious, that to assert the contrary, as Fayus does, seems next to an absurdity.

Ver. 551. Lucretius, when he disputes of the heavens, of the motions of the spheres, and of those things which the Greeks call *μετέωρα*, meteors, never affirms any thing for certain: This was the constant custom of the Epicureans, who thought they discharged admirably well the part of natural philosophers, if they assigned only any possible causes of the celestial motions. Our poet does the like in these twenty-eight verses. If, says he, the whole orb be moved, then there may

be two airs, one that may press from above, and drive it down to the west; and another, that may be said to bear and lift it up from beneath. If the orb be motionless, then some rapid particles of the sky, struggling to get into the empty space, and not able to force their way, and break through the strong walls of the world, are whirled about, and drag the stars with them; or some external air rushes in, and turns them about; or, lastly, The stars move forward of themselves, in search of proper food to keep alive their fires.

Cleanthus, in Cicero de Naturâ Deorum, lib. ii. alleging reasons to evince the belief of a Deity, urges, for the last and most weighty, "æqualitatem motus et conversionis," &c. The equality of the motion and conversion of the heavens, sun, moon, and stars; and their distinction in variety, beauty, and order. The very sight of which, says he, sufficiently declares them not to be fortuitous or casual. For what can be more evidently perspicuous, when we behold and contemplate the heavens, than that there is a God, by whose excellent providence they are governed? Thus Cicero, who, from the bare suggestion of nature, discovered the truth of what our obdurate poet, by arguments drawn from the contemplation of nature, endeavours to disprove,

OF THE FIXED STARS.

LUCRETIVS, treating in this place of the stars, and their motions, affords us an opportunity to say something of those glorious and splendid bodies: The astronomers distinguish them into two sorts, the fixed stars and the erratic, which last are likewise called the planets: Of these we will give a short account by and by, when our author comes to treat of the sun, moon, &c. and will here confine our inquiries only to the first sort, which are called the fixed stars, because they always observe, at least to us they seem to do so, the same invariable distance from one another, and from the ecliptic: Hence the sphere, in which they are believed to be placed, is termed, *ἀπλόων*, *inerrans*, because of the inviolable order observed in their intervals or distances from one another. The chief things to be considered of them, not as they are reduced into signs and constellations, with which we shall not meddle, but shall take notice of them only as they are distinct and several mundane bodies, disseminated and dispersed through the immense space of the ethereal region, which we call heaven. The chief things, I say, that deserve our observation, are,

I. Their substance, concerning which the ancients differ in opinion: Zoroaster held them to be of a fiery substance, and so too did the Stoics: The Egyptian philosophers, as Diogenes, Laertius, in Proœm. has recorded their opinion, believed, *τῶν ἀπλόων πῦρ εἶναι, καὶ τῇ σάτειν κρᾶσαι τὰ ἐγγύς γίνεσθαι*, that the stars are fire, and that by their contemperation all things are produced on the earth. In Orpheus, the sun, moon, and stars, are called, *Ἡφαίστιο μέλη*, the members of Vulcan. Thales held the stars to be both of an earthy and

fiery substance. Empedocles maintained them to be fiery, and to consist of that very fire which the ether contained in itself, and struck out at its first secretion. The opinion of Anaxagoras deserves to be mentioned, for no other reason, than because it is extravagantly ridiculous; for he affirmed, that the ambient ether, being of a fiery nature, does, by the impetuous swiftness of its motion, whisk up stones from the earth, and that they being set on fire, become stars, and are carried from east to west. Diogenes would have them to be of the nature of pumice stones set on fire, and that they are as the breathing holes, and nostrils of the world, by which it draws in its breath. Xenophanes, that they are clouds set on fire in the manner of coals, and that they are extinguished by day, and at night rekindled. Heraclides and the Pythagoreans believed each star to be a particular world by itself, existing in the infinite ethereal space, and containing an earth, an air, and a sky; and this opinion is found in the works of Orpheus: For his followers affirmed the stars to be so many distinct and individual worlds. Plato held them to consist chiefly of a fiery nature, but such as to admit the mixture of other elements, as it were, in the nature of a cement to compact and hold them together. Aristotle and his followers, assert them to be of the same substance with the heavens, but only more condensed; and that they are simple bodies, without the mixture of any elements. Pliny, and many others, believe them to be composed of the same nature as exhalations or vapours, and consequently to consist of a substance partly aqueous, partly aerial. Of all these opinions, the most probable is, that the stars are fiery bodies. This was the sentiment of the ancient Christian church, which, in Hymn. Feria secunda ad Vesper. of which Hymn, St. Ambrose is said to be the author, sings as follows:

Immenſe cœli conditor,
Qui mixta ne confunderent
Aquæ fluentia dividens,
Cœlum dedisti limitem,
Firmans locum cœleſtibus,
Simulque terræ rivulis,
Ut unda flammas temperet;
Terræ solum nec diſſipent, &c.

Where we find the reason why the waters are placed above the heavens, viz. to restrain and temper the excessive fervour of the sun and stars. And again, in Hymn. Fer. quarta ad Vesper. the same church sings:

Cœli Deus ſanctiſſime,
Qui lucidum centrum poli
Candore pingis igneo.

And of the same opinion are most of the fathers, not only of the Latin, but of the Greek church likewise. Cyrillus, Hierosolym. Cæsareus, Theodoretus, D. Chrysostom, Gregor. Nyſſen. Procopius, and Anastasius Sinaita, all of them positively assert the stars to be of a fiery nature; and with them agree Tertullian, St. Ambrose, St. Auguſ-

tine, Arnobius, Lactantius, Anſelmus, Alcuinus, Beda, &c. Besides, many of the eminent modern philosophers and astronomers concur in the same opinion. Induced, therefore, by all these authorities, we may reasonably conclude, that the stars are compound, not simple bodies, that they are composed of elementary matter, formed into fiery globes; that they consist of solid and liquid, as this terraqueous globe of ours; and consequently, that they are subject to alteration and corruption.

II. Their light; whether it be innate, and the gift of the Almighty at their creation; or mutual, and borrowed from the sun; which last is the opinion of Metrodorus, in Plutarch, de Placit. Philosoph. lib. ii. cap. 17. and with him agree many of the modern, both philosophers and astronomers; and it is the belief of some at this day. The first opinion, however, seems to be the most probable; and Macrobius, in Somn. Scip. lib. i. cap. 19. asserts the truth of it, in these words: "Omnes stellas (scil. fixas) lumine lucere suo, quod illæ supra solem in ipso purissimo æthere sunt; in quo omne quicquid est, lux naturalis et sua est." And this agrees with what we said before touching their fiery nature: For there can be no fire without light. And, indeed, it seems highly improbable, that the sun can illuminate the fixed stars, since, as Bulialdus, in Astronom. Philolaic. lib. i. cap. 11. observes, the sun's diameter, if it could be beheld from Saturn only, would appear too little, and afford too weak a light sufficiently to illustrate even that planet, much less, therefore, can it impart its light to the fixed stars, that are removed to so great a distance beyond it. For this reason, some believe each of the fixed stars to be the head and chief part of a distinct mundane system; as the sun is the head and chief part of our visible system: And, as the sun has several planets, constituted and carried about him, so likewise every one of the fixed stars has other mundane bodies, like planets disposed and moving around them; though they are invisible to us, by reason of their great distance from our earth. And, according to this opinion, Galilæo, Dialog. iii. System. Cosmic. makes no scruple to assert, that each of the fixed stars is a sun, exactly of the same nature with, and perfectly resembling this of ours; that it serves besides to illuminate the innumerable other planetary and lunar bodies, within their respective systems; and, consequently, is endowed with innate and original light. Several other of our modern astronomers are of the same opinion; among them Ricciolus, who, Almagest. nov. lib. vi. cap. 2. has these words: "Mihi longe probabilior horum (scil. Bruni, Galilæi, Renati des Cartes, et Reithæi) opinio videtur, quia magis convenit opificis numinis majestati, ut non uniecam stellarum à se ipsa lucentem, sed plures instar solis accenderet: Nec alium sui luminis fontem agnoscerent, quam omnium luminum patrem Deum."

III. Their colour; which visibly differs according to the variety of their light, as it is blended

and attuned by the different constitution of the matter, or substance, of which they are composed: for some appear to be of a ruddy, others of a leaden hue; some of a gold colour, others of a silver white, others pallid, &c. whence some have pretended to form a judgment of their several natures, and accordingly have ranged them under the several planets, of whose qualities they imagined them chiefly to partake; having regard to the proportion of resemblance they bear in their colours to those of the planets.

IV. Their scintillation; which particularly distinguishes them from the planets, which have no such vibration, or twinkling of light; as generally is observed, more or less in all the fixed stars, at one time more than at another; and most when the wind is easterly, as Schickardus in *Astroscop.* observes. Aristotle ascribes the cause of their scintillation to their remoteness from our sight; which remoteness is the reason that our eyes reach them but weakly, and with a trembling lassitude. To this opinion, Pontanus, in *Uraniâ*, lib. ii. assents, when he says,

*Scilicet alta illis regio, sedesque repostæ,
Quo postquam advenit defesso lumine visus,
Defessus tremit ipse, tamen tremere ipsa videntur.*

But this reason is not convincing; since, if it were true, the planets, Jupiter, and Saturn, should, by reason of their great distance, in some measure affect our sight with such a trembling or scintillation; and this we know they never do, even in their greatest altitude. Others ascribe the cause to refraction, and imagine this scintillation to arise from the unequal surface of the fluctuating air, or medium through which the light passes; in like manner, as stones in the bottom of a river seem to have a tremulous kind of motion, which, nevertheless, is only the curled and uneven undulation of the surface of the water. But if this reason were true, we should not only in the fixed stars, but in the planets, nay, even in the moon, discover such a scintillation. Gassendus, with more probability, conceives it to proceed from their native and primigenial light, which, like that of the sun, sparkles, and ejaculates such quick darting rays, that our infirmer sight cannot look on them without trembling: To this we may add their impetuous and whirling motion about their own axis, by which there is caused a more sudden and quicker variation in those fulgid objects than the eye can pursue. But Sheinerus, in his *Mathematical Disquisitions*, positively dissents from this opinion. The scintillation of the stars, says he, is not their proper revolution or convolution, not any interior exultating commotion; no tremulous revibrating of the sun-beams, proceeding from their first or second motions; no unquiet or unequal ejaculation of their proper rays; no trembling of the wearied sight; not any, nor all of these, but only the intercision of their several species falling upon the eye; which intercision is caused by the unquiet intercurvation of vapours variously affected. Hevelius, though he allow of their circumgyration about their own axis, yet he admits it only as an assisting, not as

the sole cause of their scintillation; which he imputes rather to a constant evibration of lucid matter, or a continual expiration of fiery vapours from those celestial bodies; even, says he, as we perceive those fulgurations and ebullitions in the body of the sun, which, the grosser they are, and in the greater plenty they are ejected, so much the greater and more visible scintillation they cause. These are the several opinions concerning the scintillation of the stars.

V. Their number; which, according to the computation of Ptolemy, including only those that are most remarkable and visible, and as they are reduced to the six commonly received degrees of magnitude, amounts to only 1022. And Pliny, lib. ii. cap. 4. reckons them to be 1600. But if we reflect on the number of all the stars in the firmament, as we regard them by the help of a telescope, which discovers many more than the bare eye can do, we may affirm them to exceed the number of human calculation. Jordano Bruno says their number is infinite. Ricciolus, speaking of the number of the stars, argues thus: That if the constellation of Orion take up in the heavens the space of 500 square degrees, as by experience we know it does, and if every square space, whose side is but two degrees, contains no less than 500 stars, as Galilæo, by the assistance of a telescope, observed that it does, there will be found in the whole constellation of Orion, at least 62,500 stars, though the bare eye cannot discover in the whole above 63. According to which proportion, if the rest of the constellations were examined, and if the difference of the number of stars, that appear by the telescope, over and above those discerned by the bare eye, were computed, it would amount to above 1000000 stars, beside those in the Milky Way. Nay, says Ricciolus, *Almagest.* Nov. tom. i. lib. 6. p. 413. if any man should reckon them above 2000000, the number would not seem to me improbable, "*Mihi quidem nihil inopinabile finxerit.*" Some of the rabbins of the Jews will not allow the whole number of stars to amount to above 12000: but the Cabalists admit of no less than 29000 myriads, which number Schickardus believes too exorbitant; and imagines, that the whole extent of the heavens is not capable of receiving above 26712 myriads, even though they were placed contiguous to one another; but as to this particular of the number of the stars, we ought to agree with Schottus, who, in *Prelus. in Firmament. Itiner. Ecstatic.* Kircheri, in *Schol. I.* says, That it is an arrogance indeed intolerable, to believe that our sight, how strengthened and assisted soever by the help of telescopes, can discover all the stars in the expanse of heaven; and an extreme piece of folly, to pretend to include them within the bounds of any definite number; that being the work of the Almighty only, who alone numbers the multitude of the stars, and calls them all by their names.

VI. Their figure, which is apparently spherical or round: and yet Plutarch de *Placit. Philosoph.* lib. ii. cap. 14. relates the different opinions of the ancients, even as to this particular. Cleanthes

held them to be pyramidical, and that they end in a sharp cone. Anaximenes would have them to be like studs or nails fixed in the chrystalline firmament, like jewels in a ring. Others imagined them to be flat, and, as it were, fiery and lucid plates, as so many flat pictures, not of any thickness or profundity. Scheinerus, and Antonius Maria de Reitha, will have them to be of divers figures or faces, of a poly-angular shape; and such indeed the larger sort of telescopes represent them. Kepler, in *Epit. Astronom.* p. 498. describes them like so many lucid points or sparkles, casting forth on all sides their rays of light: insomuch, that we are to take their figure to be only physically spherical, not mathematically so: for, though in the first acceptation, they may be said to be round bodies; yet, according to the later, their surface may be found to be uneven, and to consist of many angles or sides.

VII. Their magnitude, of which divers calculations have been made by many eminent astronomers, but to no purpose: for so great a diversity of opinions has arisen from them, partly, because authors cannot agree as to the distances of the stars from the earth, which is the supposed centre of the world; and partly, because of the different estimates of their apparent diameters, that have been made by the eye, by Tycho Brahe, and other more ancient astronomers; and by telescopes by the moderns: insomuch, that we ought ingenuously to acknowledge with Schickardus, that, "*veras illarum magnitudines vere ignoramus*," we are indeed ignorant of their true magnitude.

VIII. Their place and distance from the earth, or rather from the sun, which is a question so hard to resolve, that Pliny long ago pronounced it to be no less than a piece of madness to inquire into it: and Ricciolus, *Almagest. Nov. lib. vi. cap. 7.* treating of this subject, has thought fit, in the front of his discourse, to lay it down as an undeniable truth, that men cannot, by any certain and evident observation, come to the true knowledge of the parallax and distance of the fixed stars. For it is not known, whether the stars are all in the same spherical surface, equally distant from the centre of the world; or whether they are placed at unequal distances, that is to say, some higher, some lower, as the old Stoics held them to be, supposing the difference of their lustre, and of their apparent magnitude, to proceed from the diversity of their situation, according as they are more or less distant from our sight. Thus Manilius, giving the reason why some of the stars in Orion appear more obscure than the others, says,

Non quod clara minus, sed quod magis alta recedunt.

And this hypothesis has so great an appearance of truth, that the learned astronomers, Tycho Brahe, Galilæo, and Kepler, readily embrace it. And thus we may reasonably suppose, that their distances are as various as those of the planets, and that it is scarce possible to discover their true distance, because our short and feeble sight, being

unable to distinguish their various intervals, judges them to be all placed in the same concave spherical surface.

IX. Their proper motion, which is two-fold: First, That of circumrotation about their own centre, around which they are whirled with wonderful celerity; which, as we said before, is in part the reason of their scintillation: and this motion is called "*motus vertiginis*." Secondly, Their motion of revolution, from west to east: "*secundum ductum Eclipticæ*," in which they are observed to move so very slowly, that they run not through one degree in the ecliptic sooner than in the space of seventy-one years, nineteen days, and twelve hours, within a trifle: and they complete not the whole circle of 360 degrees, in less than 25,579 years, which is the "*Annus magnus Platonius*;" though the ancients computed it to amount to 36,000 years: And this great Platonic year, which consists of 25,579 sydereal years, is equal to 25,580 equinoctial years. And thus I have given a short account of the most remarkable observations touching the fixed stars.

Ver. 571. The skies and stars that we see move continually; and he calls them single, because the Epicureans held a multitude of worlds to be in the all, or universe, and all of them like this of ours, or even of a greater extent.

Ver. 579. But since Lucretius so often mentions the great weight of the earth, it may well be inquired, why it hangs without motion in the air, and does not rather press downwards, and fall precipitately into the infinite void? To this the poet answers in these seventeen verses, that though it have so happened that the air only is circumsufed around the earth, yet because both air and earth are bound by natural and kindred ties, and from their very beginning are parts of the same whole, the earth is no burden to the air; but having, in a manner, laid aside all its weight and compression, it only sticks fast, and cleaves naturally to it. But it would not be so, if this earth had been brought out of another world; for, in that case, it would press heavy upon this air with its weight; even as our bodies feel a little weight that is not a part of them, though neither the head nor the other members are burdensome to one another, because they are mutually congenial, and bound to one another by a general and common band. Epicurus to Herodotus, says, *τὴν γῆν τῷ αἵρει προχέσθαι, ὡς συστάνῃ*. See the note on book ii. ver. 562.

Ver. 584. Aristotle will not allow that the earth is therefore suspended in the middle of the air, because it is congenial, and, as it were, of a piece with it, as Epicurus believed; but says the reason is, because it is the heaviest of all the elements. And Plato, in *Phædon*, will have the equability of the earth itself, to be the cause of its station in the middle of the universe: According to whose opinion, Ovid. *Metam. i. ver. 12.* says,

*Et circumfuso pendebat in aëre tellus
Ponderibus librata suis —*

And our Milton in like manner:

The earth, self-balanc'd, on her centre hung.

Ver. 592. This and the following verse we have inserted to fill up a lacuna, which Creech having totally omitted this verse of his author,

Usque adeo magni refert cui quæ adiaceat res,
had left in all the former editions of this book.

Ver. 598. In these four verses, he brings another argument of the connection of the earth and air: because, says he, the thunder that causes violent motions in the air, makes the earth tremble, which it could not do, but that they are of a piece.

Here our translator seems to have imperfectly rendered the sense of his author, whose words are,

*Præterea grandi Tonitru concussa repente
Terra, supra quæ se sunt, concutit omnia motu,
Quod facere haud ullâ posset ratione, nisi esset
Partibus æriis mundi cœloque revincta.*

i. e. Besides, the earth, whenever it is shaken on a sudden, by a violent thunder, makes every thing that is upon it shake and tremble, which it could by no means do, unless, &c. Compare this with Creech's translation, and see his error.

Ver. 602. But because it may seem wonderful that so subtle a body as the air, should support a mass so vastly thick as the earth; he adds in these seven verses, that the soul, which is a most subtle substance, sustains our ponderous body; nay, not only that, but even lifts it up, and makes it leap from the ground.

Ver. 604. Where we must understand the word things; an elipsis too frequently used by Creech, though hardly allowable in our language, which hates all grammatical figures, and loves to speak plain. What, without a substantive, is always in the singular number: What raises, what controuls. "Sed hoc obiter."

Ver. 609. Epicurus, in the tenth book of Laertius, speaking of the magnitude of the sun and stars, says, that in as much as it relates to us to judge of it, their magnitude is the same that it appears to be: and that as to the thing itself, it is somewhat bigger, or somewhat less, or else exactly the same that it seems: inasmuch that our eyes lie very little, if they do at all. The poet, in these twenty-seven verses, asserts the same thing, and endeavours to prove his assertion by an argument taken from sense. As we retire from any fire, so long as we are within such a distance of it, that we can perceive its light and heat, the fire seems no less than it does when we are near it: but we feel the heat, and perceive the light of the sun: therefore, the sun is of the same magnitude it seems to be. Then he adds of the moon, that we distinctly see the outmost verge and face of it: and yet we should see it but confusedly, if it were so far off that its distance took away any of its magnitude. Lastly, He says of the stars, that they are not much larger, nor much less, but rather just as big as they seem: for even the fires that we see here below at a distance from one another, either by day or by night, present to our eyes the like variety of sizes. Epicurus writes the same doctrine to Pythocles.

Thus, neither Epicurus nor Lucretius after him, affirmed any thing for certain concerning the magnitude of the sun, moon, and stars: And indeed so many, and so various are the opinions both of the ancients and moderns, of this matter, that it is impossible to ground any probable belief upon them. However, I will give some of their opinions, but rather for curiosity than instruction. I. Heraclitus held the sun to be a foot broad: II. Anaxagoras, many times as big as the country of Peloponnesus. III. Anaximander, as big as the earth. IV. Empedocles, a vast mass of fire, even bigger than the moon. V. Archelaus, the biggest of all the celestial lights. VI. Plato, never to be conceived nor found out. VII. Cicero, immense. VIII. The Egyptians, and after them Macrobius, eight times as big as the earth. IX. Others, whose opinion Cicero, Tattius, and Philoponus mention, but conceal their names, above eighteen times as big as the earth. X. Eratosthenes, seven and twenty times as big as the earth. XI. Cleomedes, near three hundred times as big as the earth. XII. Aristarchus, above two hundred and fifty-four times as big as the earth. XIII. Hipparchus, a thousand and fifty times as big as the earth. XIV. Plutarch says there were some who held the sun to be a thousand seven hundred and twenty-eight times as big as the earth. XV. Posidonius, fifty-nine thousand three hundred and nineteen times as big as the earth. What certainty then can be grounded on so many different opinions? And Archimedes owned, it was next to impossible to take the diameter of the sun, because neither the sight, nor the hands, nor the organs, by which the observation is perceived, are sufficient to demonstrate it exactly; and therefore no credit ought to be given to them. This makes Lactantius say, "Dementiam esse disquirere, aut scire velle, Sol utrumque tantus, quantus videtur, an multis partibus major sit quam omnis hæc terra." That it is a folly to inquire, or be desirous to know, whether the sun be as big as he seems to be, or many times bigger than the whole earth. And the same uncertainty there is likewise concerning the magnitude of the moon, and of the other planets and stars.

But the more modern, both philosophers and astronomers, though their opinions be indeed various, as to the magnitude of this glorious luminary, yet having grounded them on more probable methods of observation, have at least come nearer the truth than the ancients, and not left us so much in the dark, nor in so great uncertainty concerning it. It is most certain, that we form a right judgment of the magnitude of an object, by the distance of one part of it from another, and by the distance of the whole from us: for the distance of it being first considered, we find that the rays from all parts of the object cause an impression on the retina in the extremities of more or less distant fibres. Therefore, the farther distant those extremities, so impressed are from each other, the greater we judge the object to be; and in like manner on the contrary: inasmuch, that it is first necessary to know the distance of an object, be-

fore we can attain to the true knowledge of its magnitude: And, therefore, whenever we are mistaken in the distance, we must necessarily be deceived in the magnitude likewise: and consequently, as often as we judge an object to be farther from us than it really is, we imagine it to be bigger than it is; because, the farther distant an object is, the less will be the space between the incident points of the rays that make the impression on the retina: And on the contrary, as often as we judge the object to be nearer us than indeed it is, we fancy it to be less than really it is, because the space between the points of the rays, &c. is larger. Hence we see the reason why it is so difficult to come by the true knowledge of the sun's magnitude: for the distance of the sun from

the equator is so hard to be discovered, that, if we may believe Pliny, to endeavour to find it out, "penè dementis otii est," is an employment fit for none but madmen. Ricciolus likewise confesses, that the sublimity of the sun has exceeded and baffled hitherto the search and investigation of all astronomers. However, he himself says, in *Almagest. lib. iii. cap. 11.* That the true magnitude of the sun may be known from its true semidiameter; for that being doubled, gives its true diameter, whence its other species of magnitude are derived, according to the rule of proportion. This method has been observed by many of the most learned and judicious astronomers, whose opinion concerning the sun's magnitude, may be seen at one view in the following table.

The true Magnitude of the Sun compared with the Earth.

The Sun's	True diameter.	Circumference.	Area of its greatest circle.	Convex superficies.	Solidity.
contains					
according to the following authors.	Simple diam. of the earth.	Simple diam. of the earth.	Square diam. of the earth.	Square diam. of the earth.	Solidity of the earth.

OF THE SUN.

THIS glorious luminary is in Hebrew called *Chamab*, or *Shemasb*, from his heat, or *Adon Schemaz*, i. e. Dominus Sol. By the Phœnicians, *Baal Shemaim*, i. e. Dominus Cœli. In Chaldee, *Shemso*. In Arabic, *El Shemo*. By the Greeks, *ἥλιος* and *φῶς*, quasi *φῶς τῷ βίῳ*, i. e. lux vitæ, whence the Latin *Phœbus*, called likewise *Titan*, *Apollo*, *Cor Cali*, *Oculus Jovis*, and *Ὠμμὰ Ἀιδίεος*, i. e. oculus ætheris. The Egyptians called the sun, *Potiris*, which in their language signifies the Holy God; and *Osiris*, from his vital and kindly heat: as, on the contrary, *Typhon*, and *Seth*, from his violent and destructive fervour; and by them called likewise *Horus*. By the Persians *Mitbra*, i. e. Dominus or Dynesta. By the ancient Arabs, *Urotalt*, i. e. Lucis Deus; and *Dufares*, or *Dai-Ufar*, i. e. Deus perlustrans, as Sebedius de Diis German. interprets those names. By the Syrians, according to Macrobius, the sun was called *Adad*, or, as Scaliger and Selden would rather have it, *Abad*, or *Elbad*, i. e. Unus: or as Pontanus in his notes on Macrobius, *Badad*, i. e. Solus Unicus. Heraclitus, as Macrobius in Somn. Scip. lib. i, cap. 20. calls the sun the fountain of all celestial light and heat. Most of the ancients, as Democritus, Metrodorus, Pythagoras, Plato, &c. and of the moderns likewise, as Kepler, Scheinerus, Rheitæ, Bullialdus, Kircher, Ricciolus, &c. imagine the sun to be a real fiery body, consisting of true proper elementary fire, partly liquid, partly solid; the liquid is as it were an ocean of light, and moves with flaming billows and fiery ebullitions. This is manifest to those who regard that most glorious luminary by the help of a telescope. The solid parts are like the land in our terraqueous globe, divided into continents, islands, mountains, and rocks, as if it were to restrain the vehement motion of the exestuating solar ocean, and by the frequent allisions to repel, dissipate and break the impetuous force of it; to the end it may with greater efficacy impart its all-productive virtue to the bodies on which it bestows light and influence.

It is likewise probable, that within the solar globe, as in this earth of ours, there are vast caverns and receptacles of fire, that break out of the sun's ignivomous mountains, in like manner as subterranean fires are ejected out of the mountains *Ætna*, *Hecla*, and *Vesuvius*. Besides, the solid parts of the sun, within whose bowels is contained the fluid and liquid fire, like metal in a furnace, are thoroughly ignified, in the same manner as the bricks of the roofs and sides of furnaces are made red hot, and look of the same colour as the fiery mass of melted matter within them.

It is farther supposed, that the solid parts of the sun consist of a matter abestinous and incombustible, and far better able to resist the voracity of fire than this earth of ours. Nay, supposing that some parts of the sun here and there should be consumed, and whole mountains be levelled and wasted, yet there is no necessity from thence,

that the globe of the sun should be totally destroyed, no more than is this earth by the frequent accidents of such kinds of ruins and decays. Moreover, the splendour, as well of the fluid, as solid fire of the solar globe, is evidently far more bright than our fire or flame here below: the end for which it was made necessarily requiring it should be so; since it may reasonably be conjectured to be created for the fountain of light, if not of the whole world, at least of the planetary system.

It is likewise observed, that as well this liquid sea of fire, as that which breaks out of the caverns and mountains, constantly exhales fuliginous vapours, not black and sooty, like the smoke of our fire, but bright and clear; and that these exhalations, condensing in the ambient æther, do in a manner overcast the sun, as clouds overshadow the earth. From all which, and from the evidence of frequent observations, lately made by the help of the telescope, is manifest, the mistake of Aristotle and his followers; who imagine the sun to be an unalterable substance; whereas, indeed, he is subject to divers changes and alterations; which not only the generation and production, but the dissolution and corruption likewise of several phenomena in the body of the sun, altogether unknown to the ancients, clearly demonstrate. Among which the most remarkable are those, which late astronomers call the *Maculae solares*, and the *Faculae solares*.

The *Maculae*, or spots, are, they tell us, certain cloudy obscurities appearing upon the disk of the sun; and supposed by some to be a fuliginous obscure matter or exhalation, sometimes closely compacted into one, sometimes dispersed and dissipated into several parcels, and issuing from its fervent fiery body, by force of its extreme heat. But whether they are in the sun itself, or some space distant from it, is not certain. However, it is from several observations most probable, that they are in the very body of the sun, or at least not far from the surface of it. They are very irregular in their shapes and figures, as well in regard to their form as size; and some of them are more durable than others. And those that have the longest duration, are held to be the solid parts of the sun; and it is believed that the reason why they discover themselves in various figures, and of different magnitudes, is because of the vertiginous motion of the sun about his own axle, representing them to our sight in divers situations.

The *Faculae solares* are held to be partly massy globes of fire, that burst out of the ignivomous solar mountains; and which, by reason of their brightness, shine amidst the maculae, or fuliginous cloudy vapours, and sometimes disappear in a short space of time, sometimes continue long visible; and partly effervencies of the exestuating solar ocean; which, by reason of the excessive innate fervour of the globe of the sun, boils up into mighty waves, like so many mountains of light, that scatter and disperse the darker maculae, and discover, as it were a fiery ocean, fluctuating and agitated with flaming billows of excessive splen-

dour. But Scheinerus in *disquisit. Mathem.* defines them thus: "*Faculae sunt areolae in sole lucidiores reliquo ejusdem corpore;*" i. e. The *faculae* are certain small plats, or quarters in the sun, brighter than the rest of his body. Galileo in Letter iii. delle *Macchie Solari*, describes them as follows: In the face of the sun, says he, there appear certain marks, brighter than the rest, and which observe the same motion as the *maculae*: Nor can it be doubted but that they are inherent in the very body of the sun; because it is not credible, that there can be any substance more refulgent than that of the sun itself.

Lastly, This observation of the sun's spots and lights has given occasion to astronomers to remark, that the sun, besides his motion of revolution, diurnal and annual, according to the hypothesis of the immobility of the earth, has likewise a motion from east to west about his own axle; which conversion is finished, according to some, in the space of twenty-seven days, or thereabouts; according to Kepler and others, in twenty-four hours; but others assign it a much more wonderful celerity, particularly Otto de Guericke, who affirms the vertiginous course of the sun to be completed in a moments space. All which considered, together with what we said before of the sun's magnitude, we may well say with Lucretius:

Nam licet hinc mundi patefactum totius unum
Largifluum fontem, scatere, atque erumpere flumen

Ex omni mundo, quò sic elementa vaporis
Undique conveniunt, et sic congestus eorum
Confluit, ex uno capite hic ut profluat ardor.

And conclude with the same poet, That it is no wonder the sun dispenses so much light and heat to the earth.

As to the figure of the sun, Epicurus affirmed nothing for certain concerning that neither, but only said, that the various opinions of several men, of the different figure of the sun, might for any thing he knew to the contrary, be all of them true. Meanwhile it is certain that the opinions differed concerning the figure of the sun likewise: For, I. The Pythagoreans, Platonics, Peripatetics, and Stoics, held the sun to be globous. II. Anaximenes believed it to be flat, and broad like a leaf, or plate of iron, or other metal. III. Others to be in shape like a dish or platter. IV. Heraclitus would have the sun crooked, and bending like the keel of a boat. They gave likewise the same different figures to the moon and stars. The figure of the sun is now universally held to be globous.

Ver. 619. Some hold the moon to have no light but what she borrows from the sun; but others will have her shine with no light but her own. Lucretius does not decide this controversy, but only proposes each opinion. It is most probable, and generally believed, however, that the moon borrows her light from the sun. This opinion is grounded on the opacity of that planet, which indeed proves the moon to be altogether

deprived of any innate or proper light of her own. And this opacity is demonstrably proved; because in her total eclipses, she wholly loses her lustre; which, on the contrary, if she had any of her own, would rather, in the greatest darkness, become more visible and conspicuous; whence it is rationally concluded, that all the light she has, is from the sun, and that the moon, as she is an opacous, so too she is a dense body, fitted, and apt to receive and reflect the light of the sun. Macrobius giving the reason, why the moon, when she shines, does not impart any warmth, as well as the sun, but only reflects the light like a looking-glass, ascribes it to her having no light of her own, as the sun has, but only a mututitious light, and borrowed from the sun; which her being placed beneath the sun, evidently evinces. His words are these: "*Lunam, quæ luce propria caret, et de sole mutuatur, necesse est fonti luminis sui esse subjectam. Hæc enim ratio facit lunam non habere lumen proprium, cæteras omnes stellas lucere suo, quod illæ supra solem locatæ, in ipso purissimo æthero sunt, in quo omne, quicquid est, lux naturalis et sua est.*—*Luna vero, quia sola ipsa sub sole est, et caducorum jam regioni luce suâ carenti proxima, lucem nisi de superposito sole, cui resplendet, habere non potuit.*—*Luna speculi instar, lumen, quo illustratur emittit; et sit acceptæ luci penetrabilis adeo, ut eam de se rursus emittat, nullum tamen ad nos perferentem sensum caloris, quia lucis radius, cum ad nos de origine suâ, id est, de sole pervenit, naturam secum ignis, de quo nascitur, devehit; cum vero in lunæ corpus infunditur, et inde resplendet, solam refundit claritudinem, non calorem; nam et speculum, cum splendorem de se vi oppositi eminus ignis emittit, solam ignis similitudinem carentem sensu caloris ostendit," &c. In *Somn. Scip.* lib. i. cap. 19. and Cicero, lib. ii. de *Naturâ Deor.* is of the same opinion. And Festus, in voce *Mulus*, observes, that the moon is said to be drawn by mules, in regard to her borrowed light; because, as mules are not generated out of their own kind, but of a horse; so the moon is said to shine, not with her own, but *notto lumine*, as Lucretius in this place, and after him Catullus, expresses it, with a bastard light, which she derives from the sun. And Milton, speaking of the sun, calls him*

Great palace of all light!
To him, as to their fountain, others stars
Repairing, in their golden urns draw light;
And hence the morning planet gilds her horns.
—Less bright the moon,
His mirror: with full face borrowing her light
From him, &c.

Ver 629. In these seven verses, he speaks of the magnitude of the other stars and planets; of which we have already spoken at large, ver. 551.

Ver. 636. But it seems almost impossible, that so much heat and light, as are diffused through the whole sky, immense as it is, should flow from so small a body as the sun, if it be no bigger than it appears to be. To satisfy this difficulty, Lu-

Lucretius teaches, in nine verses, that we may imagine the sun to be as the perpetual source of light and heat; because the seeds of light and heat continually flow from all parts of the universe into the body of the sun, as into a great fountain; so that we feel and perceive the heat and light, not of the sun only, but of the whole world. To which he adds, in ten verses, that perhaps the air, near the sun, is set a-fire by his beams; and that many fiery particles, invisible to us, are hovering about his orb; and thence may proceed so great a profusion of light and heat. Thus Lucretius, in a thing so doubtful, dares pronounce nothing for certain.

Ver. 652. The original has, *cæcis fervoribus*, that is to say, invisible to us: For as Passeratius notes, *cæcus* signifies not only what does not see, but also whatever is not seen. "Cæcum non tantum quod non videt, sed etiam quicquid non videtur." In Propert. lib. ii. Eleg. 27.

Ver. 655. In order to explain the annual course of the sun, and the monthly course of the moon, through the twelve signs of the zodiac, he first proposes, in twenty-five verses, the opinion of Democritus, who taught, that the lower spheres are rolled and whirled around by the highest orb, called the *primum mobile*, either swifter or more slow, according to the distance of each sphere from that highest orb. Thus the sun moves swifter than the moon; because the sun is higher, and therefore the signs more seldom overtake, and pass by him, than they do by her. Nor is it then strange, that the moon runs through all the signs in one month, which the sun goes through but in twelve.

The two first of these verses are transcribed, word for word, from Cowley, David. i. p. 19. of the folio edition. The original runs thus:

Nec ratio solis simplex, nec certa patescit,
Quo pacto æstivis è partibus Ægocerotis,
Brumales adeat flexus, atque inde revertens
Canceris ad metas vertit se ad solstitiales.

Which our translator has rendered in the two verses, that follow these of Cowley.

The south and north pole, which are two points about which the heavens are rolled; so called from *πολύω*, I turn, whence the Latins called them *vertices*. The north pole is always visible to us, and to the French, Italians, &c. The south is never seen by us, but by those whom we call Antipodes. See above, ver. 545.

Ver. 656. Cowley calls the walk of the sun crooked, by reason of the obliquity of the zodiac, through which he makes his annual revolution. See the note on ver. 661.

Ver. 658. The signs, in matter of astrology, are asterisms, or configurations of fixed stars: which are imaginary forms, devised by astrologers, the better to comprehend and distinguish those stars from one another. Thus one asterism is called the Bear, another the Dragon, &c. to the number of forty-eight in all, according to the ancient astrologers; besides a few lately invented by the discoverers of the south pole. It is not a-

greed who first reduced the stars into asterisms, or constellations; nor is it an easy task to reconcile the different morphoses or figures in the several spheres of the Chaldeans, Persians, Egyptians, Greeks, Arabians, Indians, Chineses, and Tartars; of whose opinions in this matter, the various difference may be seen in the description of Abu Masher, commonly called Albumazar, in Aben Ezra de Decanis Signorum, published by Scaliger, in his notes on Manilius; of all which Salmasius, in Præfat. ad Diatrib. de Antiq. Astrolog. believes those of the Greeks, which are most commonly used amongst us, to be of latest date. As to the names of the stars, it is scarce doubted, but that Adam first imposed them; though all those appellations, except some few preserved in scripture are since utterly lost. Yet most of the names we now use, are above two thousand years standing, as appears by Hesiod and Homer. They were not, however, all named at one and the same time; for some are of late denomination, particularly that which Conon, Antinous, and others call Coma Berenices. Some report Astræus to be the first who gave names to the stars; whom for that reason

—————Fama parentem
Tradidit Astrorum—————

As Aratus says in Germanicus; and others ascribe it to Mercury. To give the several names of the signs and constellations, would engage me in too tedious a task; I will therefore confine myself to the two Lucretius here mentions, which are Ægoceros and Cancer.

Ægoceros, by the Greeks, called *Ἀργόκερος*, from *ἄρξ*, a goat, and *κέρας*, a horn, and *Ἀργίπαις* by the Latins Capricornus; Hircus Æquoris, by Asclepiadius, and Vomanus, Pelagi Procella, by Vitalis: and thus Horace,

—————Tyrannus
Hesperiae Capricornus undæ.

The poets fabled, that Ægoceros was born of the goat Amalthea, and placed by Jupiter among the stars, in memory of that god's having been nourished with the same milk. Some say that this was made a constellation in honour of Ægipan, the son of Jupiter by the Olenian goat; but others, with more reason, that Ægipan was foster-brother to Jupiter, and son of Æga, the wife of Pan, from whence he had his name. And Bassus in Germanic. from the authority of Epimenides, writes, that Ægipan assisted Jupiter in his wars against the Titans, and helped him to put on his armour; for which reason he was honoured with this celestial dignity: he was represented half goat, half fish, the reason of which, says the Scholiast on Aratus, was, because having found on the sea shore, the shell of a murex or purple-fish, he wound it as if it had been a horn, and so struck a panic fear into the Titans, whence he came to be figured with a tail like a sea monster. The sun entering into this sign, makes the winter solstice. Cancer, by the Greeks called *Καρκίνος*, a Crab, is said to have been killed by Hercules for biting him by

the foot, when he encountered the serpent Hydra, and to have been made a constellation at the entreaty of Juno. This sign is in that part of the heaven, which the sun reaches about the middle of June, and then makes our greatest heats, longest days, and summer solstice. Moreover, these two signs, Cancer and Capricornus, are celebrated by the Chaldaic, Pythagorean, and Platonic philosophers, the first of them for being the gate by which souls descend into human bodies; the last for being that by which they re-ascend into heaven, whence they call Cancer, *Porta hominum*, and Capricornus, *Porta deorum*. Macrobius in *Somn. Scip. lib. i. cap. 12.* says, that the natural philosophers called these two signs, *Portas Solis*, the gates of the sun; and then having given the reason of it, he adds: "Per has portas animæ de cælo in terras meare, et de terris in cælum remeare creduntur; ideo hominum una, altera deorum vocatur: hominum Cancer, quia per hunc in inferiora descensus est. Capricornus Deorum, quia per illum animæ in propriæ immortalitatis sedem, et in Deorum numerum revertuntur." See likewise, *Cæl. Rhodig. Antiq. Lect. lib. xv. cap. 23.* and Kircher in *Œdip. Ægypt. tom. ii. p. 535.*

Ver. 660. Homer and Ovid make the moon to be drawn in a chariot by two horses, one black, the other white; of which Bassus in Germanic. gives this reason, because, says he, she sometimes is seen by day, as well as in the night. Others will have her to be drawn by oxen; and therefore Nonnus in *Dionys. lib. xiii.* calls her.

—Βῶν ἰλάτρεα Σελήνη.

Of both which we have express representations in the Roman coins; and particularly in those of the empress Julia Domna. See *Tristan. in his Commentar. tom. ii. p. 129.* She is likewise said to be drawn by mules, of which we have spoken above, ver. 619. Claudian, *lib. iii. de laudibus Stiliconis*, makes her to be drawn by stags in regard of the swiftness of her motion; and so too she is represented in several consular and imperial coins, that may be seen in *Ursinus, Golzius, and Goriæus.*

Ver. 661. 662. The zodiac is called by Ptolomy *Κύκλος τῶν Ζωδίων*, the circle of animals, because it is divided into twelve signs, all of which resemble, either men or some other living creatures, that are described and marked in the zodiac at equal distances from one another. By the Latins it is called *signifer*, and by the Greeks *Σημειοφόρος*. It is described to be a circle, or rather a zone, obliquely passing from east to west, by the equinoctial and solstitial points, and parted in the midst by the ecliptic, which divides it into two parts, the one northern, the other southern, both which are terminated by the circumferences of two imaginary circles, less than one of the great circles, and is far distant from the ecliptic, as is the greatest latitude of any planet from thence. The invention of this circle is by some ascribed to Pythagoras, by others to Ctenepides the Chian, and by others to Anaximander the Milesian. See *Plutarch. de Placit. Philosoph.*

and Pliny, *lib. ii. cap. 8.* Manilius, *lib. i. ver. 675.* speaking of the zodiac, says,

Nec visus aciemque fugit, tantumque notari
Mente potest, sicut cernuntur mente priores;
Sed nitet ingenti stellatus baltheus orbe,
Insignemque facit cælato lumine mundum.

Which Creech renders as follows:

It is not hid, nor is it hard to find,
Like others, open only to the mind:
For like a belt, with studs of stars, the skies
It girds, and graces; and invites the eyes.

And Scaliger, in his note on that passage, farther observes, that it has this in common with the Galaxy or Milky Way, that both of them are not, like all the other circles of the sphere, *λέγουσιν* *διωρητοί*, perceivable only to reason, but that they are both of them visible to the sight likewise, which none of the others are. Yet Manilius seems to speak poetically, making the zodiac a visible circle, because the twelve signs moving in it are visible; but properly speaking, as it is taken for a fascia or zone only, it is no otherwise perceptible than by reason; and therefore Geminus in *Isagog.* rightly says, that of all the circles in the heavens, only the *Via Lactea*, is perceivable by sense, the others being no otherwise discernible than by the eye of reason. Moreover, concerning the zodiac, there are these five things that chiefly deserve to be known. I. It is divided into 360 parts or degrees; each sign into 30 degrees; one of which degrees, or thereabouts, the sun makes or completes every day, by his primary or own proper motion, proceeding or going forward from the west to east; and thus in about the space of a year he runs through the twelve signs; meanwhile by his secondary or common motion, which the Latins calls *raptus*, a whirl, proceeding from east to west, he makes the compass of the whole earth in the space of four and twenty hours. II. The order and names of the signs are contained in these verses:

Sunt Aries, Taurus, Gemini, Cancer, Leo, Virgo,
Libraque, Scorpius, Arcitenens, Caper, Amphora,
Pisces.

Which being most of them animals, the circle was from thence called Zodiac, from the Greek word *ζῷδιον*, which signifies an animal, as we hinted before. III. Aries answers to the month of March, about the tenth of which month the sun is said to enter into that sign, and to run through all of it by about the tenth of April, at which time he enters into Taurus: and in like manner of all the rest. IV. It is called oblique, because it is not at an equal distance from each pole: but being carried cross the torrid zone, it reaches both the tropics, and twice divides the circle of the equator. In the first degree of Cancer it touches the north tropic, which is thence called the tropic of Cancer: It touches the south tropic in the first degree of Capricorn, whence that tropic has the name of the tropic of Capricorn. It cuts the equator in the first degree of Aries, and in the first degree

of Libra. V. When the sun comes to the tropic of Cancer, about the tenth of June, then is our height of summer, or summer solstice: when about the tenth of December, he reaches the tropic of Capricorn, then is our depth of winter, or the winter solstice. These tropics have their name from *πέρσας*, I turn, because when the sun has reached to either of them, he turns his course back again towards the other. Moreover, when the sun reaches to the section of Aries, which he does about the tenth of March, then is the vernal equinox; when he comes to the section of Libra, about the twelfth of September, then is the autumnal equinox.

Ver. 662. To the same purpose Cowley:

—The self same sun

At once does flow and swiftly run:

Swiftly his daily journey goes,

But treads his annual with a statelier pace;

And does three hundred rounds inclose

Within one yearly circles space,

At once with double course in the same sphere,

He runs the day and walks the year.

Ver. 665. Of him see Book III. ver. 356. and ver. 1044. and Book IV. ver. 335.

Ver. 680. In these thirteen verses he introduces two several airs, waiting on the sun and moon: by one of which they are shoved down from Cancer to Capricorn; and by the other heaved up again from Capricorn to Cancer, and this at fixed and certain times: And that it may not seem incredible, he bids us look on the different racks of clouds, which several winds drives several ways.

Besides these and the foregoing opinions, there was a third which Cicero, lib. iii. de Nat. Deor. ascribes to Cleanthes, who, as if the sun followed his food, would have the humidity that arises from the earth and from the sea to be the cause of the summer and winter solstices. For the words of Cicero are these. "Quid enim? Non eisdem vobis placit omnem ignem pastu indegere, nec permanere ullo modo posse nisi alatur? Ali autem Solem, Lunam, et reliqua Astra, aquis alia dulcibus, alia marinis? eamque causam Cleanthes affert, cur se sol referat, nec longius progrediatur solstitiali orbe, itemque brumali, ne longius discedat a cibo?" For are not you of opinion that all fire requires food, and can in no wise subsist, unless it be nourished? Nay, that the sun, the moon, and other stars are fed, some with fresh, others with sea water? And does not Cleanthes allege, that the cause of the sun's returning from the summer and winter solstice, and his going no farther is, that he may not straggle too far away from his meat?

Ver. 686. This and the following verse run thus in the original;

Et ratione pari lunam stellasque putandum 'st,
Quæ volvunt magnos in magnis orbibus annos,
Aëribus posse alternis à partibus ire.

Where we may observe, that our interpreter has totally omitted the second of those verses, in

which the poet seems to allude to the periods of the stars, and the revolutions of Saturn, Jupiter, and Mars.

Ver. 689. This many, nevertheless, deny, though it be certain, says Faber, that there is scarce any tempest of thunder and lightning, but this happens.

Ver. 693. In these nine verses he tells us that night succeeds the day, either because the sun, being fatigued with the length of his journey (for the setting sun seems faint and weary), is extinguished: Or else because he is whirled with the same force beneath the earth by night, as above the earth by day. Epicurus in the epistle to Pythocles contends, that the rising and setting of the sun may be made, κατ' ἐμφαίνεσθαι τὸ ὑπὲρ γῆς, καὶ πάλιν ἐπιπρῦνθαι, or κατ' ἀναψιν, τὸ κατὰ σελήνην.

Ver. 702. In these twenty-three verses he teaches, that the splendor, which we call the morning, and which before the rising of the sun adorns the heavens, is occasioned because the sun, returning from west to east, pours forth his rays before he appears himself: or else it happens, because the seeds of fire, that were dispersed abroad in his journey the day before, flow together in the eastern sky, and illustrate the earth with a fainty and glimmering light, before they have formed and kindled up anew the globe of the sun: And if this constancy of the seeds flowing together to one place seem incredible, let it be considered, that no less a constancy may be observed in several other things. Thus plants shoot forth their buds at a fixed and certain season of the year: Thus children breed their teeth at a certain age, &c.

This last opinion, ridiculous as it is, was nevertheless embraced by Epicurus and his followers: who as Cleomedes, lib. ii. c. i. witnesses, held that a new sun arose daily, and was daily extinguished; and Servius upon the first Georgic, says, they did not pretend, that the sun continued his course through the other hemisphere: but that the orb of a new sun was always made in the east; or at least, that the old sun was repaired and lighted up anew. For Epicurus did not so much hold the quotidian creation of a new sun, as the daily renovation of the old: To which opinion Horace, in Carmine Seculari, seems to allude,

Alme Sol, curru nitido diem qui
Promis et celas, aliusque et idem
Nasceris. —

And Gassendus explains this opinion of Epicurus in these words: Since the ocean compasses the earth, the sun may be extinguished by its waters in the west, and return all along through the waves by the north into the east, and rise from thence rekindled. Thus Gassendus; by which nevertheless he but little mends the matter. Epicurus however was not the author of this ridiculous opinion: For Xenophanes the Colophonian held, that the moon and stars were certain clouds set on fire, and that they were extinguished every day and rekindled at night: and that on the con-

rary, the sun was extinguished every night, and rekindled every morning; or to express it in the words of Minutius Felix, "Congregatis ignium semenibus solis alios atque alios semper splendere." Of the same opinion likewise was Heraclitus, whose saying was *ἡλίου νύκτι ἐφ' ἡμέρας ἔσσι* whence the proverb in Plato, "Heracliteo sole citius extingui." And from them Epicurus received by succession, "Hæreditatem stultitiæ," as Lactantius calls it, this inheritance of folly. And yet Pomponius Mela, de situ Orbis, lib. v. cap. 6. relates, that the rising sun, when beheld from mount Ida, looks different from what it does when regarded from any other place in the whole earth: For, says he, soon after midnight, many small bodies of fire are seen dispersed and scattered in the east: and as the day comes on, they are seen to join by degrees closer and closer together, till being collected into fewer bodies, all of them, from the first to the last, are kindled into flames; and these flames, joining into one, contract themselves into a round figure, and come to be a vast globe of fire, that seems annexed to the earth; then it decreases by degrees, but still continuing its globous form; and the more it lessens, it grows the more bright and fulgid: at length it disperses the shades of night, and being made a sun, rises with the day. "Orientum solem Idæus aliter quam in aliis terris solet, aspicit. Ostentantur namque ex summo vertice ejus spectantibus penè à mediâ nocte sparsi ignes passim micare, & ut lux appropinquat, ita coire et se conjungere videntur, donec magis magisque collecti, paucioris deinde, ex unâ ad postremam flammâ ardeant: et cum diei elara lux, et incendio similis affulsit, cogit se, ac rotundat, et fit ingens globus: diu is quoque grandis, et terris annexus apparet: deinde paulatim decrescens: et quantum decrescit, eo clarior; fugat novissimè noctem, et cum die, jam sol factus, attollitur. Pompon. Mela, lib. v. de situ orbis, cap. 6." This too is confirmed by Diodorus Siculus, whose account of this matter we will give below, v. 711.

Ver. 708. Lucret.

—Roseam Matuto per oras
Ætheris auroram desert, et lumina pandit.

Matuta, as Cicero tells us, was the goddess Ino, whom the Greeks called Leucothea, and the Latins, Matuta; the daughter of Caducus. "Ino dea dicitur, quæ Leucothea à Græcis, à nobis Matuta dicitur; cum sit Caduci filia." De Nat. Deor. Lib. iii. And Milton,

To resalute the world with sacred light
Leucothea wak'd, and with fresh dews embalm'd
The earth: and now the smiling morn begins
Her rosy progress.—

Ver. 711. There are two mountains of this name: one in Crete, the other in Phrygia, which last in one chain of mountains runs through the whole country of Troas: The northern part of it reaches to the shore of the Propontic; the west to the Hellespont, the south to the gulf of Adramytyum in the Ægean sea, and the east look

over the place where stood the city of Troy: and in this part of it Paris gave his judgment of the three goddesses. This was the highest part of all the mountain, and that of which Lucretius speaks: Strabo calls the top of it Gargarus. Of the sun-rising, beheld from this mountain Diodorus Siculus, lib. xvii. p. 491. Gives the following account.

"Ἰδίον δὲ τι τὸ παράδοξον συμβαίνει γίνεσθαι πρὸς τὸ ὄρος, κατὰ τὴν τῷ Κυνὸς ἐπιτολὴν ἐπ' ἀκρας τῆς κορυφῆς διὰ τὴν νημιάν. τῷ περιέχοντι Ἄϊρος ὑπὸ τῇ γένεσθαι τὴν ἀκρὰν τῆς τῶν ἀνέμων πνοῆς ὁρᾶσθαι δὲ τὸν ἥλιον ἔτι ταις νυκτὸς ὥσπερ ἀναίελλοντα τὰς ἀκτῖνας αὐτὸν ἐν κυκλοῖρεϊ χήματι τιτραμμένον, ἀλλὰ τὴν φλόγα κατὰ πολλὰς τόπας ἔχοντα δισπαρμινην, ὥστε δοκεῖν συρὰ πλείω διγρᾶναι τῷ τῆς γῆς ὀρίζοντι. Μετ' ὀλίγον δὲ συνάγεται ταῦτα πρὸς ἓν μίγνθος, ὥς ἂν ἐνῇ-αι τριπλοῦρον διάστημα, καὶ τότε τῆς ἡμέρας ἐπιλαβύσης, τὸ φαινόμενον τῷ ἡλίῳ μίγνθος πληροῦσιν τὴν τῆς ἡμέρας διάθεσιν κατὰσκειυάζει. which is as much as to say: A singular and wonderful thing happens in this mountain: For, about the rising of the Dog-star, there is so great a calmness of the circumfused air on the top of the mountain, that the highest part of it is above the least breath of wind: and even while it is yet night, the sun is seen to rise, not in a globous and circular figure, but in a flame dispersed here and there in such a manner, that many fires seem to touch the horizon; but all of them in a short space of time contract themselves into one magnitude, which takes up the space of about three hundred feet, and at length the day appearing, the complete magnitude of the sun appears likewise, and shines with its accustomed daily light.

Ver. 725. It has always been accounted a wonderful thing that the days and nights lengthen and shorten so regularly in the course of the year, that the alternate changes of the length and shortness of both of them are exactly varied by turns both in summer and winter. Of this the poet assigns three causes: I. It may happen, says he, because the sun makes his rounds above and below the earth more swiftly at some times than at others, inasmuch as the ways or places through which he travels are longer or shorter. This is contained in seventeen verses, in which he likewise describes the unequal segments of the diurnal and nocturnal circles in the oblique position of the sphere; but from this rule he excepts the equator, which in every obliquity is divided from the horizon into two equal parts; and this is the reason that the sun, being twice within the year placed in the equator, makes two equinoxes in all countries whatever. II. Then he adds, in four verses, another reason, and says, that there may perhaps be certain places in the sky where the sun finds more or less resistance, and this may retard or hasten his course. III. He says it may happen, because those fires that either compose or kindle the sun, may, at certain seasons of the year, assemble and meet more slowly in the eastern sky than they do at others.

The first of these is the true and genuine reason; for the inequality of the days and nights

proceeds from the oblique position and cite of the zodiac; whence it comes to pass, that they who have a perpetual equinox, that is to say, those that live under the equator, never have the least inequality, but a constant equality of days and nights, because they inhabit under a straight and direct sphere; but those that live towards either of the poles have their days and nights longer or shorter according as they are more remote from the pole, or nearer advanced to it. But such as live in the most oblique sphere, that is to say, under either of the poles, have six months of continual light, and by turns as many of continual night and darkness; therefore it is no wonder what Pliny, lib. iv. cap. 12. says of them, that they, "serere matutinis, meridiie metere, occidente sole fectus arborum decerpere, noctibus in specus con-di," &c. sow in the morning, reap at noon, gather the fruits of the trees at sunset, hide themselves in caverns at night, &c. And thus we know,

Quid tantum oceano properent se tingere soles
Hyberni: vel quæ tardis mora noctibus obstet.

Virg. Georg. ii. ver. 481.

What drives the chariot on of winter's light,
And stops the lazy waggon of the night.

As Cowley expresses it.

Ver. 733. In this and the following six verses, Lucretius describes the equinoctial circle, which, by the Greeks is called, *ἰσημερινός*, by the Latins, "æquidialis, æquinoctialis, æquator," and "cingulum mundi," and by mariners it is commonly called the *line*. It is one of the greatest circles of the sphere; its poles are the same with the poles of the world; from either of which it is equally distant, and divides the celestial globe into the northern and southern hemisphere. Christoph. Clavius in Sacrobosc. describes it by an imaginary line, drawn from the centre of the world, and extended to the first point, either of Aries or Libra, and thence carried about by the diurnal revolution of the *primum mobile*. Of this equinoctial circle, these things chiefly deserve to be observed: I. That it parts as well the terrestrial as the celestial globe, and is divided into 360 degrees, as every other greater or lesser circle is, because of the easy division of this number into a moiety, a third, a fourth, fifth, sixth, or eighth; its sixth, for example, being sixty, which number admits of many more divisions without any fractions. II. The sun, being posited in the equinoctial, makes the days and nights even, and then the equinoctial divides the sphere into the northern and southern hemispheres, whose poles are the poles of the world. III. Fifteen degrees of this circle rise hourly on one part, and as many set every hour on the other; so that one degree of it rises every four minutes of an hour. For which reason the equinoctial is said to be the measure of the *primum mobile*. IV. This circle shows the equinoctial points, which happen twice every year; 1. About the eleventh of March, when the sun enters into the first degree of Aries;

2. About the thirteenth of September, when he enters into the first degree of Libra. V. It divides the zodiac into two moieties, the southern and the northern, and thence the signs are distinguished into those of the north and south. VI. It is the measure of time, and shows what declination the stars, or the parts of the ecliptic have, either northern or southern. VII. Lastly, In this circle are observed the ascensions and descensions of the zodiacal signs.

Ver. 735. That is, between the north and south poles; Lucretius says, "Medio cursu flatus aquilonis et austri," which are indeed two winds, the first of which blows from the north, the last from the south, and which are commonly taken by poets for the north and south points, or poles of the world.

Ver. 736. Lucr. "Distinet æquato cælum discrimine metas:" where by *metas* he means the two tropics of Cancer and Capricorn, which are the utmost bounds of the sun's revolution, and which he never passes. They were called tropics from the Greek word *τροπή*, which signifies conversion, or turning, because the sun, when he comes at those circles, turns back again towards the equator, nor ever goes beyond those bounds, either to the north or south: Hence the Egyptians, as Clemens Alexandrinus, lib. v. Stromat. observes, hieroglyphically described the tropics under the figure of two dogs, as if they were guards deputed by nature to keep in and restrain the sun from running beyond his bounds. The first among the Greeks who found out these tropics is said to be Thales, the Milesian; who likewise wrote a particular treatise of them, as Eudemus in Laërtius witnesses. The tropic of Cancer is called *τροπικὸς ὤρεως*, i. e. "Tropicus æstivus," from the heat of summer, which we in this northern hemisphere enjoy, when the sun is nearest to that circle, which is thus described: A smaller circle, parallel to the equator, whose distance from thence is equal to the sun's greatest declination, or the obliquity of the zodiac, which it touches in the first point of Cancer. Its office, on one side, is to terminate the torrid zone, and, on the other, the northern temperate zone, and to make the summer solstice and longest day northward, and the winter solstice or shortest day southward. The tropic of Capricorn is likewise described; a smaller circle, parallel to the equator, whose distance from thence is equal to the sun's greatest declination, and touches the ecliptic in the first point of Capricorn; on one side, bounding the torrid southern zone, on the other, the southern temperate zone, making the winter solstice or shortest day northward, and the summer solstice, and the longest day southward. Moreover, the solstices were so called, because the days do then increase and shorten so very slowly, that they can scarce be perceived to do either, insomuch that "quasi sistatur sol." The reason of which cannot be better given, than in the words of Julius Scaliger, in Problemat. Gelian. "Is circulus, quem sol quotidie signat, non est circulus, sed magis quædam spira. Neque enim

revolutionis finis eodem committitur, unde initium habuerat: Major enim distantia est à puncto, unde digressus est, ad punctum, ad quem horæ viginti quatuor eum perduxere; ubi propior sit iis signis, quæ propius ad æquinoctium accedunt, propter obliquitatem. Itaque cum tendit ad solstitia, propter lineæ prope rectitudinem, vix variat; inde solstitia dicta:” Which is as much as to say: That circle which the sun describes by his daily motion, is not properly a circle, but rather a spiral line: For the end of its revolution does not terminate in the point, whence it began. For its distance from the point, from whence the sun set forward, to that to which he arrives by his daily course of twenty-four hours, is greater when he approaches nearest to those signs that are next the equinoctial, by reason of the obliquity of his course: But when he draws near to the solstitial points, there appears scarce any variation of his course, because the line is then almost straight and direct; whence it is called the solstice. Moreover, Macrobius, lib. i. cap. 21. tells us, that the Egyptians represented the statue of the sun with his head shaved on one side, and having long hair on the other, to intimate, by the first, the time of the winter solstice, “cum velut abrasis incrementis, angustâ manente extantiâ, ad minimum diei sol pervenerit spatium;” by the latter, his summer solstice, or his full grown splendour, to which he arrives by degrees, emerging again from those straits and dens which were his abode in the winter tropic, into the summer hemisphere: “ex quibus latebris vel angustis rursus emergens, ad æstivum hemisphærium tanquam enascens in augmenta porrigitur:” as the same author expresses it in the place above cited. See above, ver. 658.

Ver. 737. Of this, see above, ver. 661.

Ver. 742. These four verses contain a second cause or reason of the increase and decrease of the days and nights: But this is indeed a weak argument; for how can the air’s being more or less thick make the sun rise later or sooner?

Ver. 746. In these three verses, he alleges a third reason, which is of equal force with the last; as if the days or nights were longer or shorter, because the seeds of light flow, and meet together, sometimes sooner, sometimes later, to repair the decayed splendour of the sun. But by subjoining this third cause, the poet seems to observe, what is likewise generally taken notice of, that not only the day and the night, but that the morning and the evening twilight are sometimes shorter than they are at others: For, in an oblique sphere, the duration, as well of the twilight before sun-rising, as of the twilight after sun-set, is unequal throughout the year, being longer in the summer, and shorter in the winter; because, since the twilight either begins in the morning, or ends in the evening, when the sun is eighteen degrees, perpendicularly taken, below the horizon, the bows of the compass, or circuit of the sun, who, with those degrees either rises in the morning, or goes down in the evening, are larger in summer, and less in winter. Besides, this in-

quality is the greater the more distant we are from the equator. And yet we may not believe that the evening twilight is longest about the summer solstice and shortest about the winter; for indeed it is rather somewhat shortest of all before the vernal, and after the autumnal equinoxes. But it might seem tedious to pursue these matters farther.

Ver. 749. Here the poet inquires into the causes, why the moon changes herself into so many shapes: For as Ovid Metam. xv. ver. 196. says,

Nec par, aut eadem nocturnæ forma Dianæ
Esse potest unquam, semperque hodierna se-
quente,

Si crescit, minor est; major, si contrahit orbem.

Which Dryden thus translates,

Not equal light th’ unequal moon adorns,
Or in her waxing, or her waning horns:
For ev’ry day she wanes, her face is less,
But gath’ring into globe, she fattens at increase.

Dryden.

Now Lucretius tells us, in these twelve verses, that if she receive her light from the sun, if she be a globous body, and lastly, if she make her rounds below the sun, then they explain aright her various and manifold phases, who say, that the moon changes her face according to the different light she receives from the sun, as she approaches nearer to him, or retires farther from him. This too is the opinion of almost all the mathematicians, and of all the poets, especially of Manilius, lib. ii. ver. 96.

Tu quoque fraternis reddis sic oribus ora,
Atque iterum ex iisdem repetis, quantumque re-
liquit,

Aut dedit ille, refers; et sydus sydere constas.

Which Creech thus renders:

For as the moon in deepest darkness mourns,
Then rays receives, and points her borrow’d horns;
Then turns her face, and with a smile invites,
The full effusions of her brother’s lights.

Ver. 755. For when the moon is at full, she goes, as it were, backwards under the earth towards the sun, and comes up to him: whence it is that she decreases by degrees, till being in conjunction with him, she become invisible to us.

Ver. 756. He means that part of the heavens which is concealed from us beneath the earth.

Ver. 757. The different changes or variations of the moon, which the ancient Greeks called *phases*, and from them the Latins, *phases*, or *apparitiones*. The names of these phases or appearances, especially of the four chief and most remarkable are these. The first, reckoning her changes as she increases, is *Μηναιδης*, i. e. *corniculata*, horned, or having horns: The new moon, which happens when she is about sixty degrees distant from the sun. This phase is by the Turks and Arabs called *Nalka*, a horse shoe, because the moon then resembles the figure of one. The second, *Δισκοειδης*,

i. e. *bifecta*, or *dimidiata*; the half moon, when she is ninety degrees distant from the sun. The third, *Ἀμφίβολος*, i. e. *gibbosa*, or *dimidio orbe major*; which happens at 120 degrees distant from the sun; and the fourth and last, *Πανσίληνος*, i. e. *Totilunis*, when full, and in opposition to the sun, or at the distance of 180 degrees: and from this last, in a contrary order, are reckoned her decreasing changes. And these several phases she inviolably observes; nor are they the work of chance, as our poet would impiously insinuate, but the act and order of Divine Providence; as even another poet, though a heathen too, saw very well.

Nec lunam certos excedere luminis orbes;
Sed servare modum, quo crescat, quove recedat;
Nec cadere in terram pendentia sydera cœlo,
Sed dimensa suis consumere tempora signis;
Non Cassus opus est, magni sed Numinis ordo.

Thus rendered by Creech:

That light, by just degrees, the moon adorns;
First shows, then bends, then fills her borrow'd
horns;

And that the stars in constant order roll,
Hang there, nor fall, and leave the liquid pole;
'Tis not from chance: the motion speaks aloud
The wise and steady conduct of a god.

To which I add this of Statius, Sylv. lib. iii.

Servit et astrorum velox chorus, et vaga servit
Luna, nec injussæ toties redit orbita lucis.

And of Macrobius in Somn. Scip. lib. i. cap. 6.
"Similibus dispensationibus Hebdomadam, Luna
sui luminis vices sempiternâ lege variando dispo-
nit."

And since we are upon the subject of this planet, I cannot but take notice of an opinion, which is at this day asserted and maintained by several, as well philosophers as astronomers: viz. That the moon is inhabited. This belief they ground on the appearance of mountains, valleys, woods, lakes, seas, and rivers, which, by the help of the telescope, they discover in the orb of that planet. The ancients, as Cicero witnesses, embraced this opinion long ago: "Habitari," says he, "ait Xenophanes in Lunâ, eamque esse terram multarum urbium et montium. Academ. Quæst. lib. iv. The interpreter of Aratus: *εἶναι δὲ τὴν αὐτῆς οἰκασίαν ἀλλὰ ποταμούς τε καὶ ὄσα ἰσὶ γῆς*. And Plutarch De Placitis Philosoph. lib. ii. cap. 50. reports, That the Pythagoreans affirm the moon to be another earth, inhabited in all its parts, even as this earth of ours: and peopled with living creatures fifteen times larger than those with us: these inhabitants the ancients called Antichthones, because they believed them to dwell in an earth quite opposite to this of ours. And that author, in his treatise, "De facie in orbe Lunæ," says, That there are caverns in the moon, called "Penetralia Hecates;" and that the upper parts of that planet, which always regard the heavens, are the Elysian fields: That it is likewise inhabited by Genii, who not always make their abode there, but sometimes descend to earth, to punish or awe

mankind. Achilles Tatius in Isagog. reports also the like of the moon's being inhabited: so too does Macrobius in Somn. Scip. lib. i. cap. xi. in these words: "Lunam ætheream terram Physicâ vocaverunt, et habitatores ejus Lunares Populos nuncuparunt: quod ita esse pluribus argumentis, quæ nunc longum est enumerare, docuerunt." See more to this purpose in Kepler's "Astronomia optica," and particularly in a posthumous treatise of his, intitled, "Somnium, sive de lunari Astrologiâ." Now, why should this opinion seem extravagant, if it be admitted, that the moon enjoys as favourable an aspect from the sun, as this earth of ours, though the days and nights there be answerable to our half months, in regard it is screened with hills and mountains, under which lie deep shades and valleys, with hollow caves and recesses, of equal benefit against the extremities of heat and cold: and being watered besides with great lakes and rivers, and consequently supplied by nature with all things necessary for the support of life? How then can it reasonably be thought, that nature has conferred all those advantages and benefits for no use and end; and that the moon is made for no other purpose, and serves only to reflect to us the light of the sun? See more in Isaac Vossius in his learned treatise, "de Naturâ et Propriet. Lucis," cap. xix.

After all, it is not agreed what kind of creatures these lunar inhabitants are: however, Kepler seems somewhat positive as to this point also. "Concludendum videtur," says he in his notes, "ad appendic. Selenograph. in Lunâ creaturas esse viventes, rationis, ad ordinata facienda, capaces." He affirms the same thing of the other planets, nay even of the sun itself; concerning which, in the epilogue to his fifth book, he breaks out into this expression: "Vel sensus ipsi exclamant, ignea hic habitare corpora, mentium simplicium capacia, verèque solem esse *πυρὸς νοῦν* si non regem, at saltem regiam." Nor is this so strange as what some assert, who maintain the moon to be the paradise in which our first parents were created, and from whence, for their transgression, they were expelled, and driven down to this earth of ours. This Hieronymus Vitalis, in "Lexic. Mathemat. in voce Paradisus," endeavours to evince, as well from reason, as from the authorities of several of the fathers and schoolmen. He says indeed, that this is new and unheard of, but not therefore to be accounted foolish and absurd: "Fateor," says he, "id novum, singulare, et hæcenus inauditum, at non per hoc temerarium, atque intolerabile dixeris." Then he urges in these express words; "modo partâ tantâ rerum notitiâ, Lunæ facie Telescopio penitissimè observatâ, veterum dictis expensis, locis super hanc terram investigatis, Paradisum in Lunæ superficie collocari, ratio ipsa compellit." The reader may be farther satisfied as to this matter in that author; but it is time for us to return to Lucretius.

Ver. 761. In these six verses, he assigns another reason, and says, that if the moon do shine with unborrowed light, then we must imagine that another body, which is opacous and totally dark,

always moves with the moon, and obstructs and turns away her beams.

This is said to be the opinion of Anaximander; who, nevertheless, believed nothing like it: for, though he did perhaps say, that the moon ἴδιον ἔχει φῶς had her own light. Plut. de Placit. Philosoph. lib. ii. cap. 26 & 28. (ἰφάσκιν τὴν σελήνην ψευδοειδῆ, τὴν ἀπὸ ἑλίου φωτίζεσθαι. Laertius), yet he never so much as dreamed of any other body that moved about with her, and hindered and obstructed her light.

Ver. 762. See the note above ver. 757.

Ver. 767. In these twenty-nine verses, he proposes their opinion, who held the one half of the moon's orb to be light, the other half dark. Now, says he, if you imagine this opinion to be true, imagine likewise such an orb to be turned round on its axle or centre, and it will present the different phases we behold in the moon.

This was the opinion of Berosus, a famous astronomer in the days of Antiochus Soter, as also of the Babylonians, who defended this doctrine against a sect of the Chaldean astronomers; who, as Diodorus Siculus, lib. ii. witnesses, agreed with the Greeks, that the moon shines with light that is not her own: but the Babylonians held one half of the moon's globe to be luminous, the other dark. And that both the Chaldeans and Babylonians too were very skilful in astrology, we have the testimonies of Diodor. lib. i. de Divin. Pliny lib. vii. cap. 56. and many others: Nay, Manilius, lib. i. ver. 38. teaches, That astrology was given by the gods to the kings of the Chaldeans: for it was God, says he,

Qui sua disposuit per tempora, cognita ut essent
Omnibus, et mundi facies, cælumque supernum,
Naturæque dedit vires, se quæ ipsa reclusit,
Regales animos primum dignata movere,
Qui domuere feras gentes Orienta sub imo,
Quas fecat Euphrates, in quas et Nilus inundat.

At whose command the stars in order met,
Who times appointed when to rise and set;
That Heav'n's great secrets might lie hid no more,
And man, instructed, gratefully adore:
Nature disclos'd herself, and from her springs
Pure streams deriv'd, o'erflow'd the minds of
kings;

Kings next to Heav'n, who o'er the east did sway,
Where swift Euphrates cuts his rapid way;
Where Nile o'erflows, and whence the whirl re-
stores.

The day to us, and, passing, burns the Moors.

Greech.

Ver. 772. This and the following verse run thus in the original.

Ut Babylonica Chaldaëum doctrina refutans
Astrologorum artem contra convincere tendit.

Upon which passage, if Faber's note be true, our translator seems to be mistaken in the sense of his author: For that interpreter there says, that by "Babylonica Chaldaëorum ars," our poet here means only those Chaldeans, who followed the

hypothesis of Berosus against the vulgar astrology. What it was, says he, Plutarch teaches, "de Placitis Philosophorum," lib. ii. where he asserts, that an eclipse of the moon is caused κατὰ τὴν πρὸς ἡμᾶς ἐπιστροφὴν τῆς ἀπὸ τοῦ ἡλίου μέρους, i. e. by her turning towards us that part of her orb which is not fiery. Then he subjoins, that the Chaldeans in this place, is the name of a particular sect, not of the whole people, as might be proved out of Herodotus. To which I add this of Laërtius, πρὸς δὲ Βαβυλωνίοις, ἢ Ἀσσυρίοις Χαλδαῖοι, Γυμνοσοφίᾳ παρὰ Ἰνδοῖς. And with this agrees Cicero, lib. ii. de Divinat.

OF THE ORIGINAL AND PROGRESS OF ASTRONOMY AMONG THE ANCIENTS.

ASTRONOMY had its name ἀπὸ τοῦ νόμου τῶν ἀστέρων, because it teaches the laws and rules of the motions of the stars: but the words astronomy and astrology, were anciently promiscuously used one for the other: for what Plato calls astronomy, Aristotle, and others, call astrology. Thus Salmasius in Plin. Exercitat. tom. i. p. 6. says, That among the Greeks, Thales is said first ἀστρολογῆσαι, to astrologize, though he never treated of the judiciary art. In like manner, Pherecydes was called an astrologer, though he was only an astronomer: and the nautical astrology of Phocus the Samian, which some ascribe to Thales, treats only of the astronomical science. Manilius, on the contrary, calls his poem *Astronomicum*, though all of it, except the first book, treat of judiciary astrology. But, in after ages, this synonymy was discontinued: for when the apotelesmatic part, which, from the site and aspect of the fixed stars and planets, teaches to divine their influences, as to the production of future events, came to get footing in Greece, where, anciently, only the meteorologic part of it, which teaches the motion of the stars, was known, they distinguished them, and gave to the first the name of astrology, and called the last astronomy; which is properly understood, and described to be, *The Science*, which contemplates the motion, distance, colour, light, order, place, magnitude, and the like adjuncts of the fixed stars, and of the planets, without any respect to the judiciary part.

And as this science itself, so the professors of it too, were, in like manner, doubly distinguished. Plato, in *Epinomide*, uses the words Ἀστρονομῆτες, and Ἀστρονόμοι, in different senses. He understands, by the first of them, those who apply themselves to discover the rising and setting of the stars, in order to prognosticate concerning the seasons of the year, and the temperature of the air. By the last of them, he means those who particularly confine their studies to the theory of the planets.

The original of astronomy, says Gassendus, proceeded from admiration; "Originem ipsi ipsa fecit admiratio. *Introduct. Astronom.*" For our forefathers, astonished at the splendour, variety and multitude of those glorious bodies, and observing their constant and regular motions, applied themselves to the study of this science, and transferred their admiration into observations, which,

in process of time, they marked down in tables or parapegmas, for the instruction of posterity : and for this reason, Ricciolus, in his preface to the first tome of the New Almagest, affirms astronomy to be almost coeval with the stars themselves : And that, together with other arts divinely infused, it was reduced into experiment and practice by Adam himself, who, according to Suidas, was the parent and author of all arts and doctrines ; ὅθεν, says he, πᾶσι ἐνέχυμα καὶ διδάγματα. Besides, that Adam particularly instructed Seth in this astral science, and that too by writing, is the opinion of all the Jewish and Arabian doctors, and among them, particularly Gelaldinus Arabs, cited by Kircher in Obelisc. Pamphil. p. 5. if he be the author of the book, which goes under the title of " Liber Creationis ;" of which some are in doubt, even though it be commented upon as such, by Rabbi Abraham, and Rabbi Joseph Ben Uziel. But, however that be, Josephus, in the eleventh book of the Jewish Antiquities, writes, that Seth having been instructed in astronomy by Adam, and knowing that the world was twice to be destroyed, once by water, and once by fire, reduced this art to an epitome, and for the information and benefit of posterity, engraved it on two pillars, one of brick, the other of stone ; the first to preserve it from the fire, the second from the deluge ; which last pillar he affirms to have been remaining in his days at a place called Syrias or Seirath, which If. Vossius, lib. i. de Ætate Mundi, supposes to be the land that borders on Mount Ephraim, not far from Jericho.

Seth, the son of Adam, having thus engraved on two pillars, the theory of this celestial science, which he had received from his father ; and astronomy being thus brought into the world, the succeeding patriarchs, who, by reason of their longevity, had the opportunity of observing many astral revolutions, cultivated and improved it : Nay, some of the Jewish doctors, particularly Rabbi Isaac Aberbenel in Dissertat. de Longævitate prim. Patr. goes so far as to affirm, that the lives of the patriarchs were, by the Divine Providence, miraculously prolonged for no other end, than that they might apply themselves to the study of this celestial science ; in which the most celebrated for his knowledge is Enoch, whose books on that subject are said to be extant to this day in the territories of the queen of Sheba, as Vossius de Scientiis Mathemat. affirms ; at least they are several times cited by Tertullian and Origin.

It is not certainly known to what degree of improvement this science was brought before the flood ; but from the testimony of Origin, citing the above-mentioned books of Enoch, it appears, that the stars were then reduced into asterisms, under peculiar and distinct denominations, concerning which that patriarch, who was the seventh from Adam, writ many secret and mysterious things. Besides, it is evident from scripture itself, that the year was then, as it is now, computed by twelve revolutions of the moon, to one of the sun's through the zodiac ; for it is said ex-

pressly in Genesis, that Noah entered into the ark the seventeenth day of the second month, and went out of it the twenty-seventh day of the second month of the year following : In the same book likewise express mention is made of the seventh and tenth months : From whence we may with good reason infer, that the patriarchs had then the knowledge of the courses of the sun and moon, with their periods, and, in all probability, of the other planets also.

After the flood, when mankind came to be scattered over the face of the whole earth, astronomy began to be studied by several nations, who, no doubt, had their first knowledge of it from Noah and his posterity ; and hence arose the contest for the honour of its invention. But since it cannot be denied, that mankind dispersed themselves out of Asia into Afric, Europe, and other parts of the world, the Asiatics may justly claim to themselves the glory of it ; and among them chiefly the Babylonians, Chaldeans, and Bactrians ; of whom the most renowned for their skill in this science are Evahdnes, Belus, Zoroaster, and Otanes ; as also Cidenas, Naburianus, Sudinus, and Sclucus the Chaldean.

From the Assyrians and Chaldeans it came to the Egyptians, being brought thither by Abraham the patriarch, as Eusebius, lib. ix. Præparat. Evangel. proves from the authority of Josephus, Eupolemus, Artapanus, and others, as they are cited by Alexander Polyhistor. But Eupolemus seems to infer that Abraham, before his descent into Egypt, taught it to the Phœnicians. Others however say, that Mercury first taught the Egyptians Astronomy, and indeed all other arts and sciences. This is positively asserted, not only by Samblichus, but by Plato in Phædrus, where he calls him πᾶσι γράμματα, and by Cicero, lib. iii. Divinat. Vide etiam Lactantium, lib. i. cap. 6. There are others who attribute the honour of it to the Egyptians before the Chaldeans, who, say they, were even themselves first instructed in it by the Egyptians. To make good which assertion they produce the testimonies of Diodorus Siculus, Biblioth. lib. i. and of Hyginus Fabul. 271. the first of whom says, that Babylon was a colony of the Egyptians, founded by Belus of Libya, who instituted there a college of priests, to the end they might contemplate the stars in the same manner as those of Egypt. The last, that one Evahdnes is said to have come from beyond the seas into Chaldæa, and there to have taught astronomy.

But if this science were known to the Egyptians, before it was to the Babylonians and Chaldeans, how comes it to pass, that the Egyptian observations are so much later than those of the Babylonians ? For we scarce find any of the Egyptian to precede the death of Alexander the Great ; than which even those of the Greeks are earlier ; but the Babylonian observations were manifestly made almost two thousand years before that time. And Cicero, lib. i. de Divinat. ascribes it first to the Assyrians : The Assyrians, " ut ab ultimis auctoritatem repetam," says he, by reason of the plainness and large extent of

their country, which afforded them on all sides a clear and open view of heaven, observed the course and motion of the stars. And having framed a due calculation of their revolutions, they from thence made predictions of future events. And amongst the Assyrians, the Chaldeans " (non ex artis, sed ex gentis vocabulo nominati)" arrived to such a perfection of skill, that they could foretell what should happen to any one, and under what fate they were born; which art the Egyptians learned of them many ages ago. Thus Cicero.

There are others nevertheless who deny this honour both to the Chaldeans and Egyptians, assigning the invention of astronomy to the Ethiopians; of this opinion is Lucian, *περὶ Ἀστρολογίας*. But this assertion seems of little weight, it being contrary to the general stream of tradition, even long before Lucian's time.

The Africans too pretend to the invention of astronomy; and among them particularly the Mauritians, who are said to have been instructed in that science by their king Atlas, the son of Libya.

Aristotle ascribes the invention of it, wholly to the Babylonians and the Egyptians: *Ἀιγύπιοι, καὶ Βαβυλώνιοι, παρ' ὧν πολλὰς τέσεις ἔχομεν περὶ ἑκάστη τῶν ἀστρον.* And how the Egyptians came to be skilful in that science, Ptolemy, who was himself of Egypt, gives us this reason, *ὅτι μᾶλλον συνοικῶνται τοῖς Διόμοις, καὶ τῷ τῷ Ἑρμῇ*. And why? *διότι διανοήτικοι τὲ καὶ συνετοὶ καὶ ὁλως ἱκανοὶ περὶ τὰ μαθήματα.* Of the Babylonians he says, *ὅτι τῇ παρθένῳ καὶ τῷ τῷ Ἑρμῇ συνοικῶνται, διὸ καὶ παρ' αὐτοῖς τὸ μαθηματικὸν καὶ παρὰ ἱερητικὸν τῶν ἀστρον συνίσταται.*

Thus from the several nations before-mentioned, astronomy seems to have been anciently divided into three different and chief sects, that is to say, the Assyrian, under which is comprehended the Babylonian and the Chaldaic, the Egyptian, and the Mauritanian or Atlantic; of which last nevertheless the Romans made no account; for among them were enumerated only these three sects, the Chaldaic, Egyptian, and Grecian. Now Eudoxus is said to have been the first, who from the Egyptians brought astronomy to his countrymen the Greeks; and Berofus to have brought into Greece the science of Genethliology from his countrymen the Chaldeans. Vitruvius, lib. ix. cap. 7. "Eorum autem inventiones, quas scriptis reliquerunt, qua solertia, quibusque acuminibus, et quam magni fuerint, qui ab ipsa Chaldaeorum natione profluxerunt, ostendunt: Primusque Berofus in insula, et civitate Coa confedit, ibique aperuit disciplinam." And Pliny says, that the Athenians publicly erected a statue with a golden tongue to Berofus, for his divine predictions. After him Antipater and Achinapolus were reputed famous Genethliologists. Of natural causes and effects, Thales, Anaxagoras, Pythagoras, Xenophantus, and Democritus are esteemed the most eminent observers. After them, following their inventions, and observing besides the rise and setting of the stars, and the seasons of the year, Eudæmon,

Callisthus, Melo, Philippus, Hipparchus, Aratus, &c. left to posterity their astrological prognostics, in their tables, which are called *Parapegmata*; of which see Geminus and Theon in *Arati Phaenomen.* Thus though it be certain, that the Greeks derived their knowledge in astronomy from the Chaldeans and Egyptians, yet so great was their presumption, as confidently to affirm, that the invention of it was due to them, particularly to the Rhodians, from whom they pretend that the Egyptians received it, as Diodorus Siculus reports in the story of the *Heliadae*. And, lastly, others of them ascribe its original to their poet Orpheus; but those opinions favour too much of the fable, and therefore we may rather subscribe to their belief, who hold, that Thales the Milesian first brought astronomy into Greece, having derived his knowledge in that science from the Egyptians.

After Thales, it was improved by Anaximander, Anaximenes, Anaxagoras, Democritus, Empedocles, Euctemon, Meton, Eudoxus, and others of the Athenian School, till the time that Alexander the Great founded the city of Alexandria in Egypt. After which the Ptolemies, his successors, having erected there an academy for all manner of studies, the Grecian astronomy made its retreat thither; and flourished under those princes in equal glory with the Egyptian. And from thence we hear of the famous names of Antolychus, Calipus, Timochares, Aristyllus, Eratosthenes, Conon, Hipparchus, Sosigenes, Theon the elder, Ptolemy, Paulus the Alexandrian, Theon the younger, surnamed likewise the Alexandrian, and his daughter, the excellent, but unfortunate, Hypatia.

It was long before astronomy was introduced into Italy, or had any professors among the Romans; for though Dion Prusæus in *Orat.* 49. affirm, that the Pythagoreans instructed the Italians in that science, and that in all probability the doctrine of Philolaus, Timæus, Archytas, and others, the fame of whose learning had invited even Plato himself to make a voyage into Italy, could not have been concealed from the curious and ingenious Romans; yet that martial people, who were more addicted to arms than arts, entertained but late and slowly too, these speculative studies: Nor to pass by the rude sketches of Numa Pompilius, does the Roman history mention any persons as considerably knowing in astronomy, before Caius Sulpicius Gallus, who was legate to Æmilius Paulus, in the war against Perseus, king of Macedon, and who first among them published a treatise of eclipses. After him, we read that Lucius Taruntius, Nigidius Figulus, Varro, and Cicero, applied themselves to the study of astronomy; but to none of the Romans is that science so much indebted, as to their great dictator C. Julius Cæsar, who, as Lucan witnesses,

Media inter prælia semper
Stellarum, cælique plagis, superisque vacabat.

And who assisted by the Egyptian Sosigenes, re-

duced the Roman year to the course of the sun, which we yet retain; and writ a treatise of the stars in the Greek tongue. From him the mathematical arts, and particularly astronomy, began to flourish among the Romans; and after his example, Augustus Cæsar, who was his nephew and successor, encouraged the study of it.

Let this suffice as a brief indication of the first rise and authors of astronomy, and of the promoters of it among the ancients. It would perhaps be too tedious to continue the progress of it down to these times, and to show when, how, and by whom it has been improved, and brought to that degree of perfection to which it is now arrived.

Ver. 774. Here we see that though Lucretius, after Epicurus, believed the first opinion to be the most probable, yet he does not condemn the latter. And thus too Epicurus in Laërtius, lib. x. says, that though one reason may seem better than any of the other, for the solution of any problem whatever, yet we ought not therefore immediately to condemn all the rest that may be given, if they have any appearance of truth, even though but one of them can be true.

Ver. 776. In these twenty-seven verses he proposes the opinion of Epicurus, who held that the moon is created and dies daily, in a certain form and figure. In like manner, as he held the sun to be daily extinguished in the west, and created again in the east. And that this may be, says he, several other things demonstrate: For thus, at certain and inviolable times, the seasons of the year follow one another; the spring precedes the summer,—the summer the autumn,—the autumn the winter,—the winter the spring, &c. Ovid. *Metam.* xv. ver. 196. describes in like manner the constant succession of the four seasons of the year, and compares them to the four ages of man's life. I omit the original for brevity's sake, and will only give Dryden's translation of it to illustrate this passage of Lucretius:

Perceiv'st thou not the process of the year;
How the four seasons in four forms appear,
Resembling human life in ev'ry shape they wear?

Spring first, like infancy, shoots out her head,
With milky juice requiring to be fed,
Helpless, though fresh; and wanting to be led.
The green stem grows in stature and in size,
But only feeds with hope the farmer's eyes:
Then laughs the childish year, with flowrets crown'd,

And lavishly perfumes the fields around;
But no substantial nourishment receives;
Infirm the stalks, unsolid are the leaves.
Proceeding onward, whence the year began,
The summer grows adult, and ripens into man:
This season, as in men, is most replete
With kindly moisture, and prolific heat.

Autumn succeeds; a sober, tepid age,
Not froze with fear, nor boiling into rage;
More than mature, and tending to decay,
When our brown locks repine to mix with odious gray.

Last winter sweeps along with tardy pace,
Sour is his front, and furrow'd is his face:
His scalp if not dishonour'd quite of hair,
The ragged fleece is thin; and thin is worse than bare.

Ver. 782. For Venus, the goddess of generation accompanies the vernal season; as Lucretius himself elegantly sings at the beginning of the first book; which Dryden has no less elegantly rendered in these verses.

Delight of human kind, and gods above:
Parent of Rome: propitious queen of love:
Whose vital pow'r, air, earth, and sea supplies,
And breeds whate'er is born beneath the rolling skies:

For ev'ry kind by thy prolific might,
Springs, and beholds the regions of the light:
Thee, goddess, thee the clouds and tempests fear;
And at thy pleasing presence disappear:
For thee the land in fragrant flow'rs is dress'd;
For thee the ocean smiles, and smooths her wavy breast,

And heav'n itself with more serene and purer light is bless'd.

For when the rising spring adorns the mead,
And a new scene of nature stands display'd;
When teeming buds, and cheerful greens appear,
And western gales unlock the lazy year;
The joyous birds thy welcome first express,
Whose native songs thy genial fire confess:
Then savage beasts bound o'er their flighted food,
Struck with thy darts, and tempt the raging flood:

All nature is thy gift; earth, air, and sea,
Of all that breathes the various progeny,
Stung with delight is goaded on by thee.
O'er barren mountains, o'er the flow'ry plain,
The leafy forest, and the liquid main,
Extends thy uncontrol'd and boundless reign.
Through all the living regions thou dost move,
And scatter'st, where thou go'st, the kindly seeds of love.

See book i. ver. 1.

Moreover, our translator has repeated this and the two following verses from book i. ver. 19. though his author have not.

Ver. 784. The west wind of which, book i. ver. 21. Lucretius here calls it zephyrus: which is likewise a wind that blows from the equinoctial west, contrary to the wind called *subsolanus*, which blows from the equinoctial east. It was so called from *ζανθός*, that brings life; because, when it blows, all things bud and shoot forth. This wind was feigned to be the forerunner of Venus, because it blows chiefly in the spring, with which season Venus is said to be most delighted.

Ver. 785. "Laëtantius de falsa Religione, lib. i." calls her Faula; for which Vossius there reads Flaura; she was, as Verrius in the same author says, *Scortum Herculis*, the Harlot of Hercules; but according to others, she was a Roman dame, who, by her lewd practices having heaped up a

great deal of money, bequeathed her estate when she died, to the commonwealth of Rome. This is certain, that the senate made her the goddess of flowers, gardens, and meadows: "ut pudendæ rei quædam dignitas haberetur," as Lactantius in the place above-cited tells us: they instituted likewise festivals in her honour, called Floralia, which is confirmed by Ovid, lib. v. Fastorum:

Convenere patres, et si bene florat annus,
Numinibus vestris annua festa vovent,

And the same poet acquaints us, that these solemnities were performed towards the latter end of April:

Incipis Aprili, transis in tempora Maii;
Alter te fugiens, cum venit, alter, abit.

These festivals therefore were instituted, "ut fruges cum arboribus, aut vitibus bene prosperè-que florescerent," says Lactantius in the same place. And in these Floralia, vile, impudent strumpets were wont to dance naked in the streets to the sound of trumpets; to which custom Juvenal alludes, sat. vi. ver. 249.

—————Dignissima prorsus
Florali matrona tuba,—————

Ver. 790. The Etesias are winds that blow constantly for about eleven days together in the heat of summer, and chiefly after the rise of the dog-star. Hence they are called Etesia, which is as much as to say, annual, from the Greek word *ἔτος*, a year. Thus Pliny, lib. xxxvii. cap. 18. Strabo calls them *subsolani* of which see above ver. 784. others west winds, and others east, and Lucretius in this place makes them north winds: "Etesia flabra aquilonum." See more book vi. ver. 718.

Ver. 792. "Lucr. Graditur simul Evius Evan." Bacchus was called Evius and Even, from the word *ἴαμι*, which the mad Bacchæ or Bacchides used in their orgies: Ovid. lib. iv. Metam. ver. 15.

Nycteliusque Eleleusque Parens, et Jacchus et Evan.

Ver. 793. Lucretius.

Altitonans Vulturnus, et Ausfer fulmine pollens
Vulturnus, of which Creech takes no notice, is the south-east wind, says Agell. lib. 2. cap. 22. Ausfer is the south wind, and generally blows in autumn.

Ver. 803. In these twenty-one verses he treats of the eclipses of the sun and moon: the sun, says he, is eclipsed, when the moon, or any opacous body, below his globe, interposes between that and the earth, and thus intercepts his beams, and hinders those rays of light from coming forward to the earth. The moon is eclipsed, when she happens to be in the shadow of the earth, or any other opacous body, that is interposed between her orb, and the sun: besides; why may not both the sun and the moon grow faint and sicken, nay, as it were, fall into a swoon, when they

chance to go through any places of the heavens, that are infectious to them, and destructive of their fires and light? This last was the opinion of Xenophanes.

Ver. 816. Lucretius.

Menstrua dum rigidas coni perlabitur umbras.
That is to say, while the moon, in her monthly course, passes by the rigid shadow of the earth; which shadow is of a conic figure. But some interpret *coni* to be meant of the earth itself, as if it were *κωνοειδής*, shaped like a cone, because Aristotle, lib. 2. Meteor. says, That the earth is shaped like a timbrel, and that the lines drawn from its centre make two cones: but the poet means the lunar eclipse is made, by reason of the shadow of the earth, that stretches out in the shape of a cone.

Ver. 818. The ancient heathens were of opinion, that witches, by muttering some charms in verse, caused the eclipses of the moon; which they conceived to be, when the moon, the goddess of the earth, was brought down from her sphere by the virtue of those incantations: They believed likewise, that in these eclipses, she sickened and laboured as in an agony, and suffered a kind of death: Of this belief were even Stechorus and Pindar, as Pliny relates, lib. 2. cap. 12. Milton, though not of the same opinion, yet describes this foolish belief,

Not uglier follow the night-hag, when call'd
In secret riding through the air she comes,
Lur'd with the smell of infant blood to dance
With Lapland witches, while the lab'ring moon
Eclipses at their charms.——

And Lee in the tragedy of *Œdipus*, speaking of the moon in eclipse,

——The silver moon is all o'er blood:
A settling crimson stains her beauteous face:
Sound there, sound all our instruments of war;
Clarions, and trumpets, silver, brass, and iron,
And beat a thousand drums to help her labour.

The vain heathens farther believed, That the moon being by these enchantments brought down from heaven, they were at those times in danger of losing that celestial light: and therefore they made a great noise by beating of brass vessels, by ringing of bells, sounding of trumpets, whooping, hallowing, and the like to drown the witches mutterings, that the moon not hearing them, they might be rendered ineffectual, and she suffer no hurt. Thus Medea in Ovid boasts that she could draw down the moon from heaven:

Te quoque, Luna, traho, quam Temesæa labores
Æra tuos minuant——

Metam. 7. ver. 207.

And Tibullus.

Cantus et è curru lunam diducere tentat,
Et Facerant, si non æra repulsa sonent.

And Statius. 6. Theb.

—Attonitis quoties divellitur astris
Solis opaca soror, procul auxiliantia gentes
Æra crepant.—

And Seneca in Hippolytus.

Et nuper rebuit, nullaquæ lucidis
Nubes sordidior vultibus obstitit:
At nos solliciti lumine turbido,
Tractam Theſſalicis carminibus rati,
Tinnitus dedimus.—

And Livy, Decad. 7. 3. speaks of it, as of an ordinary custom, in these words: "Qualis in defectu Lunæ silenti nocte fieri solet, edidet clamorem."

And Juvenal says pleasantly enough of a loud scolding woman, that she alone was able to relieve the moon out of an eclipse:

—Jam nemo tubas atque æra fatiget,
Una laboranti poterit succurrere Lunæ.

Sat. 6. ver. 422.

And this absurd superstition was so grounded in the Pagans, that after many of them were become Christians, it was not quite rooted out: not even in St. Ambrose's time, whose reprehension of this piece of Paganism is cited by Turnebus in *Adversar.* And Maximus likewise blames it in a *homily de defectu lunæ*. And Bonincontrius, who lived yet several ages later, affirms, That he himself had seen this absurd custom practised upon the like occasion, by his own countrymen, the Italians. The Turks continue it to this day, as Scaliger affirms: And Plutarch in the life of *Æmilius* reports, That the Romans, besides their beating of brazen vessels, sounding of trumpets, &c. were wont to reach up flaming links and torches towards heaven, to resupply, and kindle again the light of the moon, which they believed by charms to be extinguished. *Delrius* in *Senec. Tragœd.* says, he has read that the Indians are wont with tears and lamentations to bewail this effect or deliquium of the moon, believing the sun had then whipt her till she bled, to which they impute the cause of her dark and sanguine colour. In *Commentar. ad Hippolyt.* pag. 195. Vide etiam *Turnebum* in *Adversar.* lib. xxii. cap. 23 and 24. And *Pincierus* in *Parerg. Otii Marpurg.* lib. ii. cap. 37. Of this supposed fainting of the moon *Wowerus* also makes mention in his *Pægnion de Umbrâ*, cap. 8. towards the end. But we may farther observe, that the Arabians believed the moon to be in the like agony, when she eclipsed the sun, as appears by a custom they observed at their new-moon. For keeping holy the day of their neomenia, or new-moon, and believing it unlucky to have the moon suffer any hurt on that day, they were wont, because she might on that day eclipse the sun, the solar eclipse happening when the moon is new, to defer the celebration of their neomenia till the next day: or at least for sixteen hours, till the sun was past the eclipse. And hence it is that the astronomers distinguish the neomenia of the Arabians, into the *cælestis*, which was the first and natural time;

and the *civilis*, which was not the true time, but the day following, and on which they celebrated their neomenia to avoid the ill luck, and prosperous accidents, which their superstition made them apprehend. See *Nicolaus Mulerius* in his *Diatriba de Anno Arabico*, in the explication of the Arabian Epochæ, or the Hegyra. *Ubbo Emmius* has inserted it in his chronology between the fourth and fifth books.

Ver. 824. Having explained after his manner the motions of the sun, moon, and stars, he descends from heaven to his native element, and in these ten verses tells us that he is going to describe the rise and origin of things from the earth, the common parent of all.

Ver. 834. *Lucretius* describes the rise of things from the new-formed earth in so lively a manner, that he seems even to have been present at their birth. And first, in these twenty-one verses he tells us that the earth first produced the grass, herbs, and flowers, then the trees, then the less perfect, and last the most excellent animals. For, says he, since we see that even now, when the whole world is decayed, and worn out to a great degree, she still produces mice, frogs, and other the like ignoble animals, what may we not reasonably believe of her, when both herself and her husband *Æther*, were in their blooming age?

Here we may take notice that the order which *Lucretius* observes in the creation of things, differs very little from that, for which we have a better authority than his: But let us here a Christian poet describe the same thing.

—Then the earth,
Desart, and bare, unsightly, unadorn'd,
Brought forth the tender grass, whose verdure
clad
Her universal face with pleasant green.
Then herbs of ev'ry leaf, that sudden flow'r'd,
Op'ning their various colours, and made gay
Her bosom smelling sweet: And these scarce
blown,
Forth flourish'd thick the clust'ring vine, forth
crept
The smelling gourd, upstood the corny reed
Embattl'd in her field, and th' humble shrub,
And bush, with frizzled hair implicit: Last,
Rose as in dance the stately trees, and spread
Their branches hung with copious fruit, or gem'd
Their blossoms: With high woods the hills were
crown'd,
With tufts the valleys, and each fountain-side,
With borders long the rivers.—

Ver. 847. Here the poet proves by a similitude, that all animals did in the beginning proceed from the humidity of the earth, warmed and impregnated by the heat of the sun, in like manner as we now see worms and insects generated.

Ver. 849. *Lucretius* foreseeing that it might be objected, that perfect and adult animals do not burst out of the earth, intimates in this place, that the sun is now grown a disabled lover, and the earth past her teeming time: and thus their vigour being exhausted, they cannot now pro-

duce horses, lions, &c, nor any of those large animals, which they did in the beginning of the world when they were both in the prime and flower of their age.

Ver. 853, 854. In these nineteen verses, he says, That first of all animals, and that too in the spring, for that was the most proper season, the birds were hatched from eggs, which, as Milton expresses it,

Bursting with kindly rapture, forth disclos'd
Their callow young: but feather'd soon, and
fledge,

They sum'd their pens, and soaring th' air sublime,
With clang despis'd the ground:—

For, says our poet, they had growth and strength sufficient to go in search of their food: Then from certain little bags or bladders, which he calls wombs, and that stuck to the earth, the other animals and men themselves burst forth: while for their nourishment a proper liquor, very like milk, flowed from the veins of mother earth into their infant mouths: For we ought to believe, that the earth, when she brought forth her young, had milk no less than mothers has now a-days, when they bring forth their children. Thus the earth supplied them with food, the temperature of the air was such that they needed no garments, and the meadows, thick with grass, afforded them easy beds.

This first manner of the origin of things Lucretius explains according to the opinion of Animaxander, and of some others of the ancient philosophers, as we see in the first book of Diodorus Siculus, near the beginning, where he says, That the earth first stiffen'd and grew together, when the circumfused fire of the sun had enlightened and warmed it all around: Then, when by reason of its being thus heated, the outmost surface of it was in a manner fermented, some humidities swelled in many places, and in them there grew certain slimy stinking substances, involved in tenuous membranes: the like to which may be seen to this day in fens and marshes, where the waters stagnate, when after cold weather, the air grows hot on a sudden, and is not changed by degrees: Now those humid things which we mentioned before, being animated by the heat, received nourishment in the night by the mists that fell from above: but in the day were consolidated and hardened by the heat. Lastly, When they that grew in the wombs of the earth, had attained their due growth, the membranes being burst and broken to pieces, disclosed the forms and shapes of all kinds of animals: And such of these as had the greatest share of heat, went to the higher places, and became birds: but such of these as had retained the earthy solidity, were reckoned in the rank of reptiles, and other terrestrial animals: and those that participated most of the nature of man, ran together to the places, where human kind assembled, and which was called the place of their birth. Thus far Diodorus.

Ver. 854. It is questioned by some, whether birds, which are generally called *genus æreum*,

and in the sacred scripture itself, *volatilia cæli*, may be properly reckoned among terrestrial animals. Ovid, in his distribution of animals at the creation, seems not to allow them to be so.

*Astra tenent cæleste solum, formæque Deorum,
Cesserunt nitidis habitandæ piscibus undæ.
Terra feras cepit, volucres agitabilis Aer.*

Metam. l. ver. 73.

Cicero observes the like disposition in the second book of the nature of the gods, and in Timæus: so too does Aristotle, as he is cited by Plutarch in 5. de Placit. Philosoph. To these may be added the belief of the ancient Greeks, and which they had from the Egyptians, that birds were produced before the earth itself was formed, to which Aristophanes in *Avibus* alludes. But Manilius more truly places them upon earth: speaking of which he says,

*Hanc circum variæ gentes hominum atque fera-
rum,
Beræque colunt volucres.*—

Lib. i. ver. 236.

Apuleius agrees with Manilius, and ends the controversy in these words: “*Si sedulo animadvertas, ipsæ quoque aves, terrestre animal, non ærium, perhibeantur: semper enim illis victus omnis in terrâ; ibidem pabulum, ibidem cubile, tantumque æra proximum terræ volando verberant: iterum cum illis fessa sunt remigia alarum, terra ceu portus est.*” That is, if you weigh the matter aright, birds may be truly affirmed to be rather a terrestrial than an ærial animal, for they have all their food from the earth; there they feed, and there they rest: when on wing, they indeed fan the air that is next the earth; but when their wings grow weary, the earth is their resting place. But as to this question, see Hieron. Magius, lib. i. Miscellan. cap. ult. Jacobus Cruceus Syllog. iii. and Kircher in his *Iter. Ecstatic.* ii. Dialog. ii. cap. 5. I will only add, that another difficulty, not much unlike the former, if either of them deserve to be called so, has puzzled the brains of Aristotle, Theophrastus, and most of the ancient Peripatetics, to wit, which were first created, birds or eggs, since neither an egg can be produced without a bird, nor a bird without an egg; for so Censorinus proposes the question, “*Avesne ante, an ova generata sint, cum et ovum sine ave, et avis sine ovo gigni non possit?*” de Die Natali, cap. 14. Disarius in Macrobius Saturnal. lib. vii. cap. 16. sums up the arguments on both sides, and gives the decision, of which the reader may there be informed.

Ver. 857. Milton's description of the first beasts rising out of the ground at their creation, is so lively and sublime, that it well deserves to be transcribed by way of illustration, to this passage of our poet.

—The earth obey'd, and, straight
Op'ning her fertile womb, teem'd at a birth
Innum'rous living creatures, perfect forms,
Limb'd, and full grown: out of the ground up-
rose,

As from his lair, the wild beast where he wons
 In forest wild, in thicket, brake, or den :
 Among the trees, in pairs they rose, they walk'd :
 The cattle in the fields and meadows green :
 Those rare and solitary, these in flocks
 Past'ring at once, and in broad herds up sprung
 The grassy clods now calv'd; now half appear'd
 The tawny lion, pawing to get free
 His hinder parts; then springs; as broke from
 bonds,
 And rampant shakes his brinded mane; the ounce,
 The libbard, and the tyger, as the mole
 Rising, the crumbled earth about them threw
 In hillocks: the swift stag from under ground
 Bore up his branching head: scarce from his mold
 Behemoth, biggest born of earth, upheav'd
 His vastness: fleec'd the flocks, and bleating rose,
 As plants: ambiguous between sea and land,
 The river horse, and scaly crocodile, &c.

Paradise Lost, B. 7.

Lucretius in this place speaks not after the opinion of Epicurus only, but partly too of the Stoics, who, as Lactantius witnesses, believed, "Homines in omnibus terris & agris tanquam fungos esse generatos:" That men were born, like mushrooms in every field: and partly after the opinion of Animaxander, who, though he held that men, and all the other animals were produced of the water, yet as Plutarch de Plac. Phil. lib. v. cap. 19. says, he taught, that they were contained in thorny bags, and shut up in them, till the age of puberty, and then bursting from those prisons, they came out men and women, already able to nourish themselves: And, lastly, partly after the opinion of Archelaus, who in Lactantius, lib. ii. teaches, "homines ortos è terrâ, quæ limum similem lacti ad escam eliquaverit," that men were born of the earth, which for their nourishment oozed out a slime like milk. Others had yet other opinions concerning the original of mankind: Juvenal, Sat. 6. v. 11.

Quippe aliter tunc orbe novo, cœloque recenti
 Vivebant homines, qui rupto robore nati,
 Compositique luto, nullos habuere parentes.

In which passage that poet hints at two other ways of the creation of man: the one from trees, the other from the earth. As to the first Britannicus says, "Quum primâ illâ ætate in speluncis sylvisque more ferarum, habitarent, quumque ex arboribus vetustate cavatis, tanquam ex domicilio exirent, putabantur ex arboribus esse nati." Then alleging this verse of Virgil, *Æneid.* 8. 315.

Genſque virum truncis, & duro robore nati,
 he shows in those words the probable cause of the fiction: that as they dwelt in woods, so they seemed to be born of the trees: but surely he forgets himself a little, when he says "ex arboribus vetustate cavatis," having but just before said, "primâ illâ ætate," for how then could the trees have had time to decay and grow hollow? yet Autumnus commits the same oversight. The second way, mentioned by Juvenal of man's original, gives just grounds to believe, that though

TRANS. II.

many of the more learned among the Heathens had read the history of Moses, yet that they either despised, or corrupted, or opposed the instruction: witness Julian the apostate, who in a fragment of an epistle published with his other works by Petavius, page 534. &c. seqq. delivers it as the theology of the ancient Heathens, that mankind increased not from two persons, as Moses taught, but that when Jupiter created the world, drops of sacred blood fell down, out of which arose mankind, ὡς ὅτι Ζεύς ἐκόσμευε τὰ πάντα, εὐμένων αἱματός ἱερῆς περιφασῶν, ἐξ ὧν πᾶς τὸ σῶν ἀνθρώπων βλαστῆσαι γένος: impiously urging, that otherwise the world could not have been so soon increased, though women, as he lewdly adds, had been as fruitful as swine. But what wonder is it, that men had so mean an opinion of their own original, who believed but little better of their gods? Witness Varro, who in his fragments, "Antiquitatum rerum divinarum," blaming their fabulous theology, "Mythicon genus Theologiæ," says, in this we find, That one god is born out of the head, another out of the thigh, a third from drops of blood: "In hoc enim est, ut Deus alius ex capite, alius ex femore, altus ex guttis sanguinis natus." Nor were some of the ancient philosophers less ridiculous in their opinions, concerning the reparation of mankind: To instance only in one: Every one knows, that there are in the joints of the fingers little bones, commonly called seed-bones: one of which, about half as big as a pea, is placed in the first joint of the thumb: This the Arabians call Abadara, as Bartholinus observes in his Anatomical Institutions, lib. iv. cap. ult. Now some of the wise ancients foolishly held, that out of that bone, as out of seed, mankind should at last be propagated anew. You may find likewise other opinions concerning man's original, in the learned Censorinus de Die natali, cap. iv. where he treats at large of this matter. And if you think it worth your while to see this fabulous rise of the world confuted, you may find it well done by Firmianus, lib. ii. cap. 12.

Ver. 860. Lactantius, lib. ii. de Origine Error, cap. 11, and 12, cites this verse of Lucretius, and makes this remark upon it. "Aiunt certis conversionibus cœli: et astrorum motibus maturitatem quandam extitisse animalium ferendorum: itaque terram novam semen genitale retinentem folliculos ex se quosdam in uterorum similitudinem protulisse, de quibus Lucretius, lib. v.

Crescebant uteri, terræ radicibus apti,

eosque, cum maturassent, naturâ cogente, ruptos animalia cœtera profudisse: Deinde terram ipsam humore quodam, qui esset lacti similis, exuberasse, eoque alimento animantes esse nutritos." Thus too Cicero, lib. i. de Leg. et Censorinus de die Natali, cap. 2. where he tells us besides, that Democritus too was of the same opinion.

Lucret. "Terræ radicibus apti:" i. e. affixed and sticking in the earth, by their roots.

Ver. 872. But how could these infant animals bear the inclemencies of the seasons, the parching heat, and the chilling cold: nay, how could they live, or

P p

even be born, when the sun had baked the earth, or the cold frozen it up? To this Lucretius answers in these ten verses. That in the beginning of the world there was neither winter nor summer; but that the whole year was one calm and constant spring. And certainly the earth is justly styled a mother by all the foregoing ages, since she first brought forth birds, beasts, and then man, as the master-piece of all her productions.

Ver. 878. This part of this, and the three following verses are added, with how much reason let the reader judge, by our interpreter to his author, who only says,

Aëriaeque simul volucres variantibu' formis.

Ver. 882. But why does she produce none of these things now? To this he answers in twelve verses, that the circumstance of time is changed: and the earth is now past her teeming age. And what wonder is it, that the world, being now grown cold and disabled, being sometimes tormented with too much heat, sometimes persecuted with too much cold, and fallen into the other inconveniences of long life, is at length grown fruitless and barren? Diodorus Siculus, lib. i. says, That the earth being continually baked by the heat of the sun, grew daily more and more constipated and bound up; insomuch that she could not at length produce any more of the larger kind of animals, which were then generated by the mutual commixtion of animals of the same species: To which Lucretius seems here to allude.

Ver. 884. To this purpose, Ovid. *Metam. lib. xv. ver. 235*, says finely:

*Tempus edax rerum, tuque, invidiosa vetustas,
Omnia destruitis: vitiataque dentibus ævi
Paulatim lentâ consumitis omnia morte.*

Thus rendered by Dryden.

Thy teeth, devouring time! thine, envious age!
On things below still exercise your rage:
With venom'd grinders you corrupt your meat;
And then, at ling'ring meals, the morsels eat.

Ver. 894. The poet here tells us in thirty-eight verses, That since animals were at first fortuitously born, it is reasonable to believe, that in the beginning of the world, there were innumerable other animals produced of wonderful kinds and sizes: but that they did not continue long, because they were imperfect, and wanted the means of receiving their food, and the power of copulation, and engendering their kinds. For all the animals now remaining are preserved, either by their own power and industry, or by the care of men: Thus the lion is preserved by his strength, the fox by his craft, the stag by his swiftness, &c. And those that are useful to man, as dogs, cattle, horses, &c. he takes care of and defends. But why should we nourish imperfect animals, and such as would be of no use to us? Creech has omitted one verse in this argument, where the original has *Androgynum inter utrum, nec utrumque, et utrinque remotum*:

And indeed it is generally held to be spurious: But whoever inserted it, seems to have had an

eye on the *Androgynos* in the banquet of Plato. Heinsius on the *Phoenix* of Claudian reads it thus: *Androgynen inter neutra, atque ab utroque remotam.*

Androgynus is derived from the Greek words, *ἀνρ*, a man, and *γυνή*, a woman, and signifies a person who has both sexes, the male and female: of which sort the poets fabled *Hermaphroditus*, the son of *Venus* and *Mercury* to be: Cicero, lib. de *Divin.* calls an *hermaphrodite*, "fatale quoddam monstrum;" a certain fatal monster.

Ver. 932. He now teaches in forty-seven verses, that nature, though she had neither skill nor experience, never brought forth such monstrous animals, as those, for which the poets have most notoriously belied her. And first, says he, in fourteen verses, *Theffalia* never knew a *Centaur*: nor can a man and a horse be conjoined in one body: their different duration of life, their food, their manners, all forbid it. We may say the like of *Scyllas*, and other monsters of the same nature: And they who believe the existence of a *Chimæra*, do not consider that the entrails of a lion, or any other animal may be roasted, and consumed by fire. Whoever therefore holds, that miraculous and monstrous animals could be produced by the earth, while she was yet young, may likewise believe the rivers of milk and gold, and the other idle fictions of the poets: but let him reflect too, that even at this day many seeds of herbs and trees are contained in the bowels of the earth, as were formerly the principles of all things: yet trees of several sorts never spring out of the earth in one tree, nor different herbs from the root of the same plant.

Centaurs.] Monsters, whose upper part was like a man, and their lower like a horse: The poets feign them to be begot by *Ixion* upon a cloud: thence *Virgil* calls them *Nubigenæ*, cloud-begotten. They were indeed people of *Theffaly*, who lived near the mountain *Pelion*, and were called *Centaurs*, from *κεντήρ*, I spur, because they were the first who rid horses with spurs, and who fought on horseback. *Plin. lib. 7. cap. 56.* Now when the ignorant country-people in *Theffalia* saw men first a horseback, they imagined them and the horses to be all of a piece, and this gave rise to the fable. See *B. iv. v. 733.* *Diodorus, lib. 5. Aristotle, 2. Phys. 8. de Hist. Animal et de generat. Anim. 4. et 5. cap. 3.* deny and condemn all monstrous mixtures of this nature. And *Ovid* himself, that great patron of all manner of fables, even though he has given a relation of a battle between the *Lapithæ* and the *Centaurs*, yet upon better thoughts seems to renounce that credulity: when in *Trist. lib. 4. Eleg. 7.* he says,

— Credam prius ora *Medusæ*
Gorgonis anguineis cincta fuisse comis,
Esse canes utero sub *Virginis*: esse *Chimæram*,
A truce quæ flammis separet angue leam:
Quadrupedesque homines cum pectore pectora
junctos;
Tergeminumque virum, tergeminumque canem:
Sphyngaque et Harpyias, serpentipedesque Gigantes;
Centimanumque Gygen, semibovemque virum.

Where he seems to deny not only centaurs, but also all manner of monsters. Yet Empedocles held that there were such creatures as centaurs; and Claudius Cæsar likewise, witness Pliny, who writes, "Hippocentaurum in Thessaliâ natum eodem die interiisse; et nos principatu ejus allatum illi ex Ægypto in melle vidimus." A Hippocentaur was born in Thessalia, and died the same day: and I myself saw it, when by his command it was brought to him in honey out of Egypt. Voluterranus says, that he had seen a half dog: and others other monsters, of which Lycosthenes has made a collection in his book de Prodig. & Ostent. Sometimes women have brought forth frogs, serpents, stones, and the like, that had been generated in their womb. Such productions are indeed preternatural, and the effects of disease; but not therefore to be deemed impossible, or reckoned among the number of things that cannot be. Whether the forming faculty submits and gives way to the mother's imagination, is not our business in this place to inquire, no more than it is to decide this question: whether from the execrable and unnatural copulation of a man with a brute beast, an animal of a mixed and dubious nature may not be generated. Herodotus writes, that in his days a certain woman used publicly to couple with a goat: And Pliny, lib. 7. cap. 3. witnesses, that Alcippe brought forth an elephant: and that another, in the beginning of the Marston war, was delivered of a serpent. And the same author in the place abovesaid, mentions several other monstrous births.

Ver. 935. The Schoolmen call centaurs, and the like imaginary creatures, *entia rationis*; but they are rather *entia imaginationis*: fantastic creatures, that have no existence but in the imagination.

Ver. 946. *Scyllas*.] There were two of this name; one the daughter of Nisus, the other of Glaucus, says Faber, and Creech after him, but they seem to be both mistaken, for she was daughter of Phorcus, with whom Glaucus was in love. The Scylla of Nisus is said to have been changed into the monster of that name, whom we have described, book. i. ver. 740. and book iv. ver. 733. But Ovid Metam. lib. 8. ver. 148. says she was changed into a bird.

— At aura cadentem
Sustinuisse levis, ne tangeret æquora, visa est:
Pluma fuit: plumis in avem mutata vocatur
Cirris, et à tonso est hoc nomen adepta capillo.

Milton in the second book of Paradise Lost, describing Sin, whom he makes the portress of hell-gate, had certainly an eye on this fabulous monster: his words are these:

She seem'd a woman to the waist, and fair,
But ended foul in many a scaly fold,
Voluminous and vast; a serpent arm'd
With mortal sting: about her middle round
A cry of hell-hounds never ceasing bark'd
With wide Cerberian mouths full loud, and rung
A hideous peal: yet, when they list, would creep
If ought disturbed their noise, into her womb,

And kennel there; yet there still bark'd, and
howl'd,
Within unseen: Far less abhorr'd than her,
Vex'd Scylla, bathing in the sea, that parts
Calabria from the hoarse Trinacrian shore, &c.

Ver. 955. In like manner the poet, book iv. ver. 646 speaking of the plant which he there calls veratrum, and which our translator there calls hemlock, as he does here the plant which his author calls cicuta,

— Thus hemlock-juice prevails,
And kills a man, but fattens goats and quails.

See the note on that passage.

Ver. 958. *Chimeras*.] This ignivomous monster, that had the head of a lion, the breast of a goat, and the tail of a serpent, the poet himself sufficiently explains: and no doubt he took the description from Homer,

Πρόδ'ε λέων, καὶ ὀπίσθ'ε δράκων.

See more in the note on ver. 660. book ii. To which I here add, that Bellerophon, the son of Glaucus, king of Epire, is therefore said to have killed this monster, riding on the sea-horse Pegasus, whom Neptune had lent him, because he rendered habitable a mountain of the same name in Lycia; whose top, which was wont to throw out flames, was full of lions, the foot of it stored with serpents, and the side of it proper for the pasturage of goats. Ctesias in Pliny says, that the fire of that mountain kindles with water, and is extinguished with earth, or with hay.

Ver. 968. Lucretius, book i. v. 239. has taught, why Nature could not at the beginning create men of so vast a size,

That while they wade through seas, and swelling
tides,
Th' aspiring waves should hardly touch their
sides:
Why not so strong, that they with ease might tear
The hardest rocks, and throw them through the
air?
But because things on certain seeds depend
For their beginning, &c.

Ver. 979. Here the poet describes at large the state of man, in the beginning of the world, their manners and way of life: And first in twenty-three verses he teaches, that the first men were stronger in body than men now are, by reason of the innate hardness they had inherited and contracted from their stubborn mother the earth: whence they were less subject to diseases, and much longer lived: but no man tilled the ground, for all appeased their hunger with acorns, wildings, and other fruits like those. Next he tells us in four verses, that the springs and rivers invited them by their murmurs to come and quench their thirst: Then in eleven verses, that they had no clothes, nor houses, but that shrubs, and woods, and caves sheltered them from storms and cold: And in ten verses, that they had no laws, no societies; but lived by spoil and rapine: making use of the women in

common, whom they either forced to submit to their desires by strength and violence, or gained their consent by flattery and presents, such as acorns, pears, and apples.

Lucretius does no where say, that the first men owed their origin to stones; and our translator seems rather to allude to the fabulous reparation of mankind after the deluge, from the stones, which, by command of Themis, Deucalion and Pyrrha threw behind them: Of which Ovid, *Metam. lib. i. ver. 435.*

*Inde genus durum sumus, experiensque laborum,
Et documenta damus, quâ simus origine nati.*

Ver. 991. This passage of our author, Ovid seems to imitate in his description of the Golden Age:

*Ipsa quoque immunis, rastroque intacta, nec ullis
Saucia vomeribus, per se dabat omnia tellus:
Contentique cibus, nullo cogente creatis,
Arbutos fœtus, montanaque fraga legebant
Cornaque, & in duris hærentia mora ruberis:
Et quæ deciderant patulâ Jovis arbore glandes.*

The teeming earth, yet guiltless of the plough,
And unprovok'd did fruitful stores allow:
Content with food, which Nature freely bred,
On wildings, and on strawberries they fed;
Corneis and bramble-berries gave the rest;
And falling acorns furnish'd out a feast.

Dryden.

Ver. 995. Macrobius, *lib. vi. Sat. cap. i.* observes, that Virgil has imitated this passage of Lucretius, when describing his happy countryman, he says,

*Quos rami fructus, quos ipsa voluntia rura
Sponte tulere suâ, carpsit.*—

Georg. ii. ver. 500.

He feeds on fruits, which, of their own accord,
The willing ground, and laden trees afford.

Dryden.

Ver. 997. For the chief food of the first men was acorns: Whence Virgil, *Georg. i. ver. 147.*

*Prima Ceres ferro mortales vertere terram
Instituit: cum jam glandes atque arbuta sacra
Deficerent silvæ, & victum Dodona negaret.*

Where, though the poet says, that the woods failed them, and no longer afforded them acorns, yet it is more probable, that they contemned the use of acorns, when they had discovered the art of sowing corn: Thus Juvenal, speaking in the person of the old Marfians and others, *Sat. xiv. ver. 180.*

—Panem quæramus aratro,
Qui satis est mensis; laudant hoc numina ruris,
Quorum ope et auxilio, gratæ post munus aristæ
Contingunt homines veteris fastidia quercûs.

Ver. 998. Lucret.

—Quæ nunc hiberno tempore cernis
Arbuta Pœniceo fieri matura colore.

Arbutum is the fruit of the tree called arbutus, the arbutus-tree, a plant frequent enough in Italy; it has the leaves like those of a bay-tree, but growing very thin, and bears a fruit as big as a middling plum, red like a cherry, or rather strawberry, because of its roughness, Pliny, *lib. xv. cap. 24.* calls the fruit of this tree, "Poma inhonora," apples of no value: and indeed though they have a certain sweetness, they are sour withal, and unpleasant to the taste, as well as hurtful to the head and stomach. The ancients delighted much in the shade of this tree. Horat. "Nunc viridi membra sub arbuto stratus." Pliny calls the fruit of this tree "unedines, because, says he, we cannot eat above one of them, by reason of their asperity and sourness. But he is mistaken in making the unedo and the arbutum to be one and the same thing: The first of them is the fruit of the epimelis, which some interpret to be a sort of medlar-tree. But the arbutum of the Latins, and which the Greeks call Memæcydon, is the fruit of the tree, which the Latins know by the name of Arbutus, and the Greeks by that of comarus. Thus Galen, *lib. ii. Aliment.* plainly distinguishes between the unedo and the arbutum, ascribing the first to the epimelis, the later to the comarus, or arbutus. Thus Dalecampus in *lib. prim. Plin.* argues that author of error.

Ver. 1008. Oldham,

Hard by, a stream did with such softness creep,
As 't were by its own murmurs hush'd asleep.

And the author of *Hudibras,*

Close by a softly murr'ring stream,
Where lovers us'd to loll and dream.

Ver. 1009. The nymphs were fabled to dwell in caves and dens. Of them see book iv. *ver. 589.*

Ver. 1014. Lucret.

—Neque uti

Pellibus, & corpus spoliis vestire ferarum:

For, as the poet will teach by and by, the first coverings men wore, were the skins of wild beasts they killed in hunting.

Ver. 1026. This observation is the translator's, not his author's, who, I believe, would scarce have said so. The presents Lucretius mentions, were of the greatest value in those days: therefore the price was not less than now.

Ver. 1027. These robust unpolished mortals spent all their time in hunting wild beasts, whom they pursued with stones, clubs, and such like weapons: And when they were either weary of killing them, or that night came on, they rolled themselves up in leaves and grass, and slept contented, and with a quiet mind; for they did not dread, what the Stoics foolishly believed of them, when night had involved the world in shade, that night and day would never return, because they had observed that vicissitude from the first beginning of day and night: This is contained in fifteen verses. In the thirty-one verses following, the poet goes on: But, says he, this life of theirs was vexed

with some inquietudes: the wild beasts surpris'd them, when they were sleeping; and then a sudden death was their portion, or a tedious and painful life, by means of their festering wounds; for they knew not yet the healing virtue of simples: Famine killed many, and more the venomous herbs they ignorantly fed on. But that none may think, that all mankind was, by so many ills and mischiefs as beset them, involved in one common ruin, and totally destroyed; let it be considered, that the wild beasts devoured them only one by one, and that few died by poisonous herbs, or for want of food, in comparison of the many thousands that fall in a day in our armies: Besides, what numbers are now swallowed up in the sea; how many die by poison, how many by intemperance and luxury?

Ver. 1036. Manilius is of another opinion, lib. i. ver. 66. where, speaking of the first inventors of arts, he says:

Nam rudis ente illos, nullo discrimine vita
In speciem conversa operum ratione carebat,
Et stupefacta novo pendebat lumine mundi:
Tum velut amissis mœrens, tum læta renatis
Sideribus, variosque dies, incertaque noctis
Tempora, nec similes umbras jam sole regresso,
Jam propiore, suis poterat discernere causis.

Before that time life was an artless state,
Of reason void, and thoughtless in debate:
Nature lay hid in deepest night below;
None knew her wonders, and none car'd to know:
Upward men look'd, they saw the circling light,
Pleas'd with the fires, and wonder'd at the sight:
The sun, when night came on, withdrawn they
griev'd,
As dead; and joy'd next morn when he reviv'd:
But why the nights grew long or short; the day
Is chang'd, and the shades vary with the ray,
Shorter at his approach, and longer grown
At his remove, the causes were unknown.

Greech.

And with Manilius agrees Statius, Thebaid iv. where, speaking of the primitive Arcadians, he says:

Hi lucis stupuisse vices, noctisque feruntur
Nubila, & occiduum longè Titana secuti
Desperasse diem.—

And Dracontius in Hexamēr.

Nec lucem remeare putat terrena propago;
Ast ubi purpureum surgentem ex aequore cernunt
Luciferum, vibrare jubar, flammæque ciere,
Et reducem super astra diem de sole rubentem;
Mox revocata sovent hesternæ in gaudia mentes,
Temporis & requiem noscentes luce diurnâ
Cœperunt sperare diem, ridere tenebras.

And the learned Selden, de Diis Syris, Syntagm. 2. confirms their opinions, and believes the original of the festivals, which the ancients instituted in honour of Adonis, to have sprung from no other ground. His words are these: "Non aliud cogitarunt; qui primum has nantias instituerunt, quam solis accessum & recessum: Quem ut amissum nunc lugebant, & renatum lætis excipiebant auspiciis. Ita rudiores olim, & qui simpliciore vitam degebant, prius quam ab Astronomis leges siderum didicerant."

Ver. 1053. Lucret.

Viva videns vivo sepeliri viscera busto:

Upon which Faber observes, that Dionysius Longinus blames an expression like this, in Georgias Leontinus, who calls vulturs, the living sepulchres of men, *γύπτες ἐμψυχον τάφοι*. However, he excuses Lucretius, though he condemns not the censure of Longinus: For, says he, Georgias was a rhetorician, in whose art such descriptions ought never to find place, though in poetry they have much of the sublime.

Ver. 1056. This verse is the translator's, not the poet's.

Ver. 1057. Lucret.

Expertes opis, ignaros, quid vulnera vellent.

i. e. They knew not yet the art of medicine, and were ignorant of the remedies, requisite to heal their wounds.

Ver. 1059. This and the following verse run thus in the original.

Donicum eos vitâ privârunt vermina sæva.

Festus says, that "vermina" signifies the wringing of the guts, when we feel a pain, as if worms were gnawing them: The Greeks call it *ερεψις*. But perhaps "vermina" may here signify very worms, that might be engendered in their rankling and corrupting wounds; if so, our translator is so far in the right; but how well their making a passage for the soul to fly away, agrees with the doctrine of Epicurus, the reader need not be informed.

Ver. 1061. They had yet no wars; but were wholly ignorant of the cruel arts of destroying one another: And as Ovid says, Metam. i. ver. 97.

Nondum præcípites cingebant oppida fossæ:
Non tuba directi, non æris cornua flexi,
Non galeæ, non ensis, erant: sine militis usu
Mollia securæ peragebant otia gentes.

No walls were yet, nor fence, nor moat, nor mound;

Nor drum was heard, nor trumpet's angry sound:
Nor swords were forg'd: But, void of care and crime,

The soft creation slept away their time.

Ver. 1063. Thus too Ovid, Metam. i. ver. 94.

Nondum cæsa fuis, peregrinum ut viseret orbem,
Montibus, in liquidas pinus descenderat undas:
Nullaque mortales, præter sua littora nôrant.

The mountain trees in distant prospect please,
Ere yet the pine descended to the seas;
Ere tails were spread new oceans to explore,
And happy mortals, unconcern'd for more,
Confin'd their wishes to their native shore.

And Manilius, lib. i. ver. 76.

Immotusque novos pontus subduxerat orbes :
Nec vitam pelago, nec ventis credere vota
Audebant, sed quisque satis se nosse putabat.

— None resign'd

Their lives to seas, or wishes to the wind ;
Confin'd their search ; they knew themselves a-
lone,
And thought that only worthy to be known.

Ver. 1068. For, as Seneca in *Medea* says,

Audax nimium qui freta primus
Rate tam fragili perfida rupit ;
Terrasque suas post terga videre,
Animam levibus credidit austris, &c.

Which the tragedian took from Horace, *Od.*
i. 3.

Illi robur et æs triplex
Circa pectus erat, qui fragilem truci
Commisit pelago ratem
Primus ; nec timuit præcipitem Africum, &c.

Thus rendered by Dryden,

Sure he who first the passage try'd,
In harden'd oak his heart did hide,
And ribs of iron arm'd his side :
Or his at least, in hollow wood,
Who tempted first the briny flood :
Nor fear'd the winds contending roar,
Nor billows beating on the shore ;
Nor Hyades, portending rain,
Nor all the tyrants of the main ;
What form of death could him affright,
Who, unconcern'd, with stedfast sight,
Could view the surges, mountain steep,
And monsters, rolling in the deep ?
Could through the ranks of ruin go,
With storms above, and rocks below ?
In vain did Nature's wife command
Divide the waters from the land,
If daring ships, and men profane
Invade th' inviolable main ;
Th' eternal fences overleap,
And pass at will the boundless deep.
No toil, no hardships can restrain
Ambitious man, inur'd to pain ;
The more confin'd, the more he tries,
And at forbidden quarry flies.

Ver. 1069. "*Penuria cibi*:" want of food.
The next verse is a thought of our translator's, not
of his author's.

Ver. 1073. We have hitherto seen only men,
who were wild and savage, who wandered in the
woods, and lived by spoil and rapine : but others
now enter upon the stage, who are mild, gentle,
and studious of civil life. For by this time, says
the poet, in ver. 20. that temperature and calm-
ness of the air which reigned when the world was
in its infancy, remained no longer ; but sometimes
piercing cold, and sometimes scorching heat, to-
gether with storms and tempests, persecuted man-
kind. Those hardships and inconveniencies weak-
ened them by degrees, and forced them to the

contrivance of building themselves huts and
houses, to shelter their bodies from the inclemen-
cies of the seasons. They dwelt in these new
abodes, one man confined to one woman, and
were blessed with a numerous offspring, whose in-
fant smiling innocence softened the rigid sourness
of their parent's temper, and changed their innate
sullen roughness into calmness and affability. Af-
ter this, having found out the use of fire, they
became so tender, that, unable to endure any lon-
ger their primitive nakedness, they made them-
selves clothes of the skins of beasts ; and grew so
civilized in time, that they entered into friend-
ships and societies, insomuch that they who were
desirous to be safe themselves, found it their best
way to abstain from doing injuries to others.
Thus concord preserved mankind.

Ver. 1074. Diodorus Siculus, lib. i. says, that
the poets feigned Hercules to be clothed with the
skins of beasts, and that he is painted too in that
garb, to put posterity in mind of this ancient way
of dress of our first fathers.

Ver. 1081. Lucret.

— Puerique parentum
Blanditiis facile ingenium fregere superbum.

i. e. the children, by their harmless innocent
smiles, easily softened the roughness of their pa-
rent's temper. This passage can have no other
interpretation, though Creech makes it say quite
the contrary.

Ver. 1083. They who endeavour to disgrace
religion, usually represent it as a trick of state,
and as a politic invention to keep the credulous
in awe, which, however absurd and frivolous, yet
is a strong argument against the Atheist, who
cannot declare his opinions, unless he be a rebel,
and a disturber of the commonwealth. The cause
of God, and his Cæsar are the same, and no af-
front can be offered to one but it reflects on
both ; and that the Epicurean principles are per-
nicious to societies, is evident from the account
they give of the rise of them. First, then, we
must imagine men springing out of the earth,
as from the teeth of Cadmus his dragon (" *fratres
fungorum, et tuberum*," as Bias called the
Athenians, who counted it a great glory to be
Ἀνίσχοντες), and like those too fierce and cruel ;
but being softened by natural decay, and length
of time, grew mild ; and weary of continual
wars, made leagues and combinations for mu-
tual defence and security ; and invested some
person with power to overlook each man's ac-
tions, and to punish or reward those that broke
or kept their promises. Now, if societies began
thus, it is evident that they are founded on in-
terest alone, and therefore self-preservation is the
only thing that obliges subjects to duty ; and
when they are strong enough to live without the
protection of their prince, all the bonds to obe-
dience are cancelled, and mutiny and rebellion
will necessarily break forth ; for we all know
how ambitious every man is of rule, how passion-
ately he desires it, and how eagerly he follows it,
though ten thousand difficulties attend the pur-

suit. What if he break his promise, recal his former consent, and act against the law that was founded on it? Why need he be concerned, if he has got the longest sword, and is above the fear of punishment? Will not a prospect of a certain profit lead him on to villany? And why should his conscience startle at wickedness that is attended with pleasure? Since all the Epicurean virtues are nothing but fear and interest, and the former is removed, and the latter invites. It is true, as Lucretius says, strange discoveries have been made, and Plutarch gives us very memorable instances. Plots have been defeated, but as many proved successful: and how weak that single pretence, how insufficient to secure government, is evident from the daily plots and contrivances, murders, and treasons that disturb us; though all the terrors of religion join with these fears, and endeavour to suppress them. And, therefore, these opinions are dangerous, and destructive of societies, and, as Origen says of his purgatory fires, ἐκ ἀκίνδανον τὴν τῶν τοιούτων σφαίρειαν πιστεῖναι γραφῇ, ὅτι τῶν πολλῶν ἡ χρηζόντων πλείονος διδασκαλίας παρὰ τὴν περὶ τῆς κατὰ τῶν ἀμαρτανόνων κολάσεως: εἰς γὰρ τὰ ὑπέρκεινα αὐτῆς ἡ χρησίμων ἀναβαίνειν διὰ τῆς τῆς μόγις φόβῳ αἰωνία κολάσεως καὶ συγγιλλοῦσας ἐπὶ πόσον τῆς κακίας, καὶ τῶν ἀπ' αὐτῆς ἀμαρτανόνων χύσιν. Others, though pretending to better principles than those of Epicurus, yet are altogether as faulty in stating the rise of power, and more absurd: for his opinion is agreeable to his other positions, but theirs contradict the creation they assert, and the providence they allow; I mean those that declare the people to be the spring and fountain of power, and that from their consent all the authority of the government is derived. Sure these men never considered the relation betwixt God and his creatures; and what an absolute dominion he has over those to whom he first gave, and still continues, being. But let us look on man under that circumstance, and then how naked, how divested of all power will he appear? How unable to dispose of himself, and submit to the laws of his fellow free agent? Unless he endeavours, as much as is possible, to disown the right of the Deity, and turns rebel against the authority of his being. For how can any one submit himself to another, without the express permission of him that has absolute dominion over him? And where is that permission? Is it founded on reason or scripture? Does benevolence, or self-preservation, the two proposed motives to society, speak any such thing? And does not scripture expressly oppose this opinion? Well then, all power descends from above; it is the gift of that being to whom it principally belongs, and ἐκ τοῦ Διὸς βασιλῆς, kings are from God, is true, both in the account of the sober heathen, and good Christian: and, therefore, every king that ever was, or is, whether he obtain the crown by succession, or election (except the Jewish), must be acknowledged absolute. Liberty and property of the subjects depend on his will, and his pleasure is law; for none can confine or limit that power which God bestows, but himself: and,

therefore, to prescribe laws to the governor, to choose or refuse him on certain conditions, is to invade the prerogative of Heaven, and rebel against the Almighty. Thus when God designed to limit the power of the Jewish monarchy, he prescribes laws himself; but since he hath not fixed any to other princes, every king, as such (for I do not respect their particular grants to the people, which they are bound to observe), is absolute.

To free this from all exception, it must be considered, that the discourse is concerning the origin of power, which is now settled in some persons, and by which communities are governed. The Epicureans act very agreeably to their impious principles, when they make fear and distrust the only motives to agreement, and the pacts which the scattered multitude agreed to be the foundation of the power of the prince; it being impossible for them, who had excluded Providence, to find any other original. But this opinion, as delivered by them, depending upon their other absurd and impious philosophy, must be weak and irrational; yet still this notion is embraced, though not upon the same motives; faction and ambition propagate that error, which was nothing else but innocent ignorance in the ancients. They considered man as single, unable to live with security or comfort, because his fellows, either out of pride, lust, or covetousness, would endeavour to rob him of his enjoyments, and his life too, if it hindered them in the prosecution of their wishes; thus they saw a necessity of government, and because it proceeded from man's natural imperfections, they thought him, that by his wisdom, or his strength, was most fitted for the defence and preservation of others, to be as it were a lord by nature, and born a sovereign. Thus Plutarch, ὁ πρῶτος καὶ κυριώτατος νόμος τῷ σώζεσθαι δεομένοι τὸν σώζειν δυνάμενον ἀρχοῦν κατὰ φύσιν ἀποδίδωσι. It is the first and most fundamental law, that he that is able to protect, is a king by nature to him that needs protection. Thus historians make the election of the first kings to be for their strength, their wisdom, or their beauty: and Aristotle peremptorily determines, that the barbarians are slaves by nature to the Greeks. This was innocent enough in them, but how can we be excused, who have such perfect knowledge of a creation, who hear Wisdom proclaim, that by her kings reign, who made it an article in Edward the VIth's time, and now every day in our public prayers confess, that God is the only ruler of princes? From whence it is necessarily inferred, that he only bestows the power, for if it came from the multitude, what is more evident, than that they could make what conditions they pleased, subject them to a high court of justice, and call them to account, if they act contrary to their pleasure? It being certain, and confirmed by common practice, that he that voluntarily parts from his right, may do it on what terms he thinks fit: Now, if it be certain (and demonstration proves it) that God is the alone giver of powers, if the prince be, as Plutarch and Menander say, ἡγεμὼν

ἑμψυχος Θεῷ, a living image of the Deity, if, as Pliny, "qui vice Dei erga hominum genus fungeretur," and every king, whether elective or successive, rules by the same authority, as it is certain they do, because both have power, and the people can give them none; then what is more certain, than that all kings, which way soever they are enthroned, before they have made any grants to their people, are absolute? And that their pleasure is law, for otherwise there could be none, that liberty and property depend upon their will.

Nam propriæ telluris herum neq. me, neq. illum,
Nec quenquam statuit natura.——

Nor does nature provide more privileges for one than another. And if the principles are true, and the inference naturally follows, as it does, because the people, that cannot bestow the power, have no right to make conditions for its exercise, and set limits how far it shall extend, and make such and such agreements for the admission of the prince; what harm is there in this innocent truth? For we discourse only of kings as they first are, without any reference to such and such particular communities, where they have been pleased to limit themselves; to grant privileges to their subjects, and settle property, and confirmed all this with oaths, and engaged their royal word, and promise before God and man for their performance.

I suppose it is granted on all hands, that the king is supreme, that upon any pretence whatsoever it is treason to resist; and so there can be no fear of punishment, no tie upon the king but his his own conscience; "sufficit quod Deum expectet ultorem;" yet though the law cannot punish, it can direct: though it is not a master, it is a guide, and such a one, as, because of his oath, he is bound to follow: For though the people cannot, he can limit himself; for being a rational creature, and intrusted with power, without any particular rules for the guidance of it; his reason is to be his director, and, therefore, according to the tempers and particular humours of the people, he may make laws, settle maxims of government, and oblige himself to make those his measures, because his reason assures him, that this is the best method for the preservation of the society, the maintenance of peace, and obtaining those ends, for which he was intrusted with this power.

And since princes must die, and government being necessary, succession is equally so; and therefore it may seem that every prince, owing his power only to the same original from which the first derived it, is at liberty to confirm such and such privileges and immunities, which his predecessors have granted; yet upon a serious view of the premised reason, no such consequence will follow; for since the predecessors have found these laws agreeable to the tempers of the people, and the only way to preserve the peace, it is evident that those are rational, and since he is to use his power, according to right reason, there is an antecedent obligation on him to assent to those laws;

and make those the measures of his government; unless some extraordinary case intervenes, which requires an alteration of those laws, and then that method of abrogating old, and making new ones is to be followed, which constant experience hath found rational. And since a prince cannot be bound by any ties but those of conscience, this opinion leaves all the obligations possible upon him.

Ver. 1093. But it may reasonably be asked, how leagues could be made, and societies established among men who perhaps indeed could think, but had not yet learnt to utter their thoughts? To this Lucretius answers, that the first men were conscious to themselves of their own powers and natural faculties; and that they uttered several sounds, as each object that they saw, or as any thing that they felt, caused in them either fear, joy, pain, grief, pleasure, &c. For nature herself compelled them to this; and therefore horses, dogs, birds, in short all animals that have breath, do the like: And thus man too at first stammered only imperfect and inarticulate sounds. But no commerce was yet established, they had no mutual communication with one another: Nor indeed could any such thing be, till names were given to things: Every man therefore perceived, that it would be useful to himself and others, to agree upon a certain name for each thing. Thus all, who were entered into one society, agreed among themselves upon the same names of things: And thus the usefulness of things by names, gave occasion for the invention of words. But for any to pretend, that one man gave names to all things, is wretchedly absurd and foolish. This disputation Lucretius has in sixty-three verses.

Scaliger, in the first book of his Poetic. chap. I. observes, That as all our actions, so speech too is to be considered under three different heads: I. As absolutely necessary: II. As useful: III. As delightful. The first kind was that which served as a necessary means of intercourse between man and man, barely to understand one another's meaning: And such we may imagine to have been that manner of speech, which Lactantius de vero Cultu cap. 10. mentions, and which men, according to the opinion of some of the ancients, used in the beginning of the world, when, as some believed, they only gesticulated their thoughts, and spoke their meaning by signs and nods. After which, as the same author says, and before him Diodorus Siculus, lib. I. they made essays of language, by imposing distinct nominal notes, or names upon several things, and thus by degrees they made a kind of speech. Thus too Horat. lib. I. Serm. 3.

Quum prorseperunt primis animalia terris,
Mutum & turpe pecus,——
Donec verba, quibus voces sensusque notarent,
Nominaque invenêre.——

The second sort of speech, says Scaliger, was a little more refined and polished, by being adapted and made fit for use and convenience; and by

applying, as it were, certain dimensions, prescriptions, and lineaments to the first rude sketch of language; whence proceeded a certain law and rule of speaking: The third sort was yet more polite, there having been added to the former the ornament of elegancy, as its dress and apparel. Thus Scaliger, of speech in general.

Ver. 1106. Here Lucretius seems to fall foul upon the chronologer of the Holy Scripture, by denying that names were given to things by the first man: but those writings were perhaps unknown to our poet, and he chiefly disputes against the opinions of Pythagoras and Plato; man, says Iamblicus de sect. Pythagor. was created the most wise and knowing of all animals, capable to consider things, and to acquire knowledge from them; because God had imprinted and bestowed upon him the plenitude of all reason, in which are contained all the several species of things, and the significations of all their names, and of all words: Plato in Cratylus will not allow, that any one gave names to things, but that they received their names from the wisest and most learned of men, whom he calls *ὀνομαστικῶν*, and *ὀνομαστικῶν*, the makers and imposers of names, in the giving of which, says he, the highest wisdom manifestly appears; and Cratylus adds, that no man could do it, but they, who reflecting on the nature of things, were able to judge of them, and to accommodate, and give to each thing a name, suitable to, and expressive of, its nature; Lucretius was aware of this, and therefore inquires in these four verses, How this great knowledge came to be in the first nomenclator, and denied to the rest of mankind: how should one man, says he, be able to give names to things, and not another? The answer is ready; though it will appear of no weight to Lucretius, who will not believe the creation of one man only from whom all the rest have descended; nor, that when names were first given to things, there was yet but one man in the world: and why might not that first parent of mankind, whom God had infused with knowledge, ("Creavit Deus scientiam in animo, sensu implevit eum, & mala & bono ostendit illi, addiditq. disciplinam." Eccles. cap. 17.) Why might he not, I say, being thus instructed, impose names on things? And that too then especially, when this new created monarch, on the festival of his inauguration, called all his subject animals by their names: "appellavitque Adam nominibus suis cuncta animalia;" says the sacred chronologer, Genes. iii. Which text of holy writ, Eusebius, Preparat. Evangel. lib. xi. cap. 4. reciting, says, that Moses meant nothing else by it, than that a name was given to each thing, agreeable and suitable to its nature. And since the nature of man is prone to learn, and greedy of knowledge, why might not the rest of men, who came afterwards into the world, and conversed with that first giver of names, willingly retain them in their memory, as they received them from him? from him, I say, who, not like mute animals, could express only his own affections, his own desires; but likewise knew and expressed the nature and manners of others.

But of the original of human speech, see Laërt. lib. x. Diodor. Sicul. lib. i. sub initium, & Plato in his Cratylus.

Ver. 1110. That is to say, if any one man could impose names on things, another might, at the same time, do the same thing.

Ver. 1111. In these ten verses the poet asks; how that first nomenclator could compel the rest of men to learn from him what they were to say; and to retain in their memory the words he had invented, and the names he had given to things? this argument is of little validity: for, besides, as we said before, that the nature of man is prone to learn, and desirous of knowledge, we know that children easily accustom themselves to pronounce and speak by degrees the words they hear spoken by their parents, nurses, and others that are about them. The child, who had been brought up by goats, and never in his life heard a human voice, bleated like that animal, and spoke only the language of goats. Even parrots, pies, starlings, &c. when they are taught, learn to pronounce human words articulately, merely by their own industry; and we observe them conning over by themselves, and softly muttering the lessons that have been taught them: Plutarch de Animal. Compar. makes mention of a magpie he had seen at a barber's shop at Rome, that sung no less than nine different tunes, observing the due time and measure in all of them. What wonder then, that, man, a creature endowed with reason and understanding, should learn to imitate the words of his fellow-creature?

Ver. 1121. Here the poet in ver. 35. says, that it is not surprising, that any man, to whom nature had given a tongue and a voice, could, as he thought fit, and according to the various knowledge he had conceived of the great variety of things, distinguish and mark each of them by a proper name; especially since even mute animals can, and do express the different passions and affections, by different voices and sounds: for they declare and signify their pain and pleasure, and the other affections, that are subject to those two, by inarticulate indeed, but unlike and various sounds. Why then may not any man mark and denote different things by different names? but this is not what was done by the first imposer of names? for he not only expressed his own affections; but the proper nature, and genuine manners of others, by virtue of the divine gift, the knowledge which the Almighty had infused into him.

Ver. 1123. For, as Faber on this passage observes, if the names themselves gave any knowledge, *τῶν φύσεων*, of the natures and qualities of the things that are called by them; and if upon the bare pronunciation of three or four syllables, any particular notes were obtained, that indeed would deservedly claim our admiration; but since it depends only upon use, and that use upon chance, convenience, and sometimes on the temerity and ignorance of the meaner and illiterate part of mankind, Lucretius is in the right to say, that there is no wonder in it.

Ver. 1125. Sextus Empiricus, lib. xi. Pyrrhon.

Hypotyp. seems to be of opinion, that birds and brute beasts have a particular language according to their different kinds; and with him agrees Lactantius, and says, that speech is proper to man; and yet we may observe in birds and beasts a certain similitude of speech, and that too, different upon different occasions: To us, indeed, their voices seem imperfect and inarticulate; and so too perhaps do ours to them: but their voices utter words to themselves, because they understand them. "Proprius homini sermo est; tamen et illis quædam similitudo sermonis: Nam et dignoscunt invicem se vocibus; et cum irascuntur, edunt sonum jurgio similem; et cum se ex intervallo videre, gratulandi officium voce declarant: Nobis quidem voces eorum videntur inconditæ, sicut illis fortassè nostræ; sed illis, qui se intelligunt, verba sunt." Lactan. de Irâ Dei. cap. vii. And the credulous ancients firmly believed, that magicians understood the languages of birds. And Porphyry assures us, that Apollonius Tyanæus could expound the notes of swallows; or, as Philostratus says, the chirping of sparrows. Tiresias likewise is renowned for his knowledge in the languages of birds. Apollon. Rhodig. lib. iii. mentions one Mopsus, who understood the languages of crows and daws. Pliny, lib. x. cap. 49. relates of Melampus, that he was instructed to interpret the tongues of birds by a serpent, that came to him, and licked his ears. But of this, even he himself seems to question the truth; nor does he give much credit to what he reports of Democritus, who said, that the blood of several birds, mixed together and corrupted, will produce a serpent, of which whoever eats, "intellecturus sit avium colloquia," will understand the discourse of birds. That the soothsayers drew their divinations from the voices of birds, as well as from their flight, is notorious. Virgil, *Æn.* iii. ver. 359.

Trojugena, interpres Divûm, qui numina Phœbi,
Qui tripodas, Clarii lauros, qui sydera sentis,
Et volucrum linguas, et præpetis omina pennæ:

And the birds, from whose voice they took their auguries, were called "oscines," from "os et cano," singing with the mouth: and these were crows, ravens, pies, and the like: as the others, from whose flight the divined future events, were called *præpetes*, from *προνήμιος*, flying before, as vultures, eagles, &c. But besides all this, we may produce the authority of some of the Jewish doctors, who affirm Solomon to have been learned in the languages of birds: Nay, they say, that he sent a message by a certain bird, to the queen of Ethiopia; who must therefore be thought to have been as knowing in the language of birds as himself. And in the Alcoran, he is made to say, "O homines, intelligite avium eloquentiam." And from the same authority we learn, that a lapwing, or a bird called a houp, brought him the first news of the queen of Sheba: Of which notice is taken in the Prolegom. in Bibl. Polyglott. But Delrius denies, that either birds or beasts can use discourse, because they are void of reason; yet he confesses, that they have certain indications, or ex-

pressive sounds, by which they reveal and make known their affections and appetites; and which men by long observation, may come to understand. He adds, that these indications of theirs are perfectly known to the devil, and that he may instruct magicians to know them as well as himself; which, whether he ever did or not, says he, I cannot tell; but, "non est incredibile fecisse," it is not incredible but he has. Delrius. *Disquis. Mag.* lib. ii. cap. 19.

Ver. 1149. Crows are said to prognosticate the change of weather, either to fair or foul; and to give notice of each by their different croaking. If they croak often, and with a hoarse voice, it is a sign of rain. Virg. *Georg.* i. ver. 381.

—————Et è pastu decedens agmine magno
Corvorum increpuit densis exercitus alis.

And ver. 388.

Tum cornix raucâ pluviâ vocat improba voce,
Et sola in siccâ secum spatatur arenâ.

But if they croak not above three or four times, and with a shrill and clear voice, it betokens fair weather. Thus Virgil, in the same *Georgic*, ver. 410. speaking of fair weather, says, that

Tum liquidas corvi presso ter gutture voces
Aut quater ingeminant: et sæpe cubilibus altis
Nescio quâ præter solitum dulcedine læti.
Inter se foliis strepitant: juvat imbribus æstis
Progeniem parvam, dulcesque revivere nidos.

See the note on ver. 39. book vi.

Ver. 1156. He has before made mention of fire, ver. 1073. He now teaches, in fifteen verses, that fire was either thrown down to earth by thunder; or that the trees, being rudely shaken by stormy winds, and their branches growing hot by frequent striking and dashing against one another, burst out at length into flames, and first gave fire to men, who used it to dress their meat, having observed that the heat of the sun ripened and brought their fruits to maturity, and made them more fit for their service. And thus another way of life, and change of food, invented by witty luxury, was first introduced.

Caneparius de Atramentis, cap. 13. reckons up six several ways, by which fire may be generated and kindled, viz. "propagatione, putredine, coitione, antispasi, frictione et percussione:" by propagation, corruption, coition, antispasi, or contrary revulsion, friction and percussive; which, nevertheless, he reduces to these three kinds, propagation, coition, and motion, in which the other ways are included. For corruption and revulsion to the contrary kindle fire, by compelling the dispersed heat to unite together, and therefore fall under the head of coition; as friction and percussive do under that of motion.

Ver. 1160. This, if we may believe some authors, happened often formerly in Hungary. And Lucretius has already made mention of trees taking fire by collision, book i. ver. 902. See the note on that place. Moreover, Vitruvius, lib. iii.

cap. 1. ascribes the original of our culinary fire to this accident of trees taking fire in a tempest. His words are as follow: "Ab tempestatibus et ventis densæ crebritatibus arbores agitatae, et inter se terentes ramos, ignem excitaverunt:" Which the ancients having observed, took from thence the first hint of the invention of their igniaria; for their way of getting fire was by rubbing one stick against another, till being heated, they caught fire, which they fed with dry leaves, or some other matter, that was easily combustible. Virgil, *Æn.* i. ver. 179.

Suscepitque ignem foliis, atque arida circum
Nutrimenta dedit.

And these dry nourishments, says Turnebus, in his notes on Theophrastus de Igne, they called *ισχάλα*, i. e. focus; or, according to the Scholiast of Apollonius, *σπίλον*, i. e. strator; which we may compare with our tinder. The other parts, which were the sticks, they called *τέρετρον*, i. e. terebrum, and they served instead of our flint and steel. The trees, that are most subject to take fire in this manner, are said to be the fig-tree, laurel, oak, holm, tile-tree, ivy and vine; but above all the laurel. And if we may give credit to Manilius, fire may be got almost out of every thing.

Sunt autem cunctis permixti partibus ignes;
Qui gravidas habitant fabricantes fulmina nubes;
Et penetrant terras, Ætænamque imitantur Olympo,
Et calidas reddunt ipsis in fontibus undas:
Ac filice in durâ, viridique in cortice sedem
Inveniunt, cum sylva sibi collisa crematur,
Ignibus usque adeo natura est omnis abundans.

Lib. i. ver. 850.

Which our translator thus renders:

Fire lies in ev'ry thing; in clouds it forms
The frightful thunder, and descends in storms:
It passes through the earth, in Ætna raves,
And imitates heav'n's thunder in its caves:
In hollow vales it boils the rising floods;
In flints 'tis found, and lodges in the woods;
For, toss'd by storms, the trees in flames expire,
So warm are Nature's parts, so fill'd with fire.

Greech.

Ver. 1171. In these thirty verses, he tells us, that to provide the better for their common safety, they gave the sovereign power to one man, to whom nature had given to excel in beauty, wit, or strength; and had thus herself declared him a king. This monarch fell to building of towns and towers, to defend himself and his subjects from the insults of their enemies. He governed them at will; every thing was done that he commanded, and,

O happy mankind under such a prince!

But avarice and ambition soon corrupted and overthrew all things. And such is the condition of princes, even at this day, that whosoever values his ease and quiet, and desires to live happily, will, if he be wise, avoid the administration of public affairs; for the sovereign authority is hard to gain,

and harder to keep. Instead of pleasures, it brings cares and troubles; it is always tottering and inconsistent; always attacked by ambition and envy, and often thrown down by conspiracy.

Ver. 1174. Thus too Ovid. *Metam.* i. ver. 135.

Communemque prius, ceu lumina solis et auras,
Cautus humum longo signavit limite mensor.

Then land-marks limited to each his right,
For all before was common as the light. *Dryd.*

Ver. 1178. It was the custom formerly in many countries to choose their kings for the beauty and majesty of their persons. This Aristotle, lib. 1. de Rep. reports to be true of the Ethiopians; who, says he, when they observe any one, who, in his looks, resembles the images of their gods, immediately conclude, that he was born to rule over others. And Xenophon in *Symph.* says, that beauty is something that nature herself has stamped with royalty. Heliogabalus, though but a boy, was chosen emperor by the Roman soldiers at first sight of him; as if he had had what Euripides calls *Ἔδος ἄξιον τυραννίδος*, a countenance that deserved a kingdom. Thus Dryden:

Manly majesty
Sate in his front, and darted from his eyes,
Commanding all he view'd.

And in another place:

Eyes that confess'd him born for kingly sway;
So fierce they flash'd intolerable day.

And Virgil seems to have had something like this in his thoughts, when he describes the difference of look between the lawful king of the bees, and the usurper; of which description, that this note may not stretch too long, I will omit the original, and give only Dryden's translation:

With ease distinguish'd is the regal race:
One monarch wears an open, honest face,
Shap'd to his size, and godlike to behold,
His royal body shines with specks of gold,
And ruddy scales: for empire he design'd,
Is better born, and of a nobler kind:
That others look like nature in disgrace:
Gaunt are his sides, and sullen is his face.
And like their grisly prince appears his gloomy
race.

To which I will only add, that *Θεοεικὴς*, like a god, is often used by Homer as an epithet for a beautiful person.

For as Varro Margop. says very well:

Qui pote plus viget, pisces ut sæpe minutos
Magnu' comest; ut aves enecat accipiter.

Thus Horace, Sat.

Omnia enim res,
Virtus, fama, decus, divina, humanaque pulchris
Divitiis parent, &c.

And Ovid:

Aurea sunt verè nunc sæcula ; plurimus auro
Venit honos.—

And the author of Hudibras in two words,

For money is the only pow'r,
That all mankind falls down before.

Ver. 1187. Who, that reads these lines, can believe that Epicurus was an epicure: he believed that a wise man cannot be poor: because he lives content with what he has: and thinks it enough, even though it be but little: he placed indeed the chief happiness of life in pleasure; and what he meant by pleasure, let Cicero teach us: "Negat Epicurus jucundè posse vivi, nisi cum virtute vivatur: negat ullam in sapientem vim esse fortunæ: tenuem victum antefert copioso, &c." Tuscul. Quæst. lib. 3. And Laërtius tells us, that Epicurus was often inculcating into his hearers, parsimony, continency, sparingness of food, and equanimity, or easiness and content of mind in all states and conditions: whence he had often in his mouth this saying, ἡδίστα πολὺν χρόνον ἀπολαύσασιν οἱ ἐκάσι ταύτης δόμοι.

Thus too Dryden in the Wife of Bath's tale after Chaucer;

Content is wealth, the riches of the mind,
And happy he, who can the treasure find:
But the base miser starves amidst his store,
Broods on his gold, and griping still at more,
Sits sadly pining and believes he's poor.

Ver. 1190. "Ventre nihil novi frugalius," says Juvenal, Sat. v. ver. 6. And it was the constant observation of the soberer heathens, that nature is content with very little: Diogenes in the life of Socrates, relates of that philosopher, that he was wont to say, That most men seemed to live only to eat; but that for his part he eat only to live. And Plato observes, that of all creatures, man is longest in digesting his food: and that nature has ordered it thus to intimate to us, that she would not have those nobler occupations, of which she has rendered us capable, and for which we were chiefly created, to be interrupted by too frequent eating. And as this is a good moral reason, so neither is the physical reason, which anatomists give us, to be contemned: for they observe, that the ileon, one of the guts, through which the meat must pass, and so called from ἐλίσσω, I involve, is six times longer than our whole body, and twisted and folded in such a manner, and withal so small, that what we eat cannot pass through it easily, and in a short time.

Ver. 1203. Diadems were used by the ancient kings as crowns are now, for the mark of royalty: they are by some said to be only white ribbons, adorned with precious stones, and which they bound about their heads. The word comes from διαδέν, to bind about. But Pancirollus, from an epistle to St. Jerome to Fabiola, describes a diadem to be a little cap, like a half football, bound about with a white *fascia* or wreath. This passage of St. Jerome is in Epist. 128, *de vestitu Sacerdotum*, where that father calls it *rotundum Pileolum*, a round cap; such a one as that

in which Ulysses is represented in an arched walk, called by his name. The Greeks, says he, call it *πίλεον*, and some, *galerus*: after which he adds, that this *pileolum* was tied on to the back part of the head with a ribband, in such a manner, that it could not easily slip off: "ita in occipitio vitta constructa est, ut non faciliè labatur ex capite." Yet indeed the *fascia* or *vitta* itself seems rather than the bonnet to have been the diadem: for Marcellinus, lib. xv. acquaints us, that Pompey was suspected of treason, for wearing the *fasciola cadina* about his leg, to hide, as he pretended, a sore: but, says he, the *fasciola candida* being generally interpreted a diadem, it created a suspicion, that he was aiming at the empire: the rather, because it was not material on what part of the body it was worn. See likewise Alexander ab Alex. Gen. dier. lib. i. cap. 28. And Britannicus says positively, it was not *corona*, but *fascia*: which agrees likewise with the etymology of the word diadem, which we gave before.

Ver. 1208. Here the poet tells us, that the monarchy being abolished, violence, oppression, and tumults began to rage anew, and the life of man returned to its primitive savageness: however, they at length thought fit to create magistrates among themselves, and to make laws, in order to punish the oppressors: and this was an instance of their prudence; for the dread of punishment keeps men in awe, and retains them within the bounds of their duty. And let none imagine they can violate the laws with impunity, even though they offend in private; for conscience herself is a babbler; and many, when raving under the violence of disease or even in their dreams, have been their own accusers, and betrayed their secret crimes.

Here we may observe, that Lucretius, from ver. 1170. to ver. 1233. has solved the following political problems.

I. Why man, who was born free, subjected himself from the very beginning, to the obedience of kings? For no man, as Plutarch elegantly argues, is by nature born a slave.

Either for the respect and reverence they bore to some men, on account of their beauty and majestic looks: or by reason of the superior strength of some, by which they compelled the weaker to unwilling obedience and servitude: or for the excellence of their wit, which easily and justly acquired them the command over others.

II. Why did they confer the government on one man? Were there not several endowed with equal qualifications? besides, every man seems in his own eyes to be beautiful and witty enough.

Because they deemed a monarchy to be preferable to a government of many, and believed they should live more free under the dominion of one, than of many rulers.

III. Why did the beautiful, the strong, and the witty, cease at length to reign?

The invention of gold dethroned them, for when men grew rich, the sovereign authority devolved on the most wealthy.

IV. Why did the kings fall at first to building of towers and citadels?

Either because they apprehended the insults of enemies, or were jealous of their own subjects, whom they oppressed with too severe a slavery.

V. How came the kingly power, with all its marks of royalty, to be at length totally subverted and laid aside?

Because nothing resists envy; which climbs the loftiest towers, and invades the palaces of kings: nay, the favourites of fortune are chiefly exposed to her assaults.

VI. Why were laws first invented and made?

Perhaps for the sake of commerce: for man is a sociable animal, and indigent of mutual offices. Therefore, that he might not be perpetually in arms, laws were invented to establish a rule of common society, and to restrain and keep within certain bounds, the petulancy and unbridled lust of the wicked.

Ver. 1226. For, as Cicero says very truly, "sua quemque fraus, suum facinus, suum scelus, sua audacia de sanitate ac mente deturbat," Lib. i. de Finib."

Ver. 1229. That is, as Cicero, lib. i. de Finib. treating of these things, says, "nunquam confidant id fore semper occultum," let them never flatter themselves, that these enormities will lie forever buried in darkness: because many are said to have betrayed their crimes in their dreams: and others in the delirious ravings of a disease, have discovered their abominable actions, that had lain a long time concealed.

Ver. 1230. Thus Book iv. v. 1012.

Multi de magnis per somnum rebu' loquuntur,
Indiciiue sui facti persæpè fuere.

Some talk of state affairs, and some betray,
The plots, their treach'rous minds had fram'd by day.

Ver. 1233. Religion, says he, and the fear of the gods, began at the first birth of men: But from whence had they their knowledge of the deities? It is uncertain, whether from the images that flowed from the gods themselves, to whom Epicurus ascribed, as it were, a body and blood; or from images that arose by chance. Now those images, whatever they were, or from whence soever they came, by continually striking the minds of men, either when they were sleeping or awake, were the cause that men conjectured that some substances, like those images, and capable of understanding, did exist somewhere or other: for the images seemed to speak, and to move their members; and they believed them immortal too, because the form of the images was always the same, and their power and strength, seemed to be immense; and happy likewise, because they were never terrified at dangers, nor disturbed at the fear of death: and never grew weary, as if they enjoyed eternal rest.

Ver. 1262. In these eleven verses he farther asserts, that the ignorance of natural causes gave rise likewise to religion. For when men observed the motions of the heavens, and the vicis-

situdes of the seasons, when they perceived the hail, the snow, the winds, the thunder, the lightning, &c. and could not comprehend what should be the causes of all those wonderful effects, they concluded that God was the author of them: for to whom could they ascribe the constant and continual motion of the spheres, rather than to a wise ruler and Lord? And where could they place his abode better, or with greater reason, than in the places from whence comes the snow, the hail, the thunder, &c.? Thus argued the Epicureans; but much better the Stoics, who made use of this very argument, to assert and prove the divine Providence; which the others brought to oppose it.

Thus Manilius, lib. i. v. 475. speaking of the motions of the stars and spheres:

Nec varios obitus nôrunt, variosque recursus;
Certa sed in proprias oriuntur sydera lucas;
Natalesque suos, occasumque ordine servant:

And v. 483. he adds,

At mihi tam præsens ratio non ulla videtur,
Quâ pateat mundum divino numine verti,
Atque ipsum esse Deum; nec forte coisse ma-
gistrâ,
Ut voluit credi, qui, &c.

Which our translator thus renders:

The stars still keep one course: they still pursue
Their constant track, nor vary in a new:
From one fixt point they start, their course main-
tain,
Repeat their whirl, and visit it again:
A most convincing reason, drawn from sense,
That this vast frame is rul'd by Providence;
Which, like the soul, does ev'ry whirl advance:
It must be God: nor was it made by chance,
As Epicurus dreamt, &c.

Ver. 1273. This belief of a Divine Providence, Epicurus held to be the sole cause of all the anxieties that disturb the life of man: and this opinion of his Lucretius explains in these twenty-five verses. From that belief, says he, proceeds the vain and causeless superstition of the greatest part of mankind, which is not piety to the gods. The pious man is he who looks into himself, who explores the secrets and power of nature, that he may comprehend the causes of all things, and wonder at nothing: This is he, who with an undaunted soul beholds the motions of the heavens, and all the other phenomenons of nature; because he is convinced upon certain grounds, that all things here below happen without the care and intervention of the gods: But ignorance is the parent of piety.

"Papicolum crederes Lucretium," says Creech, on this passage. Horace, Epist. vi. lib. i.

Nil admirari, prope res est una, Numici,
Solaque quæ possit facere et servare beatum.
Hunc solem, et stellas, et decedentia certis
Tempora momentis, sunt qui formidine nullâ
Imbuti spectant.

And Virgil:

Fœlix qui potuit rerum cognoscere causas,
——strepitumque Acherontis avari
Subjecit pedibus.——

Ver. 1274. *Subject unto rage.*] Velleius in Cicero explains this opinion of Epicurus, and gives us the reason of it in these words: "Quæ enim nobis Natura informationem Deorum ipsorum dedit, eadem insculpsit in mentibus, ut eos æternos, et beatos haberemus: Quod si ita est, verè exposita est illa sententia ab Epicuro, quod æternum beatumque sit, id nec habere ipsum negotii quidquam, nec exhibere alteri, itaque neque irâ, neque gratiâ teneri; quod quæ talia essent, imbecilla essent omnia: Nihil enim agit Deus, nullis occupationibus est implicatus, nulla opera molitur; suâ sapientiâ et virtute gaudet: habet exploratum fore se semper tum in maximis, tum in æternis voluptatibus. Hunc Deum ritè beatum dixerimus, vestrum vero laboriosissimum: Nos enim beatam vitam in animi securitate, et in omni vacatione munerum ponimus." De Natur. Deor. lib. 1. Upon which Lactantius says, that he is apt to believe with Possidonius in the same Cicero, that Epicurus did indeed believe, that there were no gods at all; and that what he said of the immortal deities, he said only to avoid the censure of the world: That though he indeed confessed with his mouth, that there were gods, yet he denied them in effect, by exempting them from all manner of affections, and from all employment whatever. De Irâ Dei. cap. 4.

Ver. 1279. *To bend.*] Lucret. "Vertier ad lapidem." For the Romans were wont, in their worship of the images of their gods, to turn their bodies round to the right. Plaut. in Curcul. act. i. v. 70.

All cover'd.] For the Romans likewise worshipped the images of their gods, with a veil hanging down from their head, Plaut. in Amph. "Invocat Deos immortales, ut sibi auxilium ferant manibus puris, capite operto." The reason of which ceremony, you may see at large in Plutarch, in *σωματικῆς*; and in the life of Marcellus. See likewise the interpreters of Minutius Felix, p. 10.

Ver. 1281. *Spread arms.*] Lucr. "Pandere palmas;" which was a custom observed likewise in their supplications to the gods: Virgil. *Æneid.* i. v. 97.

Ingemit, et duplices tendens ad sydera palmas.

Ver. 1298. In these twenty-eight verses he says, that fear is another cause of religion: for men, being frightened at tempests, earthquakes, &c. against which they could not struggle with any strength, nor avoid them by any art or industry of their own, implored the aid and assistance of invisible powers: This was the beginning of prayers and vows; and thus

Primos in orbe Deos fecit Timor.

But what do vows avail? The wind still rages on relentless: the un pitying gods are as deaf and

unmoved as the tempest: and chance alone directs and governs all things.

Ver. 1304. Thus Shakspeare in the tragedy of King Lear, describing a tempest,

——Man's nature cannot carry
Th' affliction, and not fear. Let the great gods,
Who keep this dreadful pother o'er our heads,
Find out their en'mies now. Tremble, thou
wretch,
That hast within thee undivulged crimes,
Unwhipt of justice: Hide thee, thou bloody
hand;
Thou, perjur'd; and thou, similar of virtue,
That art incestuous: Caitiff, to pieces shake,
That under covert, and convenient seeming,
Hast practis'd on man's life: Close pent-up guilt
Rive your concealing continents, and cry
These dreadful summoners grace.

Ver. 1326. In these thirty-eight verses, he teaches how metals came first to be discovered, what use they put them to, and the value they set upon them. He ascribes the first discovery to the burning down of the woods: No matter how, nor why they were set a fire: but the heat of the flames melted the metals that were dispersed here and there in the veins of the earth, and made them flow into one mass. Now when men first happened to see that glittering body, they were surprised at its splendor, and this it was that invited them to handle it, and try what it was good for: And taking notice that the figure of each lump of it resembled, and bore a proportion with, the figure of the hole or hollow place out of which they had taken it, they concluded, that by melting those metals again, they might bring them into what form they pleased; and that they might be made so thin, as to receive an edge, and be sharpened: Thus they began to make instruments of each sort of metal; and with them fell to cutting down the woods, cleaved the timber, made beams, &c. Now because the instruments and tools they had made of gold and of silver, as being softer metals, were more subject to blunt than the others; those first men set a greater value upon brass, because it was the more useful metal. Whence the poet takes occasion to say, that those wretched misers who sit brooding over their unprofitable gold and silver, and contemn brass and iron, 'those more useful metals, act contrary to the dictates of nature, who teaches to set value on things according to the utility and usefulness of them.

Gold.] Cadmus, the Phœnician, is by some said to have been the first who discovered gold: Others say, that Thoas first found it, and that too in the mountain Pangæus in Thrace, now called Malaca, and Castagua: The Chronicon Alexandrinum ascribes it to Mercury, the son of Jupiter, or to Picus, king of Italy, who, quitting his own country, went into Egypt, where, after the death of Misraim, the son of Cham, he was elected to succeed him in the royal dignity, and was, for the invention of gold, called *Θεὸς χρυσοῦς*, the golden god. *Æschylus* attributes the inven-

tion of this and all other metals to Prometheus: And there are others who write, that either Æacelis, whom Hyginus calls Cæacus, the son of Jupiter, or Sol, the son of Oceanus, first discovered gold, and that too in Panchaia. See Plin. lib. vii. cap. 56. and Polydore, Virgil, lib. ii. de Rer. Invent. cap. 9. Moreover, among the other metals Lucretius mentions iron, though our translator does not. The author of the Dispensary describes these mines of metals in the earth, in lines worth transcribing:

Now those profounder regions they explore,
Where metals ripen in vast cakes of ore:
Here, sullen to the sight, at large is spread
The dull unwieldy mass of lumpish lead:
There, glimm'ring in their dawning beds, are seen
The more aspiring seeds of sprightly tin:
The copper sparkles next in ruddy streaks,
And in the gloom betrays its glowing cheeks:
The silver then, with bright and burnish'd grace,
Youth, and a blooming lustre in its face,
To th' arms of those more yielding metals flies,
And in the folds of their embraces lies:
So close they cling, so stubbornly retire,
Their love's more violent than the chemist's fire.

Ver. 1331. Here we may observe, that men waged war first of all with fire, having, before the invention of iron, brass, or arms, with which they fought afterwards, discovered the destructive force of that element.

Ver. 1340. Aristotle, in his treatise *περὶ θαλάσσης*, says, that some shepherds in Spain having set fire to certain woods, and heated the substance of the earth, the silver that was in the bowels of it, melted, and flowed together into a heap: and that a little while afterwards there happened an earthquake, which cleaved the earth, and disclosed a vast quantity of silver, that had flowed together by that means. This too is confirmed by Strabo, lib. 3. where he says, that the mines in Andalusia were discovered by this accident. So too Athenæus, lib. vi. c. 4. But of the first discoverers of metals, consult the authors mentioned, v. 1336. and Georg. Agricola, lib. i. de Metal.

Ver. 1345. Thus Ovid. Met. i. v. 138.

—Itum est in viscera terræ, [bris,
Quasque recondiderat, Stygiisque admoverat um-
Effodiuntur opes, irritamenta malorum.
Jamque nocens ferrum, ferroque nocentius aurum
Prodierat, prodit bellum, quod pugnat utroque.

Thus Englished by Dryden:

Then greedy mortals, rummaging her store,
Dug from her entrails first the precious ore,
(Which next to hell the prudent gods had laid)
And that alluring ill to fight display'd:
Then cursed steel, and more accursed gold,
Gave mischief birth, and made that mischief bold,
And double death did wretched man invade,
By steel assaulted, and by gold betray'd.

Milton, in the first book of Paradise Lost, speaking of Mammon:

————— By him first

Men also, and by his suggestion taught,
Ran sack'd the centre, and with impious hands
Rifled the bowels of their mother earth
For treasures better hid.

Ver. 1359. The author of the Dispensary says to the same purpose:

Gold makes a patrician of a slave;
A dwarf, an Atlas; a Therfites, brave:
It cancels all defects. —————

And Dryden in Amphitryo makes Jupiter say,

————— When I made

This gold, I made a greater god than Jove,
And gave my own omnipotence away.

Ver. 1360. To the same purpose, Dryden
Thus ev'ry moment alters what is done,
And innovates some act till then unknown:

————— For former things
Are set aside, like abdicated kings.

Ver. 1364. Since it is reasonable to suppose, that the veins of iron, as well as of brass, silver, lead, &c. were melted by the heat of those burning forests, how comes it to pass, that the ancients scarce make any mention of iron, but often of brass? Because, says he, in these sixteen verses, brass was a more easy metal to work, and there was greater plenty of it: therefore the weapons and tools of husbandry that were first used, were made of brass: at length, iron came in play; a fitter metal to plough and till the stubborn and hardened earth, and more proper for the daily increasing roughness and cruelty of man.

Ver. 1366. For as Cowley says, David. 3.

These were the first rude arts that malice try'd,
Ere man the sins of too much knowledge knew,
And death, by long experience, witty grew.

Ver. 1370. Ovid. Fast. lib. iv.

Æs erat in prætio, chalybs jam massa placebat:
Eheu! perpetuo debuit illa tegi.

Ver. 1372. Hesiod. *Ἔργων, καὶ Ἡμερῶν*, lib. i. v. 149. speaking of the brazen age:

Τοῖς δ' ἦν χάλκεα μὲν τεύχεα, χάλκεοι δὲ τὲ οἰ-
χοι,

Χαλκῷ δ' ἐργάζοντο, μέλας δ' ἔχ' ἔσκε σιδήρεος.

And Eustathius on Iliad i. v. 236. *χαλκὸν δὲ τὸν σιδήρεον λέγει διὰ τὴν πάλαι χρῆσιν τῷ χαλκῷ* &c. to which I add this of Athenæus, lib. vi. cap. 4. *Ἰσορεῖ τὰ αὐτὰ καὶ Φανίας, ἐν τῷ περὶ τῶν ἐν Σικελίᾳ τυράννων· ὡς χαλκῶν ὄντων τῶν παλαιῶν ἀναθημάτων, καὶ τριπόδων, καὶ λισσῶν, καὶ ἐγχειριδίων· ὧν ἐφ' ἐνὸς καὶ ἐπιγεγράφθαι φησὶν*

Θάψαι μ', ἐπεὶ γὰρ ἐν Ἰλίσ ἐνερῇ πύργῳ
Ἦν, ὅτε καλλιχόμῳ μαρνάμεθ' ἀμφ' Ἑλένη,
Καὶ μ' Ἀθηνογίδης ἐφόρει κρείων Ἑλικάων, &c.

Ver. 1380. Having made mention of wars in the preceding verse, he takes occasion to explain in forty-eight verses, those savage, which we call warlike, arts of the first men, who improved in cruelty, and grew daily more and more ingenious

to destroy. At first they fought on horseback, and a horse is a tame and gentle animal: then they joined two horses to a chariot, then four, and armed their chariots with iron bills and scythes. After this, wild beasts were brought to the wars, elephants by the Africans, lions by the Parthians, then bulls, boars, &c. But Lucretius himself does not believe all this: only having met with these relations in some histories, he mentions them, and mingles truths with fables. And yet, says he, they are not altogether incredible: For what has not witty rage and cruelty invented? And what kind of assistance and relief will men not embrace and refuse, who labour under oppression and despair?

Sophocles ascribes the first invention of the bridle, and of riding on horseback, to Neptune: Lysias, the orator, to the Amazons: and others, to others: But Virgil absolutely to the Lapithæ, a people of Thessalia, that inhabited the mountains Pindus and Othrys, and were next neighbours to the Centaurs. Georg. iii. v. 115.

Fræna Pelethronii Lapithæ, gyroque dedere,
Impositi dorso: atque equitem docuere sub armis
Insultare solo, et gressus glomerare superbos.

Thus rendered by Dryden:

—— The Lapithæ add the state
Of bits and bridles; taught the steed to bound,
To run the ring, and trace the mazy ground;
To stop, to fly, the rules of war to know,
T' obey the rider, and to dare the foe.

Ver. 1383. The first invention of chariots is by Æschylus ascribed to Prometheus, by Cicero to Minerva, by the Trezenians to Hippolytus, and by Virgil to Eriethonius:

Primus Eriethonius currus et quatuor ausus
Jungere equos, rapidisque rotis insistere victor.

Georg. iii. v. 113.

Bold Eriethonius was the first that join'd
Four horses, for the rapid race design'd,
And o'er the dusty wheels presiding fate. Dryd.

But whether the poet means that Eriethonius, who was king of the Athenians, the son of Vulcan and Tellus, who is said to have been snake-footed, *anguipes*, and, to conceal that deformity, to have first invented a chariot; or that other Eriethonius, the Phrygian, who was the son of Dardanus, grandson of Jupiter, and one of the ancestors of Æneas, is uncertain. Pliny says the Phrygians first drove a chariot with two horses, and Eriethonius one with four: "Bigas primum junxit Phrygum Natio, quadrigas Eriethonius." Nat. Hist. lib. vii. cap. 56. Eusebius in Chronic. makes Trochilus, the Argive, who was son of Callisthea, the priestess of Juno, to be the first inventor of chariots; and with him agrees Tertullian de Spectac. However, he is erroneously called Orsilocho by Hyginus, who nevertheless is followed in his error by Corippus in Panegy. i. as we find by these verses, which Scaliger on Eusebius cites:

Orsilocho referunt primas junxisse quadrigas,
Et currus armasse novos, Pelopemque secundum
In soceri venisse necem. —

But Dempster, in his edition of Corippus, instead of *Orsilocho* reads *Cecropidem*, by which he means Eriethonius, who was the fourth king of Athens from Cecrops, who founded that city: Others again will have it to have been Cœnomaus, the king of Elis: But Theon, the Scholiast of Aratus says plainly, that the constellation of Heniochus, which the Latins called *Luriga*, the Charioteer, is, *εἰδωλον ἢ Βιλλαιοφονταῖ, ἢ Τροχίλῳ*, the representation either of Bellerophon or of Trochilus, the first inventor of the *quadriga*. Moreover, as to the manner of joining these four horses in a chariot, the ancients, as they differed from us, so they differed among themselves likewise: For some chariots had two poles, one between each pair of horses; for the horses went "*æquatâ fronte*," all a-breast: so that all the horses were *ζύγιοι*, i. e. *jugales*, yoked and harnessed to the poles: Afterwards Clythenes, the Sycionian, changed that manner, and made chariots with one pole only; so that the two middle horses only were *jugales*; the other two that were outmost to the right and left, had only reins, and the other necessary harness and traces, and were therefore called *στροφαῖοι*, i. e. *funales*; and these were more at liberty than those called *jugales*. Of the *funales*, Suetonius, in the life of Tiberius, gives us a remarkable example in these words, "Tiberius, pubescens Aëtico triumpho, currum Augusti comitatus est sinistrore funali equo, cum Marcellus, Octaviæ filius, dextero veheretur:" Which passage of that historian Alexander ab Alexandro undertakes to explain, but is mistaken in it: for he says, that the *equi funales* are so called *à funalibus*, i. e. *à facibus triumphalibus*, &c. from the triumphal torches, which their riders carried in their hands: But of this see Salmasius in his Plinian Exercitationes, Tom. ii. pag. 899, where he treats of these matters at large. The several figures of the *currus quadrijuges* may be seen in the consular and imperial coins, which we find represented in Ursinus, Golizius, and in Panvinus de Ludis Circensibus: but above all see Schefferus, who not long ago published a treatise upon this subject, intitled, *de re vehiculari Veterum*. Tertullian in his book de Spectaculis, acquaints us, That Romulus was the first who brought the *quadriga*, or chariot with four horses, in use among the Romans: Pliny makes mention of *currus sexjuges*, chariots drawn by six horses, and says, that the first of them among the Romans was in the time of Augustus, to whom the senate decreed a chariot with six horses, as a triumphal honour, of which nevertheless the modesty of that prince would not permit him to accept.

Ver. 1384. *The armed cars.*] Of them, see book iii. ver. 615.

Ver. 1385. *Casled elephants.*] Because they carried towers on their backs. Lucretius calls them *Lucas Boves*: and Faber says, that *Lucas* is there put for *Lucanas*, as we find *Campas* for *Campanas*.

in Plautus: Then he adds, that elephants were so called, because the first time the Romans had seen any, was in the war against Pyrrhus, and at *Lucanus*, now called *Lugano*, a town in the Milaneze, Pliny, lib. viii. cap. 6. "Elephantas Italia primum vidit Pyrrhi Regis bello, & boves Lucas appellavit in Lucanis visas; anno urbis 472." This confirms the opinion of Faber: But Varro, lib. vi. de *Lingua Latinâ*, has this Passage: "Lucas bos Elephas, cur ita sit dicta duobus modis invenio scriptum: Nam in C. *Ælii* Commentario à *Lybicis* Lucas, & in *Virginii* Commentario à *Lucanis* Lucas, ab eo quod nostri maximam quadrupedem; quam ipsi habebant, vocarent bovem; & in *Lucanis* Pyrrhi bello primum vidissent apud hostes Elephantas, id est, quadrupedes cornutas, (nam quæ dentes multi dicunt sunt cornua) Lucam bovem appellasse: Ego arbitror potius Lucas à luce, quod longe relucebant; propter inauratos regios clypeos quibus eorum tum ornatae erant turres." But this reason of Varro's seems but weak: And it is certain, that Pyrrhus first made use of them in *Lucania*, and afterwards *Hannibal* in *Africa*, against the Romans. *Lucretius* calls them likewise *Anguimanos*, snake-handed: for the proboscis of the elephant is called a hand, in *Cicero* ii. de *Naturâ Deorum*: but that hand is, like a serpent, voluble and pliable. *Milton.*

—Th' unwieldy elephant,
To make them mirth, us'd all his might and
wreath'd
His lithe proboscis.—

Ver. 1386. The Africans, but more particularly the *Carthaginians*, who, as I said before, under their leader *Hannibal*, fought against the Romans.

Ver. 1390. Here the poet teaches, that in their wars, they likewise made use of bulls, boars, and lions, to help them to fight their battles, but that these untractable beasts often did them more hurt than good; for when the armies were engaged in heat of action, these savage animals raged not on the enemy alone, but turned back upon their own masters, and, tearing them to pieces, put all into disorder. See the note on book iii. ver. 614.

Ver. 1391. The *Parthians* were a people of *Asia*, who long enjoyed the empire of the East. The country they inhabited was called *Parthia*, and lay between *Media* to the west, and *Asia* to the east; and between *Persia* to the south, and *Hyrkania* to the north: It was called *Parthia*, says *Stephanus*, from these people, who were originally *Scythians*, and fled out of *Scythia* to the *Medes*, who called all fugitives *Parthi*, and *Parthyæi*, and thus the country where they settled was from them called *Parthia*. It has now several names. *Mercator* calls it *Arach*: *Alphonfus Hadrianus*, *Jexdi*; and *Niger*, *Corassau*: For, consisting of divers provinces, it comes likewise to have sundry names. The *Parthians* were remarkable for their drunkenness; and from them came the proverb, "Parthi quo plus biberint, eo plus sitiunt." The more the *Parthians* drink, the more they are adry; nay, to be able to drink a

TRANS. II.

great deal is esteemed honourable among them: Their wine was made of the fruit of the palm-tree, and their chief food was grasshoppers. *Tertullian* says, they are so addicted to venery, that they mix promiscuously with their own sisters and mothers: Theft is with them unpunished: They neither built temples, nor erected statues to the gods; but worshipped their king for their deity: However they offered sacrifices in the mountains to *Jupiter*, and to *Sol*, *Luna* and *Tellus*, the sun moon and earth. They held lying to be the most heinous of all crimes.

Ver. 1412. In like manner an English poet.

As lions, though they once were tame,
Yet if sharp wounds their rage inflame,
Lift up their stormy voices, roar,
And tear the keepers they obey'd before.

Walsh.

Ver. 1428. In these eleven verses he tells us, that in regard to the more civilized arts, their first care was to clothe themselves, which they did at first with the skins of beasts, tagged together with thorns, not sewed, nor were the arts of spinning or of weaving yet discovered: Nor indeed was it possible they should be so, before the use of iron, without which the tools for spinning and weaving could not be made: Nor was spinning first practised by women, but by men; they being the more industrious and inventive sex: till at length the sturdy peasants reproached these male spinsters for their effeminate laziness, laughed them from the distaff, and brought them to follow the more laborious occupations.

All arts are generally distinguished into two sorts: I. The illiberal, or manual: II. The liberal, or ingenuous: Of the first sort the number is almost without number: yet both kinds, though very imperfectly, are reduced each to a septenary division, and expressed in the following distich:

Lingua, Tropus, Ratio, Numerus, Tonus, Angulus, Astra:

Rus, Nemus, Arma, Faber, Vulnera, Lana, Rates.

The first of which verses expresses the liberal sciences, viz. grammar, rhetoric, logic, arithmetic, music, geometry, and astronomy: The second, the illiberal; as agriculture, hunting, arts military and fabril, chirurgery, spinning and weaving, and arts nautical: Of the first inventors of which, see *Pliny*, lib. vii. cap. 56. *Polydore Virgil*, and *Garzone* in his *Piazza Universale*: And as to the different esteem and practice of these arts among the *Greeks* and *Romans*, you may consult *Aldus Manutius* in *Quæsit. per Epistol.* lib. ii. cap. 9.

Ver. 1439. In these nineteen verses the poet teaches, that Nature herself taught them to plant: for they had observed that the acorns berries, &c. that dropped off the trees, produced new shoots; and this put them upon endeavouring to make them do the like: Every one according to his capacity added some improvement to the culture of the fields and gardens: And thus by degrees they arrived to the perfection in which we now admire them, by the beau-

Q 9

tiful order, and regular disposition of greens, flowers, and fruits.

The antiquity of agriculture cannot certainly be contested by any other art; since the three first men in the world, were a gardener, a ploughman, and a grazier: Though this be an unquestionable truth, yet the ancients differed in opinion concerning the first inventor of it: but this variety of opinions might arise from the several persons that first introduced it into several countries: Varro, lib. iii. de R. R. confesses it to be the most ancient of all arts: The Egyptians said, it was first found out by Osyris, or Maneros, Josephus attributes it to Cain, as he does pasturage to Abel. Antiqu. lib. i. cap. 3. The Greeks ascribed it to Ceres, and the Italians to Saturn. Pliny, lib. xvii. cap. 9. says, that King Augeas was the first who invented manuring of ground by stercoration, and that he first instructed the Greeks in that art, as Hercules did the Italians: who nevertheless immortalized, and made a god of their King Stercutius, the son of Faunus; if he were not rather the same, as some will have him to be, with Evander, the Arcadian, who first introduced the worship of Faunus, that is to say, of Pan, or universal Nature, into Italy, and taught the Latins the art of manuring ground, for which he was honoured by the name of Stercutius. Tertullian in Apologet. calls him Sterculus or Sterculius; and Servius on Æneid. viii. Sterquilinus, whom he asserts to be the same with Piumnus, brother of Pileus: By Macrobius he is called Stercutus, which he proves to be one of the names of Saturn: "Saturnum Romani etiam Stercutum vocant, quod primus stercore fecunditatem agris comparaverit." Saturnal lib. i. cap. 7.

But as no other art can dispute antiquity with this of agriculture, so neither can any lay claim to an equal share of dignity: It is indeed, as Columella, lib. i. cap. 1. calls it, "res sine dubitatione proxima & quasi consanguinea Philosophiæ," without doubt the next neighbour, and the nearest of kin to philosophy; Varro says the principles of it are the same with those that Ennius makes to be the principles of the whole universe; earth, water, air, and the sun: And Cicero de senectute, speaking of the pleasures of a husbandman, says of them, that they seem to him to approach very near to the pleasures of a philosopher, "mihi quidem ad sapientis vitam proximè videntur accedere." To be a husbandman, says our excellent Cowley, is but a retreat from the city, to be a philosopher apart from the world; or rather, a retreat from the world, as it is man's, into the world, as it is God's. There is no other sort of life, that affords so many branches of praise to a panegyrist: the utility of it to a man's self; the usefulness, or rather necessity of it, to all the rest of mankind: Its innocence, its pleasures, its antiquity, its dignity: Under all which heads that author has treated of it in his admirable Essay of Agriculture, to which I refer the reader.

Ver. 1443. Lucretius. "Stirpes committere ramis;" by which he expresses only one of the several ways of infition, and what we call to grass

cleft-wise. Virgil in the second Georgic teaches the several ways, by which trees are propagated, either naturally, or artificially. They may be produced three several ways by nature.

I. Of their own accord: as the broom, the withy, the poplar, the osier, &c. are.

II. By their seed that drops by chance: I say, by chance; for there is a certain way of sowing that belongs to art: the trees that grow of fortuitous seed, are the chesnut, the oak, the beech, &c.

III. By their root: for the cherry-tree, hornbeam, laurel, &c. will shoot out young trees from their roots.

The same poet teaches, that trees may be propagated seven several ways by art, and the industry of men:

I. By avulsion, that is to say, by plucking up young shoots, roots and all, from the bodies of trees, and planting them in the ground.

II. By planting the stocks, that is to say, the lowest and thickest part of the trunk, together with the roots; or by taking the stock without any root, and either cutting it into a sharp point at the lower end, or splitting it at the bottom, and then planting it; but the general way is to split it in form of a cross; and therefore Virgil calls such stocks *quadrifidas*.

Hic stirpes obruit arvo,
Quadrifidasque fudes, et acuto robore vallos.

Georg. ii. ver. 24.

III. By propagation, which is chiefly used in vines; and this is done by bending the shoots or branches in the shape of a bow, without cutting them off from the mother-tree, and laying down the top of them into the ground. The branch so bent is called *propago*, a layer. Milton describes this way of propagating the Indian fig-tree, which, says he,

In Malabar or Decan spreads her arms,
Branching so broad and long, that in the ground
The bended twigs take root, and daughters grow
About the mother-tree; a pillar'd shade
High over-arch'd, and echoing walks between.

IV. By taking little trees or plants, together with the earth that covers them about the root, and transplanting them into another place.

V. By cutting off a sucker from a tree, and planting it, even though it have no root.

VI. By cutting the stem of the tree without any root to it, but in the middle, and into several pieces, and planting them. This way is chiefly practised in the propagation of the olive-tree.

VII. When a branch, or twig, of one tree is inserted into another tree, and that too of a different kind, and passes into the nature of it. This is the true grafting, which is practised in two manners: One, which the Latins call *infusio*, i. e. grafting within a cleft made in the top of the stock; which is the ordinary way now used, and properly called grafting; the other, inoculation, called likewise budding, and grafting scutcheonwise. Pliny adds a third way, which he calls *emplastratio*; which is generally confounded with inocula-

tion; yet there seems to be this difference between these three ways of grafting: That called *infition*, was done by cleaving the trunk of the tree, and putting one or more twigs into the cleft. *Inoculation*, by making an aperture between the bark and the trunk, and including in it the graft, or twig. And lastly, *emplastration*, by taking off part of the bark of the stock, and substituting in its place the bud of another tree, exactly of the like bigness, so as to fill up the space of the bark that is taken away. This is manifest from Pliny, lib. xvi. cap. 16, 18, &c. whence it is evident, that this art of grafting has been variously practised in different ages. And our gardeners at this day differ from the method of Virgil, who teaches to make the aperture in the very knot or joint of the stock; whereas they make it either below or above, in that part of the bark that is brightest and smoothest.

Ver. 1452. See above, ver. 308.

Ver. 1458. Music too, like all the other arts, when first invented, was rude and unpolished; nor was it more at first than an imitation of the chirping and singing of birds. Then having observed, that reeds, when shaken by a gentle gale, sent forth a whispering murmur, they made themselves pipes of reeds; with these the pensive shepherds were wont to sooth their cares, and, when the neighbourhood met to be merry, they delighted, with their uncouth airs, the whole company and themselves. In these merry assemblies they first began to laugh and jest at one another, and to trample the ground with unequal steps; and this laid the first foundation of dancing. Thus they diverted themselves, and knew no better; nor do our more artful and melodious airs delight us more, than these unharmonious artless strains of theirs did them; but new things always please, and we grow weary of the old. Thus men began to loath their acorns, and to indulge their appetites with more delicious food. Thus they despised their grassy beds, and invented easy couches and beds of down. Thus they laid aside their skins of beasts, and by degrees clothed themselves in purple. This is contained in forty-eight verses.

Ver. 1462. The western winds, says the poet, whistling among the reeds, taught them to make pipes of the stalks. But of the first invention of pipes, see Book iv. ver. 595. and Ovid. *Metam.* i. ver. 705.

Ver. 1467. Virgil, *Eclog. i.*

Formosam resonare doces Amaryllida fylvas.

From whence our translator took the thought; at least he had no hint of it from his author. *Amaryllis* is a fictitious name, used by the ancients in their pastoral poems, and continued down to this day. It is derived from the channels they made to convey water into their meadow grounds, or to drain them, if too wet; for such a conduit the Greeks called *ἀμαρύλλη*.

Ver. 1468. This and the following verse are repeated below, ver. 1536.

Ver. 1471. Lucret.

Nam tum sunt omnia cordi:

Which is the reading of all the copies; but Faber says, it ought to be "*otia cordi*," a judicious emendation, which our translator has followed. Vossius on Catullus, p. 167. corrects this passage of our poet, and says it ought to be read, "*omnia chorda*." For after men, says he, have indulged and filled themselves with eating, nothing is more delightful than music, which at that time is, *τὸ πᾶν*, all things.

Ver. 1472. This, and the five following verses are repeated from book ii. ver. 31. Cowley and Anacreon:

Underneath this myrtle shade,
On flow'ry beds supinely laid,
With od'rous oils my head o'erflowing,
And around it roses growing;
What should I do, but drink away,
The heat and troubles of the day, &c.

Compare Creech's translation of this passage with the original of Lucretius, and with these verses of Cowley, and judge from whence he took it.

Ver. 1481. Lucretius:

*Tum caput, atque humeros plexis redimire corollis,
Floribus, &c.*

Where the poet alludes to the luxury of his own age, when, in their feasting, they used to trim up their bowls with flowers, and to wear garlands of roses on their heads, and round their necks; and, in a manner, to wallow in them. Tibullus:

Et capite et collo mollia ferta gerat.

But of this custom see at large book iii. ver. 896.

Ver. 1489. *Morpheus*.] The son, or rather the servant, of Somnus, the god of sleep. See book iv. ver. 1026.

Ver. 1495. To the same purpose, Dryden, in the Tragedy of Aureng-Zebe, says finely:

'Tis not for nothing, that we life pursue;
It pays our hopes with something still that's new.
Each day's a mistress, unenjoy'd before;
Like travellers, we're pleas'd with seeing more.

Ver. 1502. Faber says, that the first garment, though but a worthless undressed skin of a beast, so pleased these earth-born men, that it was the cause of his death, who first invented and wore it.

Ver. 1506. But this fighting and murder for the skin, says the poet, in fourteen verses, may be in some measure, excused; because, before they had found out the art of weaving, skins were all the covering they had to defend their bodies from the cold. But what excuse is there for men, who destroy, and lay all things waste, with wars and rapine, that they may shine in gold, and clothe themselves in purple? This, nevertheless, they do, transported with an insatiable thirst of avarice and ambition, and because they are ignorant of that true pleasure, which Epicurus taught; and which is not so greedy after delights, as content with necessities.

Ver. 1514. For man is seldom contented with a competency, and never knows when he has enough nor when to put a stop to what Ovid calls excellently well: "Amor sceleratus habendi." Thus Manilius begins his fourth book:

Quid tam sollicitis vitam consumimus annis,
Torquemurque metu, cæcæque cupidine rerum?
Æternisq. senes curis, dum quærimus, ævum
Perdimus et nullo votorum sine beati
Victuros agimus semper, nec vivimus unquam;
Pauperiorque bonis quisque est, quo plura requi-
rat, [optat.
Nec quod habet memorat; tantum quod non habet,

Which our translator has thus rendered:

Why should our time run out in useless years
Of anxious troubles, and tormenting fears?
Why should deluding hopes disturb our ease,
Vain to pursue, yet eager to possess?
With no success, and no advantage crown'd,
Why should we still tread on th' unfinish'd
round?

Crown gray in cares, pursue the senseless strife,
And seeking how to live, consume a life?
The more we have, the meaner is our store,
The unenjoying craving wretch is poor.

Ver. 1520. Men being convinced by a long experience, that the seasons of the year return in a certain order, and that nothing is imbroiled, nothing arrives by chance, (for the atoms that at first fortuitously jumbled together, are composed in such a manner, both by the laws of their own motion, and by the power of nature, that unless some cause from without should hinder and disturb them, they will for ever observe the same motions); they at length embraced a constant and settled way of life. To this end they constituted republics, and established commerce between several nations. Then poets, the authors of history, were born: and lastly, the arts, that are subservient to life, or conducive to pleasure, were found out. For the names of the inventors of them are still preserved and known.

Ver. 1525. The nations, who are famed for the invention of navigation, are, first the Phœnicians, from whom it came to the Egyptians, and from them to the Greeks; among whom the first that sailed are said to be the Cretans. But as to the first building, and use of ships, not to mention Noah's ark, Clemens Alexandrinus ascribes the invention to Atlas, the Libyan; Æschylus, to Prometheus; and Diodorus Siculus, to Neptune: the invention likewise of sails is ascribed by the same Æschylus to Prometheus also: by Diodorus to Æolus; by Pliny and Pausanias to Dædalus and his son Icarus: by Cassiodorus, lib. 5. Variar. and by Hyginus to Isis; who, for that reason, on the reverse of some of the Roman coins, is represented, holding in her hand, a sail, swelling with the wind: it is certain that the Latins styled her Dea Pelagia, as being the president of navigation: to confirm which, we find in Gruterus, p. 312. the following inscription:

DIIS MANIBUS SAC.
SER. SULPITIO AUG. L.
ALCIMO ÆDITUO
AD ISIDEM PELAGIAM.

Of the original and first essays of navigation, Claudian in the Preface to the Rape of Proserpine:

Inventâ secuit primus qui nave profundum,
Et rudibus remis sollicitavit aquas;
Tranquillis primum trepidis se credidit undis,
Littora securo tramite summa legens.
Mox longos tentare sinus, et linquere terras,
Et leni cœpit pandere vela Noto:
Ast ubi paulatim præceps audacia crevit,
Cordaque languentem dedidicere metum;
Jam vagus erupit pelago, cœlumque secutus,
Ægeas hyemes, Ioniumque domat.

Ver. 1526. Thus too Manilius, lib. i. ver. 87.

Tum vagus in cæcum penetravit navita pontum,
Fecit et ignotis itiner commercia terris.

Which Creech thus renders:

Through seas unknown the sailor then was hurl'd;
And gainful traffic join'd the distant world.

The original of traffic is generally ascribed to the Phœnicians: some indeed, particularly Phornutus or Cornutus, de Naturâ Deorum, and Cæsar, lib. 6. de Bello Gall. attribute it to Mercury, whom, for that reason Arnobius calls "Nundinarum, Mercium, Commerciorumque mutator," lib. 3. adv. Gentes. And that merchants used to sacrifice to him as to the god of gain, and president of negotiation and commerce, is confirmed by Ovid. lib. 4. Fastor. where speaking to Mercury, he says,

Te quicunque suas profitentur vendere merces,
Thure dato, tribuas ut sibi lucra rogant.

This too is confirmed by that ancient inscription, that was found at Metz, in the year 1589, and is recorded by Philippus Thomasinus de Denariis, pag. 274.

MERCURIO NEGOTIATORI
SACRUM
NUMISIUS ALBINUS
EX VOTO.

Ver. 1528. Cicero says, that the invention of letters has circumscribed, in a few literal marks, the sounds of the voice, which seemed infinite: "Sonos vocis, qui infiniti videbantur, paucis literarum notis terminavit." Tuscul. 1. Suidas calls it γραμματικὴν φιλοσοφίαν, the grammatical philosophy, and ascribes the invention of it to Prometheus; others to the Phœnicians: thus Lucan:

Phœnices primi, famæ si creditur, ausi
Mansuram rudibus vocem signare figuris.

which passage, Brebœuf, the French interpreter of that poet, applying it to Cadmus, who from the Phœnicians brought most of the letters of the Greek alphabet into Greece, has rendered in these excellent verses.

C'est de lui que nous vient cet art ingénieux
De peindre la parole, et de parler aux yeux;
Et par les traits divers de figures tracées,
Donner de la couleur, et du corps aux pensées.

Which I the rather choose to take notice of, because they are finely rendered into our own language by a person of quality, and not till now made public.

He that ingenious art did first descry
Of painting words, and speaking to the eye;
And, by the various shapes of figures wrought,
Gave colour, and a body to a thought.

But as to the first characterizers of speech, see the learned digression of Joseph Scaliger de Liter. antiqu. upon Eusebius: and Petit. in observat. lib. ii. c. i. To which I add these anonymous verses, as they are recorded by Crinitus and Giraldus, and from them transcribed by Gerard. Joh. Vossius, lib. i. de Arte Grammat.

Primus Moyſes Hebraicas exaravit literas:
Mente Phœnices ſagaci condiderunt Atticas:
Quas Latini ſcriptitamus edidit Niſoſtrata:
Abraham Syras, et idem reperit Chaldaicas:
Iſis arte non minore protulit Ægyptias:
Gulſilas promſit Getarum quas videmus literas.

But the origin of letters is, with greater appearance of truth, referred by others to Adam himſelf: for is it not highly improbable, that he, who was to tranſmit all learning and knowledge down to his poſterity, ſhould want the neceſſary conveyances and instruments for ſo great a work? And this opinion is confirmed by the early mention that is made of letters, even in the days of Seth, who was his ſon; and who no doubt received them from him. I know not of what weight it may ſeem, but I cannot omit to take notice, that, in the Vatican Library at Rome, there is extant, to this day, an ancient picture of Adam, with a hebrew inſcription over his head; which indeed makes nothing to our preſent purpoſe: but under his feet there is another in Latin, conceived in theſe words:

ADAM DIVINITUS EDOCTUS, PRIMUS
SCIENTIARUM ET LITERARUM INVEN-
TOR. See Lomeier. de Biblioth. p. 10.

OF THE SEVERAL WAYS OF WRITING

PRACTISED BY THE ANCIENTS.

HAVING given this ſhort account of the firſt invention of letters, it may not be amiſs in this place to give ſome account likewiſe in a ſhort digreſſion, how thoſe characters of old preſerved themſelves from death. And indeed there is ſcarce any matter capable of receiving the marks of letters, that ſome or other of the ancients have not made uſe of for that purpoſe.

The firſt letters that we read of were engraved in ſtone: witneſs the two famous pillars of Enoch, one of which was yet remaining, even in the days of Joſephus: and Jamblicus confeſſes, that he took the principles of his myſtical philoſophy from the pillars of Mercury. Pliny, in his Natural Hiſtory, lib. 7. cap. 5. acquaints us, that the Babylonians, and the Aſſyrians, engraved their laws in pillars of brick, “incoctis lateribus.” And we know that Moſes writ his on ſtone: Horace

too makes mention of this ſort of writing on ſtones:

Non incifa notis marmora publicis.

The Roman laws of the twelve tables were engraved in braſs; and ſo too was the league made with the Latins, as Livy witneſſes, Decad. i. lib. 2. And Talus, of whom was reported many ridiculous ſtories, was, upon no other ground, feigned by the Cretans, to be a man made of braſs by Vulcan, but likewiſe he carried about Crete the laws that were graven in braſs, and put them ſeverely in execution.

Pauſanias, in Bœoticis, makes mention of all the books of Heſiod, that are intituled, “Εργων και ημερων,” written in plates of lead: which ſort of plates Suetonius, in the life of Nero, calls “chartam plumbeam,” leaden paper: but this cuſtom was in uſe even before the days of Job who himſelf, chap. 19. cries out: “Oh that my words were graven with an iron pen, and lead in the rock for ever:” which the interpreters explain, that he would have the leaden plates placed upon rocks or pillars.

They uſed alſo of old to write on leaves or plates of ivory; and hence the books were called “libri elephantini; and not as ſome imagine from their bigneſs and huge bulk. Thus Martial. lib. 14. Epigram. 5.

Languida nè triftes obſcurent lumina ceræ,
Nigra tibi niveum litera pingat ebur.

Waxen table-books were very ancient; for Prætuſ ſent a letter in one of them by Bellerophon, as Homer tells us, Iliad 6. Theſe table-books were made of wood, covered with wax, on which they writ with an instrument of iron or braſs, and therefore they were called “pugillares, à pungendo,” as Aldus Manutius obſerves, De quæſitis per Epift. lib. 2. epift. 1. Georgius Longus, de Annulis Signatoriis cap. 8. deſcribes them to be of a triangular form: but Laurentius Pignorius de ſervis. p. 116. ſays “Pugillarum forma fuit oblonga et quadrata, eminenti quâdam margine circumcirca conclufa, ut vidimus Romæ in veteri arcâ ſepulchrali in hortis Cyriaci Mattheii.” The ſame Pignorius in the ſame book, p. 117. deſcribes likewiſe the form of the Roman Graphium, or Stylus, with which they uſed to write in theſe waxen table-books. It was firſt made of iron; but that being dangerous to ſtab with, and too frequently abuſed in that practice, was, in after times, forbid at Rome, and publicly prohibited to be worn, as Caſaubon notes on Suetonius, lib. i. cap. 82. and then ſtyles of bone were in uſe: theſe were made ſharp at one end to cut the letters, and flat at the other to deſace them; whence the phraſe, “ſtylum vertere:” this ſtylus was uſually carried in a little caſe, called graphiarum, as Beroaldus obſerves on the ſame place of Suetonius. As for ſlates, and plates of wood, it cannot be doubted but that they were uſed to write upon.

Panciroloſ tells us, That the Longobards, now by corruption called Lumbards, at their firſt

coming into Italy, made leaves to write on, of thin shavings of wood, some of which he had seen and read in his days. The ancients writ likewise on the leaves of palm-trees, see Pliny, lib. xiii. cap. 11. and thence letters are called Phœnician, not from the country, but from *φοινῖς*, a palm-tree. Yet Guilandinus de Papyro, makes a mighty bustle to prove, that palm-leaves were never used to write upon; he believes that Phœnicea, which Pliny there uses, is not the same with *φοινῖς*, and would have us read "malvarum," instead of "palmarum." It is indeed true, that they did anciently write on the leaves of mallows likewise, as appears by Isidorus, and the following epigram of Cinna, which that author cites:

Hæc tibi Arateis multum invigilata lucernis
Carmina, queis ignes movimus æthereos,
Lævis in aridulo malvæ descripta libello,
Prusiacâ vixi munera naviculâ.

But this was not frequent: for the leaves of mallows are too soft, to be proper for that use. The names of those who were expelled the senate at Athens, were written on leaves, though of what kind, is uncertain: but from thence the sentence against them was called *Ἐμφυλλοφόρησις*; and the names of those banished by the people, were written on shells: but at Syracuse, the names of such sentenced citizens were written on the leaves of the olive-tree; and thence it was called *Πίσυλλισμος*, ἀπὸ τοῦ πίπτεον ἰλαίας. And the Cumæan Sybil in Virgil was wont to make use of this sort of paper:

Fata canit, foliisque notas et carmina mandat.
Æn. iii. ver. 444.

Upon which Hortensius cites Varro to prove, that it was peculiar to that Sybil, to describe the oracles in the leaves of palm-trees: but Cerdanus believes it to have been the general custom of those times, and that they did not yet write on the barks of trees, or on the reed called papyrus, or on parchment.

Pliny makes mention in several places of books made of linen: these were public records, and called by some "libri linteï," by others, "linteræ mappæ," and "carbasina volumina," silken volumes: Claudian.

Quid carmine poscat
Fatidico custos Romani carbasus ævi.

And Symmachus Epistolar. lib. 4. "Monitus Cumanos linteæ texta sumpserunt:" and Pliny says the Parthians used to interweave letters in their clothes.

The ancients were likewise wont to write on the thin kind of skin, that grows between the outmost bark and the body of the tree; and the paper, which the Chinese and some Indians use to this day, seems to be made of that, or something like it: and from thence a book was called *liber*.

Having tried all these experiments, at length they fell to use paper, which they called Papyrus, from a reed of that name, that grew in the fens and marshy grounds in Egypt, and of which paper

was made: they likewise called it Charta, from a town of that name in the marshes of Egypt, where it grew. Herodotus in Terpsichore says, that even in his days the Ionians called paper, skins; because in times past they were fain to supply the want of paper with skins, which shows the error of Pliny, in saying, that neither paper nor parchment were used before the time of Eumenes; from whose city Pergamus, parchment first came, and thence was called Pergamena: but of the invention, use, and improvement of paper and parchment, see at large Melch. Guilandin. in his *Treatise de Papyr*. I only add, that the Diphtheræ of the Greeks were only skins of beasts: and that, in which Jupiter is feigned to keep his memorial of all things, was made of the skin of the goat, that gave him suck: and many are of opinion, that the famous golden fleece was nothing but a book, written on a sheep's skin. Diodorus the Sicilian, affirms in his second book, that the annals of Persia were written on such skins: and many more authorities might be produced, if they were needful.

At length the poets, says Lucretius, began to celebrate in their hymns the noble actions of the heroes of those days; and this custom is at this time observed amongst the Indians, whose songs are the only histories they have. Lastly, the poet teaches, that all the other arts were invented and improved by the sagacity and experience of men; inasmuch that it is hard to say, which of them was first found out.

Ver. 1536. This and the following verse are repeated from above, ver. 1467.

Ver. 1538. Thus too Marilius, speaking of the invention of arts, says,

Semper enim ex aliis alias profeminat usus.
Lib. 1. ver. 90.

Which Creech paraphrases thus:

New hints from settled arts experience gains,
Instructs our labours, and rewards our pains:
Thus into many streams one spring divides,
And through the valley rolls refreshing tides.

Consonant to which is this of Columella, lib. 10.

Ipsa novas artes varia experientia rerum,
Et labor ostendit miseris; ususque magister
Tradidit. —

And Theocritus in Idyl. 21. ascribes the invention of all arts to want and necessity:

Ἀπείρεια, Διόφαν' ἴσ' ὅτι τὰς τέχνας ἐγείρει,
Ἀλλὰ τῷ μόχθῳ διδάσκαλος ἔστι γὰρ Ἰνδοί
Ἀνδράσιν ἐργάζεσθαι καὶ παρὶχὸν μέμνηται.

To which may not improperly be applied, what Philostratus, in the life of Apollonius, as cited by Photius, reports of the temple of Hercules at Gades; where among other altars, there was one dedicated to penury and art; to intimate, that as penury stirs up art, so art drives away penury; as Hercules put to flight, and subdued monsters, the incitements of his valour. See Riccard. Brixian.

and Casaubon explaining this passage of the prologue to Persius;

Magister artis, ingenique largitor
Venter. — — —

ANIMADVERSION,

BY WAY OF RECAPITULATION, ON THE FIFTH
BOOK OF LUCRETIVS.

WHAT Lucretius in this book asserts from ver. 60. to ver. 461. that the sun, the earth, the sea, in a word, the whole frame of this world has not existed from all eternity, nor will continue to all eternity, is believed in general by all pious men, and sound philosophers: but his proving this assertion by some probable, and by many strong and unquestionable arguments, that indeed seems peculiar to Lucretius only: for certainly no stronger proofs, no more cogent reasons [I always except the Holy Scriptures] are any where to be found. This makes me wonder the more, how so excellent a wit could insert those foolish verses from ver. 168 to ver. 266. in which he endeavours to evince, that God did not create the world: for he believes, that God is not generous enough, or rather is too spiteful and envious, to do any thing for the sake of man; and fancies, that whatever he does, he does for the sake of himself, of his own ease and quiet. If any man should give such a character of Epicurus, Lucretius would treat him as an impudent babler. In the next place he imagines, that neither God nor man can have any notice or knowledge of any things, but by the means of images. And who is this God? Is it not he whom the mind of man perceives, whom all nations acknowledge and adore? In the next place, who can bear with him, while he enumerates the faults, as he calls them, of the world? All of them false and foolishly invented. And were these defects in the new and infant world? Lucretius himself denies they were; and therefore is the more to blame, to impute the decays and flaws in a building, worn out with age, to the fault of the architect.

From ver. 461. to ver. 551. he describes the rise or birth of the world; and among all the physiologers, there is not a description of it more likely to be true, nor more lively and beautiful. The atoms are moved by their own weight, they meet, this makes them rebound, and according to the difference of the stroke and weight, the resiliation is made into different places, where they combine and grow into bodies.

Having, as he imagines, freed the Deity from all care and trouble, and kept him in ease and quiet, while the world was making, he proceeds, and from ver. 550. to ver. 824. delineates the order: and because he does not assign any one

certain cause of the motions of the heavens, of eclipses, of day and night, with that positiveness as some others do, he seems to some to waver in his opinions: but I insist, that such a constancy as they call it, in an Epicurean physiologer, would be very ridiculous: for he pronounces that all things are made and done by chance: and that no man can determine one, to say, certain cause, of these phenomenons, since they may be explained in several manners. Nor should I indeed think a man worthy of blame, who assigns several causes, while among the rest the only true and certain cause is proposed. Nor can I imagine a man could act more agreeably to his principles, or describe chance better: resolving all philosophy, all our search, and inquiry into those matters, into a naked *may be*: nay, often scarce standing within the comprehensive bounds of possibility: but to pass by all the contradictions that lie in the very principles, and beginning of his hypothesis, let us suppose these infinite atoms, moving in the infinite; and grant they could strike, and take hold, and squeeze out the lesser and more agile parts into seas, heaven, moon, stars, &c. I ask, why this mighty mass of earth as its nature requires, does not constantly descend? Why is it fixed and steady? Lucretius answers: because it lies in congenial matter, and therefore presses not: but still the question returns: why does not this congenial matter fall, since it has weight, the Epicurean property of atoms, and that other fit matter spread below it? The demand constantly returns. Besides, this matter was squeezed out of the earth by the descending heavier particles, and therefore the mass may press, and descend through it. Well then, if this earth cannot be framed, neither can any of the other elements; since, according to his description, the latter depends on the former. And since he refuses to stand to any one cause of the motion of the sun or stars, it would be endless to pursue this flying bubble, and follow him through all the mazes of conceit and fancy. Nor will I add any thing concerning what he alleges of the magnitude of the sun, moon, and stars, having said before, that that opinion is too vulgar to be regarded.

Read the rest of this book, and commiserate a man of so excellent parts, who could forget himself, and play the fool so egregiously: but it is a fate upon all who deny a Divine Providence, to reason foolishly in ethics, and absurdly in physics. Yet in the description he gives of the state of the first men, of their manners and way of life, we have a perfect image of the manners of all the present barbarous and savage nations: and in these earth-born men of Lucretius, you will easily discover the Cannibals, Brasileans, and several others of the people of the West Indies.

Q q iiiij

BOOK VI.

THE ARGUMENT.

THE first thirty-seven verses of this sixth and last book of Lucretius contain the praise of Athens, in which city the great Epicurus was born; together with an encomium of that philosopher. II. From ver. 37. to ver. 96. the poet explains the argument of this book, in such a manner as might reasonably be expected from an Epicurean. From thence, to ver. 431. he proceeds to dive into the very nature of the things we call meteors; and, that men might learn not to be dismayed at the thunder of angry Jupiter, he teaches, that thunder is made either by the collision, or corrasion, or disruption of clouds, when contrary winds fight against one another: or, by the force of winds, either struggling within the bowels of the clouds, or driving them with violence against each other: or, that it is only the hissing of flames, that fall from a dry cloud into a wet: or, lastly, that thunder is but the crashing noise of bodies of hail and ice, that meeting violently in the air, are dashed to pieces. As for the lightning, which the Latins called *Fulgur*, he says it is nothing but fire forced out of clouds, either by their collision, or other motion; or the seeds of flames that are driven out of clouds, by the force of winds. And then, as to the thunderbolt, that other sort of lightning which the ancients called *Fulmen*, he teaches, that it consists of a subtile and fiery nature; that it is conceived and bred in thick and high-built clouds; that being grown to maturity, it bursts out of the clouds by the force of wind, that either breaks through them, dashes them to pieces, or beats from without, with great violence against them; that it consists of atoms so subtile and minute that it is borne along the air with wonderous celerity; and that it is most frequent in the vernal and autumnal seasons: then he concludes this disputation with deriding the superstitious doctrine of the Thuscans, and others, who held that thunder and lightning are not the effects of natural causes, but proceed merely from the will of the offended, angry gods, and that Jupiter himself is the darter of thunder. And because a prester or fiery whirlwind, which is indeed a sort of lightning, and all other whirlwinds are certain kinds of meteors, the poet, from ver. 431. to ver. 460. disputes, IV. concerning them; and explains the nature, causes, motions, and differences of them. V. From ver. 459. to ver. 532. he treats of clouds and of rain. Clouds he supposes to be made either of the roughest and most dry particles of the air; or of the steams, vapours, and exhalations, that arise from the earth and waters. And as to rain, he says, it is generated, either by compression, as they term it, or by transmutation: by compression, if the force of the winds squeeze the water out of the clouds; by transmutation, if the clouds themselves are changed, and distil in falling drops of water. VI. In regard to the other meteors, as the rainbow, snow, wind, hail, and frost, he disputes briefly of them, or rather only mentions them, from ver. 531. to ver. 541. VII. From ver. 540. to ver. 609. he treats of the several sorts of earthquakes, and of the causes of them: which he ascribes, either to hollow parts of the earth, which, falling in, cause it to tremble; or to the tremulous motion of the waters, which he supposes the earth to swim in; or to subterraneous, and other winds; which either shake the earth in several parts, or drive it to and fro. VIII. From ver. 608. to ver. 646. he treats of the sea; and teaches, that the reason why it does not increase, notwithstanding the immense quantity of water that is continually flowing into it, is, either because of the vastness of the sea itself, or because the heat of the sun dries up its waters; or because the winds, brushing over them, bear much of them away; or because the clouds draw much moisture from them; or, lastly, because of the dryness of the earth itself, which sucks in, and imbibes, the waters of the sea. IX. From ver. 645. to ver. 715. he inquires into the causes of the fires that are ejected out of *Ætna*; and imputes them either to the violence of the wind, or to the exestuation of the waters of the sea; which, entering beneath into the cavities of the mountain, extrude and force out the seeds of flame, that are engendered and collected there, through the apertures, that are on the top of it. X. From ver. 714. to ver. 735. he treats of the annual increase of the Nile; and ascribes it either to the Etesian winds, that blow full against the stream of that river; and thus, hindering its course, cause the waters to overflow: or to heaps of sand, which the sea drives to the mouths of it, and thus chokes them up; or to the rains and snows that fall, and are melted, near the fountain of the Nile. XI. From ver. 734. to ver. 831. he disputes of the Averni, and other tracts of the earth, that are noxious, and even deadly, to birds, men, deer, crows, horses, &c. XII. From ver. 830. to ver. 894. he teaches, why the water of some wells and springs is hot in winter, and cold in summer. XIII. And thence to ver. 1006. he explains at large the attractive power and virtue of the loadstone. XIV. Lastly, from ver. 1006. to the end of the book, he discourses briefly of the cause and origin of plagues and diseases; and concludes his poem with an elegant description, taken from Thucydides, of the plague that raged in Athens, and almost laid waste and desolate the whole country of Attica, in the time of the Peloponnesian war.

ATHERNS first gave us laws, and chang'd our
 food;
 For acorns, tender fruit and corn bestow'd
 On wretched man: each was a mighty good!
 But then she taught us how to live at ease,
 She taught the joys of life, and show'd us peace.
 When Epicurus rose; when he began,
 That oracle of truth, that more than man;
 The fame of whose inventions still surviv'd,
 And rais'd an everlasting pyramid, [wide.
 As high as heav'n the top, as earth the basis }
 For he, observing some that could supply II
 Contented nature's thrifty luxury,
 Happy in honours, and in wealth's embrace,
 And doubly happy in a noble race,
 Still groan'd at home; with cares and fears op-
 Each found a sad disturber in his breast, [press'd,
 Imagin'd strait, some fault lay hid in man,
 Whence this corruption of the joys began:
 Because his wish is boundless, vast his mind;
 The goods ran through and left no sweet behind:
 Or else some ill opinion still destroys 2 I
 The ent'ring good, and still sours all his joys.
 Then he, the mighty he, by pow'ful rules,
 And true philosophy reform'd our souls,
 He purg'd away all vain and empty care,
 And taught what man should hope, what man
 should fear.

The end, at which our actions aim, he show'd,
 And taught an easy way to find the good:
 What we from chance, or nature's force may
 fear,
 And taught us how t' avoid, and how to bear,
 And prov'd that man is fondly vex'd with care.
 For we, as boys at night, at day do fear 32
 Shadows, as vain, and senseless as those are:
 Wherefore that darkness, that o'er spreads our souls,
 Day can't disperse, but those eternal rules,
 Which from firm premises true reason draws,
 And a deep insight into nature's laws.

And therefore I'll proceed. Since then the sky }
 And all that is, or can be, fram'd on high,
 Is mortal, once was made and once must die; 40 }
 Since this is prov'd, now I'll go farther on,
 And finish this so happily begun.

The various wonders of the lower air [care,
 Perplex mens doubtful thoughts with vexing }
 And make the wretches bend with slavish fear: }
 For ignorance of causes heaves the mind
 To pow'rs above; as birds soar high, when blind.
 We see effects; but when their causes lie }
 Beyond the ken of vulgar reason's eye, }
 We then ascribe them to the Deity. 50 }
 For ev'n those few exalted souls, that know
 The gods must live at ease, nor look below;
 If they look up, and view the world above,
 And wonder how these glorious beings move,
 They are entrap'd, they bind their slavish chain,
 And sink to their religious fears again;
 And then the world with heav'nly tyrants fill,
 Whose force is as unbounded as their will.
 Deluded ignorants! who ne'er did see
 By reason's light, what can, what cannot, be: 60
 How all at last must yield to fatal force;
 What steady bounds confine their nat'ral course:

And therefore err. If you refuse to fly
 Such thoughts, unworthy of the Deity;
 But think they act such things, as break their ease,
 And opposite to joy and happiness;
 Then thou shalt surely smart, and, fancying still
 The gods are angry, fear a coming ill: [ploy;
 Though no revengeful thoughts their minds em-
 No thirst to punish man disturbs their joy: 70
 Yet thou dost think their happy quiet age
 Still vex with waking cares, and vi'lent rage.

Nor shalt thou visit on the sacred days
 Their shrines with quiet mind, or sing their praise,
 Besides, the images, the forms, that rise
 From their pure limbs, and strike thy reason's }
 And constantly present the deities; [eyes,
 Those images will still disturb thy mind,
 Strike deep, and wound, and leave despair behind:
 And then how sad thy life! what pungent cares
 Will vex thy wretched soul? What anxious fears?

But now to chase these phantoms out of sight
 By the plain magic of true reason's light;
 Though I have sung a thousand things before,
 My lab'ring muse must sing a thousand more:
 How thunder, storm, and how swift lightning flies,
 Singing with fiery wings the wounded skies!
 Lest superstitious you observe the flame,
 If those quick fires from lucky quarters came;
 Or with sad omen fell, and how they burn 90
 Through closest stones, and waste, and then re-
 turn.

And you, my sweetest muse, come lead me on
 I'm eager, and 'tis time that I were gone;
 Come lead me on, and show the path to gain
 The race, and glory too, and crown my pain.

First, then, the dreadful thunder roars aloud,
 When fighting winds drive heavy cloud on cloud:
 For where the heav'n is clear, the sky serene,
 No dreadful thunder's heard, no lightning seen;
 But where the clouds are thick, there thunders
 rise; 100

The furious infant's born, and speaks, and dies.
 Now clouds are not so thick, so close combin'd }
 As stones; nor yet so thin, and so refin'd }
 As rising mists, or subtile smoke, or wind: }
 For then the upper clouds, like weighty stone,
 Would fall abruptly, and come tumbling down:
 Or else disperse, like smoke, and ne'er enclose
 The hanging drops of rain, nor hail, nor snows.

They give the crack, as o'er a theatre
 Vast curtains spread, are ruffled in the air; 110
 Or torn (for such a sound is often known
 From thunder's crack), they give a mighty groan;
 Or as spread clothes, or sheets of paper, fly
 Before the wind, and rattle through the sky.

But clouds meet not directly still, but slide,
 And rudely grate each others injur'd side:
 And hence that buzzing noise we often hear,
 That with harsh murmurs fills the lower air;
 Continues long, but with a softer sound;
 At length it gathers strength, and breaks the bound.

But more, the thunder, arm'd with pointed
 flame, 120
 May seem to shake the world, and break the frame;
 When e'er a fierce, and strong, and furious wind,
 In narrow, thick, and hollow clouds confin'd,

Breaks through the prison with a mighty noise,
And shoots at liberty with dreadful voice :
Nor is this strange, when one poor breath of air,
That starts from broken bladders, sounds so far.

Again: 'tis reason too that noise should rise
When vi'lent storms rage o'er the lower skies, 130
For thousand clouds appear, rough, close combin'd,
And thick, and able to resist the wind :
Thus noise must rise, as when the woods they
wound,

The vex'd and injur'd boughs sigh forth a mourn-
ful sound.

And winds oft cut the clouds, and, passing through,
With murmur'd sound fill all the air below :
For that the winds may break the clouds, and fly
Through all resistance in the lower sky,
'Tis easy to discover, since they break,
And twist our trees: yet here their force is weak.

Besides; vast waves of clouds seem roll'd above,
And in confus'd and tumbling order move: 142
These, meeting, strike, and break, and loudly roar,
As billows dashing on the trembling shore.

Or else hot thunder falls on rain, or snow,
And dies, and hisses, as it passes through :
As when we quench a glowing mass, the fires
Fly off with noise, with noise the heat ex-
pires.

But if the cloud be dry, and thunder fall,
Rises a crackling blaze, and spreads o'er all; 150
As when fierce fires, press'd on by winds, do seize
Our laurel groves, and waste the virgin trees;
The leaves all crackle; she, that fled the chase
Of Phœbus love, still flies the flames embrace.

Or else vast hills of hail, and rocks of ice,
May break; and, tumbling, rattle through the
skies :

For when rough storms conjoin the parts of hail,
Or scatter'd ice, their weight must make them fall.

Quick lightning flies, when heavy clouds rush on,
And strike as steel and flint, or stone and stone :
For then small sparks appear, and scatter'd light
Breaks swiftly forth, and wakes the sleepy night :
The night, amaz'd, begins to haste away, 163
As if those fires were beams of coming day.

And first we see the light, and then we hear
The noises: these but slowly reach the ear ;
Because the images of things do fly
More swift than sounds, and quickly strike the eye:
One instance clears it; for, observe, and see,
Whene'er a cruel ax does wound a tree, 170

The tree strait sighs: but if at distance shown,
We see the stroke before we hear the groan :
So whilst the noise moves slow the winged light
Flies swiftly on, and strikes the distant sight :

Though both arose at once, that moves the eyes,
Before the slow-tongu'd thunder speaks, and dies.

But more; a cloud seems fir'd, a tempest brings
Swift trembling flames upon his dreadful wings ;
When shut within a cloud, it scorns the bound,
And strives to break, and whirls, and tumbles
round; 180

And, whirling, hollows out the wat'ry frame,
At last grows hot, takes fire, and breaks in flame :
For motion causes heat: thus balls of lead,
From engines thrown, have melted as they fled :

The wind grows hot, when loos'd from cold em-
brace

Of pressing clouds, and gets a larger space :
Strait scatters sparks of fire, which swiftly fly,
And spread quick lightnings o'er the lower sky :
Then the grave murmur comes: the light ap-
pears

Before the heavy sound can reach our ears, 190
Now this is done, when cloud lies heap'd on cloud ;
Thence lightning flies, and thunder roars aloud.
Nor must you think this false; because the eye,
When plac'd below, sees clouds more broad than
high :

For look and see, the lab'ring winds can bear
Vast mountain-clouds, and whirl them through
the air ;

The lab'ring winds then move but slowly on,
And, as oppress'd with burdens, sigh and groan.
Or when upon a mountain's lofty head,
We see the higher clouds o'er lower spread. 200
And, though the winds all hush'd, they cease to
move,

Yet still the low are press'd by those above :
Then you may guess their bulk; how high they
rear !

How vast these real castles built in air !
How great, how strong their hollows, where the
wind

Shut up, grows fierce, and scorns to be confin'd,
But roars through all the clouds; as beasts dis-
dain

The den's confinement, and the slavish chain,
And roar to get their liberty again: 210
And, seeking way, rolls round the watery frame,
And gathers num'rous seeds of subtle flame,
And these it whirls, until the shining streams
Break through the cloud, and show their feeble
beams. [rise

But more, these glaring fires, these flames, may
And fall to earth through all the spacious skies,
Because the clouds hold num'rous parts of light :
For if they're dry, their colour's fiery bright :
For they must catch, and hold descending rays,
And thus look fiery red, and often blaze: 219
These, press'd by winds, to narrow place retire,
And scatter seeds that frame the glaring fire.

But farther; lightning often seems to glide
When clouds grow rare; for, as the winds divide,
The clouds must lose the seeds: These show the
fire,

But without thunder silently expire.

But now what seeds the thunder's parts compose,
Their stinks, their marks, and sulph'rous odour
shows :

For these are signs of fire, not wind, or rain :
Nay, oft they burn our towns, and men com-
plain 230

Of heav'nly fires, and angry gods, in vain.
Now these celestial fires are fram'd above,
Of parts refin'd, and thin, and apt to move :
Too strong to be oppos'd, they scorn a bound,
And pass through closest walls, as voice and
sound: [and brass :

They fly with ease through stone, through gold,
And in one instant melt the stubborn mass :

Nay, oft the cask entire, the liquors flow,
 Because the pointed flames, with secret blow,
 Widen the vessel's pores in passing through :
 Which yet the sun, with all his beams and rage,
 And all his fires can't do within an age : 241
 So quick these parts must move, so swift they run,
 So much excel in force the vigorous sun.

Now, how this force begins, how thunder flies
 With that quick strength, how these fierce motions rise,

That break our strongest tow'rs, our towns infect,
 Demolish houses, ruin man and beast,
 That split our trees, and rage o'er all the wood,
 I will explain, and make my promise good. 249

First, then, 'tis certain thunder seems to fly
 From dark, thick clouds, and those built vastly high :

For when the smiling heav'n's serene and clear,
 Or thinly clouded, we no thunder hear :
 But now ev'n sense assures no smiles adorn,
 No sky's serene, while mighty thunder's born :
 But athic cloud o'erspreads heav'n's threat'ning
 As if the shades of hell had left their place, [face,
 And fill'd the arch'd skies : so thick the night,
 So dark the horrid clouds, and so affright !

Besides ; at sea dark clouds do often fall, 260
 As streams of flowing pitch, and spread o'er all,
 Far from the darken'd sky ; and, swoln with rain,

And storms, they draw behind a dreadful train
 Of thunder-cracks, which rage o'er all the main.

Ev'n we on earth all shake, with terror aw'd,
 We seek for shelter, nor dare peep abroad.
 Therefore these clouds, that spread o'er all the sky,
 Must needs be thick, and all built vastly high :
 For else they could not stop descending light. 269
 Nor check the rays, and bring so thick a night ;
 Nor such great floods, nor so much water yield,
 As swell our streams, and spread o'er ev'ry field.

These winds and fires, when spread o'er all
 the sky,

Make thunders roar, and the wing'd lightning fly.
 For I have taught before that clouds contain
 A mighty store of fire, and much they gain
 From the sun's heat, and the descending rays,
 These when the wind has forc'd to narrow place,
 And squeez'd some sparkles from the wat'ry frame,

And closely mixes with the gather'd flame, 280
 It whirls, and then within the cloud retires ;
 And, tumbling, forges there, and points the fires :
 This, by the rapid whirl, or neighb'ring ray,
 Is fir'd ; for flame is rais'd by either way.
 Thus when the wind, grown hot, still whirls a-round,

Or when the furious flame breaks o'er the bound,
 Then thunder, fit for birth, dissolves the cloud,
 And shows the glaring fires, and roars aloud :
 The heav'ns then crack, as if the orbs would fall,
 And feeble fear, and tremblings seize on all : 290
 Then show'rs, as if the air were chang'd to rain,
 Fall swiftly down, and threaten floods again.
 So great the thunder-storms, as if they came
 From the revengeful clouds to quench the flame.

Sometimes external winds the clouds divide,
 And break wide caverns in their injur'd side.
 Through these the infant thunder makes its way :
 These winds call forth the flames, and they obey.

And sometimes too a wind unkindled flies,
 But kindles in its passage through the skies ; 300
 Losing some heavy parts it us'd to bear,
 Which could not swiftly cut the middle air :
 And gath'ring others of convenient frame, [flame:
 Which join, and fly with them, and raise the
 As balls of lead, when shot with mighty force,
 Their stubborn, their ungentle parts divorce,
 And, soften'd, melt in middle of their course. }

Sometimes the fury of the stroke may raise
 Quick sparks of fire, and make a mighty blaze :
 For by the stroke small streams of light may
 spring 310

Both from the striking, and the injur'd thing :
 As from cold flint and steel bright sparks appear ;
 They fly the blow, and fly to open air.
 And thus the clouds, if of convenient frame,
 May well be kindled, and dissolve in flame :
 Nor can the winds be cold, because they move
 Through such vast space, still tumbling from above :
 For, if not kindled by the flames they meet,
 Yet sure they must come warm with mingled heat.

The thunder's force comes thus : For, while it
 lay 320

Confin'd in clouds, it strove to break away :
 At last prevails, and flies with mighty force ;
 And hence so great the strength, so swift the
 course !

As mighty weights from strong balistæ thrown,
 Which break the walls, and shake the frighted town.

Besides, its parts are small, and quick the blows,
 And therefore meets with nought that can oppose :
 No stops can hinder, and no lets can stay :
 The closest pores will yield an open way :
 And hence it flies with such a mighty force ; 330
 And hence so great the strength, so quick the
 course.

Besides ; all weights by nature downward go ;
 But when that motion is increas'd by blow,
 The swiftness, and the force must needs increase,
 And break, whatever dares resist, with ease.

Lastly ; so vast a space since thunders run,
 Their swiftness must increase in tumbling down :
 For motions still increasing run their race,
 And all by odd proportions mend their pace :
 Or all the seeds direct their vi'lent course, 340
 And strike one part with their united force :
 Or else, as through the air they swiftly rove,
 Meet parts which strike, and make them swifter
 move.

And when the pores receive the subtle fire,
 The force flies through, the thing remains entire :
 But when it strikes the substance, then the mass
 Is broken : Thus it melts strong gold and brass :
 Because its parts are thin, and swiftly fly,
 And enter in, and soon dissolve the tie.

Now spring and autumn frequent thunders
 hear ; 350
 They shake the rising, and the dying year :

For winter yields not heat enough : the wind
 Flies cold : In summer, clouds are too refin'd :
 But in these middle quarters all concur ;
 All causes join to make the thunder roar ;
 Because those seasons heat and cold engage ;
 Both necessary things for thunder's rage ;
 That parts may disagree, and raise a war,
 And fires, and rapid whirls disturb the air.
 For, first the spring within its limits holds 360
 The coming heats, and the retiring colds :
 And therefore these two parts, thus opposite,
 When join'd, and mix'd, must strive, and fiercely
 fight.

But then in autumn, summer's flames retreat,
 And coming winter fights the flying heat.
 These are the troubled seasons of the year ;
 The times that elements go forth to war :
 What wonder, then, if frequent thunder flies,
 If frequent storms disturb the lower skies ;
 Since, fighting, all in doubtful wars engage, 370
 Here heat and flames, there cold and waters, rage ?

And hence we know the nature of the flame ;
 And how it works, and whence the fury came :
 For not by reading Thuscan books inquire
 The gods' design by this celestial fire ;
 Observe the moving flame, and then presage
 The kindness of the gods, or coming rage :
 Or if the clouds in lucky quarters swell ;
 And thunder break, and with sad omen fell :
 And hence we know, how its quick forces pass 380
 Through closest stones, and melt or break the
 mass :

[flow,
 What drives swift lightning on, what makes it
 And all the harm celestial flames can do.

For if these bolts were thrown by gods above,
 Or if they were the proper arms of Jove ;
 Why do the daring wicked still provoke,
 Why still sin on, secure from thunder's stroke ?
 Why are not such shot through, and plac'd on
 high,

As sad examples of impiety,
 That men may sin no more, no more defy ? 390
 And why does heedless lightning blast the good,
 And break his bones, or cruddle all his blood ?
 Why good and pious men these bolts endure ?
 And villains live, and see their fall secure ?

Why do they throw them o'er a desert plain,
 Why through the empty woods, and toil in vain ?
 Is it to try their strength ? or else in play
 The wantons sport, and throw Jove's bolts away ?
 Or why, the senseless rocks, they idly wound ?
 Why blunt their father's bolts against the ground ?
 Why does he suffer this ? why not prepare, 401
 And keep his useful arms for times of war ?
 Lest some gigantic, impious rebels rise,
 And unprovided he should lose the skies.

Why then the heav'n is clear, no thunder flies ?
 What, when thick heavy clouds o'erspread the
 Does he descend to take the surer aim, [skies ?
 At nearer distance then, and dart the flame ?
 Why strike the floods ? What mean such bolts
 as these ?

Is it to check the fury of the seas ? 410
 Poor weak design ! The troubled waters roar,
 And, vex'd by whirling flames, still rage the more.

Besides : this Jove is willing men shou'd fly
 These bolts, or not : if willing, tell me why
 The thunder is too subtle for our eye ?
 If not ; why does he show the threat'ning light ?
 And why o'erspread the heav'ns with clouds
 and night ?

And make a noise, and give us time for flight ?
 Besides, how can these flames at once be
 thrown

To diff'rent parts ? Or is it never done ? 420
 Does Jove at once but throw a single one ?
 Fond fancy ! For, as rain, so lightning flies
 To many parts at once, and breaks the skies.

Nay more : Why does he beat the temples
 down,

Those of his fellow-gods, and of his own ?
 Why does he hurt, and break the sacred stone ?
 Why break the curious statue, spoil the grace,
 And wound with fiery bolts the sacred face ?

Why does he seldom strike the humble plain,
 But blunt his fires on hills and rocks in vain ? 430

And hence 'tis known, how fiery whirlwinds
 rise,

How they descend, and cut the threat'ning skies ;
 For often dark and heavy clouds increase,
 And pillar-like descend, and reach the seas,
 While all around the troubled ocean raves,
 Fierce winds still blow, and raise the boiling waves.
 And all the ships, in reach of danger toss'd,
 Are whirl'd with rapid turns, and wreck'd, and
 lost.

This happens when the tumbling winds, that lay
 Confin'd in clouds, too weak to force a way, 440

Do drive it down ; for then, by slow degrees,
 As if some hand, or arm above did press,

The pillar-clouds descend, and reach the seas :
 When this divides, the rushing winds engage
 The flood, and make the waters boil and rage :

For then the whirling winds descend, and bear
 The thick, tough, heavy clouds through all the air,
 But when they reach the sea, they break their
 bound,

And mingle with the waves, and, whirling round,
 With dreadful noise, the furious billows raise, 450
 And light the waters with a mighty blaze.

Sometimes the whirling wind might whisk
 the air,

And, gath'ring parts of clouds that wander there,
 Might hollow out itself a wat'ry frame,

All like a prester, but without the flame :
 From these, as wombs, fierce whirlwinds take
 their birth,

And impiously torment their parent earth :
 But since, at land, the hills must stop their way,
 These storms are oft'ner seen at open sea.

Now clouds combine, and spread o'er all the
 sky, 460

When little rugged parts ascend on high,
 Which may be twin'd, though by a feeble tie.

These make small clouds, which, driven on by wind,
 To other like, and little clouds are join'd,

And these increase by more, at last they form
 Thick heavy clouds, and thence proceeds a storm.

And thus the lofty hills may seem to yield
 More mists and vapours than the humble field ;

Because when thin and little mists arise,
Not thicken'd yet, and wander o'er the skies, 470
All too refin'd, and subtle for our eyes;
The winds do drive them to the mountain's head,
And there the thin and airy cov'rings spread;
Which, thick'ning round the top, there first ap-
pear,

And seem to rise from that, and fill the air.

But farther on; the seas give vast supplies,
From these the greatest stores of vapours rise:
For clothes grow wet, expanded near the shore,
And drops arise, and stand in ev'ry pore: 479
And therefore from the deep and spacious floods,
Great stores of mists may rise, and frame the
clouds.

Besides; the earth, and rivers, urg'd by heat,
Oft breathe soft mists, and num'rous vapours sweat:
Which join, and make thick clouds, and stop the
light;

And stain the glorious skies with sudden night:
For the warm vig'rous rays, with constant blows,
Still beat them on the back, and press them close.

And more: external matter give supplies,
And seeds of clouds, which spread o'er all the skies.
For I have prov'd the mass immense, the space 490
Is infinite, and knows no lowest place:

And how the atoms through the vacuum rove,
How quick they measure space, and how they
move:

Slow time admires, and knows not what to call
The motion, having no account so small.

What wonder, then, that sudden storms should rise;
And hasty night spread o'er the lower skies;
Since from the mass such vast supplies are hurl'd
Through ev'ry pore, and passage of the world;
And linger here, and join: or break the chain,
And fly through the divided skies again? 501

Now sing, my muse, how rain is spread o'er all,
How wat'ry clouds are join'd, and showers fall.

First, with the clouds moist streams of vapours
rise,

From ev'ry thing: and spread o'er all the skies:
And, as in man; the moisture, sweat, and blood
Grow with the limbs, increasing with the cloud.

And oft as winds do whirl them o'er the main,
The clouds, like wool, do dip themselves in rain,
To shake their fleeces o'er the earth again. 510

The rivers, lakes, and pools, when stirr'd by heat,
Breathe forth soft mists, and num'rous vapours
sweat. [bin'd,

These rise, and set in clouds; and there com-
Or by the ambient cold, or driving wind,
They thence descend, because the winds divide,
Or else the clouds contract, their injur'd side;
Or else the upper clouds press those below,
And squeeze the water out, and make it flow.

And when the wind makes thin the wat'ry
frame,

Or rays cut through it with a vig'rous flame, 520
The rain breaks forth, the injur'd cloud appears
Like melted running wax, and drops in tears.

But when the wind with higher clouds agrees,
And their united force begins to squeeze,
When both do press the cloud, swoln big with rain,
Then storms descend, and beat the humble plain.

Then constant show'rs, when wat'ry clouds,
that lie

On one another's back, receive supply
From ev'ry quarter of the lower sky.

And when the thirsty earth has drunk the rain, 530
And throws it up in vapours back again.

And when the adverse sun's bright beauties flow,
And strike thick clouds, they paint the gawdy bow.

And how the other meteors rise and fall,
What stamps the figur'd snow, and moulds the
hail.

And why the water's pride and beauty's lost,
When rig'rous winter binds the floods with frost,
'Tis easy to conceive, if once we know

The nature of the elements, or how
Their fighting pow'rs must work, or what they
do. 540

And next of earthquakes. —

First, then, you must suppose the earth contains
Some seeds of winds, spread o'er its hollow
veins;

And there, as well as here, fierce vapour reigns:

And many lakes, and pools, and spacious caves,

And secret rivers there roll boist'rous waves:

For nature's laws command, and reason's prove,

The parts below resemble those above:

These things suppos'd: when those vast courts
below

Shall fail, the upper earth must tremble too: 550

For hills must sink, and from the mighty fall

Quick tremblings must arise, and spread o'er all:

No wonder this: while carts go slowly on,

Or swifter coaches rattle o'er the stone,

Although the weight's not great, the houses feel,

And shake at ev'ry jumping of the wheel.

Or else from arch'd caves great stones may
fall,

And strike the under waves, and trouble all;

Those agitate, and shake th' enclosing ball:

For when the liquor, as experience proves, 560

Is troubled, all the vessel shakes and moves.

Besides; when winds below, with mighty force

Against resisting caves direct their course,

The earth that way inclines: then fixt before,

Our houses nod; the higher nod the more:

The hanging beams start from the tott'ring wall,

We fly our houses, and we dread the fall.

And yet some think the world will ne'er decay;

The scatter'd seeds, dissolv'd, fly all away;

Though these few fighting winds with ease displace

The heavy earth, and turn the weighty mass. 571

For did these still rush on, no force could stay

The coming ruin; all would soon decay:

But since they press but now and then, their course

Now here, now there, now fly with mighty

force,

And, then repell'd, return with weaker wings,

The earth oft threatens ruin, seldom brings:

Inclining only from its usual plain,

Then turns, and settles in its seat again:

And therefore houses nod, and seem to fall; 580

High, most; low, less; the lowest, least of all.

But more; the earth may shake, when winds

begin,

(Or rais'd without in air, or bred withip)

To rage through hollow caves, and, whirling
 round,
 Endeavour still to force the narrow bound,
 At last break through, and leave a gaping wound.
 Thus *Ægæ*, thus Phœnician towns did fall,
 The greedy earth gap'd wide, and swallow'd all:
 Besides, a thousand towns, a thousand isles,
 Whilst cruel eddies dimpled into smiles, 590
 Have fall'n, all swallow'd by the greedy main,
 And poor inhab'tants strove for life in vain.
 But if the vapour's cold, too weak the wind
 To force a way, if by strong bounds confin'd,
 It spreads o'er all the pores the earth contains,
 And brings a shiv'ring cold through all the veins;
 As when frost comes, it brings a trembling chill,
 And makes our members shake against our will:
 Then men begin to fear, and wisely dread,
 And fly the tow'rs that nod their threat'ning head:
 Or else they think the earth will fail; the ground 600
 Will gape, and all sink through the mighty wound.
 Ev'n those, who think the world must still en-
 dure,

Eternal still, from fate and age secure,
 Yet often, waken'd by the present fear,
 Start all, and think the dissolution near;
 They think the earth will sink, the world will fall;
 And ruin and confusion spread o'er all.

Now I must sing, my muse, why greedy seas
 Devour the water still, yet ne'er increase; 610
 For it seems strange, that rivers still should flow,
 And run for num'rous years as much as now;
 And, though they daily bring a mighty store,
 The spacious ocean should increase no more,
 But still be bounded with the former shore:
 And yet it is not strange: for these, the rain,
 And all the moisture that the clouds contain,
 Scarce seem a drop, compar'd to spacious seas;
 No wonder then the waves do ne'er increase.

Besides; the sun draws much; the fiery ray
 Descends, and forces many parts away:
 For sense assures, that when the busy beams
 Prefs moisten'd clouds, the vapours rise in streams:
 Therefore from spacious seas the rays must bear
 More wat'ry parts, and scatter through the air:
 But now, though here and there few parts arise,
 Yet a vast spacious mass of water flies {skies.
 From the whole sea, and spreads o'er all the }

And then the winds take some, with wanton
 play {away: 630
 They dip their wings, and bear some parts
 This sense declares; for often after rain,
 In one short night, if winds sweep o'er the plain,
 The dirt grows hard, the ways are dry'd again. }

Besides; as winds drive on the low-hung clouds,
 And make them skim the surface of the floods,
 They take some drops away; and these compose
 And fall to earth, in hail, in rain, and snows.

And since the earth is rare, and full of pores,
 And waves still beat against the neighb'ring
 shores,
 As rivers run from earth, and fill the main, 640
 So some through secret pores return again:
 These lose their salt, and through small channels
 spread,

Then join where'er the fountain shows her head:

Hence streams arise, in fair meander's play,
 And through the vallies cut their liquid way.

Now next, why *Ætna* burns, and why the flame
 Breaks forth in whirls, and whence the fury came:
 For sure 'tis fond to think that flames arise,
 Directed by the angry deities,
 To waste fair Sicily, and burn, and spoil 650
 The farmer's hopes, and fruits of all his toil,
 Whilst all the neighb'ring nations stood amaz'd,
 Oppress'd with anxious fear, and wildly gaz'd:
 The heav'n, all spread with flames, they flock'd
 to view,

And wonder'd what vex'd nature meant to do.

But if you look about on ev'ry side,
 Consider that the whole's immensely wide;
 Then view the arch'd skies, and see how small,
 And mean a portion of the spacious all, 659
 How little man, compar'd to earth's vast ball!
 You then will find your fears and cares decrease,
 Your jealousies, and admiration cease.

For who admires to see a patient sweat,
 Or hear him groan, when scorch'd by fever's heat,
 Or when the foot, or eye is vex'd with pains,
 Or any hot disease spread o'er the veins?

And this, because there lie vast stores of seed
 In heav'n, and earth, all fit, all apt to breed
 Such strange and vexing pains; or else increase
 The noxious flame, and feed the strong disease: 670

So you may think the mass sends great supplies,
 And stores of seed through all our earth and skies,
 Sufficient to raise storms, to shake the frame,
 Raise *Ætna's* fires, and cover skies with flame:
 For that appears, when seeds of flame combine,
 As rain, and clouds, when drops of water join:
 You'll say the fire's too strong, the flame too great:
 A vain objection this, and fancy's cheat:

Thus he, that views a river, man, or tree,
 Or else whatever 'tis he chance to see, 680
 Straight thinks them great, because, perhaps, he
 knows

No larger streams, no greater things than those:
 Yet these, and all the spacious skies controul,
 Are small, and nothing to the mighty whole.

Now why the flames break forth——
 First, then, this *Ætna's* cave's a mighty one;
 A spacious hollow, and all arch'd with stone:
 This swells with winds, which whirl and tumble
 there,

(For wind is nothing else but troubled air)
 When these, by whirling round the arch'd frame,
 Grow hot, and from the flints strike sparks of
 flame, 690

Then, proud, and furious too, and rising higher,
 Break forth at top, in smoke, and sparks of fire:
 By the same force, ev'n weighty mountains rise,
 And whirling rocks cut through the wounded skies.

But more, this hollow, fiery mountain's side
 The sea still washes with impetuous tide,
 And, passing through the pores, the flame retires,
 The pressing waters drive the yielding fires,
 And force them out; these raise large clouds of
 sand, 700

And scatter stones, and ashes o'er the land.

And thus my muse a store of causes brings;
 For here, as in a thousand other things,

Though by one single cause th' effect is done,
 Yet since 'tis hid, a thousand must be shown,
 That we may surely hit that single one.
 As when a carcase we at distance view,
 We all the various means of death must show,
 That in the number we may speak the true:
 For whether he was kill'd by strong disease,
 Or cold, or sword, though 'twas by one of these,
 We cannot tell; and thus it must be done
 In other things, a thousand others shown;
 When sense determines not our choice to one.

In summer Nile o'erflows; his waters drown
 The fruitful Egypt's fields; and his alone:
 Because the mouth of that wide river lies
 Oppos'd to north: for when th' Etesias rise
 From heavy northern clouds, and fiercely blow 719
 Against the streams, these stop, and rise, and flow.
 For northern winds blow full against the streams,
 Their spring is south, it boils with mid-day beams;
 Then cuts its way through sun-burnt Negroe's
 land,
 And hisses, passing o'er the fiery sand.

Or else the troubled sea that rolls to south,
 Brings heaps of sand, and chokes the rivers mouth:
 These stop the headlong floods; they strive in
 vain
 To force a way, but weary'd turn again,
 And break their banks, and flow o'er all the
 plain.

Or else rain makes it swell: th' Etesias bear 730
 The northern vapours through the southern air:
 These thicken'd round the hill the rain compose.

Or else the sun melts Ethiopian snows;
 These swell the river, and the water flows.

Next of th' Aevs sing, and whence the name,
 And whence the rage, and hurtful nature came.
 So call'd, because the birds that cut the sky,
 If o'er those places they but chance to fly,
 By noxious streams oppress'd, fall down, and
 die:

Death meets them in the air, and strikes them
 dead; 740

They fall with hanging wing, and bended head;
 And strike the pois'nous lake, or deadly field:
 Such vapours boiling springs near Cumæ yield.

In Athens, where Minerva's temple stands,
 There never crow, nor boading raven flies,
 Not, though the fat and oily sacrifice
 Allure his smell, and call his willing eyes.

Not that he fears Minerva's vain pretence,
 Or banish'd from her train for an offence;
 But 'tis the noxious vapour drives him thence.

A place, as story tells, in Syria lies, 751
 Which if a horse goes o'er, he groans and dies,
 As if by sudden stroke, and violent blow,
 He fell a sacrifice to gods below:

Yet these effects agree with nature's laws,
 And strict observers may discern the cause:
 Lest you should fancy these the gates of hell,
 That there the smutty gods, and manes dwell;
 And through those places draw the wand'ring
 souls, 779

As deer suck serpents from their lurking holes:
 But that's absurd, irrational, and vain:
 Come, understand the cause, for I'll explain.

First, seeds do lie, as I have prov'd before,
 In earth, of ev'ry shape a mighty store:
 Some, vital parts to men, prolong their breath,
 Some apt to breed disease, and hasten death:
 To other animals some parts are good:
 Some hurt, some kill, and some give wholesome
 food:

And all these different effects arise
 From diff'rent motion, figure, shape, and size. 770
 A thousand hurtful parts through ears descend,
 A thousand pass the nostrils, and offend:
 A thousand hurt the touch, a num'rous store
 Disturb the eye, the taste a thousand more:
 Besides, on man, a thousand atoms wait,
 And hurtful all, and carry hasty fate:

Thus often, under trees supinely laid,
 While men enjoy the pleasure of the shade,
 Whilst those their loving branches seem to
 spread,
 To screen the sun, they noxious atoms shed, 780
 From which quick pains arise, and seize the
 head.

Near Helicon, and round the learned hill,
 Grow trees, whose blossoms with their odour kill:
 And all these hurtful things from earth arise,
 Because the parents earth's vast wombs comprise
 Those diff'rent stores and kinds of pois'nous seed,
 Which, fitly join'd, these hurtful natures breed:

The snuff of candles, this is often known,
 Offends the nose with stench, and makes us swoon.

Besides a thousand other things, that seize
 The soul within, oft make their way with ease,
 And shake the vital pow'rs with strong disease.

So when the belly's full, go sit, and stay,
 And wanton in hot baths, strait flies away
 Thy life, thy strength, and all thy pow'rs de-
 cay:

From charcoal deadly smells the brain engage,
 If draughts of water not prevent their rage.

To those whom fevers burn, the piercing smell
 Of vig'rous wine is grievous, death, and hell. 799

Besides, observe what pains the earth contains,
 And how much pois'nous sulphur fills her veins.

Lastly, Whilst men pursue the hidden store,
 And dig in mines of gold, or silver ore;

What hurtful damps, what noxious vapours rise!
 The wretched miner o'er the metal dies.

What noxious parts from golden mines exhale!
 How soon they seize, and make the miners pale!

With what quick force they kill the wretched
 slaves!

How soon they bury them in precious graves!
 Therefore these noxious parts must often rear,

And scatter poison through the upper air. 811

Thus hurtful parts from the Averni rise,
 And with strong poisons fill the lower skies:

And these, as birds cut through the liquid way,
 Seize them; and then some parts of life decay:

Thus they amaz'd on the Averni fall,
 And there the poisons work, and ruin all:

For first they make them giddy; then their wing
 Grows weak; they fall into the poison's spring;

There die; there leave their souls in deep de-
 spair, 820

Because the poison's fierce, and stronger there:

Or else the constant rising streams displace
The neighb'ring air, and leave an empty space :
Where, when the birds are come with nimble
force,

And still endeavour to pursue their course,
Deceiv'd they fall, they clap their wings in vain;
For no resisting airy parts sustain,
Their weight does force them on the pois'nous
plain.

And while they helpless in the vacuum lie,
Breathe out their soul through ev'ry pore, and die.

In summer, springs are cold; for earth con-
tains 831

Some seeds of heat within her hollow veins :
But when the heat's increase, and vig'rous ray
Forces a passage through, they fly away :
Thus as the summer comes, and rays begin
To cleave the earth, the streams grow cold within :
But cold contracts the pores to lesser space,
And binds the seeds of heat with strict embrace :
And these, squeez'd from the pores, with nimble
wings

Pass into lower wells, and warm the springs. 840

Near Ammon's shrine, as fame has loudly told,
A spring runs hot by night, by day 'tis cold :
This men admire, and think, when night has
spread

Her blackest curtains o'er our sleepy head,
The sun below does cast his vig'rous beams,
And pierces through the earth, and warms the
streams.

Aburd and vain! For, since the furious
ray,

When, roll'd above, it makes our warmest day,
And beats the open surface of the sea, 849
Can raise but little warmth; when roll'd below,
How pierce the earth, and heat in passing through?
Since sense assures, that when the rays do beat,
Our houses yield us a secure retreat;
We lie within, and scorn the summer's heat.

Then what's the cause? 'Tis this; a spongy
ground,

And fill'd with fiery seeds, lies all around :
This when cold nights contract, the seeds of fire,
Squeez'd out, fly off, and to the spring retire,
And make it hot: but when the vig'rous ray
Peeps forth, and opens them an easy way, 860
They leave the cold embrace, and soon retreat
To earth again, and take their former seat :
And thus, by day, it loses all its heat.

Besides, the water grows more rare by day;
In parts, divided by the piercing ray,
So lose their fire: as when the beams arise,
And warm the frozen streams with soft'ning
kiss,

They melt in the embrace, and lose their ice.

And some cold springs light flax, held o'er the
streams,

The flax takes fire, and scatters feeble beams: 870
A torch is kindled too: the flames appear,
And nod at ev'ry little breath of air;
Because the water feeds of heat contains,
And many rise from earth's capacious veins,
And cut the body of the streams, and flow,
Too weak to warm the waves in passing through.

Besides, their own quick force will make them
move,

And pass the yielding waves, and join above :
As little streams, that cut their secret way,
And rise up sweet i' th' bottom of the sea; 880
Beat off the salt, and the resisting flood
To thirsty sailors proves a mighty good :
Just so these seeds of fire might rise and flow,
And cut the yielding waves, and, passing
through,

Straight strike, and kindle oily torch, or tow; }
Because those parts are of convenient frame,
Hold seeds of fire, and fit to raise a flame :
Thus take a torch, but lately dead, and strive
To light the snuff again, and make it live,
It kindles long before it comes to touch; 890
And sure experience shows a thousand such,
Which light at distance, ere they reach the flame :
And thus this fountain acts; the cause the same.

Now sing, my muse, for 'tis a weighty cause, }
Explain the magnet, why it strongly draws,
And brings rough iron to its fond embrace :

This men admire; for they have often seen }
Small rings of iron, six, or eight, or ten,
Compose a subtle chain, no tie between :
But, held by this, they seem to hang in air, 900
One to another sticks, and wantons there;
So great the loadstone's force, so strong to bear :

In order to the cause, must first be prov'd
A thousand things, a thousand doubts remov'd,
And long deductions made; do you prepare
A strict observing mind, and list'ning ear.

First, then, from objects seen thin forms arise,
In constant subtle streams, and strike our eyes :
Thus odours fly from gums; a gentle breeze 909
From rivers flows, and from the neighb'ring seas
Sharp salts arise, and fret the shores around;
Thus all the air is fill'd with murm'ring sound;
And while we walk the strand, and pleas'd to
view

The wanton waves; or squeeze, or mingle rue,
Or salt, or bitter tastes our tongues surprise :
So that 'tis certain subtle parts arise }
From all, and wander in the lower skies;
And never cease to flow, because the ear,
And eye, and nose still smell, and see, and hear.

Next I'll repeat what I have prov'd before, 920
No compound's perfect solid, free from pore :
For though 'tis useful to direct our eye
Through all the secrets of philosophy,
To prove that solid seeds can never join,
Unless some empty space is left between }
It has its proper force in this design.

Then, first, in caves the subtle moisture creeps
Through hardest rocks, and even marble weeps :
And sweat from ev'ry lab'ring member flows,
And stubborn hair o'er all the body grows : 930
And nature drives our food with curious art
Through all the limbs, increasing ev'ry part :
Strong flames divide the rigid gold and brass;
And to a liquid substance break the mass :
Through silver, heat, and cold; and each disdains
And scorns a prison; though in precious chains :
This sense assures; into a well-clos'd room
The parts of odours, sounds, and heat will come :

And often, as our sickly soldiers feel,
The moist and subtle air creeps through their
steel. 940

Therefore 'tis certain, as I prov'd before,
No compound's perfect solid, free from pore.

Besides:—

The parts that rise from things, not all alike,
Nor equally agree to what they strike;
For, first, the beauteous sun, with vig'rous ray,
Melts snow, and ice, and wax, and hardens clay:
Thus leather shrinks in fire; but gold and brass
Dissolve; flames soften all the rigid mass:
Thus water strengthens steel, grown weak by heat,
But gently softens skins, and boiling meat: 950
Leaves of wild olives yield a sweet repast
To goats; to man a rough and bitter taste:
Thus pigs fly sweetest odours; those that please
And tickle man, offend and poison these;
Yet they will roll in dung, in filth delight;
Though squeamish man can scarce endure the
fight.

Besides: We must remember,—

Since things compos'd do num'rous pores com-
prise, [size:

Those must have diff'rent shape, and diff'rent
In animals, are various organs found, 960
And each the proper objects gently wound;
One taste, another smell, another sound.
Some things through stones, or silver, gold, or
brass,

Some move through wood alone, and others glass:
And those that pass the same, not always flow
With equal ease, and cut their passage through:
And this depends on the varieties,
And difference of pores in shape and size,
Which things of diff'rent texture still comprize.

These things thus prov'd, I now will sing
the cause, 970

Explain the magnet, show thee why it draws
And brings rough iron to its fond embrace.

First, from the magnet num'rous parts arise
And swiftly move; the stone gives vast supplies;
Which, springing still in constant streams, displace
The neighb'ring air, and make an empty space;
So when the steel comes there, some parts begin
To leap on through the void, and enter in.
But since they're twin'd, the foremost parts must
bring

The latter on, and so move all the ring: 980
For parts of steel are very strictly join'd,
Scarce any compounds are so closely twin'd.
No wonder, then, that when the foremost strove,
The other parts should stir, and all should move;
Which still they do, they still press farther on,
Until they reach, and join the willing stone.

The steel will move to seek the stone's em-
brace,
Or up, or down, or t'any other place,
Which way soever lies the empty space.
Not that the heavy steel by nature flies, 990
But blows without will force, and make it rise.

Besides, the air before the steel is rare,
And emptier than it was, and weaker far;
And therefore all the air that lies behind
Grown strong, and gath'ring like a subtle wind,

TRANS. II.

Must force it on, for still the ambient air
Endeavours, still contends to drive it near:
But then alone can move it, when the space
Is free, and fit to take the coming mass. 999

This fills the pores, and then with subtle gales
Drives on the steel, as winds great ships, and sails.

Besides, all compounds hold some parts of air;
For ev'ry compound is by nature rare:
This lurking air, no doubt, with nimble wing,
And constant turns, still whirls and beats the ring:
But, once determin'd forward, keeps the course
It first receiv'd, and that way bends its force.

But more than this: coy steel will sometimes
move,

And fly the striving stone, and cease to love. 1009

And thus steel filings, I have often known,
In little brazen pots held o'er the stone,

Will strive, and leap, as eager to be gone;
Because the little brazen parts, that rear,

Fill all the steel's small pores, and settle there:
And so the other rising streams, that come

From magnets, find no way, no open room,
And therefore strike: thus, flying through the
brass,

They rudely beat, and drive away the mass;
Which otherwise they'd take to their embrace.

Besides, no wonder this alone should feel 1020
The loadstone's power, and that move only steel,
For some their weight secures, as gold; and some

Their pores: they give the streams too large a
room;

And so they find an easy passage through,
And thus the substance ne'er endures the blow:

But steel, when brazen parts fill ev'ry pore,
And settle there, when it can take no more,

Is then prepar'd to take the subtle shove
The loadstone's streams can give, and fit to move.

Nor is there friendship 'twixt these two
alone; 1030

A thousand things besides, but one to one,
Agree: thus lime will fasten only stone:

Thus glue, hard boards; and we may often view
The solid table break before the glue:

Thus pure and fountain streams will mix with
wine,

But oil and heavy pitch refuse to join:
The purple's blood gives wool so deep a stain,

That we can never wash it out again;
No, pour on all the sea, 'tis all in vain.

Solder ignobly weds the golden mass 1040
To silver; proper solder lead to brass:

Besides these mention'd, there's a thousand more:
But stay; what need of such a num'rous store?

Why should I waste my time, and trouble thee?
Take all in short: of things, whose parts agree,

Whose seeds, oppos'd to pores, securely lie,
The union there is strong, and firm the tie:

Others by rings and hooks are join'd in one:
This way combine the loving steel and stone.

Now next I'll sing what causes plagues cre-
ate, 1050

What drives a pestilence, swollen big with fate,
To waste, and lay a nation desolate.

I've prov'd, that num'rous vital parts do fill
The air: so num'rous too are those that kill.

R r

These poisons, whether from the threat'ning skies,
Like clouds, they fall, or from the earth arise,
When she's grown putrid by the rains, or sweats
Such noxious vapours, press'd by scorching heats,
Infect the lower air, and hence proceed
All raging plagues; these all diseases breed. 1060

A traveller, in ev'ry place he sees,
Or hazards, or endures a new disease,
Because the air or water disagrees. }
How diff'rent is the air of Britain's isle,
From that which plays upon the wand'ring Nile?
What diff'rent air does Pontus' snows embrace,
From that which fans the sun-burnt Indian's
face?

And as mens shape or colour disagrees,
So ev'ry nation has its own disease:
The lepers are to Egypt only known, 1070
Those wretches drink of Nilus' streams alone:
Athens, the muses' seat, and chief delight,
Offends the feet; Achaia hurts the sight:
And thus in ev'ry land a new disease, }
New pains on all the other members seize,
And diff'rent air is still the cause of these.

Thus often when one country's air is blown
Into another, and forsakes its own,
It spoils the wholesome air where'er it goes,
And, like itself, makes all unfit for us. 1080

Thence plagues arise; and these descend and
pass

Into our fountains, tender corn, and grass,
Or other food, or hang within the air,
Held up by fatal wings, and threaten there:
So, while we think we live, and draw our breath,
Those parts must enter in, and foll'wing death.
Thus plagues do often seize the lab'ring ox,
And raging rots destroy our tender flocks:
And thus the thing's the same, if winds do bear
From other countries an unusual air, 1090
And fit to raise a plague and fever here:
Or if we travel all, and suck it there.

A plague, thus rais'd, laid learned Athens
waste; [pass'd,
Through ev'ry street, through all the town it
Blasting both man and beast with pois'nous wind:
Death fled before, and ruin stalk'd behind.
From Egypt's burning sands the fever came,
More hot than those that rais'd the deadly flame:
The wind, that bore the fate, went slowly on,
And, as it went, was heard to sigh and groan.
At last the raging plague did Athens seize, 1101
The plague, and death attending the disease.
Then men did die by heaps, by heaps did fall,
And the whole city made one funeral.

First, fierce unusual heats did seize the head;
The glowing eyes, with blood-shot beams, look'd
red,
Like blazing stars, approaching fate foreshow'd:
The mouth and jaws were fill'd with clotted
blood;
The throat with ulcers: the tongue could speak
no more, 1109
But, overflow'd and drown'd in putrid gore,
Grew useless, rough, and scarce could make a
moan,
Nay scarce enjoy'd the wretched pow'r to groan

Next through the jaws, the plague did reach
the breast,

And there the heart, the seat of life, possess'd:
Then life began to fail: strange stinks did
come

From ev'ry putrid breast, as from a tomb:
A sad presage, that death prepar'd the room. }

The body weak, the mind did sadly wait, 1113
And fear'd, but could not fly, approaching fate:
To these fierce pains were join'd continual care,
And sad complainings, groans, and deep despair,
Tormenting, vexing sobs, and deadly sighs, }
Which rais'd convulsions, broke the vital ties
Of mind and limbs, and so the patient dies.

Yet touch the limbs, the warmth appear'd not
great,

It seem'd but little more than nat'ral heat;
The body, red with ulcers, swoln with pains,
As when the sacred fire spreads o'er the veins.
But all within was fire; fierce flames did burn,
No clothes could be endur'd, no garments worn;
But all, as if the plague that fir'd their blood,
Destroy'd all virtue, modesty, and good, 1132

Lay naked, wishing still for cooling air,
Or ran to springs, and hop'd to find it there:
And some leapt into wells; in vain the heat,
Or still increas'd, or still remain'd as great.
In vain they drank; for when the water came
To th' burning breast, it hiss'd before the flame:
And through each mouth did streams of vapours
rise, 1139

Like clouds, and darken'd all the ambient skies.

The pains continu'd, and the body dead, }
And senseless all, before the soul was fled:
Physicians came, and saw, and shook their head.
No sleep, the pain'd and weary'd man's delight:
Their fiery eyes, like stars, wak'd all the night.

Besides, a thousand symptoms more did wait,
And told sad news of coming hasty fate:
Distracted mind, and sad and furious eyes;
Short breath, or constant, deep, and hollow sighs,
And buzzing ears; and much, and frothy sweat,
Spread o'er the neck; and spittle, thin with
heat, 1151

But salt and yellow; and the jaws, being rough,
Could hardly be thrown up with violent cough:
The nerves contracted, strength in hands did fail,
And cold crept from the feet, and spread o'er all:
And when death came at last, it chang'd the nose,
And made it sharp, and press'd the nostrils close;
Hollow'd the temples, forc'd the eye-balls in,
And chill'd and harden'd all, and stretch'd the
skin. 1159

They lay not long, but soon did life resign:
The warning was but short, eight days or nine.

If any liv'd, and escap'd the fatal day, }
And if their looseness purg'd the plague away,
Or ulcers drain'd; yet they would soon decay:
Their weakness kill'd them; or their poison'd
blood, [flow'd.

And strength, with horrid pains, through nostrils
But those that felt no flux, the strong disease
Did oft descend, and wretched members seize:
And there it rag'd with cruel pains and smart;
Too weak to kill the whole, it took a part: 1176

Some lost their eyes, and some prolong'd their
breath,

By loss of hands : so strong the fear of death !
The minds of some did dull oblivion blot ;
And they their actions and themselves forgot.

And though the scatter'd bodies naked lay,
Yet beasts refus'd ; the birds fled all away,
And us'd their wings to shun their easy prey :
They fled the stench : whom tyrant hunger
press'd,

And forc'd to taste, he prov'd a wretched guest ;
The price was life : It was a costly feast ! 1180.
Few birds appear'd ; no wing could serve for
flight :

The beasts scarce dar'd to trust themselves to
The plague walk'd through the woods : in ev'ry
den

They lay, and sigh'd, and groan'd, and dy'd, like
The faithful dogs did lie in ev'ry street,
And dy'd at their departing masters' feet.

Disorder'd funerals were hurry'd on ;
No decent mourners, nor a friendly groan :
Neglecting others' fates, all wept their own.

No common remedy did health impart 1190
To all ; physic was grown a private art :
For that which gave to one fresh vigour, ease,
And health, and strength, and conquer'd the dis-
ease ;

Ev'n the same thing, with equal art apply'd,
Another took, and by the physic dy'd.

All the infected lay in deep despair,
Expecting coming death with constant fear ;
Pale ghosts did walk before their eyes, and fright :
No dawning hopes broke through their dismal
night, 1199

No thoughts of help : this was a grievous ill,
This sharpen'd the plague's rage ; these fears did
kill.

Besides, the fierce infection, quickly spread,
When one poor wretch was fall'n, to others fled :
One kill'd, the murderer did cast his eye
Around, and, if he saw a witness by,
Seiz'd him, for fear of a discovery.
Those wretches too, that greedy to live on,
Or fled, or left infected friends alone,
Strait felt their punishment, and quickly found
No flight could save, no place secure from
wound : 1210

A strong infection all their walk attends ;
They fall as much neglected as their friends :
Like rotten sheep, they die in wretched state ;
And none to pity, or to mourn their fate.

Those whom their friends' complaints, and pi-
teous cries,

Did force to come, and see their miseries,
Receiv'd th' infectious and the fatal breath :
An inn'cent murd'rer he that gave the death.
This kind of death was best ; so men did choose
(A wretched choice !) this way their life to
lose : 1220

Some rais'd their friends a pile ; that office done,
Return'd, and griev'd, and then prepar'd their
A treble mischief this, and no relief : [own :
Not one but suffer'd death, disease, or grief.

The shepherd, midst his flocks, resign'd his
breath : [death :

Th' infected ploughman burnt, and starv'd to
By plague and famine both the deed was done :
The ploughman was too strong to yield to one :
Here dying parents on their children cast,
There children on their parents breath'd their
last : 1230

Th' infected ploughman from the country came,
They came, and brought with them additional
flame :

Men flock'd from ev'ry part, all places fill'd :
Where crowds were great, by heaps the sickness
kill'd :

Some in the streets, some near the fountains lay,
Which quench'd their flame, but wash'd their
soul away ;

And some in public, half alive, half dead,
With filthy coverings o'er their members spread,
Did lie and rot ; the skin, the poor remains
Of all the flesh, the starting bones contains, 1240
All cover'd o'er with ulcers, vex'd with pains.

Death now had fill'd the temples of the gods :
The priests themselves, not beasts, are th' altar's
loads :

Now no religion, now no gods were fear'd ;
Greater than all the present plague appear'd :
All laws of burial lost, and all confus'd :
No solemn fires, no decent order us'd ;
But, as the state of things would then permit,
Men burn'd their friends, nor look'd on just and
fit :

And want and poverty did oft engage 1250
A thousand acts of violence and rage ;
Some, O imperious want ! a carcase spoil,
And burn their friend upon another's pile ;
And then would strive, and fight, and still defend,
And often rather die, than leave their friend :
The other lost his pile by pious theft ;
A poor possession ! all that fate had left.

NOTES ON BOOK VI.

Lucretius, who, throughout his whole poem, is profusely lavish in praise of Epicurus, begins this sixth and last book with the praises of Athens ; which city, he declares, men ought to honour and revere, not only because humanity,

learning, religion, the tillage of the earth, the use of corn, laws, and civil societies, are believed to have taken rise there, and to have been from thence distributed amongst all the nations of the earth : [Cicero Orat. pro Flacco, " Ab Athenis
R r ij

enim humanitas, doctrina, religio, fruges, jura, leges orta, atque in omnes terras distributa putantur:] but chiefly because it was the place that gave birth to Epicurus, who, when he observed men flowing in abundance of all things necessary to lead a happy and quiet life, and that nevertheless they wasted their days in cares, and sorrows, and anxieties, applied himself to inquire into the origin of this great evil; and at length discovered, that the vessel itself, that is, the mind of man, was the cause of this calamity: for, as whatever things we put into a stinking vessel are soon corrupted and tainted with the same offensive odour; in like manner, if the mind of man be insincere, and not sound, he will never be able so to govern himself, as may be most conducive to his own felicity: In the first place, therefore, he says, that Epicurus was the man who first purged and cleansed the minds of those whom he instructed in wisdom; to whose affections he put stops and bounds of restraint; from whose minds he expelled terror; to whom he revealed the chief good, and showed the easy and direct road that leads to the attainment of it; to whom he taught the means to obviate all evils and, lastly, whom he proved to be tormented with vain anxieties, and to tremble, and be disquieted with causeless and empty fears. And this is what the poet says in the first thirty-seven verses of this book.

Ver. 1. *Athens.*] The most famous and ancient city of Greece, situate on the sea coast of Attica, and built by Cecrops, A. M. 2407. and from him called Cecropia: As to its name, Athens, the fables say, that a contest arising between Neptune and Minerva, which of them should give the name to that city, the gods, to compose the difference, were pleased to decree, that the city should be called by the name of either of them, who should confer the greatest benefit on mankind. The gods were assembled in judgment, and Neptune darted his trident against the earth, which opening was delivered of a horse, a warlike animal: Minerva struck her spear into the ground, and up starts an olive-tree, the emblem of peace. The gods decided it in favour of Minerva, who named the city Athenæ, from her own name, *Ἀθήνη*, for so the Greeks called her.

Justin. lib. ii. Cicero pro Flacc. Diodorus Sicul. lib. xiii. Plin. lib. vii. cap. 36. say, that the Athenians were the first who taught men, that fed before upon acorns, to plough the earth, and to sow corn; and that they were the first likewise who made laws, and compelled men to quit their savage way of life, and to enter into civil societies.

Ver. 6. *Epicurus.*] Of whom, B. I. v. 88. and the beginning of B. III.

Ver. 9. This and the following verse are transcribed out of Cowley's Ode on the Death of Mrs. Phillips. A pyramid is a figure broad at bottom, and smaller and sharper by degrees upwards, till it end in a point like our spire-steeple. It is so called from *πύργος*, fire, because flame ascends in that figure.

Ver. 17. This and the following verse run thus in the original:

Intellexit ibi vitium vas efficere ipsum,
Omniaque illius vitio corrumpier intus.

Where by *vas*, the vessel, the poet means the mind of man: for, in like manner as a vessel, when it is once imbued with an unfavoury odour, corrupts all the liquors it receives: so men too, says the poet, because they have admitted into their minds the fear of the gods, and the dread of punishments after death, do therefore lead their lives in tormenting inquietudes, while anxious cares fluctuate in their uneasy breasts; from which cares and terrors they might deliver their minds, if they would once consider and believe that the gods are not the authors of things, and that death to them is nothing: an impious assertion, but the main drift of our poet.

Ver. 19. Dryden from Juvenal, Sat. 10.

Such is the gloomy state of mortals here,
We know not what to wish, nor what to fear;
Ev'n he who grasp'd the world's exhausted store,
Yet never had enough, but wish'd for more,
Rais'd a top-heavy tow'r, of monstrous height,
Which, mould'ring, crush'd him underneath the weight.

Ver. 20. Lucretius here alludes to the fable of the Danaides, or daughters of Danaus; of whom book iii. ver. 1005. The allusion is clear in the original, though obscure in this translation.

Ver. 26. For Epicurus would have had men set bounds to their desires, and content themselves with what the necessities of nature required: for he said, that the things, that are neither necessary nor natural, are infinite in number, and fit only for fools.

He delivered the minds of men from fear, by proving the soul to be mortal, by taking away all belief of Providence, and overthrowing all religion: for he taught that the gods need not be feared because they cannot be angry; and that no sense remains after death. An opinion no less weak than impious.

Ver. 29. Epicurus held that all the ills, to which mortality is subject, happen from chance, or are the effects of nature: and that all the calamities that attend us, of what kind soever they be, must be ascribed to one of those two causes: all is chance or nature: there is no third to fly to: for the god of Epicurus, as Tertullian more than once observes, "*pene nemo est*," is next to nobody.

Ver. 32. You will find these six verses in the second book, ver. 58. See there the note upon them.

Ver. 38. Hitherto has been only the praise of Epicurus and of Athens. Now follows in 58 verses, an explication of the argument of this book. He says, that having in the preceding book treated of the beginning of all things, and of the celestial motions, he will now dispute of meteors, and of the other wondrous effects of nature, which men

who are ignorant of the causes of them, ascribe to the gods: whence proceed, religion, the vain dread of powers above, groundless fears, idle apprehensions, tormenting anxieties, &c. These are the ruin of true piety, and the reason that vain superstition reigns in the minds of deluded and mistaken man.

Ver. 42. Here our translator has wholly omitted the three following verses of his author;

*Quandoquidem semel insignem conscendere cur-
rum*

*Vincendi spes hortata est, atque obvia cursu
Quæ fuerant sunt placato conversa furore.*

And indeed Lambinus utterly rejects them: and the other interpreters read them so variously, and give them such different explications, as evidently shows, that, upon the whole matter, they knew not well what to make of them: and for these reasons I resolved not to add them in the text of this translation.

Ver. 43. He means the meteors, thunder, lightning, storms, whirlwinds, rain, snow, hail, &c.

Ver. 47. This similitude, though it be not in the original, is so pertinently applied in this place, that Lucretius himself, were he living, would judge it worthy of him.

Ver. 48. This and the two following verses are in book i. ver. 185. and they should be repeated again below after ver. 91. of this translation, for Lucretius does so in the original, but Creech has nevertheless omitted them in that place.

Ver. 51. This, and the ten verses that follow it, are likewise repeated from book v. ver. 87.

Ver. 57. Severe and cruel gods; whom such wretches as are ignorant of the causes of things, fear and adore, as if they were the authors of them. See Book v. ver. 94.

Ver. 60. This and the two next verses are in book i. ver. 99. as well as book v. ver. 96.

Ver. 71. Horace in like manner:

*Namque Deos didici securum agere ævum,
Nec si quid miri faciat Natura, Deos id
Tristes ex alto cæli demittere tecto.*

Ver. 78. Epicurus foolishly believed, that a god, who foresees all, protects all, and provides for all, must be indeed, a terrible and dreadful god: insomuch, that the image of such a god can never enter into the mind of man, but anxiety, fear, and terror will be the immediate effect.

Ver. 82. It is next to incredible to believe, to how great a degree wilful ignorance and dulness prevailed among the ancients. and that too, even in the midst of Athens, the chief seat of learning. Plutarch, in the Life of Nicias, tells us; that they could not discover the reason of the eclipses of the moon, but thought it a portent that foreboded some great disaster. For, says he, Anaxagoras, who first treated of the celestial phenomena, durst not discourse of them in public but only in private, and with some particular friends: for neither natural philosophers, nor those they cal-

led *Μετεωρολόγους*, i. e. such as argued concerning meteors; were suffered among them: they being looked on as men, who endeavoured to limit the Divine Power, and to derogate from it, by ascribing all things to natural causes: for which reason Protagoras was banished, and Anaxagoras thrown into prison: but Pericles with much ado, procured him to be set at liberty: Socrates was taken off, merely for the name of a philosopher: for he was averse to studies of that nature. At length, the authority of Plato, as well by reason of the probity of his life, as for that he subjected natural effects, to more potent and divine causes, wiped off the scandal from those studies, and opened a way to the doctrine of the mathematics. Thus Plutarch; who, in the life of Pericles, farther teaches us, what great advantages that Athenian general gained by his acquaintance with Anaxagoras: for he there informs us, that he delivered his mind from all superstition, which strikes a terror into those, who are ignorant of the causes of the celestial meteors; and tremble at the things above, which consternation, adds the same author, the knowledge of natural causes takes away; and, instead of that frightful and disquieting superstition, inspires a secure and quiet religion, together with good hope. Thus we see to what tend the endeavours of Lucretius, in the following disputation, and how much they ought to be esteemed.

Ver. 89. This relates to the discipline of the Thuscans: of which Cicero in the second book de Divinat. "Cælum in sex decim partes diviserunt Etrusci: facile id quidem fuit, quatuor, quas nos habemus, duplicare; post idem iterum facere, ut ex eo dicerent, fulmen quâ ex parte venisset." The Thuscans divided the heaven into sixteen parts: it was indeed easy for them to do so, by doubling the four we have, and then doing the same again: that they might know by that means, from what part comes the lightning: but the same quarters were sometimes reckoned lucky, sometimes unlucky, lucky as in this of Virgil:

*Subitoque fragore
Intonuit lævum.* Aen. ii. ver. 692.

Unlucky, as in this of the same poet,

*Sæpè malum hoc nobis, si mens non læva fuisset,
De cælo tactas memini prædicere quercus:
Sæpè sinistra cavâ prædixit ab ilice cornix.*

Eclog. I.

Thus the left side was ambiguously taken by the Romans often as a good omen, often as a bad: and the right, in like manner, was sometimes a lucky omen, sometimes unlucky. But whence came the same part to have so different, nay, contrary a power? Was it because, in the interpretation of their auspices, they sometimes had regard to the place and site of the gods, by whom those bodings were given them, and sometimes to that of the augurs, who asked those tokens of the gods? for the right of the giver is the left of the asker or receiver: some favour this opinion, and ground their belief on the testimony of

Plutarch lib. de Quæstionibus Romanis: but Cicero suggests another reason, for lib. ii. de Divin. he says, that the Greeks and Barbarians take the omens from the right to be best, as the Romans do those from the left. Hence the Romans may, in the affair of divination, be said to speak often after their own manner; often after that of the Greeks. However, it is certain, that amongst the Romans, in "auspiciis, quæ sinistra sunt, bene eventura putantur;" the auspices on the left were thought to forebode good success: as Alexander ab Alexandro in his Gen. dier. lib. v. cap. 13. & Tiraquel. on that place prove at large; without omitting the reason of it: for they acquaint us, that in taking their "Auspicia ex cælo," their auspices or omens from heaven, which was the chief kind of all; and on which they most depended; the thunder or lightning that came from heaven, was supposed to come from the right hand of God, when it was on the left of the auspex, or sooth-sayer: as, on the contrary, when it happened on his right side, they believed it to come from the left hand of God; because, they always took it for granted, that his face was turned towards the auspex. Thus too Donatus, on the "intonuit lævum," of Virgil, which I cited before, says, "Quod dixit lævum, debet prosperum intelligi: cujus ratio hæc est; læva in aliis contraria significant in sacris autem signis idcirco prospera accipiuntur quæ læva sunt, quia sacrificantis, vel precantis latus lævum dexterum est ejus, qui postulata largitur." So likewise in the omens taken from the voices of birds, the rule was, that those on the left were always lucky; "semper cantus Oscinis, quum sinister est, secundissimus fuit," says Alexander ab Alex. in the place above cited: indeed he makes some exceptions to this doctrine, but delivers it in general to be true. And here we may observe by the way, that of the birds, from which the ancients took their auguries, some were called Oscines, and from the voices of these they drew their divinations; and others Præpetes, from the manner of whose flight, they took their omens: crows, swallows, kites, owls, and such like birds, were counted inauspicious; and others, as vultures, eagles, swans, &c. in some cases portended good luck, in others bad: but even this depended too on which side the bird was; and some birds were held to be lucky on one side, and unlucky on the other. A raven was lucky on the left, a crow on the right: "Cornix à sinistra, corvus à dextra, ratum facit," says Cicero, de Divin. lib. i. But which auguries did the ancient Greeks and Latins take to be left, which right? for both of them, though they spoke differently, yet meant the same thing: that is to say, the oriental omens, or those that came from the east, did to both of them seem to be the best, for this reason, because the beginning of light and motion is from that part of the heavens: and yet what the Greeks called right omens, the Romans called left. Concerning the Greeks it is manifest from Homer, Iliad. xii. ver. 239. where Hector says, that he values not the augural birds, whether they go to the right towards the Aurora

and the sun; or to the left towards the dusky west:

"Εἰτ' ἐπὶ δεξιῇ ἴωσι πρὸς ἥω τ' ἡελίοντα,

"Εἰτ' ἐπ' ἀριστερᾷ τοίγῃ, πρὸς ζόφον ἡερόεντα·

As to the Romans, it is evident from Varro, who, Epist. Quæst. lib. v. says, "A deorum sede cum in meridiem spectes, ad sinistram sunt partes mundi exorientes, ad dexteram occidentes: factum arbitror, ut sinistra meliora auspicia, quam dextera, esse existimentur." Festus Pompeius quotes this passage, and mentions others of the ancients of the same opinion: which Pliny, lib. ii. cap. 54. confirms in these words: "Læva, prospera existimantur, quoniam lævâ parte mundi ortus est." Now the reason of the different appellation is, because, in taking their auguries, the Greeks turned themselves towards the north, the Romans towards the south. But to inquire why they did so, would engage me into too long a digression.

Ver. 90. See below, ver. 379.

Ver. 92. The poet invokes his muse in these four verses, of which, our translator, not having fully rendered them, obliges me to give the original.

Tu mihi supremæ præscripta ad candida calcis
Currenti spatium præmonstra, callida Musa,
Calliope, requies hominum, divûmque voluptas;
Te duce ut insigni capiam cum laude coronam.

Whence we see, that, notwithstanding what some imagine, that Lucretius never finished his poem, or at least writ more books that are lost, he never proposed to himself to write above six; and that he is now hastening "ad præscripta candida supremæ calcis:" which Seneca helps us to explain: for that author, Epist. 19. teaches, That what in the Circus was in his days called Meta, the goal, the ancients called Calx, because the end of the course was often marked with chalk. Calliope was one of the muses, so called from καλὸς, beauty, and ὄψ, ὄρος, a voice: she was mother of Orpheus, and president of heroic verse. See book i. ver. 932.

Ver. 93. This verse our translator seems to have been fond of: for he repeats it from book i. ver. 930. where it is placed with as little authority from Lucretius, as it is here.

Ver. 96. Lucretius begins his disputation of meteors; and first of thunders: the various motions and differences of which he explains several ways: and l. in these thirteen verses, teaches, that the noise of thunder is made by the collision of clouds, that are driven and dashed against one another by adverse winds. And if it be objected, that clouds are rare and thin bodies, and therefore very improper and unlikely to make so great a noise, the answer is, that the clouds do not equal stones and wood in density; nor on the other hand, are so rare as mist, or smoke: for then indeed they would vanish away: but they are however of a middle nature between both, and dense enough to contain hail and snow.

Diogenes Laërtius says, this was the opinion of Epicurus and Anaxagoras, and we read in Sto-

bæus, that Democritus and the Stoics too were of the same belief: nor does Seneca oppose it, cap. 39. *Nat. Quæst.* where he says, "Quid enim non quemadmodum illis manus plausum edunt sic illis inter se nubium sonus potest esse magnus quia magna concurrunt?" Since even the hands clapped together make a noise, why should not the noise of clouds dashing against one another be great, seeing they are great bodies that meet, and strike one another? And to one that objected, "*nubes impingi montibus nec sonum fieri*," that clouds strike against mountains, but make no noise, he answers: "*Non quomocunque nubes illis sunt, sonant, sed si apte sunt compositæ ad sonum edendum. Adversæ inter se manus collisæ non plaudunt: sed palma cum palma collata plausum facit*," the clouds do not make a sound in what manner soever, they are dashed against one another, but only when they are composed in a due manner to make a noise: The backs of our hands struck one against another, do not make that sound of applause, as when we clap one palm against the other. This was the opinion of many of the ancients, and, if we will give credit to some of our philosophers at this day, it is next to truth.

Ver. 98. For the Epicureans denied that it ever thunders, when the sky is clear; and therefore Horace when he was about to leave that foolish wisdom, as he calls it, says,

—————*Namque dies piter
Igne corusco nubila dividens,
Plerumque, per purum tonantes
Egit equos, volucremque currum.*

Ver. 109. In these six verses, he explains, by a comparison, the noise that clouds make when they are dashed by winds against one another, and at the same time brings a second explication of thunder. For one single cloud driven by the wind, is sometimes rent asunder by the violence of the blast; nor shall we condemn this interpretation, if we compare the noise that a cloud so torn makes, with the rustling of curtains that are hung up in a large theatre; with that of paper when you tear it hastily, or of clothes hung abroad, and rustled by the wind.

Nardius observes, that what Lucretius in this place advances, that the noise of thunder may be made by the mutual friction of clouds, that jostle against one another; like the noise made by sails or curtains rustling in the wind, and the like, is altogether improbable, but agrees but ill with his own doctrine. For having, ver. 102. assigned a middle consistency to the clouds, he banishes from them that dryness and solidity, which of necessity all such bodies must have, as, by their collision excite a sound, that can be perceived from far. Besides, that sort of noise, which is made in the clouds, is not like the mutual agitation of solid bodies. For then one only noise answers to one only blow; but the roar of thunder lasts, and is repeated. Nay, sometimes the cloud grumbles for a considerable space of time; and since the poet pretends, that this is done by contrary winds

that violently drive the clouds against one another; we add, that when two opposite winds, suppose the north and the south, contend with each other, no thunder, but roaring blasts only are then heard. And this last observation is strong against Lucretius; for it never thunders except when the clouds move slowly, at least not when the rack drives with violence; and, which is chiefly to be considered, the clouds grumble, and burst out in thunder, when they are not agitated by winds.

The Roman theatres were uncovered at top; and to keep off the sun or rain from the spectators, curtains were spread over them, as appears by what Lucretius himself says, book iv. ver. 75. Propertius too mentions these curtains, lib ii. Eleg.

Nec sinuosa cavo pendebant vela theatro.

Quintus Catulus was the first who introduced the use of them, when he dedicated the capitol; and Lentulus Spinter first brought up the use of silken curtains, in the Apollinarian games. This we have from Pliny, lib. xxiii. in these words: "*Vela in theatris tantum umbram fecere, quod primus omnium invenit Q. Catulus, cum capitolium dedicaret. Carbasina deinde vela primus in theatrum duxisse fertur Lentulus Spinter, Apollinaribus Ludis.*" Of these curtains see more, book iv. ver. 75.

Ver. 115. In these six verses, he gives us a third explication of the noise of thunder. Sometimes the noise of thunder is like a crashing, or creaking sound; and this happens when the clouds do not meet full; but as we call it, but only rudely jostle and shock the sides of one another in an oblique manner. From whence proceeds that clangour, which Lucretius calls "*aridus sonus*," a dry sound; and our translator, ver. 118, a harsh murmur. Thus Milton:

—————*The clouds,
Jostling, or push'd by winds, rude in their shock,
Tine the slant lightning, &c.*

Ver. 119. Dryden in *Troilus et Cressida*, describes this sort of thunder-clap.

*It comes like thunder, grumbling in a cloud
Before the dreadful break, &c.*

Ver. 121. These eight verses contain the fourth explication. Wind, says he, pent up in a cloud, rages to get free. Thence proceeds a grumbling noise, till the wind having burst its passage, makes a dreadful roar. Pliny, lib ii. cap. 43. favours this opinion, and says, "*Posse spiritum nube cohibitum tonare, naturâ strangulante sonum dum rixetur, edito fragore cum erumpat, ut in membrana spiritu intentâ.*" That wind, while it continues shut up in a cloud, may thunder; because so long as nature chokes the sound, it makes a grumbling noise, but when the wind frees its passage, and breaks out, it gives a horrid clap; as when we break a bladder, blown hard with wind. If you are disposed to laugh, see Aristophanes in *Nubibus*, Act. i. Scen. 4. Moreover, this was likewise the opinion of Strato, and Diogenes, but chiefly of Leucippus, Empedocles, and Aristotle,

who allow nothing but this to be the cause of thunder. Moreover, this sort of thunder which Lucretius explains by the bursting of a blown bladder, may yet better be explained by the report of our cannon, elegantly described by Pontanus in Meteor. in these verses.

Ut cum armata manus tormento exclusit aheno
Fumantem pilam, versatque volubile saxum,
Inclusi erumpunt ignes nigrantibus auris;
Fit tremor horrendumque sonat; tum plurimus
antè
Sternit iter fragor, et gemitu saxa icta resultant;
Disiectæque ruunt prostratis mœnibus arces.

And by Milton in Paradise Lost, book vi.

————— Immediate in a flame,
But soon obscur'd with smoke, all heaven appear'd,
From those deep-throated engines belch'd, whose
roar
Embowel'd with outrageous noise the air,
And all her entrails tore, disgorging foul
Their devilish glut, chain'd thunderbolts and hail
Of iron globes, &c.

Now though these implements of mischief were wholly unknown to the ancients; yet Epicurus in Laertius, lib. x. uses almost the same comparison, and says, that thunder may be made by wind shut up in hollow clouds, even in like manner as our vessels burst with noise, when they are heated by included fire. Moreover, Anaximander and Metrodorus seem to have been of the same opinion. For they held thunder to be a wind conceived, and enclosed within the bowels of a thick cloud; and which, breaking out with violence, makes the noise we call thunder; and that the lightning is caused by the breaking of the cloud. In like manner, added Anaximenes, who subscribed to this belief, as the sea, when dashed and broken with oars, sparkles and shines.

Ver. 129. In these six verses is contained explication fifth. We see, says the poet, some clouds, whose branchy edges resemble the boughs of trees, growing out on all sides from the body; and if winds get in among them, why should they not cause thunder? For when a rough blast of wind blows through a thick forest, the shaken branches clash against one another, and make a rattling noise.

Ver. 135. In these six verses, he gives explication sixth. The clouds, says the poet, may likewise be broken to pieces by the winds, when they beat hard upon them; and none can doubt but that winds can shatter the clouds, since we often see that they tear up the stoutest trees, and toss their broad roots into the air.

Ver. 141. Explication seventh, in these four verses. If you like not these reasons, imagine the air to be an immense sea, and the clouds its waves. Let them dash against one another; and they roar no less than the vexed billows of a boisterous ocean, when they insult the shores that bound them.

Ver. 145. Some philosophers taught, that thunder was caused by the falling of stars into a wet

cloud, and their struggling with the moisture. Now Lucretius for the eighth cause of thunder, in the room of their stars, substitutes the flame of lightning, which, falling from a dry cloud into a wet, hisses like red hot iron, when plunged into the smithy. This was particularly the opinion of Anaxagoras.

Ver. 149. Explication ninth. That he may be sure to omit none of the causes of thunder; he now, in those six verses, sets the very clouds on fire; and pretends, that as laurels and other things crackle in the flames, clouds may do so too.

Ver. 152. Pliny, lib. xv. cap. ult. says that Cato distinguished between two sorts of laurel; the Delphic, and the Cyprian; this last has a short blackish leaf, turning up at the edges and indented. The other, a very large leaf, and bears very large berries, that turn from green to red; with this the victors at Delphi, and those that triumphed at Rome, were wont to be crowned. Pompeius Lænaeus added a third sort of laurel, which he called "mustas, quod mustaceis subiceretur." Lucretius here calls it "Delphica laurus," the laurel being a tree sacred to Apollo, because, as Pliny, Nat. Hist. lib. xv. cap. 30. says, many very fine laurels grew on the Mountain Parnassus; and because, as the interpreter of Hesiod says, *ἱερὰ πρὸς ἱεραία*. Dryden from Chaucer's Tale of the Flower and the Leaf.

The laurel is the sign of labour crown'd,
Which bears the bitter blast, nor, shaken, falls to
ground:

From winter winds it suffers no decay;
For ever fresh and fair, and ev'ry month is May:
Ev'n when the vital sap retreats below;
Ev'n when the hoary head is hid in snow;
The life is in the leaf, and still between
The fits of falling snow appears the streaky green.

Because Daphne flying from Apollo, to whose love, she would not consent, was changed into a laurel. See the next note.

Ver. 153. Pliny, lib. xv. cap. 30. "Laurus manifestò abdicat ignes crepitu." The laurel, by its crackling in the flames, shows its natural detestation of fire.

This alludes to the known fable of Phœbus and Daphne, who was feigned to be the daughter of the River Peneus in Thessalia, because the banks of that stream abound with laurels. With this nymph, Phœbus fell in love, and she, refusing to yield to his desires, who would have offered violence to her, fled from him, and in her flight arriving on the banks of her father's flood, and imploring his assistance, was changed into a laurel. Her transformation is described at large by Ovid. Metam. 1. and finely translated by Dryden, as follows:

Scarce had she finish'd, when her feet she found
Benumb'd with cold, and fasten'd to the ground:
A filmy rind about her body grows;
Her hair to leaves, her arms extend to boughs:
The nymph is all into a laurel gone:
The smoothness of her skin remains alone:

Yet Phœbus loves her still, and, casting round
Her bole his arms, some little warmth he found :
The tree still panted in th' unfinish'd part,
Not wholly vegetive, and heav'd her heart.
He fix'd his lips upon the trembling rind,
It swerv'd aside, and his embrace declin'd :
To whom the God : because thou canst not be
My mistress, I espouse thee for my tree.
Be thou the prize of honour and renown ;
The deathless poet, and the poem, crown :
Secure from thunder, and unharm'd by Jove ;
Unfading, as th' immortal powers above :
And, as the locks of Phœbus are unshorn,
So shall perpetual green thy boughs adorn ;
The grateful tree was pleas'd with what he said,
And shook the shady honours of her head.

Ver. 155. In these four verses is contained the tenth and last cause of the noise of thunder. When it thunders, hail, and many little fragments of ice, fall in some places, but chiefly in the northern climates. Therefore, that noise may well be ascribed to the breaking into shivers of congealed and frozen clouds.

To this last opinion subscribes our countryman Hobbes, who holds thunder to be the breaking of a cloud, congealed to ice ; and that breaks by the struggling of enclosed air. The Stoics held it to be a noise occasioned by the collision of two hollow clouds ; and that the lightning proceeds from their attrition. This I hinted before ; and mention it in this place again, only to say, that Des Cartes differs not much from the opinion of these philosophers : for he conceives thunder to be caused, when several flat clouds, " tabulatorum instar," says he, like so many floors, are driven with violence, the higher on those below them, and clatter one upon another ; and the lightning to proceed from the nature of exhalations, that are included in the interstices, or spaces between the clouds, and which, by their falling upon one another, is crushed out, and explored with violence. But much more consonant to truth, nay, indeed true, is their opinion, who hold thunder to be a hot and dry exhalation, of a sulphurous and nitrous matter, contracted and shut up in a cold and moist cloud ; whence struggling to get free, it kindles itself by the agitation, and violently breaks forth from its confinement. And according to this opinion, Cowley says finely,

Why contraries feed thunder in the cloud ;
What motions vex it, till it roar so loud.

David. iii.

Ver. 159. Hitherto of thunder : He comes now to inquire into the causes of lightning, which may be struck out of hardened clouds, dashed against one another ; in like manner as fire is out of iron, flint, or wood ; for we ought to believe that some seeds of fire are lurking in the clouds, as well as in those other things, says Lucretius in these six verses.

But before we proceed any farther, it will be necessary to observe, that under the general name of thunder, three several things are comprehend-

ed : I. The noise, which the Greeks called *Βρονχή*, the Latins, *tonitru*, in English, thunder. II. The coruscation, by the Greeks called *Άστραπή*, by the Latins, *fulgur*, which answers to what we call the lightning. III. What the Greeks call *Καταιγής*, the Latins *fulmen*, and we a thunderbolt. I know that the ancients, especially their poets, no less than we at this day, often confounded these three things, taking one of them for the other, though they are different, as will more plainly appear by what shall be said by and by, when I come to explain the difference between the *fulgur* and *fulmen* of the ancients. I now return to Lucretius, who held, that as in stone, iron, and wood, there are seeds of fire, which by attrition may be forced out, and struck into sparkles. So in the clouds likewise there are seeds of fire, that by the attrition of those clouds, caused by the violent force of the wind, may be struck out into lightning. For though the clouds be moist, yet fire may nevertheless be generated and produced by their attrition. This Seneca seems to confirm, Nat. Quæst. lib. ii. cap. 25 and 26, where he says, that neither is fire produced without some moisture, nor are the clouds wholly watery, but contain a part that may take fire ; in like manner, as we often see the same piece of wood burning in one part, and sputtering out moisture in another : " eo modo, quo sæpe in ligno alia pars arder, alia sudat." Nor is this opinion contradicted by Pliny, who, lib. ii. cap. 42. says, " Posse et attritu, dum in præceps fertur, illum, quisquis est, spiritum accendi : posse et conflictu nubium elidi, ut duorum lapidum scintillantibus fulgetris." And Seneca, in the place above cited, adds the example of the wood of laurel, and of ivy, which by attrition produce fire. Thus too Democritus in Stobæus, Eclog. Phys. says, that lightning is the collision of clouds ; by which collision, the corpuscles, that are the efficient causes of fire, being by various confrications, got together, and kindled in one body, are, as it were, strained through the many pores and apertures of the clouds.

Therefore, what the Latins called *fulgur*, is nothing else than light emitted from the flame of *fulmen*, and diffused through the air. Yet Pliny, lib. ii. cap. 43. Seneca, lib. ii. cap. 16. and 18. and Aristotle, lib. ii. de Meteor. cap. 9. will have the fire of *fulgur* to be more loose and rare, inasmuch as it only cleaves the cloud, and vanishes into air ; but the fire of *fulmen* to be more compressed and close ; because it breaks the cloud with violence, and sometimes dashes against the earth. But this seems probable only in the coruscations without thunder ; but cannot be in those that are attended, " cum tonitu ac fulmine." For such coruscations break the cloud to pieces, and cannot be said to cleave it, but rather to scatter and disperse it on all sides, while the *fulmen* itself is directed to one part only. And thus the very moment that the matter of *fulmen* is kindled, the *fulgur* or coruscation is produced ; but this *fulgur* is momentary, because the flame of the *fulmen* is so too : and if the *fulgur* have sometimes any duration, the flame of the *fulmen* must of necessity con-

tinue the longer. This is manifest in our cannon; which being fired in the night, a coruscation from the flame of the powder is diffused all around; whence men that stand at a distance easily guess, that they shall soon hear the report.

Ver. 162. This and the two next verses our translator has added to his author. The thought seems to be taken from Waller's sea-fight.

Ver. 165. But if thunder and lightning be both made by the same collision of the clouds, why do we see the lightning before we hear the thunder? Because, says he, in these twelve verses, light is swifter than sound: For common experience evinces, that the species of a visible thing is sooner conveyed to the eyes, than the noise it makes is to the ears. Thus Aristotle, lib. ii. Meteor. speaking of lightning, says, γίνεσθαι δὲ μετὰ τὴν πλεονάζουσαν καὶ ὑστερον τῆς βροντῆς, ἀλλὰ φαίνεται πρότερον διὰ τὸ τὴν ὄψιν πρότερον τῆς ἀκοῆς. The coruscation is made after the stroke and after the thunder; but it is seen first, because the sense of seeing is swifter than that of hearing: And in the same place he brings an instance of men rowing a boat in the water, and says, that they are seen lifting up their oars the second time out of the water, by that time the noise of the first stroke is heard.

That the action of light is quicker than that of sound; and that light is therefore sooner conveyed to the eyes, than sound to the ears, is true beyond any contradiction; and the instance Lucretius brings to prove this assertion is just: for nothing is more certain, than that we see the motion of the hatchet, lifted up the second time to strike, before we hear the sound caused by the first blow, even though we are placed but at a small distance from the striker. The reason of which is, because the "materia subtilis" in lucid bodies, which is the medium by which we see, consists of particles, that are much less, and more solid than those of the air, the medium by which we hear: And consequently the motion of that subtile matter is more quick than that of the air: because more strength is requisite to overcome the resistance of a greater body, than that of a less: Besides, the greater body loses much of its motion, in conquering the resistance of the body it meets: Therefore the air, whose particles are intricate, and, like those of all other sulphureous bodies, twisted and entangled in one another; and in their magnitude far surpassing those of the subtile matter, whose very name supposes something the most minute that can be conceived; therefore, I say, the air cannot move with equal swiftmess, as does the "materia subtilis," whose particles being extremely minute, and solid, and inflexible, must therefore move more nimbly, and retain their motion longer. And this is the reason that the sense of seeing is quicker than that of hearing.

Ver. 177. In these fourteen verses, he says, that if thunder be caused by the winds breaking and tearing the clouds, lightning is likewise made by the same winds, that by the swiftmess of their motion grow hot, and kindle into flames, as they are agitated and whirled about in the bowels of the clouds. Thus Creech interprets this passage,

and says that Gassendus, and all that follow him, are mistaken in their interpretation of it. Now to confirm this opinion of Epicurus, we may observe, that several of the ancients seem to have been of the same sentiments: For Heraclitus, as Seneca, lib. ii. cap. 56. witnesses, held, that this fulguration is like the attempts of our fires, when they begin to kindle, and resembles the first uncertain flames, now dying, now rising again at every puff of the bellows. And we learn from Plutarch de Placit. Philosoph. lib. iii. cap. 3. that Metrodorus believed, that this coruscation is produced, when a cloud is assaulted and dashed to pieces by the wind. And these opinions are like theirs, who hold, That motion is the cause of heat: For we see many things grow hot by motion, as wheels, the axletrees on which they are hung, &c.

Ver. 183. This is no truer than what Virgil writes of the arrow of Accetes,

Qui tamen æthereas telum contorsit in auras,
Ostentans artem pariter, arcumque sonantem:
—volans liquidis in nubibus arsit arundo,
Signavitque viam flammis, tenuesque recessit
Consumpta in ventos: cælo seu sæpe refixa
Transcurreunt, crinemq. volantia sydera ducunt.

Æn. v. ver. 520.

Who, shooting, upwards, sends his shaft to show
An archer's art, and boast his twanging bow:
Chaf'd by the speed, it fir'd, and as it flew,
A trail of foll'wing flames ascending drew;
Kindling they mount, and mark the shiny way,
Across the skies, as falling meteors play,
And vanish into wind, or in a blaze decay.

Dryd.

Ver. 193. In these twenty-three verses he answers the objections of those, who pretend that the clouds, though they are broad, yet cannot be deep or thick enough to contain within their bowels, such vast hollows, as could be capable to enclose so much wind: To which he adds something of the winds grumbling within the clouds, and then bursting out into flames.

Ver. 197. For this and the following verse, our translator has no authority from his author: but has transcribed them from the Bishop of Rochester's Plague of Athens, and repeats them again almost word for word, ver. 1099. of this book. Where indeed they are better applied than here: For how come the winds, that, in the preceding verse, whirled the clouds through the air, which implies a violent and swift motion, to be able to move but slowly in this, and to groan under the weight of their burdens? Dennis speaking of a row of oaks, as he calls them, says finely,

The tempest sees their strength, and sighs, and
passes by.

Ver. 203. Sir R. Blackmore gives a lively description of these mountain-clouds in the following verses:

When on their march embattle'd clouds appear,
 What formidable gloom their faces wear!
 How wide their front! How deep and black
 their rear!
 How do their threat'ning heads each other
 throng!
 How slow the crowding legions move along!
 The winds, with all their wings, can scarcely
 bear
 Th' impending burden of th' oppressive war.

Ver. 205. Thus after our poet Virgil says of the winds,

*Illi indignantes magno cum murmure montis
 Circum claustra fremunt.* —

This way and that th' impatient captives tend,
 And, pressing for relief, the mountain rend;

Ver. 214. In these eight verses he proposes another cause of lightning, and says, that not only the seeds of fire, agitated and whirled about in the clouds, may be kindled into flames, but the clouds themselves contain many corpuscles of fire, which they receive from the sun, or from elsewhere: and this is evident from the bright and flamy colour of some clouds: Now these corpuscles, or seeds of fire, being forced out by the wind that drives and compresses the clouds together, make the lightning. Aristotle says, that several adhered to this opinion, which nevertheless he confutes, lib. ii. Meteor. Empedocles held that this fire, that catches in the clouds, is kindled by the beams of the sun: but Anaxagoras will have it descend from the highest ether, which he holds to be fire.

Ver. 222. He said in the last place, that the seeds of fire that are in the clouds, are driven out by the strength and violence of the wind: But now in these four verses, he says, that if they are not driven out in that manner, yet they must of necessity fall down, when the clouds grow thin, and break, and open of themselves: and that from thence proceeds the mild and gentle lightning, whose splendor dazzles the eyes, though no thunder invade the ear.

By this breaking, or rather rarefaction of the clouds, and the falling down of the atoms that make the lightning without any thunder or noise, the poet seems to insinuate the opinion of Clidemus, who, as Aristotle says, believed lightning not to be real fire, but only an empty species, that is to say, that the cloud, being agitated, and as it were struck and beaten in the humid part of it, brightens in like manner as the sea foams and turns white, if it be beaten with a rod. To this purpose too Anaximenes in Stobæus alleges the example of the sea turning bright when the oars cut the waves. Thus likewise Xenophanes said, that the cloud by its motion conceives the splendor that lightens: And, lastly, Animaxander favoured this opinion, when he said, that lightning is only the wind that turns bright by forcing its way through the blackness of the cloud.

Ver. 226. Hitherto the poet has treated of the coruscation of lightning, which the Latins called

fulgur: he is now going to dispute concerning the *fulmen*, by which the ancients meant the lightning, that falls and does mischief upon earth, and which in English is called a thunderbolt: The French call it "Carreau de Foudre:" which answers to our denomination of it: The Greeks called it *κεραυνός*; and Aristotle defines it in these words: τὸ δὲ ἀσφράψαν ἀναπνεύον βαρὺ ὡς ἄχρη τῆς γῆς διχθόν, κεραυνὸς καλεῖται. i. e. the lightning, if it continues its course to, and dashes upon the earth, is called a thunderbolt; Lucretius, even in this disputation, confounds the words *fulgur* and *fulmen*, often using one for the other: and indeed they both signify lightning, and the sole difference is in the effects they produce: Our translator too does the like; nay, sometimes uses the word thunder for lightning, particularly in this verse; though thunder properly means only the noise. This distinction was necessary to be observed in order to the better understanding of the following disputation; in which the poet treats of many things relating to lightning: I. Of its nature: II. How it is generated: III. Of its motion: IV. In what seasons of the year it is most frequent: And V. he inveighs against the superstition of such as ascribe thunder to Jupiter; and against the Thuscans, who drew their auguries from thunder and lightning. This disputation continues to ver. 431; and, first, in these eighteen verses, he disputes of the nature of lightning, and teaches that it must consist of a fiery substance, because it singes and burns whatever it touches, sets fire to houses, &c. But that it pierces through walls, that it melts gold, brass, and other metals, that it draws out the liquor and leaves the vessel entire, must be ascribed to the swiftness of its motion, and the tenuity and subtleness of its fire.

Ver. 227. For things that are blasted by lightning not only seem burnt, but retain a sulphurous smell.

Ver. 234. While the poet here takes notice of the wonderful effects of lightning, he observes the several sorts of it. Aristotle allows only two; one, which he calls *καπνώδης*, smoky, which occasions the swarthy colour of the things it blasts: the other, *λαμπρὸς*, clear, to which he ascribes its penetration. But Pliny, lib. ii. cap. 51. adds a third sort, which he calls *siccus*, dry; whose nature, says he, is indeed wonderful, since by that vessels are exhausted of their liquors, and drawn dry, while the vessels themselves remain untouched: Since gold, and silver, and brass, are melted by it, while the bags that contain them are not so much as singed, nor even the wax which seals them in the least melted, nor the impression disordered: Nay, what is yet more strange than all this, "Martia Romanorum princeps," says he, "icta gravida, partu exanimato, ipsa citra ullum aliud incommodum vixit:" Martia, a Roman princess, was struck with lightning when she was big with child; which killed the child within her; but she received no other hurt whatever. To which we may add what Seneca says, that it melts the sword without doing any hurt to the

scabbard; and all the iron of a spear, without so much as scorching the wood: that it breaks the vessel, and hardens the wine, so that it will continue as it were in a lump, and not run away: but that this stiffness or congelation of the liquor lasts not above three days, "*nec citra triduum rigor ille durat*," &c. lib. ii. cap. 31. And cap. 52. of the same book, he says, "*Valentiora, quia resistunt, vehementius dissipat: cedentia nonnunquam sine injuriâ transit: cum lapide, ferroque, & durissimis quibusque confligit, quia viam necesse est per illa impetu quærat; itaque faciat viam, quâ effugiat: teneris et rarioribus parcit, quamquam et flammis opportuna videantur, quia transitu patente minus sævit*:" &c. But here, since Lucretius gives us this opportunity, we will, with Nardius, propose several questions and problems, relating to thunder and lightning, and give the answers and solutions of them.

PROBLEMS CONCERNING THUNDER AND LIGHTNING.

1. Why is a man debilitated, and deprived of all his strength by lightning, even before he is actually struck by it? This was the observation of Thages the Thuscan, as Ammianus Marcellin. lib. xiii. witnesses.

Because the blast is quicker than the bolt: and therefore every thing is shaken and blasted, before it is struck. But that which blasts is pernicious, and collected out of the Averni, says Pliny, lib. ii. cap. 54.

2. Why, as it is reported, is not he struck, who either first sees the lightning, or hears the thunder? Plin. loc. cit.

Because he provides for his safety by his flight: and, as Seneca says, No man ever feared lightning, without avoiding it. "*Nemo unquam fulmen timuit, nisi qui effugit*." Nat. Quæst. lib. ii.

3. Why does one sort of lightning pierce, another dash to pieces, and another burn? Senec. loc. citat.

This depends on the quality of the thing that is struck, and of the matter of which the lightning is composed; which matter, if it be subtle, and chance to light on a thin and unresisting body, pierces it through and through: if the matter be more dense, and meet with a more solid body, it enters it indeed, but in the penetration dashes and tears it to pieces: when the matter is bituminous, it clings to combustible bodies, and burns them.

4. Why does it lighten more without thunder, in the night, than by day? Plin. lib. ii. cap. 54.

It lightens likewise in the day-time: but the corporeations are drowned by the superior light of the sun, unless they be vast indeed.

5. Why is it seen to lighten without thunder? Plin. lib. ii. cap. 54.

It does thunder, but at too great a distance to be heard; but if no object intercepts the flame, it may be seen at the most remote part of the horizon.

6. Why is man the only animal, that lightning does not always kill outright, though it strikes any other creature dead in a moment? Plin. lib. citat.

The matter of lightning may be less noxious to man than to brutes; or, perhaps, because his lungs are softer and more lax, whence coming to breathe without any forcible endeavour, without straining, more seldom, and at longer intervals, he does not so easily respire and suck in the ambient infection: Thus too it happens to the seal-fish, or sea-calf.

7. Why do all things, that are struck with thunder, always fall down and lie on the contrary part? Plin. loc. citat.

The violence of the blow tumbles them down in that manner.

8. Why is a man, who is struck with lightning, when he is awake, found with his eyes winking, or half closed; and a man struck when asleep, with his eyes broad open? Plin. loc. citat.

This observation is not always true. But when it does happen, the reason is, because the bodies, blasted by lightning, grow stiff in an instant, and continue exactly in the same site they were in before; the man awake, with eyes winking and half-shut for fear; the sleeper, awakened by the sudden noise.

9. Why was it not permitted to burn the body of a man thus slain? Plin. loc. citat.

Because, though they held that the purging fire of the funeral pile cleansed the soul of its contracted filth, yet they despaired that so great pollution would ever be admitted into their society. And this too was the reason why the Greeks burnt not the bodies of such as laid violent hands on their own persons. Servius in *Æneid.* iii. Quintil Declam. x.

10. Why did they esteem it a piece of religion to bury them in the earth? Philostrat. in *Heroic.*

Lest beasts and birds of prey should mangle and devour the body, or the ferryman of the Stygian lake refuse to waft over the wandering souls. Plin. loc. cit.

11. Why are the wounds of the thunder-struck colder than the rest of their body? Plin. *ibid.*

Because the heat in the other members is only suffocated; but quite consumed in the wounded: for all suffocated things long retain their heat; but such as corrupt and waste by degrees, grow stiff and cold immediately.

12. Why were men blasted by lightning never removed, but buried in the very place where they were struck, wherever it happened to be?

Because the law of Numa forbade funeral rites to be paid to a man killed with lightning; which would have been in some measure done, if the body had been removed, and carried from the place where it lay.

13. Why did they bury the body of such a man, by heaping up dirt over it?

Because they believed that to touch it would offend the gods.

14. Why were the augurs permitted to handle such bodies?

Because holiness becomes the holy. "Sacros sacra decent."

15. Why were the places that were blasted by lightning, hedged in and enclosed around?

Left a sacred thing should be trampled on unawares.

16. What means Lucan by this verse,

Inclusum Thusco veneratur cespite fulmen?

Because the place was immediately esteemed sacred.

17. For what reason was it thought so?

They believed that God seemed to consecrate it to himself.

18. What then was their opinion of a person who was killed by thunder?

They seem to have had the same opinion of him too; for Artemidorus held that a man, killed in that manner, was not polluted, but ought to be worshipped as a god.

19. Why is the money melted, and the bag untouched: and in like manner the sword, while the scabbard receives no damage? Seneca in *Quæst. Nat. lib. i. Q. 31.*

Because of the subtle force of the lightning, which passes through some things; though such as are dense, and resist its force, it instantly tears to pieces.

20. Why are metals melted by lightning in a moment's time, while the workmen receive no damage? Sen. loc. citat.

Because of the arsenical spirits that are in the lightning: For even the coiners of money can render metals fluid with a very small quantity of arsenic.

21. Why does the wine stay in a broken vessel? Senec. *ibid.*

Because it is congealed by the nitral spirits.

22. Why does not that stiffness last above three days?

Because the remaining sulphurous spirits, favoured by the ambient air, at length overcome the nitral.

Why is the wine hurtful, and even pernicious? Senec. *lib. cit. Q. 3.*

By reason of the virulence of the arsenic, that the wine has conceived; for wines will retain something of sulphur, as we know by experience in Rhenish wines.

Why is the venom of serpents taken away by lightning?

Because lightning consumes it: Thus the poison of scammony abates by the bare steam of sulphur; which, continued for some time, totally takes away its cathartic virtue.

Why are some things turned black by lightning?

Because, being burnt, they retain the sooty marks of the fire.

Why are some things discoloured?

Because there is a less portion of sulphur in the lightning, and a greater of some other combus-

tible; for fire alone gives iron a violet colour, and the soils that are put under precious stones are coloured by fire only.

To all which I add what Nardius relates of the wife of a certain apothecary at Florence, who had been blasted with lightning, but was still living in his days, and who, after that misfortune had happened to her, became, of a very cold temperament, as she had been of before, to be of a constitution so extremely hot, that she could scarce endure to wear any clothes, though ever so thin; of which he gives this reason: Because, says he, that most subtle fire consumed immediately the superfluous humidity that had been long stagnating in her members, and imprinted and left behind it some of its own fiery quality.

Ver. 244. In inquiring into the cause of thunder, it must be observed, that it never thunders but when the sky is over-cast with clouds: For unless the clouds were thick and high-built, so great a quantity of rain or hail could not fall at the same time. Therefore, in those clouds you may imagine a wind agitated and whirled about in a turbulent motion, growing hot with that motion, and forcing out of the clouds many seeds or atoms of fire: And that at length the wind itself takes fire, either by its own motion, or by those fiery particles, and breaks out with a horrid roar; and that, by that violent eruption, it so shakes and tears the parts of the clouds, that they are all shivered into hail, or dissolved into a shower of rain. This is contained in fifty-one verses.

Ver. 252. The same matter composes wind, thunder, lightning, and earthquakes, that is to say, a dry exhalation, says Aristotle, *lib. ii. Meteor. cap. ult.* For of this dry exhalation wind is made in the air, earthquakes within the earth; showers, tempests, thunder, and lightning in the clouds.

Ver. 256. These four verses Lucretius has before in book iv. ver. 172.

Ver. 260. Sir R. Blackmore's excellent description of a storm at sea, will illustrate this passage of Lucretius:

Now gath'ring clouds the day begin to drown;
Their threat'ning fronts through all th' horizon
frown:

Their swagging wombs low in the air depend,
Which struggling flames, and in-bred thunder
rend:

The strongest winds their breath and vigour prove,
And through the heav'ns th' unwieldy tempests
shove:

O'ercharg'd with stores of heav'ns artillery,
They groan, and pant, and labour up the sky:
Loud thunder, livid flames, and Stygian night,
Compounded horrors, all the deep affright:
Rent clouds, a medley of destruction spout;
And throw their dreadful entrails round about
Tempests of fire, and cataracts of rain
Unnat'ral friendship make t' afflict the main:
This orb's wide frame with the convulsion shakes,
Oft opens in the storm, and often cracks:

Horror, amazement, and despair appear
In all the hideous forms that mortals fear.

Ver. 266. Suetonius says of Tiberius, that he was frightened at the noise of thunder, that he ran to hide himself in caves and cellars.

Ver. 268. It is therefore evident, that there can be no thunder except in thick and deep-bellied clouds, that the matter that composes it may be included within them: For what Pliny says to the contrary, "Catilianis prodigiis Pompeiano ex municipio M. Herennium decurionem sereno die fulmine ictum fuisse:" and Horace, who, *Carmin. lib. i.* speaking of Jupiter, says, that he "plerumque per purum tonantes egit equos, volumcremque currum:" These instances, I say, are no farther to be credited than that thunder may perhaps have sometimes been heard, and lightning seen by persons, over whose head the sky was clear: but then some other part of the horizon must have been covered with clouds, from which the thunder and lightning broke out.

Ver. 273. The poet having taught, that lightning is generated in thick and high-built clouds; he now, in these twenty-two verses, farther shows, that the fires and winds, contained within the clouds, oft produce lightning, which is followed by a roaring noise, a trembling of the earth, and a violent shower of rain. For, first, says he, The clouds contain many seeds of fire: Secondly, The wind drives and compels those clouds, as it were, into high mountains, and by that means squeeze out of the clouds those particles of fire, by whose contact, or at least by the violence of its own motion, the wind itself is kindled into flame: Thirdly, When that wind is thus kindled, the lightning grown mature, cleaves the clouds, and glares around in dreadful flashes: Lastly, The thunder roars, the earth trembles, mortals are seized with consternation and dismay, and the rain falls with such violence, as if the heavens were descending in the shower.

Ver. 287. Milton in *Paradise Regained*, Book iv.

— Either tropic now

'Gan thunder: at both ends of heav'n the clouds
From many a horrid rift abortive pour'd
Fierce rain, with lightning mix'd; water with fire
In ruin reconcil'd: Dreadful was the rack
As earth and sky would mingle.—

And Sir R. Blackmore:

Heav'n's crystal battlements, to pieces dash'd,
In storms of hail were downward hurl'd:
Loud thunder roar'd, red lightning flash'd,
And universal uproar fill'd the world:
Torrents of water, floods of flame
From heav'n in fighting ruins came:
At once the hills that to the clouds aspire;
Were wash'd with rain, and scorch'd with fire.

Ver. 295. In these four verses, he says, that if the wind that is pent up in the cloud cannot break through, it may be assisted by other winds from without; and by whatever means the cloud

be opened, the flames that is ripe for birth will necessarily fall down.

Ver. 299. Lucretius adds two other ways by which lightning may be caused; the first in nine verses. For unkindled wind breaking out of a cloud may grow hot and take fire, by the swiftness of its motion, and the length of its course: Nor is this in the least incredible, since a ball of lead, driven with mighty force, will melt as it flies. Thus the poet: and though the instance he brings might be confirmed by several authorities of the ancient poets and historians, yet it ought to be reckoned among the fables of antiquity: Nevertheless, no man will deny but that many things take fire by the swiftness of their motion.

Ver. 305. This instance the poet brought before ver. 183. See the note upon it.

Ver. 308. The second, in these twelve verses. If the wind beat furiously upon any thing, the seeds of fire may flow together upon the stroke, as well out of the wind as out of the thing it strikes. Thus the wind takes fire, and lightning is made. But that such a conflux of the seeds of fire may be made in that manner, is evident from the striking of flint and iron: And the objection of the wind's being cold (though even that can by no means be granted, by reason of the swiftness of their motion), is of no weight: for the nature of iron is full as cold, yet fire will sparkle out when we strike it.

Ver. 320. Hitherto he has treated of the nature and generation of thunder, he comes now to argue of its swiftness, and violence of stroke; which, says he, may be gathered and explained from what has been said already. For wind shut up in a cloud, rages and grows hot; struggles on all sides to get out of its prison; and, therefore, where it finds a passage, it must of necessity burst out with mighty force and violence, in six verses. Besides, it consists of smooth and small particles, and therefore passes through the void and empty passages of the air, in six verses. Add to this its weight, and that too very much increased by blows, in four verses. And, lastly, in eight verses, that it falls from a great distance, and therefore every moment increases the swiftness of its motion: perhaps, too, it is helped forward by the air. And what wonder that a heavy body, bursting out with violence out of a close prison, and shoved forward by other bodies, falls impetuously, and dashes to pieces all it meets in its way?

Ver. 324. The balista was a warlike engine, which the ancients made use of in their wars to shoot darts or stones. It was called balista from *βάλλω*, I cast.

Ver. 326. In these six verses, he proves the swiftness of lightning, from the tenuity of the atoms of which it consists. See book ii. ver. 365. where the poet has already proved, that lightning is composed of smooth and subtle principles, which is the reason that nothing can withstand the violence of its stroke.

Ver. 332. In these four verses, the poet argues for the swiftness of lightning, and the violence of

its blow, from the descent that is natural to all heavy bodies; to which, if any external force be added, they descend with yet greater velocity: But lightning is a heavy body, and, falling from above, is impelled by the force of the wind; therefore, it is not strange, that it overturns and tears to pieces whatever opposes its passage.

Ver. 336. In these eight verses, he brings his last argument for the celerity and impetuous force of lightning, from the great distance from whence it comes, and says of it, as Virgil of Fame, that

Mobilitate viget, viresque acquirit eundo,
Æn. iv. ver. 175.

— Ev'ry moment brings
New vigour to her flight, new pinions to her wings.

It was anciently observed by those who made it their study to inquire into natural things, that the motion of all moveables is the swifter, the nearer they approach to the place for which they are designed; insomuch that they move swiftest of all when they are almost at their journey's end. Thus a stone gives a heavier blow to a plate of brass, or tin, for example, when it falls upon it from a great height, than it does when it drops from a less distance: according to the variety of which distance, experience evinces, that the effect varies likewise, and that the descending thing gains a surplussage of gravity, though not of weight. This, nevertheless, is denied by Simplicius, in his Comment upon Aristotle de Cælo, lib. i. cap. 85. where he derides this increase of gravity, and declares it a vain fiction. But we may ask him why that stone descends? Is it not by reason of its weight? And since nothing is done without cause, why does it descend swifter this moment than it did the last? Its swiftness must increase either by some external or internal cause: which last can be only a more intense gravity: the first, Lucretius ascribes, as we have seen already in the foregoing argument, to the additional and like seeds, that the descending stone meets in its passage, and that help to drive it down with greater swiftness. And, according to the doctrine of Epicurus, a more proper solution of this problem cannot be given. Others again ascribe it to a certain, I know not what, quality, that the medium through which it passes imparts to it; and that still presses it more and more: Others impute it to the natural, sympathetical, and attractive power of the centre; to which, say they, all heavy bodies, the nearer they approach, move the swifter. According to which opinion, which is indeed consonant to many other experiments in nature, Cowley sings,

And now the violent weight of eager love
Did with more haste so near in centre move.
David. iii.

And if it cannot be denied, that the air, though it be light in its own nature, does nevertheless descend, and insinuate itself into the pores of the earth, as compelled by a certain necessity so to do, by reason of the impurity it has contracted,

then this question is easy to solve; for the descending stone may be said to be borne through the air, as a boat that goes down the river with the stream; and both of them, the air as well as the stone, move the swifter when they are near the centre; for the air is there more thick and impure, and consequently has a greater propensity to tend downwards: Besides, when it is arrived on the confines, as I may say, of its journey's end, it is swallowed up, and ingulfed as by a certain violence, and imparts the same lot to its companion in the fall.

Ver. 340. For the seeds of thunder, like those of other things, wander undetermined to any certain place, but being driven by that length of violence, are determined and moved in a direct line.

Ver. 344. But lightning does not break in pieces all that it falls upon: for all rare bodies remain safe and unhurt, because the subtle fire finds a free passage through their pores: it dissolves solid bodies, as brass, gold, &c. because it strikes into their solid corpuscles, and being once entered into their pores, and not finding a passage out, it disjoins the very principles, melts metals, and reduces stones into powder.

Ver. 350. In these twenty-two verses, the poet solves the fourth question which we proposed above, in the note on ver. 226. and inquires into the reason why it thunders more frequently in the spring and autumn than either in winter or summer? [But this must be taken to be meant only of some countries of Italy.] And the reason is, says he, because, since thunder is of a fiery nature, and breaks out of thick clouds, it is then most to be expected, when the weather is warm, and not altogether free from cold: for where there is no heat, it is in vain to look for fire, and where there is too much heat, it suffers not the clouds to thicken. But in the spring, and in autumn, the cold and the heat are blended together: thence proceed clouds, winds, fire, and at length tumults and tempests in the air, and from them thunder and lightning.

In this opinion Seneca agrees with Lucretius; and so too does Pliny, lib. ii. cap. 50. where he teaches that it never thunders in winter and summer, except in as much as "mitiore hyeme, et æstate nimbosâ, semper quodammodo vernat, vel autumnat;" in a mild winter, and in a cloudy summer, the weather is neither violently cold, nor violently hot, but partakes in some measure of the middle temperatures of the spring, or of autumn. and he strengthens this argument, by instancing in some countries, where by reason of the extreme cold, as in Scythia, or of the violent heat, as in Egypt, it never thunders at all. But of these matters you may consult P. Gassend. in lib. 10. Laert. de Meteorolog.

Ver. 370. In the spring, and in autumn, heat and cold contend for mastery: in summer heat governs, and cold in winter.

Ver. 372. Here the poet insults the college of augurs and soothsayers at Rome, who pretended to teach divination, as if it had been a science: this, says he, is to know the nature of thunder, &c.

a science not to be met with in your books, that are made up of nothing but trifling and false conjectures.

Ver. 374. The books that treated of divination were composed by the Thuscans, a people of Italy, whom Tages had instructed in that art: from him these books were called Tagetici; and Macrobius says they were handed about in his days. Of this Tages, Cicero gives us the following account. "Tages quidam dicitur in agro Tarquinienſi, cum terra araretur, et fulcus altius eſſet impreſſus, extitiſſe repente, et cum affatus eſſe, qui arabat. Is autem Tages, ut in libris eſt Hetruſcorum, puerili ſpecie dicitur viſus, ſed ſenili fuiſſe prudentiâ. Ejus aſpectu cum obſtupuiſſet bubulcus, clamoremque majorem cum admiratione edidiſſet, concurſum eſſe factum, totamque brevi tempore in eum locum Hetruriam conveniſſe: tum illum plura locutum multis audientibus, qui omnia ejus verba exceperint, literiſque mandaverint: omnem autem orationem fuiſſe eam, quâ Haruſpicina Diſciplina contineretur, eam poſtea creviſſe rebus novis cognoscendis, et ad eadem illa principia referendis," lib. 2. de Divinatione. As they were ploughing in the Tarquinian field, and the ſhare ſtriking deep into the ground, one Tages is ſaid to have ſtarted on a ſudden out of the earth, and to ſpeak to the ploughman. This Tages, as we find in the Tuſcan books, is ſaid to have had the look of a boy; but the prudence and wiſdom of old age. The peaſant diſmayed at the apparition, cried out aloud, and people ſlocked about him, inſomuch that in a little time the whole country of Etruria were got together in that place: then Tages ſpoke a great deal in the hearing of many perſons, who writ down all his words: the ſubject of his diſcourſe was only the doctrine of divination: which afterwards got footing in the world by new additions of knowledge, built on the principles he had taught them: Ovid. Metam. lib. 15. ver. 553.

— Cum Tyrrenus arator
Fatalem glebam mediis aſpexit in arvis,
Sponte ſua primum, nulloque agitante, moveri:
Sumere mox hominis, terræque amittere formam;
Oraque venturis aperire recentia fatiſ:
Indigenæ dixere Tagen, qui primus Etruſcam
Edocuit gentem caſus aperire futuros.

See likewiſe Lucan, lib. i. ver. 530, 587, 606.

Ver. 379. *Omen.*] This word, as we find in ſome authors, ſeems not to have had originally ſo extenſive a ſignification, as we generally give it. Feſtus explains it, "Omen quaſi orimen, quod ore fiat augurium." Now auguries were drawn either from tokens given by the gods, or by men: and thoſe given by men were properly called omens: "neque ſolum Deſum voces Pythagorei obſervabant; ſed etiam hominum, quæ omnia vocabant," ſays he, in lib. i. de Divinat. Apuleius de Deo Socr. ſays, "Ita eſt apud Platonem: ne quiſquam arbitretur, omnia eum vulgo loquentium captâſſe:" and ſoon after he adds, "videmus pleriſque uſu venire, qui nimia omnium ſuperſtitione non ſem-

per ſuoſte corde, ſed alterius verbo reguntur:" yet other authors reſtrain not the ſignification of this word to the voice, or utterance of the mouth only, but extend it to all the actions of life; making it to ſignify the ſame with the *συμβολα* of the Greeks, who by that word underſtood the foreboding ſigns or tokens of prosperous or improſperous events: thus to begin with Cæſar, we read that Auguſtus, contrary to his cuſtom, had put on his left ſhoe firſt, the day that he narrowly eſcaped being killed in a mutiny of the ſoldiers: and Lampridius recounts among the ſigns of Alexander's future empire, that the picture of the emperor Trajanus, which hung over his father Philip's genial bed, fell down upon it, while his mother was in labour of him in the temple: and this omen Feſtus and other authors call "caducum auſpicium." Spartianus, in the Life of Hadrian, ſays, that while he was ſpeaking in praiſe of Antonius, a "prætecta" [a gown worn by the children of noblemen] dropt down of its own accord, and covered his head; and that a ring, on which his figure was engraved, fell off his finger, of its own accord likewiſe: Ovid too believed in omens, when he ſaid,

Omina ſunt aliquid: modo cum decedere vellet,
Ad limen digitos reſtitit iſta Nape.

Pliny too ſpeaks of theſe remoras, theſe obſtacles, and hindering omens, which he calls "offenſiones pedum; et Plautus, auſpicia & religionem: ante auſpicium commoratum eſt:" In Amphit. And in another place, "an religio tibi objecta?" Of like nature is that, which was offered to Otho, going againſt Vitellius; when ſome adviſed him to defer the expedition becauſe the bucklers were not all ready. This Tacitus relates in theſe words: "Fuere qui proficiſcenti Othoni moras religionemque non conditorum ancilium afferrent." See Suetonius likewiſe in the life of Nero, cap. 19. And Tibullus elegantly of theſe ſtumblings;

O quoties ingreſſus iter mihi triſtia dixi
Offenſum in portâ ſigna dedidiſſe pedem!

And ſuch were the omens they regarded in going to a place: but they likewiſe drew auguries from their departure; as if any one who went with an intention to go to a certain place, returned on a ſudden unexpectedly, and without executing his deſign: but this took place only in ſacrifices. Apollonius concerning the ceremonies of the gods, deſc. Trivia, or Diana, is thus rendered:

— Sacriſque peractis
Rufus abire pyra moneo: convertere nullus
Te retro ſtrepitufque pedum, fremitufque caninus
Cogat; nam ſacri fiat labor irritus omnis.

where he ſeems to imply, that the ſolemn mysteries were rendered of no effect by a noiſe, or any other interruption. Valerius Max. lib. iii. cap. 5. "Ne ſacrificium Alexandri aut concuſſo thuribulo, aut edito gemitu impediret:" but this was chiefly obſerved in ſacred rites; yet Pythagoras gave the like precaution by a perpetual ſymbol: *βαδίζοντας οὐκ ἀποδυνάμεις μὴ μίλας ἐπιφρονας* of which he adds

the reason: for the furies are passing along. And of greater moment, but not unlike this, is the admonishment of the author of Human Salvation: "qui aratro manum applicuit, ne respiciat:" moreover, as they named these omens, "religionem objectam," so, on the other hand, we learn from Plautus, that when they had a mind to give a favourable interpretation to an omen, they called it, "religionem à se rejicere," and the Greeks, ἀπορρίπτειν. This might be confirmed by many examples; but we have one illustrious indeed in the person of Julius Cæsar, who, at his landing in Africa, as he leaped ashore, happened to fall down, and to avert the unlucky omen of that accident, cried out, I have thee, Africa. Suetonius: "Cum Cæsar Africæ oram appulisset, et in terram insulturus corruisset, dixit, ut infaustum ex casu omne averteret, Teneo te Africa." And the same Cæsar always discovered an undaunted greatness of soul, and his mind was so much superior to these superstitions, that we nowhere read that any omen whatever could deter him from any enterprise, or make him delay the execution of any design he had resolved to attempt. The same Suetonius tells us, that though the victim had escaped from the altar, he would not put off his expedition against Scipio and Juba. "Licet," says he, "immolanti aufugisset hostia, profectionem adversus Scipionem et Jubam non distulit." To which Seneca alludes in *Consolat. ad Marciam*, where he says, "tam cito dolorem vicit, quam omnia solebat." Moreover, the left parts of the body, as the left hand, the left foot, &c. are in many authors esteemed unlucky: but, on the contrary, Apuleius represents them as omens of good success: and speaking of the left hand, says: "Quartus æquitatis ostendebat indicium, deformatam manum sinistram porrecta palmula; quæ genuina pigritia, nulla calliditate, nulla solerita prædita, videbatur æquitati magis aptior quam dextera." And Macrobius in *Saturnal. lib. i. cap. 9.* "Ideo Apollinis simulacra manu dextra Gratias portant, arcum cum sagittis sinistra; quod ad noxam sit pigrior, et salutem manus promptior largiatur:" which the following passage of Catullus at once illustrates and explains:

Hæc ut dixit, amor sinistra amanti
Dextram sternuit approbationem.

After which he adds:

Nunc ab auspicio hono profecti,
Mutuis animis amant, amantur.

But these omens properly relate to the actions of human life; and the ancients had besides some more occult and secret omens, which they took from things, from days, from names, and even from places and clothes: to things seem to relate the omens that were taken to be unlucky, as shipwrecks, and the remains of them: and those things chiefly which from some unfortunate accidents have given rise to proverbs; as "aurum Tolosanum," and Equus Sejanus:" which, because they are so well known, I purposely forbear to explain. But I cannot omit a remarkable passage

TRANS. H.

in Virgil, which makes much to our purpose, and which that poet, who was deeply read in the augural and Pythagorean doctrine, has secretly veiled with this superstition. For to avoid openly to assert, that those gifts of Æneas to Dido, as being saved from the destruction of Troy, were unlucky to her, he has insinuated that they were so by circumlocution, in the following verses:

Munera præterea Iliacis erepta ruinis
Ferre jubet, pallam signis auroque rigentem,
Ornatus Argivæ Helenæ, quos illa Mycenis,
Pergama cum peteret, inconcessosque Hymenæos,
Extulerat, Ledaæ matris mirabile donum.

Æn. i. ver. 651.

And soon after; ver. 683.

Dona ferens pelago, et flammis restantia Trojæ.
This Statius understood, and has imitated, lib. 2.
Thebaid.

Nec mirum: nam tu infaustos, donante marito,
Ornatus Argiva geris, dirumque monile
Hermiones. Longa est series, sed nota malorum
Persequar, unde novis tam sæva potentia donis.

The belt of Pallas too strengthens this opinion: for Æneas would have spared the life of the prostrate Turnus, had not that unlucky token, which Turnus had taken from the slain Pallas, called afresh to his remembrance, and renewed his grief for the loss of his dearest friend:

Stetit acer in armis
Æneas, volvens oculos, dextramque repressit:
Et jam jamque magis cunctantem flectere sermo
Cœperat: infelix humero cum apparuit ingens
Balteus, et notis fulserunt cingula bullis
Pallantis pueri, victum quem vulnere Turnus
Straverat, atque humeris inimicum Insigne gerebat;
Ille oculis postquam sævi monumenta doloris,
Exuviasque hausit; furiis accensus, et ira
Terribilis: tunc hic spoliis indute meorum
Eripiare mihi? Pallas te hoc vulnere, Pallas
Immolat, et pœnam scelerato ex sanguine sumit.

And Homer, in like manner, describes Achilles swelling with rage and fury, at sight of the arms that Hector had taken from Patroclus. As to the days, such as were noted for any overthrow in battle, or any the like unfortunate event, were called religiosi, nefasti, and atri: of all which see Augellius, lib. i. cap. 18. who there fully handles this matter; to which I will only add this passage out of *Facitus*, lib. 2. "Histor. Funesti omnis loco acceptum est, quod maximum Pontificatum adeptus Vetellius de Ceremoniis XV. Cal. Aug. edixisset, antiquitus infausto die Cremerensi Alliensique cladibus." Of names, some were omens of prosperity and diuturnity; others of the contrary: Crassus, Valerius, Macrobius, Lucius, Lucris, were names foreboded good. Plautus in *Perf. Luc.* "Nomen atque omen quantivis est pretii: Dor. Si te eam mihi quoque Lucridem confido fore re." Furius, Hostilius, Macer, were ill names, *Martial. lib. v. Epigram 22.*

Quinctum pro decimo, pro Crasso, regule, Macrum
Ante salutabat Rhetor Apollonius.

See likewise Festus in *Lacu Lucrino*. Nor may we omit Aul. Gellius, who, lib. i. cap. 28. says, "Cavenda igitur non improprietas sola verbi, sed etiam pravitas animi, si quis se nunc senior Advocatus adolescenti superesse dicat." Places were held to be ominous, either from their names, or for their having been polluted with dead bodies, or otherwise: Plautus in *Menæchm.* had regard to the name: "Ne mihi Damnum in Epidamnino duas." And Petronius, "Epidamni Nomina quære." As to any thing that foreboded ill in the places themselves, we find a remarkable testimony in Tacitus, *Annal.* lib. i. where Germanicus purges by sacrifices the places where Varus had encamped with his whole army: "Quid Tiberio," says he, "haud probatum, seu cuncta Germanici in deterius trahenti, five exercitum imagine cæforum insepultorumque tardatum ad prælia, et formidolosiores hostium credebant. Neque Imperatorem auguratis et vetustissimis Cæremoniis præditum attrahere feralia debuisse." Of clothes or garments we have an instance in Q. Curtius, who believed them ominous, and even to portend the change of empire in Alexander, inasmuch as he affected and took delight to wear a foreign, or Persian dress: to which the judicious Tertullian seems to allude: "Vides," says he, quasdam et capillum croco vertere: pudet eas etiam nationis suæ, quod non Germania aut Gallia procreatae sint. Ita patriam capillo transferunt. Male ac pessime sibi auspicantur flammeo capite." Where by "flammeo capite," he means that perpetual fire, which in another place he calls "ignem jugem." St. Jerome in like manner: "Ne caput gemmis oneres, nec capillum irrufes, et ei aliquid de Gehennæ ignibus auspiceris." This passage is in the Epistle to Læta, and no doubt copied after Tertullian, as many other passages in that father are.

Ver. 384. Here the poet takes away the thunder from Jupiter, and the other gods, who seem to him not to employ it so prudently as it were to be wished they did: and at the same time he overthrows the whole doctrine of the Thuscans: for, if it be not the gods who dart the thunder, there can be no divination by thunder; and if they do, why do they let the wicked escape, and often destroy the innocent? What does it avail the thunderer to launch his bolts upon uninhabited deserts? What, when he throws his unerring shafts into the middle of the sea? or upon the bare tops of mountains, which he does very often? And lastly, why is there no thunder without clouds? Why does he strike down his own temples, and those of his undergods? All this the poet has included in forty-seven verses, in which there are many things spoken satirically, and many by way of derision.

Ver. 384. The Thuscan books taught, that Jupiter gave leave to nine gods to dart thunder down upon the earth. Plin. lib. ii. cap. 52. Arnobius, p. 122. "Diis novem Jupiter potestatem jaciendi sui fulminis permisit."

Ver. 385. Why Jupiter is said to be the author of thunder and lightning, Pliny, lib. ii. cap. 20.

gives this physical reason: the fires of the three highest planets, says he, falling to the earth, bear the name of lightning: but chiefly that of the three, which is placed between the two others, that is to say of Jupiter: because, participating of the excessive cold and moisture of the circle of Saturn, which is above him, and of the immoderate heat of Mars, that is next under him, he, by that means, discharges the superfluity of either: and hence it is commonly said, that Jupiter is the darter of lightning. But Seneca, much better than our poet, and with more analogy to truth, takes not away the thunder from Jupiter, when he says, that Jupiter is not indeed the darter of thunder: but all things are ordered in such a manner, that even the things that are not made by him, are not made without cause and reason, which are his. The force and power of them is his permission: for though he makes them not now himself, he was the cause that they are made: "Interim hoc dico, fulmina non mitti à Jove, sed sic omnia disposita, ut etiam ea, quæ ab illo non fiunt, sine ratione non fiunt, quæ illius est: vis eorum illius permissio est: nam etsi Jupiter illa nunc non facit, fecit ut fierent; singulis non adest, sed signum, et vim, et causam dedit omnibus." Thus Seneca, in lib. ii. *Nat. Quæst.* 48 who is mistaken only in the true name of the first Divine Cause. Horace;

Tu parum castis inimica mittes Fulmina lucis.

And according to the doctrine of the Tagetic books, nothing was ever blasted with fire from heaven, but what had before been stained with some pollution.

Ver. 386. Seneca proposes this question in a few words: "Quare Jupiter, aut ferienda transit, aut innoxia ferit?" And the last exceptions, which Lucretius brings against Providence, are drawn from that common observation; Good men are oppressed with trouble and misery, subject to all the rage and violence of the wicked; whilst the impious swell with the glories, and revel in the delights of life: This has been the subject of many solicitous disquisitions: Disputes have been multiplied; and some have been as industrious to vindicate the methods of Providence from all seeming irregularities, as others to defame them. Some have sent us to look for retribution in another world, and indeed this is an easy way of solving the difficulty, and with little pains deducible from the immortality of the soul, which I have already asserted. But because to look beyond the grave, requires a sharp and steady eye, I shall observe the reasons of the philosophers, and propose what Plutarch has excellently delivered. And here we must take notice, that only that part of the objection, which concerns the prosperity and impunity of the wicked, seems formidable and concluding; for all those men we generally call good, as their own conscience will tell them, deserve those afflictions which the most miserable have endured. And upon this the poets, orators, and historians have been very copious.

Τολμῶ καλεῖσθαι μήτις' ἢ ἐὼς ἐστὶν θεοί·
Κυκοὶ γὰρ ἐντυχῶντες ἐπιπλήττωσί με.

I dare to say no gods direct this whole,
For villains prosperous distract my soul

says Aristophanes: and Diagoras resolved to be an Atheist, as Empiricus delivers, because he did not see vengeance fall presently on the perjured person, and consume him: Velleius Paterculus produces the long and quiet reign of Orestes, as a convincing proof, that the gods directed him to murder Pyrrhus; and approved the action: and Martial has contracted all the force of the argument into one Epigram.

Nullos esse Deos, inane Cælum
Affirmat Selius, probatq. quod se
Factum, dum negat hæc, videt beatum.

Seneca in his treatise, "Cur Malis benè & Bonis malè, cum sit Providentia," talks much of the privilege of sufferings, that to afflict argues care and kindness; and, in short, thinks this a great commendation of virtue.

Τῆς δ' ἀρετῆς ἰδρωτὰ θεοὶ προσηύχουσιν ἱθὺς
Ἀθανάσει—

Th' immortal pow'rs have sweet near virtue
plac'd.

But this is not the way to answer the demands of an Epicurean, to satisfy his doubts, who had rather be accounted a happy servant, than a miserable son of the Deity, who would not be fond of torments, that he might show "spectaculum Jove dignum, virum fortem cum malâ fortunâ compositum:" who cannot think that fears and jealousies are the necessary products of irreligious opinions; but makes such the only means of obtaining happiness and perfect serenity of mind: who is most delighted with the most pleasing physic, and would think him cruel, who makes use of saws and lances, when a gentle cordial would restore the patient to his health; we must therefore look for other answers, and Plutarch presents us with enough, some of which have a peculiar force against the Epicureans; who confess man to be a free agent, and capable to be wrought on by example and precept.

First, then, quick vengeance does not blast the wicked, that they themselves might learn lenity, and not be greedy to revenge injuries to others: τέλος τῶν ἀλκαδῶν τὸ ὁμοιοῦναι θεῶ· it is the end of good men to be like God, says Plato; and Hierocles places the life of the soul in this imitation: Here God sets forth himself an example, and any noble and generous mind would rejoice to have the most excellent for a pattern of his actions: Lucretius followed Epicurus, because he thought him so, and the rest of his admirers make his fancied virtues the ground of their respect. This, taken by itself, I confess, is but a weak answer, since one thunderbolt would secure them from doing mischief, whilst mercy and forbearance often exasperate; and, because God holds his tongue, they think he is even such a one as themselves:

but if we consider it as a consequent of another reason, that is drawn from the goodness and kindness of the Deity, then it proves strong and satisfactory.

The second reason follows: God doth not presently punish wicked men, that they may have time to become better; and here Plutarch brings examples of such, whose age was as glorious as their youth infamous: if Miltiades, says he, had been destroyed, whilst he acted the part of a tyrant; if Cimon in his incest, or Themistocles in his debaucheries, what had become of Marathon, Erymedon and Dianium, what of the glory and liberty of the Athenians? for as the same author observes, ὅτιναι αἱ μεγάλαι φύσεις μικρὸν ἐκφέρουσι, ἢ δὲ ἀργεῖ δι' ὀξύτητα τὸ σφραγῶν ἐν αὐταῖς, καὶ θεασθήριον, ἀλλ' ἐν σάλῳ διαφέροντας πρὶν εἰς τὸ μόνιμον, καὶ καθίστηναι ἡδὺς ἰδεῖν great spirits do nothing mean, the active principles that compose them will not let them lie lazily at rest, but toss them as in a tempest, before they can come to a steady and settled temper.

Thirdly, The wicked are sometimes spared to be scourges to others, and execute just judgment on men of their own principles: this is the case of tyrants and outrageous conquerors; such was Phalaris to the Agrigentines, such Pompey and Cæsar to the Romans, when victory had made them swell beyond their due bounds; and pride and luxury fled from other countries upon the wings of their triumphing eagles: Such Alexander to the Persian softness, and, if we look abroad, ten thousand instances occur and press upon us; Cedrenus, page 334, tells us, that when a monk inquired of God, why he suffered cruel Phocas, treacherous to his emperor Mauritius, and an implacable enemy of the Christians, to obtain the empire, and enjoy power as large as his malice? a voice ἀεράτως, gave this answer to his demand, χείρονα ἢ ἐγὼν πρὸς τὸν κακίαν τῶν καλειπύλων ἐν τῇ πόλει· because I could find none worse to scourge the wickedness of the citizens: and Alaricus declared, ἢ ἐκ ἰσχυροῦς τὰ ἐκὼν πορεύμαι, ἀλλὰ τις καὶ ἐκείνην ὀχλεῖ μοι βασανίζων καὶ λίγων, Ἀπιδε τῶν Ρωμαίων πόρθεσον πόλιν· it is not of my own accord that I attempt this, but something will not let me rest, but urges me on, and cries, Go sack Rome: and this requires, that they should not be only free from punishment, but likewise enjoy wealth and power, and all the opportunities and instruments of mischief: and this answer is equal to the objection in its greatest latitude, and gives satisfaction to all those numerous little doubts, which lie in the great objection, as it was proposed.

Fourthly, The impious are not presently consumed, that the method of Providence may be more remarkable in their punishment: The history of Bessus and Ariobarzanes in Curtius is an excellent instance of this; and, amongst others, Plutarch gives us a memorable one of Bessus, who, having killed his father, and a long time concealed it, went one night to supper to some friends; whilst he was there, with his spear he pulled down a swallow's nest, and killed the

young ones, and the reason of such a strange action being demanded by the guests, his answer was, ἡ γὰρ μὴ πάλαι καὶ μαρτυροῦσιν αὐταὶ ψευδῶς, καὶ καλῶσιν ὡς ἀπεικόνοντο τὸν πατέρα; do not they bear false witness against me, and cry out, that I killed my father? Which being taken notice of, and discovered to the magistrate, the truth appeared, and he was executed.

A great many other reasons are usually mentioned, but these are the principal, and suppose the liberty of the will; for if a man follow fate blindly, he is driven on, not persuaded to act: if he be an automaton, and move by wheels and springs, bound with the chain of destiny, it is evident that fate is the cause of all his miscarriages, and the man no more to be blamed for wicked actions, than a clock for irregular strikings, when the artist designs it should do so. No example can prevail on him, no promises entice, no threatenings affright him; being as unfit to rule himself, or determine his own actions, as a stone in its descent; and a piece of iron may be said to act as freely as a man, if he be led on by fate, and its motion as spontaneous, if liberty consisted in a bare absence of impediments.

Ver. 395. In these ten verses, he argues, secondly, That thunder is the effect of natural causes, and not made by the gods: for if it were, they would not be so lavish of their bolts, as to throw them into solitary deserts: Had not Jupiter better keep them in store to destroy his enemies, in time of need?

Ver. 405. The poet in these eight verses argues, thirdly, That thunder comes not by the will of the gods, but is made by the laws of nature: for otherwise, why does it never come without clouds and noise? Why does it fall alike upon the seas and earth? What crime have the waters been guilty of, that they are thus punished?

To what has been said of this already in the note on verse 68, and the example we gave verse 268, in the person of M. Herennius, the Decurion, who was killed by thunder in a clear day, we add this of Lucan. lib. i.

Emicuit cælo tacitum sine nubibus ullis
Fulmen——

And this distich, which we find in Tully, de Divinat.

Aut cum terribili percussus fulmine civis
Luce serenanti vitalia lumina liquit.

For they held that thunder, in a clear and unclouded sky, was an evincing proof of a Deity, and a certain presage of some extraordinary event: Cicero, in great indignation against the Atheists of his days, and speaking of this accident, cried out: "Negemus omnia, comburamus annales, ficta hæc esse dicamus; quidvis denique potius, quam Deos res humanos curare, fateamur?" Lib. de Divinat.

Ver. 409. Why does he throw his bolts on any thing that is not guilty of some crime? Thus Cicero, lib. ii. de Divinatione. "Quid enim pro-

ficit, cum in medium mare fulmen jact Jupiter? Quid cum in altissimos montes? Quod plerumque fit. Quid cum in desertas solitudines? Quid cum in earum gentium oras, in quibus hæc ne observantur quidem? And, to the same purpose, Aristophanes, Νεφέλ. If Jupiter's bolts, says he, are aimed against the perjured, how comes it to pass, that neither Simon, Cleonymus, nor Theodorus are blasted by that celestial flame? They, who are perjured with a witness! Why does his own temple, why does Sunion, the promontory of Attica, and why do mighty oaks, rather feel the effect of the fire? No doubt, because they are all perjured.

Ver. 413. In these six verses, he, by way of dilemma, proposes two other wonderful arguments to deprive Jupiter of his thunder. Either he would have us avoid his bolts, or he would not: If he would, why is his thunder so subtle, and so swift, that we cannot perceive it coming, and get out of its way? And if we would not, why does he give us notice before hand of its coming, by overcasting the air with gloomy clouds, by the grumbling of his thunder? &c.

Ver. 419. In these five verses he argues, sixthly, That thunder must be the effect of nature, since it thunders in several places at the same time: a task too laborious for any one Jupiter. But let us hear Seneca delivering the opinion of the ancients upon this matter: They did not believe, says he, that a Jupiter, like him we worship in the capitol, darted his thunders with his hand: but they meant the mind and spirit, who is the maker, lord and ruler of this mundane system, to whom every name agrees: The Thuscans too therefore held that thunder is sent by Jupiter, because nothing is done without him. "Ne hoc quidem crediderunt, Jovem, qualem in Capitolio, & in cæteris ædibus colimus, mittere manu fulmino; sed eundem, quem nos Jovem, intelligunt, custodem rectoremque universi, animum, ac spiritum, mundani hujus operis dominum, & artificem, cui nomen omne convenit. Idem Etruscis quoque visum est: & ideo fulmine à Jove mitti dixerunt, quia sine illo nihil geritur. L. ii. Q. 45.

Ver. 424. In these seven verses, he argues, seventhly, to this purpose: If thunder were directed by the will of the gods, is it credible they would beat down their own stately temples? Would they dash to pieces such elaborate statues, the very masterpieces of Polycletes? a poor mean-spirited revenge! The poet speaks this by way of ridicule.

Ver. 429. In these two verses he argues, eighthly, That it is but reasonable to believe, that thunder is produced by natural causes, since, for the most part it falls on the highest mountains. Dost thou not see, says Artabanus, the uncle of Xerxes, that God strikes with his lightning the largest animals, nor suffers them to grow insolent, and that he leaves the less unhurt? Dost thou not see that his fiery darts always throw down the most lofty edifices, and the tallest trees? For God takes delight to depress and humble the haughty. Herodotus, lib. vi. And Horace agrees with Lucretius,

—Feriant altos

Fulmina montes :

Of which Seneca gives a physical reason, and says, That the tops of the mountains, being opposite to the clouds, are exposed to stand the brunt of every thing that falls from heaven; so that they intercept the lightning in its course.

Thus Lucretius concludes his disputation concerning this amazing meteor; which made no small part of the religion of the ancient Romans, whose many superstitious opinions concerning thunder and lightning will not improperly find a place here; and therefore I promise myself, that the reader will not be displeased to see them at one view, as I find them collected by Nardius, page 452. in his 27th accurate animadversion on Lucretius.

THE SUPERSTITIOUS OPINIONS

OF THE ANCIENTS CONCERNING LIGHTNING AND THUNDER.

THE Romans derived these superstitious opinions from the Thuscans, and, soon imbibing the precepts of this new religion, they committed them to the care of certain priests: who, nevertheless, dismayed at the enormity of some lightnings, did, at the general request of the people, repair to the Thuscan augurs, from whom they had their first instructions, to be informed what those dreadful sheets of flame, and bursts of horrid thunder portended: For the Thuscans, as Diodorus Siculus, lib. vi. cap. 9. witnesses of them, having employed much time in searching into the causes of natural events, and in the study of theology, were of all men the most knowing in the interpretation of lightning: inasmuch, says he, that, even to this day, almost the whole world admire their depth of science, and apply to them to be instructed in the art of interpreting that celestial fire. Verrius, the grammarian, relates, that these Thuscan diviners were sent for to Rome, and, being disaffected to the Romans, wilfully ordered undue sacrifices, and such as were displeasing to the gods: and that, by their treacherous advice, the people of Rome were prevailed on unfortunately to remove the famous statue of Horatius Colches to a certain place, where, being surrounded by high-built houses, the sun might never shine upon it: but, their treachery being discovered, they were accused before the people, and, being convicted of the perfidy, were put to death: And upon this occasion was made this senary verse,

Malum consilium consultori pessimum est,

which was sung about by the boys in all the streets of Rome. This accident of the Thuscan augurs increased the credit of the books of the Sybils, which, according to Servius on *Æn.* 6. were kept in the temple of Apollo, as well as of those of the Marfians, and of the nymph Bygois, who had writ the art of divination, as practised by the Thuscans.

We have already spoken in the foregoing notes

of the matter, of which the ancients held lightning to consist, and of the manner of its generation, which it is needless to repeat in this place: we likewise have said already, that the Latins often confounded "fulgur" and "fulmen:" and how they came to do so, Festus teaches in these words: "Fulgere prisce pro ferire dicebant, unde fulgur dictum est; fulguratum id, quod est fulmine ictum." And they believed there was no other difference between them, than only that of more or less, which among logicians makes no difference whatever of the species: And we find a remarkable passage in Seneca, who, after an accurate disputation, concludes, by determining the difference between "fulgur" and "fulmen," as follows: "Ergo," says he, "et utramque rem ignem esse constat, et utramque rem inter se meando distare. Fulguratio est fulmen non in terras usque perlatum et rursus licet dicas, fulmen esse fulgurationem usque in terras perductam. Non ad exercendum verba hæc diutius pertracto, sed ut ista cognata esse, et ejusdem notæ, ac naturæ probem. Fulmen est quiddam plus, quam fulguratio: vertamus istud; fulguratio est pene fulmen." *Nat. Quæst.* lib. iii. cap. 21. And in *Quæst.* 57. of the same book: "Et, ut breviter dicam," says he, "quod sentio, fulmen est fulgur intentum." And lib. citat. *Quæst.* 16. "Quid ergo inter fulgurationem et fulmen interest? Dicam: Fulguratio est late ignis explicitus: Fulmen est coactus ignis, et impetu factus."

The poets, according to their custom, shadowed the nature of either under the veil of fables, which nevertheless Servius accurately explains, upon the following passage of Virgil, which I am obliged to transcribe at length, for the better understanding of what follows:

Insula Sicaniâ juxta latus Æoliumque
Erigitur Laparen, fumantibus ardua saxis.
Quam subter specus, et Cyclopum exesa caminis
Antra Ætnæa tonant, validique incudibus ictus
Auditi referunt gemitum, striduntque cavernis
Stridoræ chalybum, et fornacibus ignis anhelat:
Vulcani domus et Vulcania nomine tellus.

Æn. 8. v. 416.

Which is thus rendered by Dryden:

Sacred to Vulcan's name, an isle does lie
Between Sicilia's coast and Lipare;
Rais'd high on smoking rocks; and deep below
In hollow caves the fires of Ætna glow.
The Cyclops here their heavy hammers deal:
Loud strokes and hissings of tormented steel
Are heard around; the boiling water roar,
And smoking flames through fuming tunnels soar.

This passage of Virgil is explained by Servius, as follows: By Vulcan, says he, is meant fire, which is called Vulcanus, "quasi Volicanus," because it flies through the air: For fire is generated in the clouds: And for this reason too Homer says, that Vulcan was precipitated from the air upon earth, because all lightnings fall from out the air; and because it often lightens in the island Lemnos, therefore Vulcan is said to have fallen upon that island. "Vulcanus, ut diximus ignis

est, ei dictus Vulcanus, quasi Volicanus, quod per aerem volat, ignis enim nubibus nascitur. Unde etiam Homerus dicit eum de mare præcipitatum in terras, quod omne fulmen ab aere cadit: quod quia crebro in Lemnum insulam jacitur, ideo in eam dicitur Vulcanus cecidisse." Thus Servius: and this fall of Vulcan is described by Milton in the following verses:

—In Ausonian land
Men call'd him Mulciber: and, how he fell
From heav'n, they fabled, thrown by angry Jove
Sheer o'er the chrystal battlements. From morn
To noon he fell, from noon to dewy night;
A summer's day: and with the setting sun
Dropt from the zenith, like a falling star,
On Lemnos, the Ægean isle.—

The same Servius, on the above cited passage, teaches, that Vulcan is said to be lame, because flame, by nature, is never straight: "Claudius autem dicitur Vulcanus, quia per naturam nunquam rectus est ignis." And, what is more than all this; Virgil says, the thunder is forged in subterranean caverns

Hic tunc ignipotens cælo descendit ab alto:
Ferro exercebant vasto Cyclopes in antro. [racmon:
Brontesque, Steropesque, et nudus membra Py-
His informatum manibus jam parte polita
Fulmen erat, toto genitor quæ plurima cælo
Dejicit in terras, pars imperfecta manebat:
Tres imbris torti radios, tres nubis aquosæ
Addiderant, rutuli tres ignis et alitis austri.
Fulgores nunc terrificos, sonitumque, metumque,
Miscebant operi, flammisque sequacibus iras.

Æn. viii. ver. 424.

Hither the father of the fire, by night,
Through the brown air precipitates his flight;
On their eternal anvils here he found
The brethren beating, and the blows go round:
A load of pointless thunder now there lies
Before their hands, to ripen for the skies:
These darts for angry Jove they daily cast,
Consum'd on mortals with prodigious waste:
Three rays of writhen rain, of fire three more;
Of winged southern winds and cloudy store
As many parts the dreadful mixture frame;
And fears are added, and avenging flame.

Dryd.

The physiology of which is thus explained: Vulcan is said to have a forge in those places, between Mount Ætna and the island Lipare, that is to say, between fire and wind, because those two things are very proper, nay necessary for smiths: "Physiologia est, cur Vulcanus in ipsis locis officinam habere fingantur inter Ætnam et Liparum, scilicet propter ignem et ventos, quæ apta sunt fabris," says Nardius. "in prolusione de igne subterraneo." The several offices of his servants,

Brontesque, Steropesque, et nudus membra Py-
racmon,
their very names in part declare: For Brontes was so called, ἀπὸ τῆς βροντῆς, from thunder; Steropes, ἀπὸ τῆς στεροπῆς, from lightning; and Py-

racmon, ἀπὸ τοῦ πυρός καὶ τῆς ἀκμῆς, because he never stirs from the burning anvil: And Virgil himself more particularly, *Georg. iv. ver. 170.*

Ac veluti lentis Cyclopes fulmina massis
Cum properant: alii taurinis foliibus auras
Accipiunt, redduntque: alii stridentia tingunt
Æra lacu: gemit impositis incudibus Ætna:
Illi inter sese magnâ vi brachia tollunt
In numerum; versantque tenaci forcipe ferrum.

As when the Cyclops, at th' almighty nod,
New thunders hasten for their angry god;
Subdu'd in fire the stubborn metal lies:
One brawny smith the pressing bellows plies,
And draws, and blows reciprocating air;
Others to quench the hissing mass prepare:
With lifted arms they order ev'ry blow,
And chime their sounding hammers in a row:
With labour'd anvils Ætna groans below.
Strongly they strike; huge flakes of flame expire:
With tongs they turn the steel, and vex it in the
fire.

Dryd.

Moreover, on the ancient marbles, thunder is figured with twelve rays, disposed into a circle; the rays not straight, but bending into several angles, each of which ends in three sharp-pointed fangs: Such too is the figure of this Virgilian thunder; of whose form Cerdanus thus: It generally thunders, either when it hails, or in great showers of rain, or when the air is hot and sultry; or, lastly, when the winds blow: Now, by rain, "imber tortus," Virgil means hail; by "aquosæ nubes," great showers of rain; by "ignis," the heated sultry air, and by "auster," blasts of wind; for tempests are more frequent when auster, the south wind, blows, than when any other.

After this, not useless, but necessary digression, it is time to return and keep close to our subject: first, then, The art and doctrine of thunder, according to Seneca, is divided into three parts: I. Investigation. II. Interpretation. III. Exoriation. The first part relates to the form; the second to divination; the third to the propitiation and pacification of the gods; of whom, says he, we ought to pray for good things, and to deprecate from us all manner of evil: to pray that they would make good their promises; to deprecate that they would remit their threats; besides, to imprecate and draw down thunder on the heads of our enemies; which last I add to Seneca; not to give occasion to the learned Muretus, to take in ill part the omission of it. The form I interpret to be the species and nature of the lightning, together, with whatever else can conduce to the physical and perfect knowledge of it; in the disquisition of which, according to the Thuscans, its rise, that is to say, whether it bursts out of the earth, or breaks from the skies, deservedly claims the first to be inquired into. Now the Thuscans held that the earthly lightning darts in a straight line, the aerial obliquely. It was believed to be of great moment too, from what part of heaven the lightning came; whither it directed its course, and where it fell. For we must not forget what Pliny, lib. ii. cap. 54. teaches, That the Thuscans

of old divided and quartered out the heavens into sixteen parts, which they called temples, as is observed by Varro de lingua Latina, lib. 3. Nor did they lay any small stress upon this circumstance; whether the thunder struck down the strongest buildings, and overturned the towers and castles of kings; or whether it was weak, and vanished inoffensive in the air. Its force and violence too was likewise considered: that is to say, whether it struck in an instant, or lingered in its flight; and, in some measure, gave warning of the blow: They likewise observed the size and magnitude of it; which they measured and determined by the events and effects it produced. Besides, by the consent of all, there are properly three sorts of lightning, which, according to Seneca, are, I. That which pierces. II. That which shakes to pieces: And, III. That which burns. According to Servius, which blasts, which burns, which cleaves; and according to Festus, which burns, which blasts, which pierces; and from hence it came to be called "trifulcum," three-forked; unless we had rather ascribe that epithet to the three kinds of lightning mentioned by Pliny, i. e. the dry, the humid, and the bright; which were so called from their effects: For the dry does not burn, but dissipate; the humid does not burn, but infuscates; and that, which they called the bright, is indeed of a wonderful nature, as we shall see by and by. I go now to that sort of lightning that infuscates, or renders swarthy the things it strikes: Now this, says Seneca, either strains, or colours, which is thus distinguished: that is said to be stained, whose colour is tarnished, not changed: that to be coloured, whose colour is changed from what it was before, as cerulean, or black, or pale, &c. They observed besides, the manner of the lightning's coming, and the number of the flashes and claps; whether even or odd, and whether alone, or with hail or rain: They had regard besides to the quality of it, whether it were resplendent and glittering, which, perhaps, is that which Suidas calls white, or swarthy and obscure: and it was of the greatest importance, whether it thundered in a clear or cloudy sky, whether in the night or by day; whether in the morning, or the evening, or at noon: And so much for the diagnostic part. We come now to the prognostic or divining.

The prognostic doctrine of lightning was, no doubt, contained in their fulgural books, and the priest, or interpreter of lightning, was called Fulgurator. The ancients ascribed to lightning and thunder a power of foreboding future events superior to all other ominous portents: For whatever any other omens might have portended as a fixed and certain event, was all taken away, and held to be of no effect, if thunder chanced to intervene; but not on the contrary: For whatever thunder had portended was unalterable, and could not be changed by the intervention of any other omen whatever. It is not certain, who they were that did at first distinguish lightning into two sorts; "brunum et fatidicum," brute and fatidic, or fate foretelling, as they afterwards called

them; for they held, that whatever was the cause of lightning, it was always destined to forebode some future event; whether it proceeded from a fortuitous collision of the clouds, as the Latins believed, or whether the clouds suffered that collision, by the command of the Deity, that lightning might be struck out of them by that means, which was the belief of the Thuscans, who likewise held, that lightning does not portend, because it is made, but is made on purpose that it may portend something. But Pliny, lib. ii. cap. 43. says, That no doubt fortuitous lightnings do sometimes happen, which either forebode nothing at all, or at least if they do, the knowledge of what they portend comes not to us. Hence they were called brute lightnings, as coming on no design, and, as I may say, upon no errand whatever. These, says Seneca, strike the mountains, fall into the seas, and do no manner of harm: But the lightnings that are called fatidic, come from their own stars, and are destined to forebode some unavoidable event: Of these, says Cæcinnus, there are three sorts; which he calls "consiliarium, auctoritatis, and status:" The "consiliarium," or counsel-giving, precedes the action, but comes after the thought; as when we are considering in our minds, whether we shall do a certain thing or not, and are persuaded to do it by a flash of lightning, or dissuaded from the attempt: That of authority comes after the action is done, and forebodes whether the event will be prosperous or unlucky: That which he calls "status," of station, is when lightning happens at a time when we are in total inaction, neither doing, nor even thinking of any thing; this either threatens, or promises, or admonishes: therefore he calls it "monitorium," monitory. He makes no mention of a fourth sort, which was called "executivum," the executive, and that inflicts punishments on transgressors; of which anon.

But before we proceed any farther, it will be necessary to know from whom these thunders were sent: The Thuscan books, as Pliny witnesses, taught, that nine gods had the privilege of darting these fiery bolts, and that there are eleven kinds of them: of which Jupiter launches but three: Of these eleven sorts the Romans had retained but two, and ascribed the diurnal to Jupiter, the nocturnal to Pluto: The first Manubia, as they called it, that is, thunder-bolt of Jupiter, gently forewarns, and is mild: this he sends at his own pleasure, whenever he will: He indeed sends a second; but by the advice of his council, which consists of twelve gods, whom he summons for that purpose. This shaft does sometimes do good; but in such a manner that the good it does is always attended with some hurt; its chastisements avail, but punish. The same Jupiter sends also a third bolt, but not without the advice and consent of the gods, whom they call "Dii Majores, Dii Valentes, et Dii Potentes," *ἑσὶ μεγάλοι, θεοὶ χρεστοί, καὶ θεοὶ δυνατοί*. This bolt destroys whatever it meets; it changes and overturns the state of things, as well public as private: For fire suffers nothing to remain in

the same condition in which it finds it. Others plunder the armoury of Jupiter, (Acron in Horat.) and scarce reserving to him the red and bloody thunderbolts, they assign the white and black to Minerva.

———Scit triste Minervæ
Sydus———*Æn. viii. 265.*

Hence "Minervales Manubiæ," says Servius on that passage of Virgil, by the power of which the Grecian fleet was driven on the rocks of the Mountain Caphareus, and perished there. Nor is Pallas idle,

Prima coruscanti signum dedit Ægide Virgo,
Fulmineam jaculata facem———
Flacc. Argonaut. 4.

And she is the more to be feared, because not content with her own, but

———Fulmine irati Jovis
Armata———*Sen. Frag. Agamemn.*

armed with the thunder of angry Jove, she threatens sore, and exterminates her enemies. This privilege Juno envies her,

Ipsa Jovis rapidum jaculata è nubibus ignem,
Disjecitque rates, evertitque æquora ventis.
Æn. i. ver. 46.

For Minerva could come at the thunder, when she would, as she herself boasts in Æschines in Eumen.

Καὶ κλυτὰς εἶδα μόνη δαίμων θίων
Ἐν ᾧ κεραυνὸς ἔσσι.

I alone, of all the gods, know the keys of the magazines where the thunder is kept. And Servius, "ex ælio," observes, that Juno too had her thunder: Hence she upbraids Jupiter for darting her thunderbolts:

———Mea fulmina torques. *Statius.*

Thus we have three thundering gods: Mars was the fourth, and his bolts are red-hot and burning: those of Saturn, cruel and execrable, nor are Pluto's more mild: What can we expect from Vulcan and the south wind, which is said to be "pollens fulminibus," potent in thunderbolts?

The Romans, loath to weary so many gods, gave the thunder but to two: they assigned the day-lightning to Jupiter, who was called Diespiter, i. e. the father of the day: and the night-lightning to Pluto: the lightning which they called *fulmen pervorsum*, because it was uncertain whether it happened in the night, or by day, they gave sometimes to the one, sometimes to the other. Besides this, they had, I. Their *Postularia Fulmina*, which signified the breach of vows, and the profane neglect of religious sacrifices: II. *Monitoria*, by which they were taught what to avoid. III. *Pestifera*, lightnings, which portended death and banishment. IV. *Fallacia*, which were fatal under an appearance of good: these gave the consulship to persons, to whom that office would be fatal; and an inheritance to

those who were to be ruined by getting it. V. *Deprecanea*, which brought a show of danger where there was none. VI. *Peremptalia*, which utterly destroyed the threatening tokens of other lightnings. VII. *Atestata*, that confirmed the promises of former. VIII. *Atterranea*, that happened in close places. IX. *Obruta*, by which things that had been struck before, were struck again, before they had been purged by sacrifice. X. *Regalia*, which fell upon the courts of justice, or other public buildings, or places, belonging to a free city. Concerning the duration, they say, that lightnings are either, I. *Perpetua*, whose tokens belong to the whole life: nor does this sort denounce one single thing only, but embraces the whole context and series of whatever is to happen in the future age of a man. These are the lightnings that happen next after the enjoyment of a patrimonial estate, and in any new circumstance or condition of any man, or city. II. *Finita*, whose prognostications extend only to a certain day. III. *Prorogativa fulmina*, are those whose threats may be delayed to be executed, but can never be wholly averted, or taken away: and such of these as they called *Privata*, because they related only to particular persons, they held could not be delayed for more than ten years, except from the day of first marriage, or the birth-day: nor the *publica*, which regarded communities, and civil societies, for above thirty years, except in the dedication of towns.

Moreover: we said before, that the lightnings, which fly in a direct line, burst out of the earth: These the Thuscans called *Infera*, they are most frequent in the winter, and are held to be the most fatal and execrable; because they come from a small distance, and out of a troublous matter. The Syderial and general, which dart obliquely, and from thence are called *Obliqua Fulmina*, are not always lucky, and the most unlucky of them are those that go from west to north; thus it is of the highest importance, from whence the lightning comes, and which way it directs its course. The most lucky is that which returns towards the eastern parts of the heavens: therefore, when they come from that part of heaven, and incline the same way again, they portend the greatest felicity: we read that an omen of this sort was given to Sylla the dictator. The others in that part of the world are less prosperous, if not absolutely unlucky. They held it unlawful to interpret, or even to inquire into some: unless they were sent as indications of future events to a guest, or a parent: the lightnings that happened on the left were esteemed lucky, because the east is in the left part of the world: the coming of it was not so much regarded, as its return: whether fire rebounded from the stroke, or whether the work being perfected, or the fire consumed, the blast returned back. The Greeks in general, and some of the Latins, held the lightning on the right to presage good fortune: of this we have frequent examples in Xenophon, some in Homer, and many in the Latin poets: however they all agreed, that none portended good fortune, except those

that happened in the day; forasmuch as the nocturnal were unlucky, from whatever part of heaven they came. There is a verse of Ennius recorded by Cicero de Divinat. lib. 2. which makes to our present purpose:

Cum tonuit lævum benè tempestate serena.

And though, as Capitolinus tells us in the life of M. Antonius Pius, the lightning was innoxious, that in a clear sky fell into the court of his palace, yet it was ominous, and a presage of death to Titus. Diodorus Siculus, and Suetonius both witnesses in general, that in those days lightnings were often seen in a serene and unclouded sky: but those historians have neither of them thought fit to particularize any of them.

Besides, they had great regard to the number of the flashes; and an even number seems to portend good fortune, rather than an odd; at least, it betokens neither calamity nor death: But if the lightning fell on temples or public buildings, or if men were blasted by it, in either of those cases it was judged to signify some great misfortune: To a free city it threatened a kingly power; and to others the subversion of their present state, or total destruction. And this, as Cicero in Vatin. observes, was the reason, that from the first building of the city, it was not permitted, but even held irreligious, to hold any assembly of the people, or to continue the sittings of their courts of justice, whenever it happened to thunder. And Livy, lib. v. decad. 3. relates that Marcellus, being created consul, was removed from that office, because it had thundered when he entered upon the consular dignity: what would have been done, if a tempest of wind and hail had accompanied the thunder? Which accident was held to forebode calamity. And even at Rome, as the same Livy, lib. x. decad. 4. affirms, a tempest only did sometimes make the senate break up their assemblies: For the minds of men had already imbibed the superstitious credulity, that lightning portended future events, and gave tokens, not of particular things only, but denounced in a successive order the whole series of future fates; and that too by decrees more plain and evident, than if they had been written in the most visible characters: This Seneca teaches, Nat. Quæst. xxxii. lib. 2. Pliny too seems to have been tainted with the same superstition; for, lib. ii. cap. 53. he says in express terms, That the science of the interpretation of lightnings was improved to that degree, as was evident from innumerable, both public and private examples, that it foretold what should happen even on a fixed and certain day, and whether the lightning foreboded the delay, or the total obstruction of fates, already foretold, or revealed, or gave tokens of others, that lay till then concealed: Wherefore let them be, as it has pleased nature to make them, certain to some, doubtful to others, approved by some, and condemned by others. Thus Pliny.

It now remains, that we say something of their expiations, by which they endeavoured to avert

the imminent dangers that threatened them. In the first place, the fulgural books pronounce, That a place struck with lightning ought neither to be regarded, nor trod upon: For which reason, says Ammianus Marcellinus in Jul. it was lawful to hide or bury the lightning; but a crime against the gods to uncover it. Now the lightning was then said to be buried, when an altar was erected over the place where it had fallen: And this altar had a hole in the top of it, open towards heaven; and was called Puteal, or Capitium, by Vulpianus, Operculum. The place itself Nigidius Figulus calls Bidental, because two sheep were sacrificed there; after which, says he, it was immediately deemed holy. And Augustus consecrated and dedicated to Apollo the area in the palace he had bought, because lightning had fallen in it: But bidental signifies sometimes the sacrifice likewise, and sometimes too the person that was struck, as in Perseus, Satir. ii. ver. 27.

Triste jaces lucis evitandumque bidental.

Moreover, to this custom of burying the lightning, Lucan alludes, lib. i.

Dispersos fulminis ignes

Colligit, & terræ mæsto cum murmure condit.

And the ancient interpreter of Juvenal, on this verse,

Atque aliquis senior, qui publica fulgura condit,
Sat. 6.

says, that lightning is then said to be buried, when the priest has collected together the scattered fires, by which we may reasonably conjecture, that they meant, when he had collected together what was scorched by the lightning; and consecrated the place by a certain prayer, pronounced with a low voice to himself, and by heaping up earth upon it. Thus it had fared but ill with the Parthian magicians, if, as Pliny, lib. xxxvii. cap. 9. says they had tried to find, by digging for it, the gem, which is called "ceraunia," and some take for a real thunderbolt, because it is never found, but in places blasted with lightning, since it was not permitted even to look upon such places. Besides, we learn from Festus, that, by an old law of Numa, it was forbid to burn the body of a man, who had been killed by thunder, or to allow him the rites of funeral. Every man, who was slain by thunder, was buried in the place where he was struck; except, as Quintilian, and some other learned men observe out of Festus, the place belonged to the public. Such men had this privilege, that the priests were permitted to gather up their scattered members: This we have from Seneca, who besides, speaking of such as apprehend and tremble at the danger of thunder, has this remarkable passage: "Non maximum ex periculis, sed speciosissimum fulmen est. Male scilicet erit actum tecum, si sensum mortis tuæ celeritas infinita prævenierit, si mors tua procurabitur, si tu nunc quoque cum expiras, non supervacuæ, sed alicujus magnæ rei signum es." Lib. ii. Nat. Quæst. in calce. The earth

was heaped up, not dug into the ground, as Cornutus is of opinion, till it raised a monument high enough, to give notice of the place to passers by. Plutarch. in Symp. iv. Probl. 2. asserts, That the bodies of men blasted with lightning never putrify; for many, says he, neither burn them, nor bury them, but suffer them to lie where they were struck; and hedge in the place, that those uncorrupting carcases may remain as a spectacle of admiration: And for this reason they foolishly thought such persons to be honoured by Jupiter. But Seneca, Nat. Quæst. lib. ii. with more consonance to truth, says, that bodies, killed by thunder, crawl with worms in a few days; and adds besides, that they were buried with the lightning: Whence the saying, "Male tecum agitur, si cum fulmine conderis." The places were hedged about, that they might not be trod on unawares; and the bodies were interred to avoid the stench of their corruption: For it is known by experience, that as well men as beasts, are for the most part suffocated by the blast of lightning, not burnt with the fire; and when the innate heat of the animal decays, the remaining moisture is prone to corruption. Yet some persons, struck with lightning, were not buried, but only covered with a white garment; as well because they believed such bodies did not putrify, as that they might be seen by the people; who, nevertheless, were not permitted to look at them, except at some distance: for none were permitted to come within the enclosure, but the priests.

I shall pass by many things relating to thunder, but cannot omit one, which Pliny mentions, lib. xxviii. cap. 25. where he says: "Fulgetras Poppyfmiis adorare, consensus est gentium." All nations agree in adoring the thunderbolts, by pressing their lips close together, and then, by drawing in the air by force, to make such a sound as horsemen generally do, to encourage and put forward their horses; for such a noise the word "poppyfmiis" signifies: and this was the custom both of the Greeks and Romans in their expiatory sacrifices. Some of the learned add likewise the clapping of hands, which others nevertheless take to be only the noise that is made, by closing the palms of the hands, and hissing between the thumbs. But to proceed:

When the portents and prodigies were uncommon, or more than usually frequent, they consulted the Tuscan Fulguratores, or the Sybilline books, and the city was expiated, by public sacrifices and supplications, and by the ceremonies they called *Lectisternia*, i. e. bringing their beds, on which they lay down to eat, into the temples, where they used to feast themselves in honour of the sacred rites; as also by votive games, Livy in decad. iv. lib. 10. gives an example of the purification of the city, after the fall of lightning, in these words: "Ob ea decemviri jussi adire libros, edidere quibus diis, et quot hostiis sacrificaretur: Et a fulminibus complura loca deformata, ad ædem Jovis ut supplicatio diem unum esset. Ludi denique votivi Q. Fulvii Conf. per dies decem magno apparatu facti." For to distinguish to

which god the sacrifice was due, was not so easily discerned by the Romans, but that they equally sacrificed sometimes to Jupiter and Pluto, when the lightning happened at a doubtful time, that is to say, either in the morning or evening twilight: and this lightning, as we said before, they called "pervorsum." Joannes Magnus, in his history, lib. iii. cap. 8. relates a ridiculous custom of the Goths and Vandals; and which is likewise confirmed by his kinsman Olaus Magnus: They tell us, that those people, when they heard the noise of thunder in the clouds, were wont to shoot arrows up into the air, to express their earnest desire to assist their own gods, whom they believed to be then engaged in battle with other gods; and that, not contented with this foolish superstition, they had mallets of an unusual weight, bound about with brags, and which they held in great veneration, on purpose that, by their help, as by the imitative thunder of Claudian, they might express the noise they heard in the heavens, and which they believed was made by mallets likewise: And they held it very meritorious to be thus present, and assist in the battles of their gods.

It remains only to speak of the lightnings, which the ancients called *Elicia*, and these were either commanded and compelled from heaven, or allured and obtained by holy rites. Pliny tells us, That lightning may either be compelled, or implored from heaven, by certain holy rites and supplications; that there was an old tradition in Etruria, that it had been obtained by holy rites, when a monster they called *Volta*, entered into the city *Volfinii*, after having first depopulated the country round it: And the same author, on the testimony of Piso, whom he calls an author of credit, says, That *Porfenna*, king of the *Thuscans*, drew down thunder from heaven; and that, before him, *Numa* had often done the like. He adds, that *Tullus Hostilius*, endeavouring to imitate them, and either not knowing, or for not observing the due rites, was himself struck dead by a thunderbolt. "Extat annalium memoria, sacris quibusdam et precationibus, vel cogi fulmina, vel impetrari: Vetus fama *Hetruriz* est, impetratum; *Volfinios* urbem, agris depopulatis, subeunte monstro, quod vocavere *Voltam*. Evocatum et à *Porfenna* suo rege, et ante eum à *Numa* sapius hoc factitatum, in primo Annal. suorum tradit L. Piso, gravis Author: quod imitatum parum rite *Tullum Hostilium*, ictum fulmine. Lucosque et aras, et sacra habemus inter quæ *Statotes*, et *Tonantes*, et *Feretrius*, *Elicium* quoque accepimus *Jovem*." Plin. lib. ii. cap. 52. He concludes with making this remark: "Varia," says he, "in hoc vitæ sententia, et pro cujusque animo. Imperari naturæ adacis est credere: nec minus hebetis, beneficiis abrogare vires." Thus Pliny. In relation to *Numa*, Livy relates the matter at large, in decad. i. lib. 1. where, among many other things, he tells us, that *Numa*, in order to allure down thunderbolts from the divine minds, erected an altar on the *Aventine* hill, to *Jupiter Elicius*; "Ad ea (scil. ful-

mina) elicienda, ex mentibus divinis, Jovi Elicio aram in Aventino dicavit; deumque consuluit auguriis, quæ capienda essent." And that nothing might be wanting to this fable, Valerius Antias, as cited by Arnobius, advers. gent. lib. v. says, that king Numa, not having the science of procuring lightning, and, by the advice of the nymph Ægeria, being desirous to know it, gave chains and fetters to twelve chaste young men, and placed them in ambuscade, near a certain water, in which Faunus and Martius Picus were wont to bathe, with orders to surprise and bind them: This they did, and extorted from them the art of alluring Jupiter, of whom Numa by this means learnt the art of drawing down thunderbolts out of heaven. The Greeks, however, will not allow this honour to be first due to Numa, but ascribe it to Prometheus; who, as Servius on the 6th Eclogue of Virgil, relates, by residing long upon the top of Mount Caucasus, discovered the art of alluring down lightning, and taught it to men; from whence the fable of his having stolen fire out of heaven. Lastly, These "elicia fulmina" were of three sorts: I. "Hospitalia," which Seneca mentions in lib. ii. Nat. Quæst. and these by sacrifices compel, or rather, to use their milder expression, invite Jupiter from heaven: But if his godship should happen to be unwilling, or in an angry mood, they invite him to their own cost: and this, says the same Seneca, was the misfortune of Tullus Hostilius, the third king of the Romans, whom we mentioned before. II. The "Auxiliaria," which were also called "Advocata," but these always came for the good of those that called them. III. The "Imprecatoria," which cannot be reckoned in the number of auxiliary lightning; for no man desires destruction, or imprecates thunderbolts on his own head. After all, Pliny, lib. xxviii. cap. 2. observes out of old authors, that it was a very difficult task to allure down lightning by supplications and sacrifices. And so much for the superstition of the ancients, in regard to thunder and lightning.

Ver. 431. Hitherto the poet has been treating of thunder and lightning; and is now about to dispute of another kind of meteor, called whirlwinds: And for the better understanding of such disputation, it will be necessary, with Aristotle, lib. iii. Meteor. and with Pliny, lib. ii. cap. 48. to distinguish between the several sorts of whirlwinds, which the ancients called by several names, according to their several natures; as "ecnephias, prester and typho:" For since all these things, thunder, lightning, "ecnephias, prester, and typho," and thunderbolts, are only several winds, we ought to distinguish between them. First, then, if the wind be thin and subtle, and if it be blown and scattered piecemeal here and there, it produces thunder and lightning. If it be more dense and thick, it begets the tempest, which the Greeks call *ἑκνεφίας*, i. e. a storm without rain, a hurricane, as Pliny says, lib. ii. cap. 48. But if the wind bursting out of the bowels of a cloud, meet with other winds, breaking out of other

clouds likewise, and without fire, it comes to be that sort of whirlwind, which the Greeks called *τύφος*, of which there are two sorts, called by the Latins "vortex and turbo:" "Vortex," if it make a great and roaring noise: "Turbo," if it make none at all, or but a whistling one. But if the wind, when it breaks from the clouds, takes fire, and kindles into flame, it makes a "prester," called by the Greeks *πρεστήρ*, which signifies, inflaming, swelling, and making hot, "quasi comburens contacta, pariter et proterens," says Pliny, in the place last cited: If the wind, after it breaks from the clouds, do not take fire; but bursts out in a flame, it makes the lightning, which the Greeks call *νεφέωνος*, a thunderbolt: And, lastly, if the wind cannot break the cloud, but forces and drags it down upon the earth, or sea, it then makes the whirlwind, which the Latins called "columna," a pillar. And of these whirlwinds the poet disputes in the following twenty-nine verses, and seems to call the "columna, vortex, and turbo," all of them certain presters. And first, in these twenty-one verses, he explains the cause of a fiery whirlwind, called a prester; which, says he, is a wind impetuously whirled about, and that takes fire by the continuance and vehemence of the agitation. If this wind burst out of the clouds, and move violently in a straight line, it kindles into lightning only; but if the cloud be so tough, that it cannot break through, but bears it down into the sea, and, there impetuously whirling round in the waves, it becomes a prester, the sure destruction of sailors.

Ver. 452. Presters are seldom felt at land, but chiefly infest the sea. There is another sort of whirlwind, which is not fiery: and this too is a wind, that turns and whisks about with violence in a cloud, and tumbles down with that cloud upon the earth; where breaking out without being kindled into flame, it whirls and tumbles down all things where it lights: Neither is this sort of whirlwind frequent at land; for the hills hinder its descent, and break its force; but at sea the poor sailors often feel its violence.

Of this sort of whirlwind, Pliny, lib. ii. cap. 48. "Sin vero flatus repentini depresso sinu arcitius rotati nubem effregerint, sine igne, hoc est, sine fulmine, Vorticem faciunt:" which agrees with what Lucretius says of it. But whatever he says of their being most frequently felt at sea, they are very common in Florence, and in several other countries.

But before we leave this subject of whirlwinds, it will not be improper to give a short account of the cause of wind; the original of which is reckoned among the hidden secrets of nature. Aristotle will have it to proceed from the earth, and defines it to be a dry earthy exhalation: Metrodorus and Animaxander held, that it proceeds from the water: of the same opinion too is Vitruvius, who, lib. i. cap. 6. says, "Ventus est æris fluens unda, cum incerta motus redundantia; nasciturque cum fervor offendit humorem & impetus fervoris exprimit vim spiritus flantis:" This he illustrates, by the example of *solipila*,

windballs: and Des Cartes pretends to demonstrate the truth of this opinion in the same manner. And Salmasius, lib. de Anno Climacter. asserts the same opinion, in the very words of Vitruvius. There is a third opinion, which seems to have been more ancient than either of the former; and according to that, wind is nothing but air put in motion. Apuleius de Mund. is of this last opinion. "Nec enim," says he, "aliud est ventus, nisi multum et vehemens in unum coacti aeris flumen:" But this is not satisfactory; for, by not assigning the first cause of that motion, it leaves the matter in suspense, and undetermined. The most probable opinion therefore is, that wind is an earthy or watery exhalation, mixed with saline spirits, and other vapours, drawn or forced out of the earth or sea, by the power of the sun, or of subterranean fires, which being rarefied by heat, or condensed by cold, and impelled for the most part by a transverse, but sometimes by a direct motion, exagitates the earth, air, and sea. But of this subject see particularly my Lord Bacon's treatise de Ventis; Des Cartes in the place above cited; Gassendus's Animadversions on Epicurus; Fromond. in Meteor.; Kircher. in Mund. subterranean.; and Isaac. Vossius, de motu Marium & Ventorum.

Ver. 462. The poet is now going to treat of the generation of clouds; which, he says, may be produced three several ways: And first, in these seven verses, he teaches, that certain rough and hooky atoms, that are flying to and fro in the air, meet and join together: These form the thin clouds first; and these thin clouds, condensing and joining with one another, make the thick and heavy clouds.

Anaximenes, Plutarch, and Seneca, held the clouds to be made of the very concretion or congelation of the air itself: The first of them indeed believed, that all things proceed from the air: And Plutarch, de Placit. Philos. l. iii. c. 4. calls the clouds *αἶρος παχύτητας*, thickenings of the air; and Epicurus in Laërtius, *αἶρος πύλσεις*, accumulations or heaps of air; but Seneca, lib. ii. c. 30. "Spissitudinem aeris crassi," the thickness of gross air: for he will not allow, that clear and unmuddy air can thicken and grow into clouds; because it is too subtile, and free from vapours; by virtue of which only it can condense into clouds. Macrobius, "Aër terreni frigoris exhalatione densatus, in nubem cogitur." In Somn. Scipionis, lib. i. cap. 22.

Ver. 467. In these nine verses he observes, that clouds frequently seem to rise from the tops of high mountains: the reason of which, he says, is this; because some thin mists and watery steams, that are too subtile to be seen, are driven up thither by the wind; where joining together, and growing thick, they become visible. Moreover, our translator has omitted the two last verses of this argument, which, in the original, are as follows.

Nam loca declarat sursum ventosa patere
Res ipsa, & sensus, montes cum ascendimus altos.

And indeed they are of no great moment; and therefore I have foreborn to translate and insert them in the text of this version. What they say is only this: For, when we ascend a high mountain, the thing itself and sense demonstrate, "*ventosa loca sursum patere*," i. e. that the winds tend to the highest places, and reign there. This is the interpretation Creech himself gives them in his Latin edition of Lucretius.

Ver. 476. In these six verses Lucretius proposes a second reason of the generation of clouds: and that matter may not be wanting to compose such vast bodies of clouds as are rolling up and down in the air, he raises vapours and exhalations from the sea; and then, in ten verses, from the rivers and other waters, nay, even from the earth itself; not that he believes any earthy particles ascend, as Gassendus interprets, but because the earth, being moistened with dews and rain, seems to smoke, and breathe forth watery exhalations, which the particles of heat, that are continually descending from above, meet in their ascent, and press them into clouds. The last verse of this argument is likewise omitted by Creech in this version: It runs thus in the original:

Nam ratio cum sanguine abest humoribus omnis.

And indeed the interpreters know not well what to make of it: some place it above, after ver. 410. others below, after ver. 531. In either of which places it seems to have but as little to do as here: so that upon the whole matter, their opinion seems best, who will not allow it to be genuine, and therefore absolutely reject it.

Ver. 478. This the poet has mentioned before, b. i. v. 357.

Ver. 486. This and the following verse in the original run thus:

Urget enim quoque signiferi super ætheris æstus,
Et quasi densando subtexit cæcula nimbis:

In his interpretation of which we may observe, that Creech has followed the opinion of Gassendus, and some others, who interpret *ætheris æstus* to mean the ether itself, whose heat condenses the clouds; and this must be explained, say they, to be intended of the antiperistasis, by reason of which the region of the clouds grows cold. But our translator, in his Latin edition of Lucretius, has changed his opinion, and says, that this antiperistasis of theirs, as they call it, will avail them nothing; and that they allege a cause, by which the clouds may indeed be attenuated, but never condensed: And Lucretius himself, a few verses lower, urges the heat of the sun for one of the reasons of the liquefaction and dissolution of the clouds into rain:

Aut dissolvuntur solis super iacta calore,

says he, v. 513. And therefore Creech explains *ætheris æstus* to mean the little bodies that are still descending from the heavens in a confused and turbulent manner. And indeed this interpretation seems more consonant to reason than the

other: therefore instead of, For the warm vigorous rays, &c. read, For the descending parts, &c.

Ver. 488. In these fourteen verses, as a third cause of clouds, he fetches the seeds of them from the infinite space, and from the other worlds. For Lucretius, after Epicurus, believed, that the atoms which assemble in the concretion of clouds, came not only out of the air, water, and earth, but out of the void likewise: for having taught, book i. ver. 1005. & seq. that the space in which, out of which, and through which the infinite atoms are continually flying, is immense and infinite likewise, what wonder is it, if they supply from that inexhaustible magazine a sufficient quantity of seed for the production of clouds?

Ibid. *External matter*] That is to say, matter that comes not only from the sea, nor only from the earth, nor only from the air, but from without; i. e. from the immense and infinite space of the universe.

Ver. 490. See book i. ver. 960. & seq. & 1050. & seq. where the poet has brought many arguments to prove the universe to be infinite, and that it has no centre.

Ver. 493. See book ii. ver. 134. &c.

Ver. 494. This and the following verse are transcribed from Cowley, and repeated in this place, from b. iv. v. 226.

Ver. 502. These thirty verses contain a short disputation of rain. Many seeds of water rise up together with the seeds of the clouds, and grow bigger together with the clouds, in like manner, as the blood, and other humours increase in proportion with our bodies. For a cloud may be supposed to be a body, that contains the rain, which may be compared to the blood in the bodies of animals. To these seeds of water and clouds, add those particles of water that the clouds, like fleeces of wool, which they seem to resemble, draw from the rivers and sea. And thus when the clouds are full of water, if they are pressed either by the force of the wind, or their own weight, water must of necessity be squeezed out, and drop from them: This in seventeen verses. Then he says in four verses, that if the winds rarefy the clouds, the rain will likewise drop from them; and if the heat of the sun pierce the clouds, they will flow like melted wax. That a violent hasty shower is occasioned by a violent compression of the clouds: in four verses, and lastly, in five verses, that constant showers happen, when many clouds are heaped upon one another, and when the earth resolves into vapours the rain it has received, and sends it up again into the region of the clouds.

Aristotle and his followers, who held that the elements change from one into another, and so make a circle of generation, define rain to be air converted into water, and distilling from a cloud in drops. Epicurus held that rain might be generated two several ways: I. By transmutation. II. By compression. By transmutation; because such is the nature of the air, that it changes by condensation into water; and such too is the na-

ture of a cloud; that by the retreat and absence of heat, and by the accession of cold, its parts are so transposed and varied, as renders them more apt to flow and fall. This is exemplified by vapours gathering together in a limbeck, and then falling in drops. By compression, when by wind or cold the cloud is compressed, and the vaporous corpuscles within the hollows of it are crowded together; and thus, by that accession of weight, or by the force of the wind, are driven and squeezed out of the cloud, in like manner as water out of a sponge. From whence it appears, that the drops of rain are formed by coalition, rather than by division; and that rain is not, as it is vulgarly taken to be, a watery mass effused from a cloud, as water out of the rose of a watering pot, nor as Trepasius and Aristophanes, deriding this opinion, says, does it proceed from Jupiter's making water through a sieve. For, if there were any such stagnation of water in a cloud, it would fall from thence in a torrent, or as water does from spouts, rather than in drops. Moreover, there are reckoned three kinds of rain. "Stillicidium, Imber, and Nimbus." The first is a misty rain. The second more intense, and composed of larger drops, a sober rain. The third, a violent pouring rain; which, as Fromondus says, falls "decumanis guttis:" Apuleius de mundo, sums up the whole matter in a few words: "Tot diversitatibus," says he, "pluviae cadunt, quot modis aer nubium conditionibus cogitur."

Ver. 505. Hippocrates agrees with Lucretius in this opinion, and lib. de Aer. Aqu. et Loc. says expressly, that there is moisture in all things.

Ver. 508. Here the poet teaches in five verses, that while the clouds are driven by winds over the surface of the sea, or other waters, they, like wool, hung in damp places, imbibe and suck in the moisture.

Ver. 513. In these six verses, the poet mentions one of the ways, by which rain distills from the clouds, that is, by compression; when the clouds, compressed by the force of the wind, or by the great quantity of water, contained within their bowels, let drop the rain; as water is squeezed out of a sponge, by pressing it.

Ver. 519. These four verses contain the other way, by which Epicurus, and, after him, Lucretius held, that rain might be made, to wit, by transmutation, that is to say, when the clouds, being struck and rarefied, either by the force of the wind, or the heat of the sun, distil in rain, as is explained above, ver. 502.

Ver. 523. These four verses, that give the reason of a violent storm of rain, are sufficiently explained in the note on ver. 502. and so likewise are the five that follow them, and assign the cause of constant showers.

Ver. 532. In these two verses, he tells us, that a rainbow is made by the beams of the sun, striking upon an opposite and wet cloud.

Lucretius says not any thing of the various colours of the rainbow; a subject which nevertheless has employed many of the philosophers; and concerning which, there are two things chiefly to

be inquired into; their number, and their order. As to the first, Aristotle discerns only three distinct colours; *φαινίκεον*, a light red, or saffron, as some interpret it; *χλωρὸς*, green, and *πορφύρεος*, purple, or violet, and cerulean; and thence he called the rainbow three coloured: but Ptolemaeus calls it seven coloured, because of the mingled colours that intervene among those three chief colours. Others call it many-coloured, as if the number of its colours could scarce be distinguished. Whence Virgil, *Æn.* iv. ver. 701.

Mille trahit varios adverso sole colores.

A rainbow is only the picture of the light of the sun, in an opposite cloud, moist or wet, and just ready to be dissolved, and fall down in rain. It is in itself of no colour; and the various colours that appear, are but reflections of the light of the sun received differently, according as the cloud is more or less dense: this is evident by artificial rainbows. And yet this shadow, this almost nothing, does, by reflection, sometimes make another rainbow, though not so distinct and beautiful. Sir R. Blackmore describes a rainbow poetically, and like a philosopher too.

Thus oft the Lord of Nature, in the air,
Hangs ev'ning clouds, his sable canvass, where
His pencil, dipt in heav'nly colours, made
Of intercepted sun-beams, mix'd with shade
Of temper'd ether, and refracted light,
Paints his fair rainbow, charming to the sight.

There are only four chief colours in a rainbow. I. A light red. II. A yellow, or saffron. III. A green. IV. A purple. These colours change their site and order, according to the difference of the rainbow; for there are two distinct sorts of rainbows; "*iris primaria*," and "*iris secundaria*," the primary and secondary rainbow. The primary rainbow is that which, for the most part, appears alone, and in which the ruddy colour is outmost, or highest; the yellow next, the green the third colour, and the purple the inmost, or lowest. But the "*iris secundaria*," or secondary rainbow, is that which never appears alone, but always above, and larger than the primary, and has the same colours, but more faint, and quite inverted; that is to say, in the secondary rainbow, the purple colour is the outmost, or highest, the next to that the green, the third the yellow, and the ruddy the inmost or lowest. This rainbow is not so distinct and beautiful as the other, of which it is held to be only a reflection. It is agreed by all, that there are two causes of the colours of the rainbow; the sun, and the watery cloud placed against it; but they do not explain this in the same manner. Metrodorus in Plutarch de Placit. Philosoph. l. iii. c. 3. believes, that the redness of the rainbow proceeds from the beams of the sun, and the cerulean colour from the cloud. Seneca assents to this opinion, and adds, that the other colours are only a mixture of these two. Aristotle, 3. Meteor. will have the cloud to be in the nature of a mirror, from which the beams of the sun, being variously reflected, produce the various co-

lours: the light red, because they are reflected from that part of the cloud that is nearest to his orb; the green, because they are reflected from the part that is farther off; lastly, the purple, because they are scarce reflected at all, by reason of the yet greater remoteness of the cloud; nor does he distinguish the yellow from the red, only because it grows whitish, by reason of the vicinity of the green. Scaliger believes the cloud to consist of the particles of the four elements, and therefore will have the upmost parts of it to turn red, when they receive the light of the sun, because they are fiery; the next to become yellow, as being aerial, and the third to grow green, as holding of the earth. As to the figure of the rainbow, it is round; but it would be too tedious to relate the various opinions why it is so. Of this consult P. Gassendus on the tenth book of Laërtius. *Animad. de Meteorolog.* p. 1123.

Ver. 534. Lucretius says nothing in particular of the causes of snow, wind, hail, hoar-frost, ice, &c. but only takes notice in these seven verses, that whoever contemplates on these things, and considers the clouds and showers, and at the same time reflects on the various figures and motions of the principles, will easily be able to comprehend the causes of these and the other meteors, which he leaves unexplained.

Ver. 535. Pliny, lib. xvii. cap. 2. calls snow, the foam of celestial waters, when they dash against one another; which, says Cowley, is ingeniously expressed for a poet, though but ill defined for a philosopher. Aristotle, and after him, most of our modern philosophers, hold it to be generated of a moist, but rare and thin cloud, which, being condensed by cold, as it falls down, that it may the more easily cut through the air, divide itself into flakes, like fleeces of wool; to which the Psalmist alludes, "*Qui dat nivem, sicut lanam*," Psal. 147. He gives snow like wool. Yet Bodinus, in *Theatro Naturæ*, is of opinion, that the Royal Psalmist resembles snow to wool, because of the warmth it affords to plants and vegetables in the cold of winter, as woollen garments do to men, rather than for its fleecy similitude. The whiteness of snow is derived from its efficient cause, which is cold; and also from the copious mixture of aerial spirits. Anaxagoras affirmed it to be black; and in Armenia it is of a ruddy colour; which, as Eustathius on the second Iliad observes, is caused by the terrestrial particles, or atoms of the soil of that country, which abounds with minium. For those particles, mixing with those of the air, tinge the snow, and give it that hue. Of the wonderful contexture and figure of snow, which is said to be always sexangular, see Kepler, who has written a particular treatise upon that subject.

Ibid. Hail is nothing else but rain congealed in its fall: and this congelation or concretion is made not far from the earth, because hail is never seen upon the high mountains, which are often covered with snow; besides; hail, the nearer to the earth the cloud is, out of which it falls, is the more triangle or pyramidal in its figure: the

Higher the cloud, and the more remote from the earth, the rounder the hail: the reason of which is, because those inequalities, or angles, are worn away, and rounded by the length of its passage and descent through the air: and its congealed hardness proceeds from the antiperistasis of the lower region of the air: and this too is the reason why hail falls more frequently in summer than in winter; and seldom in the night, unless the night be warm. See more in Fromondus, Meteorolog. lib. v. cap. 9. I will only add Aristotle's short, but true, definition of snow and hail: snow, says he, is a cloud congealed, and hail congealed water.

Ver. 541. Before we enter on this disputation, of earthquakes, it may not be amiss to take notice of the several sorts of them. Apuleius, lib. i. de Mundo, reckons up seven several sorts of earthquakes. I. The first is termed Epiclintes, seu inclinator, from *ἐπικλίνω*, I incline, because it moves sidelong; and, thus, striking at oblique angles, overturns things by inclination, or sideward. II. The second is called Brastes, seu effervescens, from *βράζω*; I boil; the similitude of boiling water, because it bears all above it in a direct line. III. The third, Chasmatias, from *χασμάω*, I gape, because it makes an hiatus or chasm, in which the place it forces, is swallowed up. IV. The fourth, Rhectes, from *ρήσσω* I break, because it forces its way by a rupture: though it opens not so wide a chasm as the former. V. The fifth sort is called Ostes, from *ὠσίζω*, I thrust with violence: and this both shakes and overturns. VI. The sixth, Palmatias, from *πάλλω*, I shake, or throb: this shakes the ground and buildings, but not so as to overturn them. VII. The seventh is called Mycematias, or Mycetias, from *μύκασμαι*, I bellow, because it makes a roaring noise. But Ammianus Marcellinus, and, after him, Cælius Rhodiginus, allow but four kinds of earthquakes.

Thales and Democritus ascribe the cause of earthquakes to subterranean winds, that undermine the bowels of the earth, and then force out their passage: the Stoics attribute it to moisture, rarefied into air; which struggling for room to get free, and meeting with the thick and tough body of the earth, shakes it by its struggling. Others hold that earthquakes proceed from enclosed air, or spirits arising from combustible matters, as sulphur, nitre, allum, sal-armoniac, bitumen, or the like; which being set on fire, and consequently rarefied, cause the same effects as gunpowder does in mines. See Fromond. Meteorolog. lib. iv. cap. 2. where those authors treat of these matters at large. I now return to Lucretius, who, in order to give a right explication of earthquakes, first supposes several things, which I think no man ever doubted: and first, says he, in eight verses, you may suppose the earth to be full of hollows, that the caverns are full of vapours, into which the wind can easily rush: in the next place, that there are many lakes, many broad pools of water, and rivers too, rolling their waves within the bowels of the earth. These things being granted: the poet assigns the first

cause of earthquakes to the earth itself; and in eight verses more tells us, that one cause of earthquakes may be this: when any of those subterranean cavities are decayed by length of time; and it is certain they will decay: the upper part of the hollow will fall down: nor can it be doubted, but that a trembling of the earth must be caused by such a concussion, since we see, that when coaches or waggons go along the streets, the houses on either side are shaken.

This was the opinion of Anaximenes, who in Seneca, lib. vi. says, that the parts of the earth, which moisture has loosened, or subterranean fire undermined and consumed, or the violence of wind has shaken, or that the length of time has brought to moulder and decay, may fall in. But Aristotle and Plutarch say, that Anaximenes held, that these fallings in of the earth could not proceed, except from dryness and moisture. Epicurus in Seneca, lib. vi. cap. 20. speaks of this first cause of earthquakes, in these words: "Fortasse aliqua parte terræ subito decidente terra ipsa percutitur, & inde motum capit. Fortasse calida vis spiritus in ignem versa & fulmini similis cum magna strage obstantium fertur." Perhaps, says he, some part of the earth falling down on a sudden, the earth itself is shaken, and thence is caused the motion: perhaps in some parts the earth is supported as with pillars, which being decayed, and giving way, the superimposed weight trembles: perhaps the hot force of wind is changed into fire, and borne about like lightning, makes a wide destruction of all things that resist its passage. And in the same author, lib. vi. cap. 9. Anaxagoras holds almost a like cause of earthquakes, which, he says, are the effect of lightning.

Ver. 553. Seneca, Nat. Quæst. lib. vi. cap. 22. "Si quando magna onera per vicos vehiculorum plurium tracta sunt, (perhaps per vicos vehiculorum plurium ordine tracta sunt) & rotæ majori nisu in salebras inciderunt, terram concuti senties. Asclepiodorus tradit, cum petra è latere montis abrupta cecidisset, ædificia vicina tremore collapsa. Idem sub terris fieri potest, ut ex his, quæ impendent, rupibus aliqua resoluta magno pondere & sono in subjacentem cavernam cadat, eo vehementius, quo aut plus ponderis habuit, aut venit altius: & sic commovetur omne tectum cavatæ vallis." When heavy loads are drawn in carts along the streets; if the wheels happen to plunge into a hole, you will feel the ground tremble. Asclepiodorus relates, that a rock, breaking off from the side of a mountain, shook down the neighbouring buildings as it fell. The same thing may happen in the hollows under ground: if any of the impending rocks break off with mighty weight and noise, and tumble down into the subjacent cavern, and that too with more violence and impetuosity, the greater the weight is, and the higher it falls; then all the bulk of earth, that covers that cavity, will be moved and tremble.

Ver. 557. Another cause of earthquakes, and which he ascribes to water, is contained in these five verses, to this effect. If a vast quantity so

earth fall down into a great pool of water, it will cause an agitation in that water, and that agitation may cause a staggering or reeling of the earth, that contains that water, as in a vessel.

Democritus, as Aristotle, lib. ii. "de rebus superis" witnesses, was of opinion, that the earth, since it abounds with water, and admits into its bowels a great quantity of rain, is moved and shaken by it: for, because the cavities cannot contain all the water, the earth swells and increases with it: and thus the water, forcing its way into the earth, causes an earthquake: and the earth growing dry, and attracting the water from the places, that are full, into those that are empty, is moved by the water, and changes place, and glides from one into another. Thus Epicurus in Seneca, lib. vi. cap. 20. "Ergo, ut ait Epicurus, potest terram movere aqua, si partes aliquas eluit & abrasit, quibus desit posse excavatis sustineri, quod integris ferebatur." Thus in A. Gellius, lib. ii. cap. 28. the poets feign, that Neptune, that is, water, is the mover and shaker of the earth: to this likewise may be referred the opinion of Thales, that the earth is supported by water, and sometimes runs adrift, and floats, like a ship, got loose from her anchor. And indeed, in earthquakes, when the earth opens and gapes, water for the most parts breaks out, almost in the same manner, as it works itself into a ship that has sprung a leak. But Lucretius believes that the earth shakes, by reason of huge pieces of it, that break off and fall down into a cavern of water: as, for example, a vessel full of water cannot remain without motion, if the water it contains fluctuate; till that water ceases its agitation, and be at rest. Thus he seems to speak after the opinion of Thales, who held that the earth floats in water.

Ver. 562. In these twenty verses, he proposes the wind as a third cause of earthquakes, and says, that the wind, rushing into the caverns of the earth, makes it incline, and, as it were, drives it forward: but since the blast is not continued on [for if it were, the whole earth would fly before the driving violence], and since, sometimes meeting with opposition, it is repelled, and goes back, the earth, after several fluctuating motions, settles again in its ancient former seat. But by this fluctuation of the earth, buildings are shaken and tumbled to the ground.

To this sort of earthquake may be referred, that amazing prodigy, which Pliny, from the authority of the Tuscan books, relates of two mountains in the country of Modena, which Lucius Marcius and Sextus Julius being consuls, met, and butted against each other, making a dreadful noise, and casting out smoke and fire into the air, and then retiring: he adds, that this was seen by many Romans from the Æmilian way. "Namque montes duo inter se concurrerunt crepitu magno assultantes; inter eos flamma fumoque in cœlum exeunte interdium; spectante è viâ Æmiliâ magnâ equitem Romanorum familiarumque et viatorum multitudine," Plin. lib. ii. cap. 83. Moreover, the sort of earthquake which Lucre-

tius here speaks of, is that which they call "Epiclintes," or "inclinators;" and is compared to the nodding motion of a vessel in the water. But Aristotle allows only two sorts of earthquakes, which he calls a trembling and a pulsion; the trembling is compared to the shaking that seizes us in a fit of an ague; the pulsion to the beating of the arteries. Now, because this last seems to be a succession of the earth while it is shaken, or an intermitting and perpendicular motion: and because the trembling seems to be without intermission, and a lateral or sidelong motion, therefore some bethought themselves of this sort of earthquake, which they call an inclination, while the earth inclines and nods towards the horizon. This inclining earthquake is mentioned by Milton in *Paradise Lost*, Book vi. As if, says he,

Winds under ground, or waters forcing way
Side long, had push'd a mountain from his seat
Half sunk with all his pines.—

Ver. 572. To this purpose, Ovid speaking of the wind, says,

His quoque non passim mundi fabricator habendum
Aëra permisit. Vix nunc obsistitur illis,
Cum sua quisque regant diverso flamina tractu,
Quin lanient mundum. *Met. i. ver. 57.*

Nor were these blust'ring breth'ren left at large,
O'er seas and shores their fury to discharge:
Bound as they are, and circumscrib'd in place,
They rend the world, resistless where they pass. *Dryd.*

And Virgil yet more closely to the sense of Lucretius, says, that Æolus

Lucentes ventos, tempestatesque sonoras
Imperio premit, ac vinclis et carcere frænat. *Æn. i. ver. 57.*

Ni faciat, mare ac terras, cœlumq. profundum
Quippe ferant rapidi secum, verrantque per auras. *Ver. 63.*

With pow'r imperial curbs the struggling winds,
And sounding tempests in dark prisons binds:
Which did he not, their unresisted sway
Would sweep the world before them in their way: [roll,
Earth, air, and seas, through empty space would
And heav'n would fly before the driving soul. *Dryd.*

Ver. 582. In these twenty-one verses, he says, that this inclination and fluctuating motion of the earth is often attended with a violent beating and succession of it; for if the wind break through the caverns, and cleave the earth, then cities, islands, &c. together with all their inhabitants, are ingulfed and swallowed up in the hideous chasm; but if the wind do not break through them, there is then only a trembling, or as it were, a shuddering of the earth, which is caused by the chilling wind that is diffused through all its pores. Now, though there seem but little or no danger to be apprehended from a bare tremb-

ling of the earth only, yet it may be joined with the other sorts of earthquakes: Nor can any one be certain but that the trembling may be often repeated, and that too with still more and more violence, so as to overthrow the buildings, and make the earth gape a little. Seneca says, that Epicurus held wind to be the chief cause of earthquakes, "Nullam tamen placet Epicuro causam esse majorem, quam spiritum." Nat. Quæst. lib. vi. cap. 20.

Ver. 587. *Ægæa*.] The name of several towns. I. In Macedonia, not far from the river Halyacmon, and where the kings of Macedonia were buried, Plin. lib. iv. cap. 10. II. In Cilicia, on the banks of the river Pyramus, now Malmistra, Plin. lib. v. cap. 27. III. In Æolia, Plin. lib. v. cap. 50. IV. In Eubœa, now called Negroponte, and from which Strabo says the Ægean sea took its name. V. in Lydia. VI. In Ætolia. VII. In Locris, Steph. But Lucretius speaks of Ægæ in Achaia, and which is commonly called Ægira, Plin. lib. iv. cap. 5. And the earthquake which the poet here mentions is perhaps the same of which Aristotle, lib. ii. Meteor. cap. 8. and some other of the ancients make mention, and say, that two great towns, not far from Ægira, and whose names were Helice and Bura, were swallowed up by an earthquake. Of which Ovid. Metam. xv. ver. 293.

Si quæras Helicen et Buran, Achaïdas urbes,
Invenies sub aquis; et adhuc ostendere nautæ
Inclinata solent cum mœnibus oppida merfis.

Phœnician towns.] Lucretius mentions Sidon, a city of Phœnicia, one of the provinces of Syria, and which was built by the Tyrians, who at first inhabited the midst of the country, where, being afflicted with continual earthquakes, they left their abodes, and built a new city near the sea-shore, and called it Sidon, from the great plenty of fish with which the sea abounded. For Sidon in the Phœnician language signifies a fish. "Tyriorum gens condita à Phœnicibus fuit, terræ motu vexati, relicto patriæ solo, Assyrium stagnum primo, mox mari proximum littus incoluerunt, condita ibi urbe, quam à piscium ubertate Sidona apellaverunt. Nam piscem Phœnices Sidon vocant." Justin, lib. xviii. And what Lucretius says of this town, is confirmed by Possidonius, who in Strabo writes, that a city, situate above Sidon, was totally swallowed up by an earthquake, and that near half of Sidon itself was thrown down. But notwithstanding these authorities, Faber believes that some other earthquake is meant in this place. For, says he, that passage of Justin is taken erroneously; for Justin is not speaking of that earthquake which threw down the town of Sidon, but of that which did great mischief to the Phœnicians, not on the coast where Sidon stood, but in the country of the Idumeans; for the Phœnicians of Justin are the Idumeans: and Herodotus, Pliny, and Dionysius the African, witness, that they were originally inhabitants of the coast of the Red Sea; to which he adds, that by the Stagnum Assyrium of Justin is meant that very sea or lake which in Holy Scrip-

TRANS. II.

ture is called the Lake of Gennesareth. Sidon is the port in the Mediterranean now called Sayde.

Ver. 589. Pliny, lib. ii. cap. 80. mentions twelve cities of Asia that were destroyed by an earthquake all in one night. The like happened not many years ago to the city of San Severo in Apulia, now Puglia: and part of Ragusa was lately swallowed up.

Ver. 590. If this verse were left out, the sense of Lucretius would not be interrupted nor imperfect, therefore Creech might have left it where he found it. Cowley, David.

The terror of their brows, so rough e'er while,
Sunk down into the dimples of a smile.

Ver. 596. Lucret. "Disperitur ut horror." Which Celsus, lib. iii. cap. 3. speaking of fevers, explains, interpreting horror to be a trembling of the whole body. "Horrorem voco," says he, "ubi totum corpus intremat."

Ver. 603. In these six verses, he insults over those who believe the world eternal and immortal, even though they perceive the earth, that great part of it, to be thus shaken and impaired; nay, though they themselves fear the dissolution and ruin of the whole frame.

Ver. 609. Since so many and so great rivers are continually discharging their waters into the sea, why does it not increase and overflow its bounds? Lucretius answers, in eleven verses, I. That the gulf into which the rivers disembogue their streams is so vast, that all their waters, together with the rain, snow, hail, &c. seem not to add one drop to the sea. II. In nine verses, that the sun drinks up a great deal of its moisture. III. In five verses, that the winds brush off and carry away no small quantity. IV. In four verses, that the clouds take some away. And, V. In eight verses, that as the rivers run into the sea, so they are reconveyed from thence through the hidden veins of the earth back to their own springs. Thus the waters roll in a revolving course, and therefore no wonder the sea does not increase.

Thus too the author of Ecclesiast. solves this question: "Omnia flumina intrant in mare, et mare non redundat, quoniam ad locum, unde exeunt flumina revertuntur, ut iterum fluant." Eccl. i. And for this reason Homer and the other poets call Oceanus, not only the origin and parent of all seas, rivers, fountains, lakes, &c. but the gulf and tartarus of them all likewise: For all rivers flow into that abyfs, and from thence again derive their origin.

Ver. 620. This second reason why the sea does not increase, the poet has given already, book v. ver. 300.

Ver. 629. This reason too we have seen before in book v. ver. 302. and ver. 432.

Ver. 638. This last and true reason why the sea does not increase, the poet has likewise given already, book v. ver. 306.

Ver. 642. This and the three following verses are repeated from book v. ver. 305. Consult the place and notes upon it.

T t

Ver. 644. *Meanders.*] Of this we have spoken at large on the note on book v. ver. 308.

Ver. 646. Lucretius having, as he thinks, sufficiently explained the causes of meteors, of earthquakes, and of some of the phenomenons of the sea, he now endeavours to show the causes of the other wonders of nature, which he suspects may create a belief of the gods, and of Divine Providence. And, first, In thirty-nine verses, he disputes of the fires of Mount *Ætna*, which, says he, though they sometimes burst out with great violence, and lay waste the island of Sicily, ought not, nevertheless, so much to surprise us, as to make us foolishly believe they surpass the strength of nature. Some may say that the flames are vast indeed, and their force wonderful, because they see no other like them; but in many things we are deceived by judging over-hastily of them. If we contemplate the infinite universe, there is nothing that can be said to be great, nothing that deserves our admiration: For, from that universe may flow together, on a sudden, an infinite quantity of the seeds of fire, or of wind, and they, gathering together in a body in Mount *Ætna*, or in any other mountain, may assume strength and violence, may cause earthquakes, may at length burst out, and scatter far and wide, smoke, flame, ashes, and coals of fire. But these eruptions are, as it were, the diseases and convulsions of this world: And as the seeds of diseases may be derived, and flow out of this world into man [for we are often in fevers, our teeth ache, &c.], so may they likewise out of the universe into this world: For, to make a comparison, a man is, in respect to this world, what the world is in respect to the universe.

Ver. 646. *Ætna.*] Of *Ætna*, the greatest mountain of Sicily, and now called Mongibello, besides what is contained in this disputation, and the notes upon it, see book i. ver. 742.

Ver. 650. *Sicily.*] An island of Italy, and the largest of all the islands in the Mediterranean sea; being, according to the modern geographers, at least 700 miles in compass. See the rest, book i. ver. 737.

Ver. 654. That Mount *Ætna* throws out fire, flames, and ashes, almost all authors witness; but chiefly St. Austin, lib. iii. de Civitate Dei. cap. 31. in these words: "Legimus apud eos, *Ætneis ignibus ab ipso montis vertice usque ad littus proximum decurrentibus ita servisse mare, ut rupes exurerentur, et picæ navium solverentur. Hoc utique non leviter noxium fuit, quamvis incredibiliter mirum. Eodem rursus ignium æstu tanta vi favillæ scripserunt oppletam esse Siciliam, ut Catanensis urbis tecta obruta, et oppressa diruerint, qua calamitate permoti misericorditer ejusdem anni tributum ei relaxavere Romani.*" We read, says he, that Mount *Ætna* has cast out fires with such violence, that they have flown even to the sea-side, heated the waters of the sea, burnt the rocks, and melted the pitch of the ships. This, though incredibly wonderful, must have done much damage. They write besides, that the country round is sometimes overwhelmed

with the vast quantity of cinders it throws out; and that the roofs of the houses at Catana [a city ten miles distant from *Ætna*] were broken down by the weight of the cinders that fell upon them, inasmuch that the Romans, commiserating the condition of the inhabitants, forgave them the tribute of that year. Thus, too, the mountains, Vesuvius in Naples, Hecla in Island, and Quit in Peru, sometimes eject coals and flames. Cicero says that Mount *Ætna* has cast out so much smoke among the flames, as has darkened the country round to that degree, that the inhabitants, for two days together, could not know one another. "Nos autem tenebras cogitemus tantas, quantæ quondam eruptione *Ætnæ*orum ignium finitimas regiones obscuravisse dicuntur, ut per biduum nemo hominem homo agnosceret," lib. ii. de *Naturâ Deorum*. And Pliny the younger witnesses, in his epistles, that his uncle, the great Pliny, was suffocated by the smoke, stones, and cinders that Vesuvius had thrown out. Appian, lib. iv. de Bello Civili, adds horrid noise; and Lucretius takes notice of all these things, and more, as we shall see by and by.

Ver. 666. Lucret.

Existit facer ignis, et urit corpore serpens
Quameunque arripuit partem, repitque per artus.

Where the poet describes the disease which the Latins call "facer ignis," the Greeks *ἑγχεῖς*, and we, St. Anthony's fire. Celsus, lib. v. cap. 20. calls it an ulcerous disease. "Sacer ignis," says he, "malis ulceribus annumerari debet." Virgil. Georg. iii. ver. 556.

—Contactos artus facer ignis edebat.

But of this disease, see at large Celsus in the place above cited, and Paulus *Ægineta*, lib. iv. cap. 20.

Ver. 674. Of the fiery eruptions of *Ætna*, Virgil, *Æneid*, iii. ver. 571.

Interdumque atram prorumpit ad æthera nubem,
Turbine fumantem piceo, et candente favilla:
Attollitque globos flammæ, et sidera lambit:
Interdum scopulos avulsæque viscera montis
Erigit eructans, liquefactæque fæxa sub auras
Cum gemitu glomerat, fundoque exæstuat imo.

Thus rendered by Dryden:

By turns, a pitchy cloud she rolls on high,
By turns, hot embers from her entrails fly,
And flakes of mounting flames that lick the sky:
Oft from her bowels massy rocks are thrown,
And, shiver'd by the force, come piecemeal down:

Oft liquid lakes of burning sulphur flow;
Fed from the fiery springs that boil below.

But of these eruptions, see at large Cluverius, de *Siciliâ*, lib. i. cap. 2.

Ver. 685. In these thirty verses, the poet explains the reason why the flames that are gathered together in the cavities of Mount *Ætna* burst out with so great violence. He says that the eruption is caused by the force of wind; that the

seeds of that wind come from the infinite universe, and, gathering together in the mountain *Ætna*, drive out either the flames that lurk within the bowels of the mountain, or those they strike and force out from the very stones of it; or else, that wind rushes in at the hollows that are at the foot of the mountain, and whose entrances are open, when the ebbing sea leaves the shore (for the sea washes the foot of the mountain) and blows out the flames. Lastly, He says, that winds are bred in the very hollows of the mountain. And then he tells us, he gives many reasons, that among them one at least may be true and certain.

By the wind that rages within the caverns of *Ætna*, may be understood the sulphurous and bituminous exhalations which are continually generated and agitated within those hollows, and which, when they can no longer, by reason of their great quantity, be contained within them, break their prison, and burst out in flames. Thus *Trogus* in *Servius*, on the third *Æneid*: "Nam Sicilia terra cavernosa et fistulosa: Quo fit, ut ventorum flatibus pateat; unde ignis concipitur: Intrinsecus sulphur habet et bitumen; in quæ ubi ventus per spiramenta cavernarum incubuit, diu luctatus, ignem concipit: Sic *Ætnæ* durat incendium."

Ver. 689. There are three opinions concerning the wind. I. *Aristotle*, *Meteor.* lib. ii. and *Theophrastus*, as *Olympiodorus*, in 1st and 2nd *Meteor.* witnesses, held the matter of winds to be an exhalation arising out of the cavities of the earth. And this opinion most of the philosophers, since them, have followed. II. Others ascribe the origin of winds to the water; as *Metrodorus*, who, in *Plutarch de Placit.* 37. defines wind to be an ebullition, or violent surging of a watery vapour; and *Vitruvius*, who, lib. iii. cap. 6. calls the wind, "Aëris fluens unda, cum incertâ motûs redundantia." III. And others held the wind to be only an agitation of the air. Of this opinion was *Hippocrates*, lib. i. de flatibus, where he calls it a violent flux and motion of the air. And with him agree *Animaxander* in *Plutarch* 3. de *Placit. Philosoph.* 7. *Anaxagoras* in *Laërtius*, *Seneca*, lib. v. cap. 1. and 6. and *Lucretius* in this place. But the opinion of *Aristotle* is chiefly followed. And it is generally held, that in those concavities of the earth, when the exhalations, which *Seneca* calls subterranean clouds, overcharge the place, the moist vapours turn into water, and the dry into wind; and these are the secret treasures out of which God is said in the scripture to bring them. This too is what the poets meant when they feigned that *Æolus* kept the winds imprisoned in a vast cave. Thus *Virgil*, *Æn.* i. ver. 56.

— Hic vasto rex *Æolus* antro
Luctantes ventos, tempestatesque sonoras
Imperio premit, ac vinclis et carcere frænat.

Upon which *Seneca* seems too critical, when he says, "non intellexit, nec id quod clausum est, esse adhuc ventum, nec id quod ventus est, posse

claudi: nam quod in clauso est, quiescit, et aëris statio est: omnis in fuga ventus est." For though it get not out, it is wind as soon as it stirs within, and attempts to do so. *Juvenal*, in his fifth satire, describes very well the south wind in one of these dens:

— Dum se continet Auster,
Dum sedit, et siccat madidas in carcere pennas.

See more above in the note on ver. 452. where we have already spoken of the cause of wind.

Ver. 694. *Milton* in the first book of *Paradise Lost*:

— As when the force
Of subterranean winds transports a hill
Torn from *Pelorus*, or the shatter'd side
Of thund'ring *Ætna*, whose combustible
And fuel'd entrails thence conceiving fire,
Sublim'd with min'ral fury, aid the winds,
And leave a singed bottom all involv'd
In stench and smoke.—

Ver. 696. In these six verses, the poet subjoins another peculiar cause why *Ætna* vomits flame; and says, that the sea washes the foot of the mountain; and entering into the cavities where the fire is conceived, the flames yield to the driving flood, which compels them to belch themselves out at the breathing holes on the summit of the mountain. Our translator has totally omitted the two last verses of this argument, which in the original are as follows:

In summo sunt ventigeni crateres, ut ipsi
Nominant, nos quas fauces perhibemus et ora.

i. e. On the top of the mountain there are certain "crateres," for so the Greeks call them, basins or cisterns, but we, the Latins, call them "fauces" and "ora," mouths and jaws. Now the apertures of *Ætna* were called "crateres," because through them winds are almost continually issuing out of the bowels of the mountain. Of this no man can doubt, if any credit may be given to *Strabo*, who, in lib. vi. has these words: "Οὐδὲ γὰρ προσίλον εἶναι τὸν τόπον, ὅθ' ὄραρον· Εἰκάζειν τὸ μὴδὲ κατὰβρίφθῃναι τί δύνασθαι ἐκείσε, ὑπὸ τῆς ἀνιστορίας τῶν ἐξ βάθους ἀνέμων, καὶ τῆς θερμότητος, ἣν προσπαυλῶν ἔυλογον πόρρωθεν, πρὶν ἢ τῶν σιμίων τῶν κρατῆρος προσελάσαι· εἰ δὲ κατὰβρίφθῃ, φθάνει ἂν διαφθαρέν πρὶν ἀναβρίφθῃναι πάλιν, ὅσοιον παρελήφθη πρότερον· τὸ μὲν ἔν ἐκλείπων, ποῦ τὰ πνεύματα καὶ τὸ πῦρ, ἐκλείπτουσι ποτε τῆς ὕλης, ἢ ἀλογον· ὃ μὲν ἐπὶ τοσούτοις, ὥς τε ἀντὶ τῆς τοσαύτης βίας, ἐφικτὸν ἀνθρώπων γενέσθαι τὸν πλησιασμόν·" that is to say, for that place can neither be approached, nor look upon, and that he conjectured even that nothing could be thrown in it, because of the opposite blast of the winds and heat that come from the bottom; which, it is probable, comes from far before it approaches the mouth of the crater: But if any thing were cast in, the figure it had when injected, would be changed long before it was thrown out again: Besides, that it is not absurd to say, that if the matter for some time fail, the wind and fire cease for some time likewise; but that

that intermission is not so great that any man can approach near and place himself against that force. Apuleius likewise retains the Greek word, and calls the mouths or apertures by which flames, smoke, stones, coals of fire, &c. belch out of this mountain, "crateres;" "Ex *Ætnæ* cervicibus quondam effusis crateribus per declivia, incendio divino, torrentis vice, flammarum flumina concurrerunt." *Apul. lib. de Mundo*, page 73. Now what Lucretius says, in these two verses, is, that the wind enters into the caverns, not only at the apertures in the foot of the mountain, but is generated in the mouths and breathing holes on the top of it. Nor, indeed, is this in the least improbable, since nothing is more certain than that air rushes on all sides to flame, and that wind is thence generated. Thus Creech himself upon this passage.

Ver. 702. In these thirteen verses, the poet makes an excuse for his having assigned so many causes: but, says he, this is the safest way of proceeding in doubtful things; and among them all, some one may, perhaps, satisfy the reader: and, lastly, he confirms this method by a similitude. We may observe, that Lucretius takes no notice of the snows that are continually lying on the top of this mountain. It is, nevertheless, very extraordinary, that snow and fire should inhabit so near each other; and many of the ancients mention it as such; particularly Pindar, *Od. i. Pyth.* Solinus, *cap. xi.* and Claudian, who, in *I. Rapt. Proserp.* says,

Sed quamvis nimio fervens exuberet æstu,
Scit nivibus fervare fidem; pariterque favillis
Durescit glacies, tanti secura vaporis,
Arcano defensa gelu, fumoque fideli
Lambit contiguas innoxia flamma pruinas.

Thus too Silius Italicus, *lib. 14.*

Summo cana jugo cohibet, mirabile dictu,
Vicinam flammis glaciem, æternoque rigore
Ardentes horrent scopuli; stat vertice celsi
Collis hyems, callidaque nivem tegit atra favilla.

And this description of the neighbourhood of fire and snow upon Mount *Ætna*, Cowley has imitated from those poets, in his *Pindaric Ode to Hobbes*.

So contraries on *Ætna's* top conspire;
Here hoary frosts, and by them breaks out fire:
A secure peace the faithful neighbours keep:
Th' embolden'd snow next to the flame does sleep.

Tacitus says the same of Mount Libanus, and uses the like expression. "*Præcipuum*," says he, "*montium Libanum, mirum dictu, tantos inter ardores opacum, fidumque nivibus;*" shady in the midst of such great heats, and faithful to the snow: but these expressions are too poetical for prose, and become the poets better than the historian. See likewise Seneca, *Epist. 79.*

Ver. 715. From the summer solstice to the autumnal equinox, the river Nile then swells to such a degree, that it overflows the country of Egypt,

and, covering the fields with a slimy mud, manures and renders them fruitful, though without it they would be barren and produce nothing. A manifest and wonderful monument of Divine Providence! "*Ægypti incolæ aquarum beneficia percipientes, aquarum colunt*," says Julius Firmicus de Err. Prof. Rel. The Egyptians, perceiving the great benefits of this inundation, worship the water. Lucretius, according to his custom, assigns natural causes for the overflowing of this river: and first, in ten verses, says, that the Etesian winds, which blow from the north, repel and drive back the stream of the river, that comes from the south, and are the cause that it fills up its channel, and overflows its banks. Now if it should be objected, that the Etesian wind, for winds are light bodies, is too weak to stop so great a weight of waters, he adds, in five verses, that the sands, which the sea, being agitated by those winds, casts into the mouths of the Nile, choke them up, and thus cause the inundation. To these he adds two other causes: the rains that fall at the sources of the river, in three verses, and the melting of the snows, in two verses. For all these causes conspiring, will make the Nile, or any other river, overflow.

Thales Milesius held the first of these to be the true cause of the overflowing of the Nile; nor does Philo the Jew, *lib. 1. de vit. Mos. nor Pliny, lib. 5. cap. 9.* disapprove of his opinion. Euthymenes, likewise in Seneca, *l. 4. Nat. Quæst. c. 2.* ascribes the cause of the overflowing of this river to the Etesian winds; for he believes that the Nile increases by means of the waters of the Atlantic Sea, which the Etesias drive into the channel of the river. These are his words: "*Inde [from the Atlantic Sea] enim Nilus fluit major, quamdiu Etesiae tempus observant; tum enim ejicitur mare obstantibus ventis: cum resederint, pelagus conquiescit, minorque discedenti inde vis Nilo est; Caterum dulcis mari sapor est, et similes Niloticæ belluæ.*" But this reason is good for nothing. For sometimes the Nile increases before the Etesias blow, and decreases even while they are yet blowing: nay, though they blow exactly contrary to the stream, the Nile nevertheless runs into the sea. Besides, why does not the like happen to other rivers that run against the Etesian winds? But the truth is, those winds are unable to keep back, much less to repel the current of that river.

In summer.] For the Nile never begins to swell till after the sun has entered into Cancer: which is about the eleventh of June. Thus Manilius, *lib. iii. ver. 630.*

Nilusque tumescit in arva,
Hic rerum status est, Cancri cum sidere Phœbus
Solstitium facit, et summo versatur Olympo.

The reason of which we will give by and by.

The Nile o'erflows, when with exalted ray,
In summer solstice Phœbus bears the day
Through Cancer's sign, and drives the highest
way.

Ver. 718. Aristotle, lib. 2. de rebus superis: *ὅδε ἑστίασι πνίψαι κατὰ τροπὰς, καὶ πυνὸς ἱππολῆν*. The Etesians blow after the solstice, and the rising of the Dog-star: and this wind continues generally for eleven or twelve days. They are called Etesias, from the Greek word *ἔτος*, which signifies a year, as who should say annual, because they blow constantly at a certain season of the year: Strabo calls them "subsolanos," eastern winds; but Pliny, lib. ii. cap. 47. "Post biduum exortus Caniculæ Aquilones constantius perflant diebus quadraginta, quos Etesias vocant." When the Dog-star has been two days risen, the northern winds, called Etesias, blow constantly for forty days together. And Lucretius himself says, ver. 720. The Etesias bear the northern vapours; which shows the mistake of Fayus, who takes it for a south wind.

Ver. 722. Many of the ancients despaired, that the source of the Nile would ever be discovered: Hence Ammianus Marcel. lib. 22. "Origines fontium Nili, sicut adhuc factum est, posteræ quoque ignorabunt ætates:" Hence too those complaints of the poets, Tibull. lib. i.

Nile Pater, quam possum te dicere causa,
Aut quibus in terris occuluisse caput?

Claudianus Epigr.

Se certo de fonte cadens, qui semper inani
Quærendus ratione licet; nec contigit ulli
Hoc vidisse caput: fertur sine teste creatus.

And Lucan, lib. 10.

Arcanum Natura caput non prodidit ulli,
Nec licuit populis parvum te, Nile, videre.

And again,

——— Ubicunque videris,
Quæreris, et nulli contingit gloria genti
Ut Nilo sit læta suo———

Hence Homer calls the Nile *δητιτῖα ποταμὸν*, the river sent down from heaven. And Diodorus, lib. i. tells us, that the inhabitants of Meroe call it in their language "astapoda," that is to say, dark or obscure. Herodotus, after he had travelled four months in search of the fountain of this river, stopped in his journey, being told that it flowed from beyond the island of Mero. Ptolemy Philadelphus sent persons on purpose to discover the source of it, but without effect, as Strabo witnesses, lib. 17. and Lucan says, that Alexander the Great sent on the same errand, but his messengers had the like success. Pliny, lib. vi. c. 6. says, that Nero sent two centurions, and that when they came back, he heard them say: "Ad ulteriora quidem pervenimus, ad immensas plaudes, quarum exitum nec incolæ noverant, nec superare quisquam potest." The sacred authors believed the Nile to arise in the terrestrial paradise. Pomponius Mela thinks it rises at the Antipodes. Euthymenes in Seneca, lib. iv. c. 2. and in Plutarch 4. Placit. i. brings it out of the Atlantic Sea; Pliny from a mountain of the lower Mauri-

tania: and Ptolemy from two lakes beyond the Equinoxial Line. And Vossius, de Ætat. Mund. and in Melam. observes, that before the discovery of the Indian Ocean, many of the ancients were so ignorant as to believe, that the Nile derived its source from the utmost east, even from India itself. With which error, not to mention many others of the ancients, Virgil seems to have been tainted, as appears, Georg. iv. ver. 290.

Quaque pharetratæ vicinia Perfidis urget,
Et viridem Ægyptum nigra fecundat arena,
Et diversa ruens septem discurrit in ora,
Usque coloratis amnis devexus ab Indis.

Thus various were the opinions of the ancients, and none of them true: for the Nile is now known to rise on the south of a great lake called Zambre, at the foot of the mountains, called the Mountains of the Moon, Lunæ Montes, which are in the province of Guyoma, a country inhabited by the Æthiopian Abyssines. And one of the titles of Prester John is, King of Guyoma, where the Nile begins: but of this the ancients were totally ignorant, insomuch that it was reckoned among the famous properties of that river, that it concealed its spring: "Fontium qui celat origines." And indeed the Nile is incomparably the most famous river in the whole world, whether we consider the largeness of it, and the length of its course, for it runs about 900 German miles, or the things that it produces, and its miraculous overflowing, and returning again within its banks, Seneca, lib. iv. Nat. Quæst. cap. 11. says, it brings both water and earth too, to the thirsty and sandy soil: for flowing thick and troubled, it leaves, as it were, all its lees in the clefts of the parched and gaping ground, and spreads the dry places with the fatness it brings with it; and thus does good to the country two ways, both by overflowing and manuring it: for this reason Herodotus calls it *Ἐγγαίικον*, the husbandman. Tibullus.

Te propter nullos tellus tua postulat imbres;
Arida nec pluvio supplicat herba Jovi.

And Lucan says that Egypt has no need of Jupiter:

——— Nil indiga mercis
Aut Jovis; in solo tanta est fiducia Nilo.

And one in Athenæus yet more bold, calls it the Egyptian Jupiter, *Ἀιγυπτίαι Ζεῦ Νεῖλι*. Nay, the Egyptians themselves called it *ἀντιστοιχίας τῷ ἑρῶνι*, the river that emulates and contends with heaven; and even in the Scripture itself it is called absolutely Nachal Misraim, the river of Egypt: from whence the word Nile may not unnaturally be derived, Nahal, Naal, Neel, Neil; as Bahal, Baal, Beel, Bel, *βῆλος*. And Pomponius Mela, lib. v. cap. 10. reports that the fountain of Nilus is called Nachal by the Ethiopians. The learned Massacus, upon Plutarch de Fluv. and Mont. nominibus, has collected the several names that were given by the ancients to this river. It was first of all called Oceanus, or (but as he says, bar-

barously) Oceanes: then Aëtos, or Aquila, and Melas, from its depth or profundity, because all deep waters seem black; or from Melas, the son of Neptune: afterwards Ægyptus, either from Ægyptus, the son of Belus, or of Vulcan and Leucippes, who threw himself into it; or *παρὰ τὸ αἶγας πιάσειν*, from fattening of goats; from whence likewise the whole country of Egypt seems to be so named. The Hebrews call it Gehon, and Schior, the last of which signifies black, or troublous, and from hence perhaps came its Æthiopian name, Siris. It was also called Νῆς; or Nus, and Triton; and last of all Nilus, either from what we said before, or from Nilus, the son of Cyclops, or Nileus, or Nileusius, Egyptian princes: or lastly, and rather than all the other, *παρὰ τὸ νέαν ὑλὴν ἄγειν*, from bringing new mud or slime. By the Latins it was particularly called Melo, as is evident from the testimonies of Ennius, Festus, Servius, and Aufonius.

Ver. 723. He means Æthiopia, in the south parts of which country the Nile arises. Manil. lib. i. ver. 44.

—Gentes, in quas et Nilus inundat.
Qua mundus redit, et nigras superevolat urbes.

Ver. 725. This reason is mentioned likewise by Pomponius Mela; and that too with a seeming approbation of it.

Ver. 730. There were three parties who favoured this opinion. I. Democritus; who held that exhalations arise from the melted snows in the northern climates, and being driven by the Etesian winds into Æthiopia, they dash against the mountains, where they stop and thicken into rain. This opinion Lucretius here approves. II. The philosophers of Memphis, now called Grand Cairo, who, as Diodorus witnesses, held that the Nile flows out of the temperate southern zone; and that, since it is winter in those countries when it is summer with us, that river swells by reason of the frequent rains that fall near its fountain, during the winter of those southern regions. III. Agatharchides, who, as the same Diodorus reports, held that the Nile is increased by the great rains that are continually falling all the summer long in the mountains of Æthiopia. And to strengthen the probability of this opinion, he urges, that during the whole summer, it rains about the river Hydaspes, snows on Mount Caucasus, and hails in many parts of India.

Ver. 733. This opinion is ascribed to Anaxagoras, who believed that the Nile swells by means of the snows that are melted during the summer in the mountains of Æthiopia. But that this belief is erroneous, Herodotus gives these reasons: because those countries are very warm, and exempt from snows; nay, even the very air is always hot; besides, the sun is very remote from those regions, when the snows must be melted to swell that river.

Æthiopian.] Ethiopia is a vast region of Africa, that borders upon Egypt: the country of the Abyssines. It lies beneath the torrid zone, extended from the Tropic of Cancer to beyond the

Equator. The river Nile cuts its way almost through the middle of it, as it does through Egypt.

OF THE ANNUAL INUNDATION OF THE RIVER NILE.

THE constant and annual increase of the Nile has long and much employed the thoughts of the studious; and that too not without reason; for many things occurred that deservedly claimed their admiration. Among others, not the least is this, that it constantly overflows about the middle of June, or rather a day or two after; some positively fix it to the time of sun-rising on the 17th of that month; besides, it gives beforehand such certain tokens, to what height the flood will rise, that they, whose business it is to discover it, are never deceived in their conjectures, whether they weigh the sand in a balance, or measure the future inundation by a rule, which they call a Niloscope. The event is certain, the cause doubtful: For it is controverted, whether the swelling is occasioned by its mouths being stopped and choked up, or by the rains that fall in Ethiopia, and by the melted snows of the mountains of that country; or, lastly, by the water of the sea, driven into the channel of the river by the Etesian winds: And here we may not omit an Egyptian erudition, which we find in Horus Apollo, touching the symbols of the Nile: "Tres porro Hydrias, nec plures, nec pauciores pingunt, quod triplex ex eorum sententia fit inundationis causa effectrix: unam quidem Ægyptiæ terræ ascribunt, quæ ex sese aquam producit: alteram oceano, ex quo, inundationis tempore, aqua in Ægyptum exæstuat: tertiam imbris, qui per id tempus, quo intumescit Nilus, ad austrinas Æthiopix partes contingunt." The Egyptians, says he, make three water pots, neither more nor less, because in their opinion there are three efficient causes of the inundation: one of them they ascribe to the land of Egypt, which produces water out of itself; another to the ocean, out of which, at the time of the flood, the water surges into Egypt; the third to the rains, which, at the time when the Nile swells, happen in the southern parts of Ethiopia: As to the first of these reasons, it is evidently false; for the parched and thirsty soil of Egypt gapes indeed for moisture; but in no part of the country does the land ooze out water: Nor can we judge more favourably of the second, when we consider the difference between the sea water, and that of the river Nile: And as for the rain, which they assign for the third cause, we will speak of that by and by: Meanwhile we will observe, that those mounds of sand, with which they dam up the river, are soon borne down, and washed away by the never-ceasing course of the stream; and, what is chiefly to be considered, if any let or opposition whatsoever were the cause, that the Nile, by retrogression, overflowed its banks, the waters of that river would be observed to rise first in the lower

part of the country, that is to say, from the Mediterranean to Cairo, rather than on the contrary, in the more inland parts of it; but that it does so, is allowed by the unanimous consent of all. We must therefore travel out of Egypt, for the cause of this inundation. No doubt but a plenteous accession of waters swells the river, before it washes the land of Egypt: And this it was that persuaded some to believe (see the note on ver. 733.) that the Nile increases by means of the snows that melt in Ethiopia. And indeed they are certainly mistaken, who hold with Herodotus, that it never snows in that country: For they go contrary to experience and observation: Neither are those others to be credited, who assert, that at the season when the Nile inundates the land of Egypt, it is the depth of winter in Ethiopia. For who can believe that the snow, which was congealed by cold, can be dissolved by cold likewise? This would be repugnant to the laws of nature, who has ordained, that things congealed by cold shall be melted by heat. The third cause is assigned to rain, (see the note on ver. 730.) and to this adhere the authors of greatest note, though it has been long and strenuously opposed by some of no mean reputation: They who call it in question, object the great heat of the country, and the scarcity of vapours; but there are several things, of which these persons ought not to be ignorant: The first is, that in those countries there are two winters, and as many summers, in the year; though of unlike effect indeed, if compared with ours. The winter is more severe with us; but not so mild with the Ethiopians, as not to produce snows in the mountains, together with constant rains, that continue for 40 days, as is affirmed by the natives, as well as by travellers into those parts. This truth Democritus has learned in his travels, and, as by tradition, delivered it down to posterity, till at length it became known in Italy, by the care of our Lucretius. Besides, in summer, the sun is nearer to Ethiopia, than it is to us; and his rays, though troublesome to the inhabitants, yet suffer themselves to be overcast by a very thick mist, that hangs over a certain mountain, which mariners call Serra Leone, perhaps from the noise it makes; for it generally roars, and from the dusky mist almost continually darts out lightning, together with dreadful thunder, that is heard 40 miles around. And a master of a ship, as he was sailing to the island St. Thomas, observed, that all this happened when the sun struck perpendicularly on Ethiopia. Let such then, as object the heat of the country, make the most of that weak argument; nor will they fare better, who deny vapours to that region. For they ought to reflect on the lakes and rivers that Africa contains; and to have some regard to the ocean that washes its coasts: all which may furnish an immense quantity of matter for future rain; and then especially, when the sun, retiring, permits the inferior elements to extend their own bounds: The Mediterranean too conduces something to increase the store, by gratefully sending into Ethiopia a vast quantity of clouds, which the

winds, that arise in Greece, bear thither: This Prosper Alpinus, who was himself an eye witness of it, relates in these words: "Cayri, in toto fere augmenti fluminis tempore, Etesia, perflantes singulis fere diebus ab orto sole, usque ad meridiem, multas nubes nigras, crassas, pluviosas in altissimos usque Libyæ, Ethiopiæque montes, propellunt atque asportant: in quibus montibus hæc concrecentes, in pluvias vertuntur, quæ, ab his in Nilum cadentes, sunt causæ ipsius augmenti. Observatur quotidie Cayri, dum flumen hoc augetur, quæ die multæ nubes supra Ægyptam versus meridiem à septentrionalibus his ventis asportatæ transferint, multum flumen augeri; atque ex contrario, clara apparente die, nullisque nubibus in eo cælo apparentibus, parum crescere: Et hæc eos nunquam fallit observatio," Lib. i. de Medic. Egypt. At Cairo, says he, during almost the whole time of the swelling of the river, the Etesias blow almost every day, from sun-rising till noon, and bring, and drive before them, many black, thick, and rainy clouds into the high mountains of Libya and Ethiopia: In which mountains, these clouds gathering together, are turned into rains; which, falling from thence into the Nile, are the cause of its increase: It is observed every day at Cairo, that so long as this river is increasing, on what day soever many clouds are brought by those northern winds, and carried over Egypt towards the south, the river that day swells very much; and, on the contrary, that in a clear day, when no clouds appear in the sky, it increases but little. And this observation never fails them. It is credible enough, that when the clouds are come into Africa, they are resolved into rain, not that, as Lucretius thought, it is squeezed out of them, as water out of a sponge, but because, by reason of the cold of the place, the included fire of the clouds flies away, or is extinguished; and then the vapours grow thick, and return into their former nature. But on what day the rains begin to fall, and how much time the waters take up in their course, while they are flowing into the Nile, has not been inquired into, or at least is doubtful: But this in our age we know for certain, that these things happen in the kingdom of Guyoma, which is subject to the emperor of the Abyssines. Hence the great hospitality of the Egyptians to the Abyssines, that come to sojourn among them; not so much out of gratitude, as for fear of a famine and general inundation: For the monarch of Ethiopia, whom we commonly call Prester John, commands the cataracts of the Nile; for which reason the emperor of the Turks pays him a yearly tribute, on condition, that he do not divert the waters of the Nile, nor suffer them to come in too great a quantity, either of which would be the destruction of Egypt. Hence in the last age sprung up a cruel war, as Natalis Comes relates. In the year 1570, says he, Selim emperor of Constantinople, who was then at war with the Venetians, received an unfortunate piece of news; for David, the great king of Ethiopia, whose empire extends from the equinoctial, almost to either tropic, since many kings are subject to

him, had begun to destroy, by an inundation of the river Nile, the city of Cairo, and all the neighbouring country of the Turks, together with many other cities thereabouts: The reason of this hostility was, because Selim owed him 400,000 crowns for two years tribute; for he paid him 200,000 a year: Now the country of Egypt has not rain enough to render the land fertile; for it rains there very seldom, and the soil is of all others the most fruitful, and owes its fertility to the waters of the Nile, which are in the power of the king of the Abyssines, who can send them down in what quantity he pleases, and either refresh the thirsty land with a gentle flood, or, by cutting certain dykes, pour in such an inundation, as will lay waste the whole country. Now the Sultan, because he would not pay the tribute that was due, levied a great army, and, invading Arabia, put all to fire and sword. Thus Natale Comes, *histor. lib. 23.* But more prudently Osiris, who, if we may give credit to Diodorus Siculus, *lib. vi. cap. 2.* when he was in the mountains of Ethiopia, mounted up the banks on either side the Nile, that the inundation might not be too great; and made sluices to let in only such a quantity of water, as would be necessary for the fertility of the land: The increase of the Nile, therefore, is more due to rains than melted snows; whatever Anaxagoras say to the contrary: And indeed the true cause of the overflowing of the Nile is only the great rains that constantly fall in Ethiopia, from about the beginning of June, to the month of September: This is testified by Alvarez Fernandez, and many others of late date: And, in confirmation of their opinion, it is observed, that the river Niger swells at the same time, and never fails to increase when the Nile does: And that the rains, which fall in Ethiopia, are the cause of the swelling of the river Niger, is certain beyond dispute: Nor was this unknown to Pliny, who, *lib. v. cap. 8.* says, "*Nigro fluvio eadem natura quæ Nilo.*" Besides, the reed papyrus grows on the banks of both those rivers, and they produce the same sorts of animals. See Gassendus, page 1084. on the tenth book of Diogenes Laertius.

Prosper Alpinus proposes two problems concerning the Nile, but despairs of the solution of either of them: I. Why that river constantly swells the 17th of June at sun-rising? II. How, by weighing the earth, or sand of the river, the inhabitants foretel the measure and degree of its increase? For, says he, in the month of June, several days before the sun's accession to the tropic, they take some of the sand of the river, that has been kept and dried for a whole year before; they weigh this sand in scales, and, by adding or subtracting, make the number of the weights answer exactly to the drachms of the sand: For example, let us suppose the sand to weigh three drachms, which they lay by, and keep in a dry place, close shut up on all sides: this they weigh every day, and observe it nothing increased or diminished in weight, till the 17th day of June; on which day they find its weight augmented:

and from the weight, more or less increased, they foreknow that the river will be more or less augmented likewise: and from the knowledge of the exact increase of the weight, they know for certain before hand, how many cubits the river will swell that year: The cause whereof, says the same Alpinus, I cannot conceive, can be discovered by natural principles. His very words are as follows: "*Nam mense Junio, ante solis ad tropicum accessum, multis diebus Egyptii terram illiusce fluminis toto integro anno adservatam, et siccatam, arefactamque accipiunt, quam lance expendunt, faciuntque ut ponderum numerus, addentes, ac subtrahentes, drachmis sedulo respondeat: ut exempli gratia, terra sit trium drachmarum pondere, quam in loco sicco, undique concluso reponunt, et conservant: quotidieque librant, ipsam observant nihil auctam, nihilque imminutam pondere esse, usque ad diem decimam septimam mensis Junii, in aqua die auctam ipso pondere inveniunt; ex cujus pondere, multum vel parum aucto, multum vel parum flumen illud auctum iri prænoscent: à diligentique perausi illius ponderis notitia, quoties etiam cubitis ipsam sit augendum, certo prænoscent. Quorum causas naturalibus principiis posse cognosci, nullo modo fieri posse arbitror.*" However, it is not forbid to inquire into this matter: Now Seneca acquaints us, that in the tenth and eleventh year of queen Cleopatra, the Nile did not increase at all: which, he also tells us, on the authority of Callisthenes, had happened in former ages for nine years together: Of this Ovid was not ignorant, when he sung:

Dicitur Egyptus caruisse juvantibus arva

Imbribus, atque annis sicca fuisse novem.

Let this suffice for the inconstancy of its increase: and as to the uncertainty of the time, there was a remarkable delay of it in the reign of the emperor Theodosius, which is recorded by Nicephorus and Sozomen. Nor can that be imputed to the want of rain; for the Nile, not long after, swelled to such a degree, that the highest parts of Egypt were covered with the inundation: Now, though these events happen but seldom, yet they are sufficient, if not to destroy, at least to render suspected, that generally believed constancy of time: Let us nevertheless grant Alpinus, what he for seven years successively observed with great diligence and sedulity: the rather, because it is not civil to distrust, or derogate from, the testimony of an eye-witness: The question is, Why the Nile begins every year to increase, for the most part, at a certain day? The cause must proceed from the constant and certain return of the season, which the invariable constitution and revolution of the heavens have prescribed them: For, since the sun is at that time at his remotest distance from Ethiopia, nothing can hinder the vapours from coming to a consistency, nor from condensing into rain, because the ambient air is changed from hot into cold, at least has lost its effervescency. And the winds, that blow from the north, cannot there, as they frequently do with us, hasten the winter; for in that scorching

climate, the matter of the winds is soon dissolved, and their piercing nature qualified immediately. And so much for the solution of the first problem: The other is not so difficult, though at first sight the cause of it seem obscure. For the sand that has been long kept for the sake of making the experiment, being grown thorough dry, and, as I may say, thirsty, does, when it is exposed to the surrounding air, attract to itself the moisture, with which that air is newly grown damp, and the weight of the dry body is increased in proportion to the degrees of its dampness: And that the near approaching waters of the Nile taint the air with humidity, the sagacity of the birds in Egypt is a pregnant and convincing proof: For they never lay their eggs, except in such a place, as they perceive before hand, will not be covered by the inundation. Men, indeed, who enjoy a perfect state of health, are less sensible of such small mutations of the air, as nevertheless brute animals seem to have some foreknowledge of, and of which even inanimate bodies give foreboding signs. The geese, we know, often gaggle, and the frogs croak in uncertain weather, but not in settled fair, which cinders sticking to the tongs foreshow: The very stuff of lamps give bodings of rain, and that too so visible, that even our drudging maids perceive them: Virg. Georg. i. ver. 390.

Nec nocturna quidem carpentes pensa puellæ
Nescivere hyemem, testa cum ardente viderent
Scintillare oleum, et putres concrefcere fungos.

But of this see Aratus, lib. iii. var. lect. cap. 21. and chiefly Theophrastus, in his book "de Indiciis Ventorum, Serenitatis, et Pluviae," who first of any, says P. Victorius, fully adorned this subject. And no doubt the dried dirt, and slime of which we were speaking, would have imbibed some portion of the humidity, the day before the Nile overflowed, had it not been kept so close: but being once released from that custody, it forthwith rushes into the embraces of the desired moisture, following the natural propensity of dry bodies to wet.

Ver. 735. Lucretius does not acknowledge a beneficent, but flatly denies an angry God: and as he takes from the gods above the phenomena of the heavens and of the air, so does he too from the powers below some noxious things that pass for prodigies upon earth. For, says he, there are certain places, which we call Averni, and that are fatal to birds that fly over them, and to other animals that chance to pass by them. One of these Averni is at Cumæ, another near Minerva's temple in Athens, and a third in Syria. These places men believe to be the entrances of the roads that lead to hell, to the palace of Pluto, and that the manes, or souls of the dead, pass that way to the subterranean abodes. Now the poet, that he may more fully and distinctly explain the force and nature of these places, teaches, first, that the earth contains many seeds, as well noxious as wholesome, both to men and other animals: and then he brings a heap of examples,

to prove that the exhalations that flow from many things, are hurtful and deadly to many things. Having premised this, he comes to the question, and says, that a noxious vapour breathes from the Averni, and either that poisonous steams strike with sudden death the birds that fly over them, or that the rising exhalation attenuates and drives away the air to that degree, that the birds cannot support themselves, nor sustain their flight in so void and empty a space, and that, falling into that void, they forthwith expire. This is contained in ninety-six verses.

Ver. 737. In these seven verses, the poet premises the etymology of the word Averni, or rather the reason why these places were so called. Virgil too gives the same reason of the name, and has imitated this passage of Lucretius in his sixth Æneid, v. 237. in these verses.

Spelunca alta fuit, vastoque immanis hiatus,
Scrupea, tuta lacu nigro, nemorumque tenebris;
Quam super haud ullæ poterant impunè volantes
Tendere iter pennis; talis sese halitus atris
Faucibus effundens supera ad convexa ferebat;
Unde locum Graii dixerunt nomine Avernum.

Which Dryden thus interprets:

Deep was the cave, and downward as it went
From the wide mouth, a rocky, rough descent;
And here th' access a gloomy grove defends,
And here th' unnavigable lake extends,
O'er whose unhappy waters, void of light,
No bird presumes to steer his airy flight;
Such deadly stench from the depth arise,
And steaming sulphur, that infects the skies.
From hence the Grecian bards their legends make,
And give the name Avernus to the lake.

For the Greeks called it *Ἀόρνες*, from the privative particle *ἀ*, and *ὄρνες*, a bird, because the noxious vapours that exhaled from the Averni, were so poisonous, that they struck dead the birds that flew over them. Thus Homer, Odyss. 12.

Τῇ μὲν τ' ὄδῃ ποταμὰ παρέρχεται, ὄδῃ πύλαι.

i. e.

Where neither dove, nor other bird can fly.

And so much for the reason of the name Avernus, which extends to all places, whose deadly exhalations kill the birds that fly over them.

Ver. 741. Lucretius:

Remigii oblita pennarum vela remittunt.

For the wings do the same office to birds, as oars and sails to ships, which are said to fly with sails, as with wings. Virg. Æn. iii. v. 520.

—Velorum pandimus alas.

And, on the contrary, birds are said to swim Virg. Æn. vi. v. 15. speaking of Dædalus, *Præpetibus pennis ausus se credere cælo, Insuetum per iter gelidos enavit ad Arctos.*

And in the same book, ver. 19. we find the very expression of Lucretius, "Remigium alarum:" And Æn. i. ver. 304. speaking of Mercury,

—Volat ille per aëra magnum
Remigio alarum.—

But not only Virgil after Lucretius; for all the ancient poets used this metaphor. Ovid, in his Epistles, applies it to mens arms:

—Remis ego corporis utar.
I'll use the bodies oars.

See more, book v. ver. 315.

Lucret. "Molli cervicē profusæ:" A fine image of a fainting, dying bird; and not unhappily rendered by our translator.

Ver. 743. This verse runs thus in the original: Qualis apud Cumas locus est, montemque Vese-Oppleti calidis ubi fumant fontibus auctus. [vum, In which two verses the poet teaches, that there is such a place at Cumæ, and on the mountain Vesuvius. Cumæ was a city of Campania, not far from Puteoli, now called Puzzuolo, in the kingdom of Naples: but of Cumæ there are no footsteps remaining. The lake Avernus is to this day called Lago d'Averno, and lies between Baia and Puzzuolo. Near this lake there are now to be seen the remains of two caves; one on the south side of it, still called Grotta di Sibylla, where dwelt the Cumæan Sibyl, and seems to be the mouth of that passage under ground, which led from Avernus to Cumæ, but is now stopped up by the falling in of the earth; the other is that which to this day leads from Puzzuolo to Naples, being dug through the mountain Paufilypum, now known by the names of Antignana and Conocchia. Now the true nature of the lake Avernus was this: The waters of it were very clear and deep: whence Herodotus, lib. 4. calls them cerulean, that is to say, black; for all deep waters seem of that colour. This lake was surrounded with steep rocky hills, covered with thick woods, that rendered it inaccessible, except in one place only. This we learn from Strabo, lib. v. And Pliny, lib. xxxi. cap. 2. acquaints us, that all that tract of land abounded with innumerable springs of hot water, mixed with sulphur, alum, salt, nitre, and brimstone. But that the vapours which steam from this lake are fatal to birds, is by Strabo, in the place above cited, deemed a fable, because of the clearness and transparency of the water: of which Aristotle too takes notice. Vesuvius, or Vesuvius, is a mountain of Campania, not far from Naples, and that vomits out flame and smoke, like Ætna in Sicily. Sir R. Blackmore describes it thus:

As high Vesuvius, when the ocean laves
His fiery roots with subterranean waves,
Disturb'd within, does in convulsions roar,
And casts on high his undigested oar,
Discharges massy surfeit on the plains,
And empties all his rich metallic veins,
His ruddy entrails: cinders, pitchy smoke,
And intermingled flames the sun-beams choke.

Ver. 744. In these seven verses the poet says, there is such another place at Athens, at the very top of the tower, near the temple of Pallas.

Est & Athenais in mœnibus, arcis in ipso
Vertice, Palladis ad templum Tritonidis almæ.

Of Athens, see the note on the first verse of this book.

Ibid. *Minerva*.] She was the same with Pallas, who was called Minerva, either from *minari*, to threaten, because she is painted in armour; or from *memini*, I remember, because she is said to be the goddess of memory; or rather from the old word *minervo*, I admonish, because she gives good advice to men, as being the goddess of wisdom and of arts. She was called Pallas, from the Greek word *πάλλω*, I shake, because she is feigned to be born out of the brain of Jupiter, and armed, and brandishing a spear. She is said to be the first who invented building, and even to have built herself the tower at Athens, which was called *Ἀκρόπολις*, because it stood in the highest place of the city. Hence Virg. Ecl. ii. v. 61.

—Pallas, quas condidit arces,
Ipsa colat.—

She refused to marry with Vulcan, and kept her virginity. Whence the same Virgil, *Æn.* ii. ver. 31. calls her innupta Minerva. She was likewise called Tritonis, or Tritonia, either from the Greek *τρίτην*, which signifies a head, because, as we said before, she was produced out of the head of Jupiter; or because, in the time of king Ogygius, she was first seen in the habit of a virgin, on the banks of the river Triton. This is confirmed by Pomponius Mela, lib. i. cap. 7. where, speaking of Triton, the name of a lake and river in Africa, not far from the Syrtis Minor, he says, that Minerva was called Tritonis, because, as the inhabitants believe, she was born there; and that they celebrate her birth-day with ludicrous sports, of virgins contending with one another. "Unde," says he, "Minervæ cognomen inditum est, ut incolæ arbitrantur, ibi genitæ: faciuntque ei fabulæ aliquam fidem, quod quem natalem ejus putant, ludicris virginum inter se decertantium celebrant." Thus too Lucan, lib. ix. ver. 347.

Torpentem Tritonos adit illæsa paludem;
Hanc & Pallas amat: patrio quæ vertice nata,
Terrarum primam Libyen, (nam proxima cælo
est,
Ut probat ipse calor) tetigit: stagnique quietâ
Vultus vidit aquâ, posuitque in margine plantas;
Et se dilectâ Tritonida dixit ab undâ.

Or perhaps the Latin authors allude to the Greek epithet of Pallas, who, *Iliad.* ii. ver. 157. and elsewhere, is said to be *ἀτρεσάνη*, untamed, void of fear, from privative *ἀ*, and *τρέω*, to tremble.

Ver. 746. The raven, says Lucretius, has such an aversion to that place, that, although sacrifices are offered there, he will not even then come near it, though the smell of the tempting flesh seem to invite his hunger to taste.

Ver. 748. Lucretius alludes to the known fable of the nymph Coronis, who, flying from Neptune, who would have offered violence to

her, was changed by Minerva into a raven, and permitted nevertheless to attend her train: But when that goddess had given Erichonius, shut up in a basket, in charge to Pandrosos, Herse, and Aglauros, with orders not to open it, the raven saw them transgress the commands of Minerva, and acquainted her with it: for which garrulity she banished her from her protection and train. The fable is related at large in Ovid. *Metam.* 2. by Coronis herself, who says,

*Acta Deæ refero: pro quo mihi gratia talis
Redditur, ut dicar tutelâ pulsa Minervæ.*

———*Mea pœna volucres*

Admonuisse potest, ne voce pericula quærant.

Ver. 751. In these four verses the poet says, there is a place in Syria that strikes dead in a moment any four-footed beast. But Lambinus believes the poet speaks of the Plutonium in Hierapolis, not far from Laodicea; which is a cave so called from Pluto, because it was believed to be the breathing hole of that infernal god. Strabo, lib. 13. describes it to be a hole in a hollow place, under the brow of a mountain, wide enough to receive the body of a man, but immensely deep; that it is present death to any animal that goes into it. Bulls, says he, led to the place, drop dead immediately. He adds the like of sparrows, that were put in at the mouth of it. To which we add, what is reported of the cave called Panium, at the foot of mount Libanus: That it exhales a vapour, that causes likewise sudden death.

Ibid. *Syria*.] Is a province of Asia, and the largest of that quarter of the earth. It is generally divided into four: Syria, Assyria, Cœlosyria and Leucosyria.

Ver. 755. In these eight verses he says, that all these things proceed from natural causes: Therefore the poets falsely taught, that these Avernian are the gates of the roads that lead to hell: which fables they invented only to strike a terror into easy believers. And he promises, that he will explain all these matters, and show the natural causes of these seeming wonderful effects.

Ver. 757. The Latin poets, when they treat of the affairs of their own country, make that Avernus, of which ver. 743. to be the gate of hell. Virg. *Æneid.* vi. ver. 126.

———*Facilis descensus Averni.*

And Æneas, with the Sybil, descended that way. But when the same poets describe the affairs of the Greeks, they place the gates that lead to the infernal mansions in the caves of the mountain Tænarus, which is a promontory of Laconia, in the most southern part of Peloponnesus, between the Laconic and Messeniac Gulfs, and now called Capo Maina. Orpheus is said to have descended this way, Georg. iv. ver. 467.: and so too are Hercules and Theseus, in the Herc. Fur. of Seneca.

Ver. 758. *The smutty gods*.] The infernal gods. Lucretius names Orcus, whom Silius Italicus takes for Cerberus, and others for Charon: but

Cicero, de *Naturâ Deorum*, lib. iii. cap. 43. for Pluto, the brother of Jupiter and of Neptune; and to whom by lot fell the empire of hell. He ravished Proserpina, the daughter of Ceres. He was called Dis, as well as Pluton, both which names he has from riches, which are said to be dug out of the bowels of the earth. For he was called Dis by the Latins, from *divitiæ*, and Pluton by the Greeks, from *πλούτης*, which signifies the same thing.

Ibid. *Manes*.] Of the manes, and the several acceptations of the word, we have spoken at large in our note on ver. 52. of book 3.

Ver. 760. Pliny says, that the breath of elephants draws serpents out of their holes; and that the breath of deer burns them. "Elephantorum anima serpentes extrahit, cervorum item urit." Nat. Hist. lib. xi. cap. 53. But if this be false, the raillery of Lucretius is not the less sharp and pleasant.

Ver. 763. In the following forty-nine verses, the poet, before he demonstrates that all these things happen by natural causes, puts us in mind of what he taught in the first and second books, viz. that in the earth are contained atoms of many various shapes; and that by reason of the dissimilitude of their nature, and the different texture of their figures, some of them are beneficial, others pernicious to men; but that some of them are hurtful to the eyes, others to the ears, others to the tongue, &c. all which he confirms by several examples.

Ver. 777. In these five verses, he brings example first of things that are hurtful to man; but says nothing of the name of the tree, whose shade is offensive. Pliny, lib. xvii. cap. 12. says, that the shade of the walnut-tree offends the head, and that no plants will thrive under it. Fayus, in his note on this place, cites these two verses of Virgil, *Eclog.* x. ver. 75.

*Surgamus; solet esse gravis cantantibus umbra,
Juniperi gravis umbra; nocent & frugibus umbræ.*

But the shade of the juniper is very grateful, being an odorous tree, and that suffers nothing venomous to grow near it. But the meaning of Virgil was, that to continue long in the shade, might be dangerous, because of the cold: and some editions read not *cantantibus*, but *cunctantibus*. And Lucretius means the same thing, and not the shade of any particular tree. The shade of the box-tree, however, is said to cause the headache.

Ver. 782. In these six verses, he proposes his second example. What tree he means is hard to say: some suppose it to be the box; of which Pliny, lib. xvi. cap. 10. But besides that the "floris odore necare," which are the words of Lucretius, agrees but ill with that tree, why should he send us to Helicon for a tree that is very plentiful in Italy? Helicon is a hill in Bœotia, not far from Parnassus, which our translator here means by the learned hill: and they have both of them equal title to that appellation, be-

ing alike sacred to Apollo and the muses. Of Helicon, see more in the note on ver. 557. book iv.

Ver. 788. Third example. To which we may add what Pliny says, lib. vii. cap. 7. that it often causes abortion in women.

Our translator has omitted the fourth example, which Lucretius brings of an ointment made of the testicles of the beaver, which by its nauseous smell, says Pliny, makes women with child miscarry: But Lucretius says only, that it stupifies women, and throws them asleep; and that if they smell the odour of it at the time when they have their monthly disease, it makes them let fall whatever they hold in their hands. This in the original runs thus:

Castoreoque gravi mulier sopita recumbit,
Et manibus nitidum teneris opus effluit ei,
Tempore eo si odorata est, quo menstrua solvit.

Ver. 793. In these three verses he brings example fifth, of bathing: for, says he, it is hurtful to continue long in a hot bath immediately after eating. The custom among the Romans was to bathe before supper: but the riotous used to bathe themselves also after supper: and this they did to procure digestion. See Pliny, lib. 29. However the physician in Persius advises his patient not to bathe after eating, that being a custom very pernicious to health: but the gluttonous youth, refusing to take his advice, paid dear for his obstinacy, if the effects of his bathing were truly such as they are described by that poet, Sat. iii. ver. 30. in these verses:

Turgidus hic epulis, atque albo ventre lavatur,
Guttur sulphureas lente exhalante mephites:
Sed tremor inter vina subit, calidumque triental
Excutit è manibus; dentes crepuere resecti;
Uncta cadunt laxis tunc pulmentaria labris, &c.

Juvenal too, Satyr. i. ver. 142. mentions the danger of this practice of bathing with a full stomach, and says,

Pœna tamen præsens, cum tu deponis amictus
Turgidus, & crudum pavonem in balnea portas.

Moreover, we may farther observe, that at their baths there were three cells; the cold, the warm, and the hot: all which were baths of water. But in some of their bathing houses there was a fourth cell, which they called "laconicum," or "cella assa," that is to say, "sicca sine lotione:" ἀψιδωτήριον and where these were, the places were rather called "balnearia," than "balnea:" according to the property, of which, as Marcellus notes, Tully, lib. 3. ad Q. Frat. epist. i. speaks, when he calls them "assa in balneariis." Horace likewise, and others, often mention the faintness that seizes such as bathe themselves after a full meal.

Ver. 796. Example 6th in two verses, and example 7th in two verses likewise, need no explanation.

Ver. 800. In these two verses, which contain example 8th, the poet observes, that sulphur and all bituminous matter, whose steams and vapours

are very offensive and hurtful to man, are generated in the very bowels of the earth.

Ver. 882. In these ten verses, the poet brings the 9th and last example; and says that the mines, in which metals are dug, exhale such noxious damps and vapours, as often kill the wretches, who are condemned to that slavish drudgery. Thus, from these veins of the earth, as well as from the other things above mentioned, breathe forth poisonous and deadly exhalations.

Ver. 806. It is observed, that all metals have not the same smell. Gold, heated in the crucible, is sweet: Silver not so pleasing: melted brass stinks: and the steam of melted iron is intolerable.

Ver. 812. In these ten verses, he concludes by way of similitude from the instances above given, That in these places, which are called *verni*, the earth exhales virulent and deadly vapours, and sends out noxious atoms, which kill the birds as they are flying over those places.

Ver. 822. In these nine verses, he adds another, but ridiculous cause, why the birds drop down dead into the *Averni*: As if the vapours, that exhale from thence, change the air into *vacuum*, or rather totally expel, and drive it away, so that the birds cannot bear themselves up, nor support their flight in a mere void.

Ver. 831. There are many things so excellently well accommodated to the use of man, that they are alone sufficient to evince a bountiful and gracious Providence: Thus in summer well-water is cold, as if it were ordered so on purpose to moderate the heat of that season: and on the contrary, it is warm in winter, to refresh and revive us. But Lucretius, in these ten verses, endeavours to elude this difficulty: and gives this natural reason of that change: In summer, says he, the surface of the earth, is rarified by the heat of the sun; and the seeds of fire, that are contained in the earth, break out into the air: but in winter the same seeds are constrained, and, being bound fast in the earth by the cold of that season, are compressed and squeezed into wells; and thence proceeds the warmth of the water.

Aristotle says this is caused by an "antiperistasis," i. e. "circumobstantia," a reciprocation, and surrounding on all sides, by means of which, where heat is, thence cold is expelled: where cold, thence heat. And Cicero, after the opinion of the Stoics, explains it thus: "Omnes igitur partes Mundi, tangam autem maximas, calore fultæ sustinentur: quod primum in terræ natura perspicui protest: nam & lapidum conflictu, atque tritu elici igem videmus: & recenti fossione terram fumare calentem: atque etiam ex puteis jugibus aquam calidam trahi, & id maximè hiernis fieri temporibus, quod magna vis, terræ cavernis, contineatur caloris; eaque hieme fit densior: ob eamq. causam calorem insitum in terris contineat arctius," Lib. ii. de Nat. Deorum. Therefore, says he, all the several parts of the world are supported by heat: this is evident from the nature of the earth itself: for, by striking and rubbing of stones, we urge out fire, and new-dug ground exhales a warm smoke: besides,

we draw warm water out of our wells, and that too chiefly in winter: the reason is, because much heat is contained in the caverns of the earth: and the earth becomes more dense and contracted in winter; and for that reason keeps in the more closely its innate heat and fires. There are some, however, who controvert the truth of this matter, and assert it to be only a vulgar error, and not a solid and certain observation. But most are of a contrary opinion, and assign two causes of this effect: One of them they call privative; the other, positive: The first of them is, by reason of the departure of the heat, or hot bodies (for we are permitted to speak thus in the school of Epicurus, and of Aristotle too, who will not allow, that accidents pass from subject to subject), out of the earth. That innate heat of the earth is occasioned by subterranean fires; and evaporates in summer, attracted by the ambient heat: for, according to the observation of Hippocrates, like things resort to like, and naturally delight to be together.

Ver. 841. But it may be objected, that though the Divine Power be not in all springs and wells, it is certainly visible in the fountain, that is at the temple of Jupiter Ammon, of which Curtius, lib. iv. sect. 7. says: "Ammonis nemus in medio die, cum vehementissimus est calor, frigida eadem fluit: inclinatio in vespertum, calescit; media nocte fervida exæstuat: quôque propius nox vergit ad lucem, multum ex nocturno calore decrescit, donec sub ipsum diei ortum affluato tempore languescat:" In the midst of the grove of Ammon, there is a spring of water, called the Water of the Sun: at sun-rising it flows out luke-warm, at noon, when the heat is most violent, it comes out quite cold: in the evening it grows warm again; at midnight it gushes out very hot; and as the night wears away, and the morning approaches, the heat it had in the night decreases, till about the usual time, at break of day, it becomes again barely warm. This is confirmed by Pliny, lib. ii. cap. 103. by P. Mela, lib. i. cap. 8. in these words: "Ammonis Oraculum fidei inclytæ; & fons, quem solis appellant:—Fons media nocte fervet: mox & paulatim tepescens, fit luce frigidus: tum, ut sol surgit, ita frigidior: subinde per meridiem maximè riget: sunt deinde tepores iterum; & prima nocte calidus: atque, ut illa procedit, ita calidior: rursus, ut est media, perfervet." Nor may we omit the testimony given by Ovid. *Metam.* lib. xv. ver. 368. in these words:

—Quid? non & lympa figuras
Datque capitque novas? medio tua, corniger
Ammon,
Unda die gelida est; ortuque, obituque calescit.

See likewise Potanus in *Meteor.* And Ammianus, lib. iii. But this too, says Lucretius, is alleged in vain, and signifies nothing: For though they are mistaken, that impute the cause of it to the sun, who, as they pretend, when he is beneath the earth, warms those waters through the body of the whole earth thick as it is; yet the reason may be, because the earth, being contracted by

the cold of the night, squeezes down and transmits the seeds of fire into the water, which by that means grows warm; but the same earth being loosened and set at liberty by the heat of the day, receives, and, as it were, swallows them in again: and thus the waters lose much of the heat they had in the night. Besides, that very water, which becomes warm, because the cold and chilling night depresses and keeps down the seeds of fire, grows cold again in the day; because the beams of the sun, darting into the water, and rarifying it, open a free passage for those seeds to get out into the air: For the heat of the sun dissolves ice in such a manner, as to release and set at liberty the slender stalks of corn, and other things of like nature, which by the cold of the night, were detained and bound in icy fetters. This is contained in twenty-eight verses. Thus Lucretius assigns two causes; but whether either of them be true or not, it is not worth while to inquire, since the thing itself is a mere fiction: for none of our historians or geographers, who describe fountains, pretend that they ever saw this. Yet we have pretty good authority for a fountain, that was discovered not long ago in the woods, near Clermont in Auvergne: whose waters freeze hard in the months of July and August; but never in the winter. "Prope urbem Claramontem fons, nuper inventus, dicitur, La Cave de la glace: Qui fons certe mirabilis: nam ejus aqua, Julio, & Augusto mensibus, gelu vehementer astringitur, minime vero hyeme," says a certain eye-witness of it.

Ibid. Ammon.] Jupiter Ammon had an oracle that was in great renown with the Egyptians and Africans, and a temple in Lybia, to the east of the country of Cyrenaica, to the west of Egypt, and to the north of the Garamantes and Nasamones, in a moist and palm-bearing soil, though all the country round be most dry and desert. The origin of this is variously reported: the most common opinion is, that Liber or Bacchus, after he had conquered all Asia, and was leading his army through the deserts of Lybia, was in danger of perishing, he and all his men with thirst: In this distress a ram appeared to him, and with his horn showed him a fountain of water: now he supposed this ram to be his father Jupiter, and therefore erected a temple to him, and gave him a ram's head and horns. He called him Ammon from the sand, which in Greek is ἄμμος, or ψάμμος. But Plutarch, "lib. de Iside," seems to deny this name to be of Greek extraction, and says it is derived from the Egyptian language: Whence some believe that Ham or Cham, the son of Noah, and who was the first that cultivated the land of Egypt, was worshipped under that name: others will have Ammon to be the sun; Macrobius. *Saturnal.* lib. i. cap. 21. "Ideo & Hammonem, quem Deum solem occidentem Libyes existimant, arietinis cornibus fingunt, quibus maximè id animal valet, sicut sol radiis; nam & apud Græcos ἀνὰ τὴν καρχήϊον, appellatur." And, to strengthen this opinion, the Hebrew word "Hamma," signifies the sun and heat: But whoever it was that

was there worshipped under the name of Ammon, Alexander the Great, when he was in Egypt, went to this temple, and made the priests acknowledge him for the son of their god.

Ver. 847. In these eight verses the poet confutes their opinion, who believed, that the water of the fountain of Ammon grew cold by day, and hot in the night, for the sole reason of the departure, or accession of the sun: And this he proves to be impossible by an argument, "a majori," as they call it. For, if the sun cannot warm the open and naked body of the water, when he shines upon it from above, much less can he impart his heat to the waters through the thick and close-compacted body of the earth: For the heat of the sun must of necessity pass through the whole body of the earth to warm by night the waters of that fountain: And yet we see that even our houses shelter and protect us from the fiercest of his beams.

Ver. 855. In these nine verses, he ascribes the first cause of the nocturnal heat, and diurnal cold of the waters of the fountain of Ammon to the seeds of fire or heat, that are in the earth about that fountain, and beneath the water: He explains this in the manner that follows: The earth, says he, being compressed by the cold of the night, squeezes out, and transmits into the water, those seeds of heat; by means of which the water grows hot: but, being loosened by the heat of the day, she receives again into her bowels those very same seeds, and thus the water becomes cold.

Ver. 864. In these five verses, he refers the second cause to the heat of the sun: as if it were possible that the water, which in the night is made hot by the seeds of fire, could grow cold again in the day, by reason of the beams of the sun penetrating into the same water, and rarifying it in such a manner, as to open a free passage into the air for those seeds of fire.

Ver. 867. Here our translator had his eye upon Cowley; who says,

So the sun's am'rous play
Kisses the ice away.

Ver. 869. In these twenty-five verses, he mentions a spring, that will both extinguish a lighted torch, if it be plunged into the water, and light it again, if it be moved gently to touch the surface of the water: The reason of which, says he, is, because there are in that water, or in the earth under it, many seeds of fire, which, breaking out of the water, stick to the tow, or torch newly extinguished, and set fire to them again. Nor is it more incredible, that seeds of fire should force their way out of water, than that a spring of fresh water should rise up in the middle of the sea: And we every day see candles, torches, &c. that are but just put out, kindle again, even before they come to touch the fire towards which they are moved.

Lucretius mentions neither the name nor place of this miraculous spring: but having shown that there is nothing wonderful or divine in the spring

of Jupiter Ammon, he here attacks the fountain of Jupiter of Dodona: for he never gives any quarter to that god. Now, not far from Dodona, a city of Epirus, there was a grove of oaks sacred to Jupiter, where the oaks are said to have pronounced oracles; though others say the answers were given by two doves sitting on these oaks, and one of which flew away to the temple of Apollo at Delphi, the other to that of Jupiter Ammon, where they continued their old trade of fortune-telling. Pliny, lib. ii. cap. 103, says, "In Dodone Jovis autem Fons, cum sit gelidas, & immensas faces extinguat, si extinctæ admoveantur accendit." And Gassendus, on the tenth book of Laërtius, page 157, says, that not far from Grenoble, there is an ardent fountain, that will take fire, if it be touched with a lighted torch, and continue burning for more than a few days. Pliny, lib. xxxi. cap. 2, says, that there is a fountain in India, called Lycos, whose water will light a candle; and he reports the same thing of another at Echbatan, which Solinus confirms to be true. And since we are on this subject of wonderful fountains, we will mention some of the many recorded by the ancients, and whose effects, if true, are indeed miraculous. There is a fountain in the Island Cea, that perfectly stupifies those that drink of its waters: Plin. lib. xxxi. cap. 2. Another, near Clitor in Arcadia, whose water causes a loathing of wine: Plin. Loc. citat. And Ovid. Metam. xv. ver. 322.

Clitorio quicunque sitim de fonte levârit,
Vina fugit; gaudetque meris abstemius undis.

On the contrary, the water of Lyncestis in Macedonia inebriates, says the same poet, lib. citat. ver. 329.

Huic fluit effectu dispar Lyncestius amnis,
Quem quicunque parùm moderato gutture traxit,
Haud aliter titubat, quam si mera vina bibisset.

And Plin. lib. i. cap. 103, reports from Mutianus, that there is a fountain in the Island Andros, whose waters have the taste of wine, and inebriate likewise. The river Athamas in Phthia kindles wood, if it be thrown in, in the wane of the moon: Ovid. Metam. xv. ver. 311.

Admotis Athamanis aquis accendere lignum
Narratur, minimos cum Luna recessit in orbes.

A river at Colossæ turns wood into stone: Plin. lib. xxxi. cap. 2. And Ovid says, the Ciconians, have a river that petrifies the bowels of those that drink of it: and brings a stony hardness on all things that touch the waters.

Flumen habent Cicones, quod potum faxea reddit
Vicera quod tactis inducit marmora rebus.

Metam. xv. ver. 313.

But Pliny says only, that a stony bark grows over wood, thrown into this river; and that the lake Velinus, now Lago di Pie di Luca, the rivers Silarus and Surius turn wood or leaves into stone. Nat. Hist. lib. ii. cap. 103. A fountain at Perperene in Lydia turns earth that is moistened

with its waters into stone, Pliny, lib. xxxi. cap. 2. There are two fountains at Orchomenus in Eubœa; the water of one of them confers memory: that of the other causes forgetfulness, Plin. loco citat. Mutianus witnesses, that there is one at Cyzicus, which delivers from the uneasy passion of love. A pool at Samosata breeds a sort of slime, that burns when put into water, and is extinguished with earth. Plin. lib. ii. cap. 104. Whatever is thrown into the lake Sides, or Sideris in India, instantly sinks to the bottom. Idem, lib. xxxi. cap. 2. The waters of a fountain at Zama in Africa, render the voice harmonious, Idem, lib. xxxi. cap. 2. There is a lake at Troglodytæ, the water of which grows bitter, and then again sweet, three times every day, and as often every night. Plin. lib. xxxi. cap. 2. And many other wonderful stories are related of other rivers and waters; but I may not omit to mention what many now living have experimented, and know to be true. There are two baths or fountains at Baia, not far from Naples, into one of which, when a dog is thrown, he is immediately deprived of sense, and seems to be dead; but, thrown into the other, he comes to himself, and revives in as little time. And from thence the place is called Grotto del Cane.

Ver. 877. In these seventeen verses, Lucretius argues, that the reason why the water of this fountain kindles tow, &c. may be this: Those seeds of fire, rising up to the surface of the water, may there be condensed, and gathered together in such a manner, as to kindle any combustibles, that are apt to take fire, if they be advanced to them. Thus too fountains of fresh water bubble up in the midst of the sea; and as those seeds of fresh water, rising up, join into one body, and flow in a stream of fresh water; so too these seeds of fire, rising up, and combining into one, may easily create a flame. Thus a candle, newly extinguished, if put to a burning taper, or to fire, catches again, and is lighted even before it touch the flame.

Ver. 879. Thus Alpheus, a river of Peloponnesus, after it flows into the sea, is said to preserve its waters unmixed with those of the briny flood, and, flowing in one continued course, to dive into the earth, and break out again at the head of the fountain Arethusa, in the west of the island Ortygia. Virg. *Æn.* iii. ver. 694. speaking of Ortygia,

—Alpheum fama est huc, Elidis amnem,
Occultas egisse vias subter mare; qui nunc
Ore, Arethusa, tuo siculis confunditur undis.

And this the ancients would have to be true, because in the Olympic games, which were celebrated at Elis every fifth summer, the garbage of the victims being thrown into Alpheus in Greece, was restored through the mouth of Arethusa in Ortygia. Plin. lib. ii. cap. 107. "Quidam fontes odio maris ipsa subeunt vada, sicut Arethusa, fons Syracusanus, in quo redduntur jacta in Alpheum." But Strabo, lib. vi. explodes this fiction. This, however, gave occasion to the fabulous loves of Alpheus and Arethusa. Pliny re-

ports the like of the rivers Lycus and Erasinus; the first in Lydia, the other in Arcadia; which is likewise confirmed by Ovid. *Metam.* lib. xv. ver. 273.

Sic ubi terreno Lycus est epotus hiatu,
Existit procul hinc, alioque renascitur ore.
Sic modò combibitur, recto modo gurgite lapsus
Redditur Argolicis ingens Erasinus in arvis.

Thus Lycus, swallowed up, is seen no more;
But far from thence knocks at another door:
Thus Erasinus dives, and, blind in earth,
Runs on, and gropes his way to second birth;
Starts up in Argo's meads, and shakes his locks
Around the fields, and fattens all the flocks.

Dryden.

Ver. 894. The following 156 verses, contain a disputation concerning the loadstone. And here too, says Creech, the drift of the poet is the same as in all his other disputations; which has not been hitherto observed. For Hercules is said to have found out this stone; and no doubt his godship is well-pleased that men should hold themselves obliged to him for so great a benefit; and that the virtues of that stone are ascribed to him. Jupiter has already lost his fountains, and why should the poet give quarter to the son, since he never would spare the father?

In the three first of these verses, the poet tells us, he is going to dispute of the virtue or power of the loadstone; which, though Lucretius acknowledges but one, is known nevertheless to have a twofold power, or two different virtues, which are thus distinguished: I. The power, by which it attracts the steel to itself. II. The power, by which it directs both itself and the steel towards the poles of the world. The first of these is called its attractive power, the second, its directive. As to the first of them, though it may seem a very hard paradox, nay, even an absurdity, to assert, that attraction is unjustly ascribed to the loadstone, and that we speak not properly, when we say, that it draws and attracts iron, yet we should not want great authority, nor even experiment itself, to confirm this assertion. For, in the first place, Renatus Des Cartes, in his principles of philosophy, has these express words: "Præterea magnes trahit ferrum, sive potius magnes et ferrum ad invicem accedunt; neque enim ulla ibi tractio est." This too is solemnly determined by Cabijs: "Nec magnes," says he, "trahit propriè ferrum, nec ferrum ad se magnetem provocat; sed ambo pari conatu ad invicem confluent." And with these authors agrees the assertion of Doctor Ridley, physician to the emperor of Russia, and who, in his tract of *Magnetical Bodies*, defines magnetical attraction to be a natural incitation and disposition, conforming to contiguity; or a union of one magnetical body with another, and not a violent and forcible attraction, and hauling of the weaker body to the stronger. And this is likewise the doctrine of Gilbertus, who terms this motion a coition, which, says he, is not made by any attractive faculty, either of the loadstone,

or the iron, but by a syndrome, or concourse of both of them: a coition always of their vigours, and of their bodies likewise, if not obstructed by their bulk, or some other impediment; and therefore those contrary actions, which flow from opposite poles or faces, are not so properly expulsion and attraction, as "*sequela et fuga*," a mutual following of, and flight from, each other.

Moreover, the foregoing opinions are confirmed by several experiments: For, I. If a piece of iron be fastened to the side of a bowl, or basin of water, a loadstone, swimming freely in a boat of cork, will presently make to it. II. If a steel, or knife, untouched, be offered towards a needle that is touched, the needle moves nimbly towards it, and strives to unite to the steel, that remains without motion. III. If a loadstone be filed very fine, the powder, or dust of it, will adhere and cleave to iron that was never touched, in like manner, as the powder of iron does likewise to the loadstone. And, IV. Lastly, if a loadstone and steel be placed in two skiffs, or small boats made of cork, and within the orbs of their activities, neither of them will move, while the other stands still; but both of them, if I may use the expression, hoist sail, and steer to each other; insomuch, that if the loadstone attract, the steel too has its attraction; because, in this action, the alliciency is reciprocal, and, being jointly felt, is the reason, that they mutually approach, and run into each others arms. Thus, therefore, upon the whole matter, more moderate expressions than are often used, would more suitably express this action; which, nevertheless, some of the ancients have delivered in the most violent terms of their language. Thus St. Austin calls the loadstone, "*mirabilem ferri raptorem*;" and Hippocrates, *λίθος ὅτι τὸν σίδηρον ἀρπάζει*. "*Lapis, qui ferrum rapit*:" Galen, disputing against Epicurus, uses the term, *ἰλκεῖν*, which seems likewise too violent. Aristotle alone among the ancients speaks more warily, and calls it, *λίθος ὅστις τὸν σίδηρον κινεῖ*, the stone that moves the iron, and him, Aquinas, Scaliger, Cusanus, and others have followed.

I return now to Lucretius, and must first observe, that our translator has omitted the third and fourth verses of this argument, in which the poet explains how this stone came to be called the magnet: These verses run thus in the original:

*Quem magneta vocant patrio de nomine Graii;
Magnetum quia sit patriis in finibus ortus.*

i. e. which stone the Greeks call the Magnet, from the name of the country; because it is produced and found in the country, inhabited by the Magnetes. This country is a region of Lydia, and called Magnesia, whence the inhabitants had their name. Aristotle, by way of excellence, calls it barely, *λίθος*, the stone: Some, "*Herculeus lapis*," either because Hercules first discovered it; or from the city Heraclea, where it is said to be found: or, lastly, from its great strength, or wonderful power. The Italians call it "*pietra d'amante*," the loving stone: the name of the loadstone, by which it is commonly known among us,

is a word of Saxon extraction; but the French know it only by the name of "*l'aimant*," the lover: And this modern name agrees with what Orpheus sings in Claudian, Epig. iv. That iron rushes to the loadstone, as a bride to the embraces of the bridegroom.

*Pronuba fit natura Deis, ferrumque maritat
Aura tenax.*

*Flagrat anhela flix, et amicam faucia sentit
Materiem; placidosque chalybs cognoscit amores:
Jam gelidas rupes, vivoque carentia sensu
Membra feris: jam saxa tuis obnoxia telis,
Et lapides suos ardor agit, ferrumque tenetur
Illecebris, &c.*

Now Lucretius, the better to explain the attractive virtue of this stone, premises four heads, or chief positions, which, though he has proved them already, yet, because of the great difficulty of the task he is now going to undertake, he thinks fit to inculcate here again. I. That certain corpuscles are continually flowing out of all things, in twenty-six verses. II. That no concrete body is so solid, as not to contain some empty little spaces, in twenty-three verses. III. That the corpuscles, that are emitted from things, do not agree with all things alike, and in the same manner, and produce not the same effects on them, in fourteen verses. IV. That the void little spaces are not alike in all things, but differ in size and figure, and therefore cannot be fit for all bodies indifferently, in thirteen verses. This being premised, he endeavours to tell the reason why, or the manner how, the loadstone attracts iron, or the iron is conveyed to the loadstone, which consists in this. Many particles flow from the loadstone, and dissipate the air all around it; and thus many void little spaces are made: But when the iron is placed within the sphere of that dissipated air, there being a great deal of empty space between that and the loadstone, the corpuscles of the iron leap more freely forward into that void (for the seeds of all bodies fly forward on a sudden into empty space), and for that reason are carried towards the loadstone: now they cannot tend that way, without dragging along with them their coherent seeds (for the seeds of iron are most intricately entangled, and twined together), and consequently the whole mass of iron, in seventeen verses. But because the iron moves any way, upwards, downwards, across, or in any obliquity, without the least distinction, according as it is placed to the loadstone, he teaches in five verses, that this could not be, but by reason of the empty space that is made by corpuscles that flow from the magnet, and into which all bodies, that otherwise tend only downwards, are protruded indiscriminately, by the strokes and blows of other bodies. And this is in general what Lucretius teaches concerning the loadstone; we will examine his arguments a part, in the order he has observed in the disposition of them.

Ver. 897. In these six verses, he takes notice of the first power and virtue of the loadstone; and says, that it draws five, or more iron rings, ad-

hering one to another. This is the virtue of the magnet, which is called the attractive; but of the other, the directive, he says nothing; nor indeed do any of the ancients treat of this last power of the loadstone. The moderns alone have inquired into that matter; and that too, only since the invention of the magnetic needle; which, according to some, was first discovered a little more than five ages ago, that is to say, A. D. 1200. At which time Guyotus, a native of Provence in France, writ a poem, which he called *Marineta*, in praise of this invention. And hence, say the French authors, the *Flower de Luce*, which is the arms of France, is every where, even among the barbarous nations, represented at one of the ends of that needle. Petrus Peregrinus, another Frenchman, about three hundred years ago, writ a treatise of the Magnet, and of a perpetual motion to be made by it; which treatise has been preserved by Gasslerus. Paulus Venetus, and Albertus Magnus, who flourished about five hundred years ago, both of them, mention this verticity of the loadstone, and cite for it a book of Aristotle's, intituled, *De Lapide*; but Cabeus and others rather judge that book to be the work of some Arabic writer, who lived not many years before the days of Albertus. And, indeed, it is very probable, that the knowledge of the loadstone's polary power and direction to the north was unknown to the ancients; and Pancirollus justly places it among the modern inventions; though Levinus Lemnius, and Cælius Calcagninus are of another belief; but their strongest argument is only the following passage in Plautus:

Hic ventus jam secundus est; cape modo verforiam.

Now the word "*verforiam*" they interpret to be the compass; but, according to Pineda, who has particularly discussed this matter, and to Turnebus, Cabeus, and several others, it rather signifies the rope that helps to turn the ship, or that makes it tack about; for the compass shows that the ship is turned, rather than contributes to its conversion. As for the long expeditions and voyages of the ancients, which may seem to confirm the antiquity of this invention, it is not improbable, but they were performed by the help of the stars, by the flight of birds, or by keeping near the shore: for thus the Phœnician navigators, and Ulysses too, might sail about the Mediterranean; and thus likewise might Hanno coast about Africa. And as to what is contended, that this verticity of the loadstone was not unknown to Solomon, who is presumed to have had a universality of knowledge, it may as well be averred, that he knew the art of typography, of making guns and powder, or that he had the philosopher's stone, though he sent to Ophir for gold. It cannot indeed be denied, but that, besides his political wisdom, he was very knowing in philosophy; and perhaps too, as some believe, from his philosophical writings, the ancient philosophers, especially Aristotle, who had the assistance of the acquisitions of Alexander, collected many things

TRANS. II.

worthy of note; yet it must be granted, that if he knew the use of the compass, his ships were very slow sailers, since they made a three years voyage of it from Eziongeber in the Red Sea to Ophir, supposed to be Taptobana, or Malaca, in the Indies, which is not many months sail; and since too in the same, or a less, time, Drake and Cavendish performed their voyage round the earth.

Moreover, some are of opinion, that this directive power of the loadstone depends upon, and is derived from the two poles of the heavens: others from the Arctic pole only: Cardanus, from the tail of the Bear; Des Cartes from I know not what tractorous point, as he calls it, and which he imagines to be I know not where too, beyond the heavens; Fracastorius, from certain magnetic mountains under the Arctic Pole: Guilielmus Gilbertus, from the earth itself, which, as one huge loadstone, conforms and brings into its native and natural site, that is to say, towards the north and south, the loadstone itself, as a small earth, and the iron as its offspring. In regard to the attractive virtue of the loadstone, the opinions likewise are different. Thales, Aristotle and Hippias ascribed it to the soul, with which they held it to be endowed. But it is not certain what hands, or what senses nature has given to this stone. Cardanus intimates that it is only a certain appetite, or desire of nutriment, that makes the loadstone snatch the iron; and according to this opinion, Claudian Epig. 4.

*Ex ferro meruit vitam, ferrique rigore
Vescitur: has dulces epulas, hæc pabula novit.*

And Diogenes Apolloniota, lib. ii. Nat. Quæst. cap. 23. confirms the same opinion, when he says, that there is humidity in iron, which the dryness of the magnet feeds upon. Others fly to sympathy, and certain occult qualities. The opinions of Democritus, Epicurus, and Lucretius, are explained in the following notes.

Ver. 903. In these four verses, the poet only tells us, that to give a methodical account of the attractive power of the loadstone, it will be necessary to take the matter higher, and to repeat some of the maxims he has taught already.

Ver. 907. In these thirteen verses, he premises, I. That corpuscles are perpetually flowing from all things: and this he has taught before, Book IV. ver. 47. et seqq.

Ver. 909. This and the ten following verses are repeated from B. IV. ver. 240. et seqq. Consult there the notes upon them.

Ver. 920. In these twenty-three verses, he premises, II. That no compound body is so solid, as not to consist of some void: that is to say, as not to contain some empty little spaces. And this the poet has demonstrated at large. B. I. ver. 402. et seqq.

Ver. 933. This, and the three next verses are repeated word for word, from book i. ver. 335. though Lucretius varies them in the original; but the sense indeed is the same.

U u

Ver. 939. This and the following verse run thus in the original,

—Quin ferri quoque vim penetrare suevit,
Undique qua circum corpus lorica coercit,
Morbida vis quæcunque extrinsecus insinuat.

This passage has puzzled the interpreters, and after all, they know not well what to make of it: Creech in this translation has followed the opinion of none of them, and indeed disapproves of them all in his Latin edition of Lucretius: for, says he, what can Lucretius mean by a coat of mail? No man ever believed, that the infectious power of disease ever pierced through a coat of mail. He dislikes also all the other explications given by the several other annotators to this passage: which at length he corrects, and instead of "morbida vis," reads "fervida vis;" which lection, says he, makes all things plain and easy: for often, when men armed from head to foot, scaled the walls of a city, the besieged poured down upon them melted pitch, sulphur, scalding water, &c. the heat of which pierced through their armour, and made them sensible of it. This exposition seems the most natural of any that have been given to this passage, and agrees best with the preceding part of the argument. But he is evidently mistaken in the interpretation he gives it in this translation: and this may serve for one of the many instances might be given, that he had not studied his author so thoroughly, when he rendered him into English, as afterwards, when he came to publish his Latin edition.

Ver. 943. In these fourteen verses, the poet premises, III. That the corpuscles which flow from things, do not agree with all things, nor affect them alike, or in one and the same manner. This he has demonstrated in many places of the preceding books; but chiefly in the fourth.

Ver. 957. In these thirteen verses, he premises, IV. That there are different little spaces, or pores of various figures in all compound bodies: from whence it comes to pass, that all things cannot be adapted to, nor fit, and agree with, every one of them: this he has proved before, in the second and fourth books: and confirms again in this place, by the same examples he there alleged in proof of this doctrine.

Ver. 970. In these three verses he concludes, and says, that these things being premised, it is easy to discover and understand, how, and for what reason the loadstone attracts iron. And this is what he is going next to explain.

Ver. 973. Epicurus explained two several ways the attractive virtue of the loadstone; and it is strange Lucretius has omitted one of them: or rather it has been lost out of the text, since what Lucretius has so carefully premised, seems more properly adapted to that cause, than to the other that remains. If you are desirous to know more of it, see Gassendus, tome ii. p. 129. where you will find many things by which this doctrine of Epicurus is illustrated, and fully explained. But to proceed: Lucretius having premised the four propositions abovementioned, undertakes in this

place to show the reason why, or manner how, the loadstone attracts the iron, and the iron, on the other hand, is carried and moves towards the loadstone. To this end, in these fourteen verses, he teaches, I. That many corpuscles flow as well from the loadstone as from the iron; but the greater quantity, and the more strong from the magnet: whence it comes to pass, that the air is always dispersed, and driven away to a greater distance round about the loadstone, and consequently, that fewer empty little spaces are made around the iron. And because, when the iron is placed within the sphere, as they say, of the air, that is removed and driven away, there must be a great deal of void space between that and the loadstone; the corpuscles of the iron fly the more freely into that empty space, and therefore necessarily towards the magnet; but those corpuscles of the iron cannot hurry that way in a great quantity, without dragging along with them the particles that adhere to them, and by consequence the whole mass of iron.

Ver. 987. These five verses Gassendus thus explains: inasmuch as the iron tends indiscriminately upwards, downwards, across, in a word, any way, according as it is placed above, below, on one side, &c. of the magnet; the poet teaches, that it could not move in that manner, but by reason of the induction of the void, into which the corpuscles of the iron, that would otherwise move downwards only, are carried indifferently, and without the least distinction. Thus Gassendus believes, that these five verses relate to the explication last above proposed; but I, says Creech, am of another opinion: for the whole matter there relates to the corpuscles of the iron leaping forward into the void, that is made by the effluvia from the loadstone: but here, in these verses, the little bodies are protruded into the void by blows: therefore they more properly belong to what follows. Creech. in Edit. Lat.

Ver. 992. Lucretius labours hard to prove, that the motion of the steel is helped forward by the air, because of its certain continual motion and agitation. And first, in these ten verses, he says, it is assisted by the exterior air, which, since it is always driving forward, and that too with more force, the more there is of it, cannot but push on the iron into that place where there is least air, and consequently most void: which must be towards the loadstone. Then, in six verses, by the interior air, which for the same reason, since it always agitates, moves, and drives forward, cannot but begin the motion towards that place, which is rendered most void and empty.

Ver. 1008. Gassendus here observes, that Lucretius seems to have seen that experiment, in which the loadstone sometimes manifestly repels, or at least seems to repel, the iron. What he means is this: it is discovered, that there are in the loadstone two opposite parts [we now commonly call them poles; one the northern, the other the southern], to one of which, if one end of the iron needle be moved, it is drawn and attracted by it; and if the same end of the needle

be afterwards applied to the other pole, it leaps, and seems to be repelled from it. But that great man, says Creech, indulges himself too much in his own opinion: for the poet proposes nothing in these verses concerning the flight of the iron from the loadstone, nor do any of the following examples speak fully of it: but Lucretius had seen little rings, and filings or segments of iron, when put into a vessel of brass, move and dance about, if a loadstone were applied to the bottom of the vessel: and, perceiving this to be caused by the interposition of the brass (though the same will happen if glass, wood, stone, or any other substance be interposed), in these twelve verses, he gives this reason of it, That some corpuscles are emitted from the brass into the filings, or little bits of iron, and that these corpuscles so fill up the little void spaces of the iron, that the magnetic corpuscles, which come afterwards, and are transmitted through the brass, finding these little empty spaces already taken up, heave and drive forward the bits of iron with all the strength they can.

Ver. 1010. *Steel filings.*] Lucretius calls them "Samothracia ferrea," which were hollow iron rings, made to open, and in which they wore their amulets: at first the "Flamen Dialis" wore them: "annulo, nisi pervio calloque, ne utitor." At length servants took upon them to wear them; and, in the age of Pliny they were laid over with gold: "servitia jam ferrum auro cingunt; alia per sese mero auro decorant: cujus licentia origo nomine ipso in Samothrace, id institutum declarat." Plin. Nat. Hist. lib. xxxiii. cap. 1.

Ver. 1020. It may be asked, why a loadstone does not make the filings of other bodies move in like manner? The poet teaches in these ten verses, that the reason is, because they are either too heavy to be moved, or if they are light, they are then too rare; insomuch that the corpuscles of the magnet find a free and open passage through them.

Ver. 1030. Hitherto of the motion of the iron towards the loadstone, or of its flight from it. Now, as to its adhesion to it, he tells us in twenty verses, that it ought not to seem strange, because there is a like consent and agreement between other things also, which refuse to be joined, or connected, except to one certain thing only. Thus stones are cemented with plaster and lime: boards with glue; and that too so strongly, that the planks themselves will break, rather than the glue disjoin: water mingles with wine, but not with oil and pitch: wool is dyed with the blood of the purple fish: and gold is soldered with silver, but not with lead; which nevertheless solders brass to brass. And thus the adhesion of the steel to the loadstone is made in this manner: on the surface of the magnet there are hooks, and on the surface of the steel little rings, which the hooks catch hold of.

Ver. 1033. Lucret. "glutine taurino:" for the strongest glue was made of the ears and genitals of bulls: "glutinum præstantissimum fit ex auribus taurorum, et genitalibus." Plin. Nat. Hist. lib. xxviii. cap. 17.

Ver. 1036. *Oil and heavy pitch.*] Both of them refuse to mix with water; but differently: for oil rises above the surface of the water; therefore Lucretius here calls it "leve olivum;" but pitch sinks to the bottom.

Ver. 1037. The purple of the ancients was dyed with the blood of a shell-fish, called *Purpura*; it was found in a white vein, running through the middle of the mouth, which was cut out and boiled; and the blood, used in dying, produced the colour "nigrantis rosæ sublucentem" which Pliny says is the true purple, though there were other sorts too of it, as the colour of violet, hyacinth, &c. Of this invention, see Plin. lib. ix. cap. 38. and Pancirollus. The greatest fishing for these purples was at Tyre; and there was the chief manufacture and trade of purple, as likewise the first invention of it; which is attributed to Hercules Tyrius, who, walking upon the shore, saw his dog bite one of those fish, and observed his mouth all stained with that excellent colour, which gave him the first hint of teaching the Tyrians how to dye with it: from this invention of this colour, it is called in Greek *άλμυρος* because, says Aristotle, de color. it is, as it were *άλδος ἕργων*, the work of the sea; and Plato in *Timæus* defines *άλμυραν*, to be red mingled with white and black. See Guil Tyrensis, Pontif. lib. 13. Belli Sacri, cap. 1. where he speaks of Tyre. The purple of Africa, a country nearer to the sun, was, as we are told, for that reason, of a violet colour: the ingredients of which consist of much white, and a little red: but the common purple now-a-days is, as the best artists tell us, a mixture of a great deal of red and a little black; yet the Tyrian purple is generally held to have been more inclining to red, which is a certain mixture of white and black, or rather to scarlet. But this sort of purple, ever since the fishing for the *purpura* is by the taking of Tyre, come into the power of the Turks, has been totally lost: not for want of materials; for the fish is still to be found; but because the true art of ordering it is no longer known. Pancirollus tells us, we may guess at the colour of it by the Italian July-flower; and that it was not, as some believed, like the amethyst, but rather like the ruby, *pyropus*, or carbuncle. Some will have it to have resembled the colour of the elemental fire; and others, that of what they never saw, the empyrean heaven. But to guess what the colour of this true purple was, by the description, which the ancients have left of it, we may call to mind, that Juvenal calls it "ardens purpura," flaming purple; and we find in Cicero, "Qui fulgent purpurâ," who shine in purple; which Statius yet improves:

• Illius è rosco flammatur purpura vultu: "

And many the like instances might be produced from the ancients, of the refulgency of this colour. Some mention an extraordinary way of dyeing the purple colour with the blood of apes: and the Indians make trial of the best common purple, by dropping some oil on a piece of purple silk, which, they say, will not stain it, if the purple be good: but these two particulars I mention only for the

sake of their extravagancy. Whatever the purple of the ancients was, our purple is made of what the druggists call turnesol, which is a mixture of vermilion and blue bysse, or cinnaber. As to the ancient wearing of purple, Lemazzo, lib. iii. cap. 14. observes, that the kings of Troy, and the chief of the nobility, were wont to dress themselves in several colours, on the several days of the week, and wore a particular colour on each day: and that the chief of them was the purple: thus on Sunday they wore yellow, on Monday white, on Tuesday red, on Wednesday blue, on Thursday green, on Friday purple, and on Saturday black. Now the reason, why they dressed themselves in purple on Friday, may have been, because that day was sacred to Venus, whose buskins are said to have been red, between which and purple, there was but little difference, says the same Lemazzo, in the place above cited. He farther observes, cap. 19. of the same book, that they wore likewise several colours on the festivals of several months of the year: in those that happened in January, they wore white, in February ash-colour, in March tawny, in April dark green, in May light-green, in June carnation, in July red, in August yellow, in September blue, in October violet, in November purple, and in December black. Now the month of November was under the protection of Diana amongst the Romans, who derived themselves from the Trojans, and that goddess, like Venus, wore red, or rather purple, buskins: and therefore, for the like reason, it may be conjectured, that they wore purple on the holidays of that month. Besides, in November their festival dedicated to Jupiter, and therefore they might probably go then dressed in purple: for many of the Roman customs, as well as their pretended original, were derived from the Trojans: and lastly, that author takes notice, that in succeeding ages, whenever the emperor himself went into the field, the standard was of a purple colour. Thus we see, that purple was anciently the wear of princes: and therefore honest Umbritius in Juven. Sat. 3. conceived so great indignation, that the meaner sort of people began to clothe themselves in that regal colour, that he alleges it as one of the reasons of his retiring from Rome: "*Horum ego non fugiam conchyliæ?*" ver. 81. And Augustus, as we find in Suetonius, in his life, forbid the promiscuous use of it: for which Tacitus commends that emperor, and at the same time gives the reason of that prohibition in these words: "*Præclarè vero prudentèrque Cæsar ordines civium veste discriminavit, ut scilicet qui locis, ordinibus, dignationibus antestant, cultu quoque discernèrentur.*" Annal. 2. Yet at length, liberty prevailed at Rome, and the meaner sort, if their money could reach it, clothed themselves in purple; and lived as in the Spartan commonwealth, where, by the laws of Lycurgus, it was forbid to all alike, that any one man should go better dressed than another.

Ver. 1038. Thus Waller:

The fleece that has been by the dyer stain'd,
Never again its native whiteness gain'd.

Ver. 1040. Solder.] What the goldsmiths use to solder gold, is called borax, a sort of chrysolite, which is a kind of mineral, found like sand in mines of brass, silver, or gold.

Ver. 1045. Here Lucretius tells us, that the juncture is most strong, and the union most firm and lasting, between things, whose parts exactly correspond and square with one another: those things, says he, whose textures mutually answer to one another, in such a manner, that the cavities of this thing agree with the plenitudes of that: and the cavities of that with the plenitudes of this, may be conjoined most easily, and in the strictest manner: and some things may be so joined to others, as if they were fastened together with hooks and rings: and in this manner it is, that the loadstone seems connected to the steel.

Thus our poet concludes his disputation concerning this wonderful stone: which is alone sufficient to humble the towering arrogance of prying man, and to baffle and mock his vain pretence to knowledge: since he never could attain to the discovery of what it is, nor of the great power, that the Divine Wisdom has bestowed upon it: well may it be styled Herculean, it being insuperable on many accounts: the ancients knew scarce any thing of it; and the modern philosophers, that they might seem to be ignorant of nothing, pretend to explain this hidden secret of nature; but have failed in the attempt, and have only involved it in yet greater difficulties: for what is more absurd, or more repugnant to common observation, than to imagine to ourselves, that the whole earth is compacted of solid iron, or than to call it the great loadstone, whose purer segments do now and then by chance fall into our hands. Is it thus that we philosophize, and think it better to pervert than suffer things to lie hid in the inscrutable majesty of nature? Lucretius endeavoured to discover the cause of a most notorious effect, viz. Why iron runs to the loadstone, and obstinately adheres to it? But setting sail imprudently, was shipwrecked in the port. His first assertion is, that the corpuscles of the loadstone strike and chase away the air: but this we know by experience to be false: for the water is not moved, when a loadstone is put under the vessel that contains it: neither will you find the air to be moved, if, for trial's sake, by the exhalation that steems from a censer, or the vapour of hot water, you render it so thick, that from perspicuous it become conspicuous: for the smoke will go alike forward, whether you apply the loadstone, or take it away: and if no force be offered to the medium, the loadstone will still strongly attract the steel: therefore the place is not made empty, nor the air expelled: but grant the space to be void, whence proceeds that great sedulity of the steel, to fill immediately the vacant place? If it be answered, from the established order of things, to the end, nothing in the universe may be void of body; it may be replied, that it then overthrows their opinion, who hold the void to be the second principle of natural things. Besides, corpuscles flow no less from the iron, than

from the magnet: therefore, if the effluvia of the iron have filled the vacant space, why is not the ring stopped, and why does it hasten onward? If it be answered, that it is driven forward by external air, why is not that protrusion perpetual, even while the magnet is away? And whence proceeds this inconstancy, that compels the air to renounce its natural gravity, and move by ascent? Nor is the internal air, included in the ring, of any greater moment: For since the iron emits corpuscles on all sides, why does it incline and move one way rather than another? Besides: how ill does what Lucretius here asserts, that the air resides in, and fills up the pores or open passages of concrete bodies, agree with his doctrine of a void, which he endeavoured before to persuade us to believe, and which he grounded on those very pores of bodies? In vain, therefore, has been the search of our poet into this miraculous secret of nature, since it has led him unawares into arguments, that tend to the confutation of that philosophy, which he has been labouring to establish.

Ver. 1050. Hitherto our poet has been disputing of the things, that are commonly said to be, "*secundum naturam*," natural: he is now going to try the strength of his philosophy in those, which by the physicians are called, "*præter naturam*," preternatural; and these are held to be three: I. Disease. II. The cause of disease. III. The symptom, or the effect, accident, or passion, attending any sickness: for symptom, in the general acceptation of the word signifies whatever happens to an animal preternaturally: i. e. disease, and the internal cause of disease, together with whatever supervenes in the disease. As to what relates to the cause of diseases, and their symptoms, Lucretius takes but little notice: for he disdains common diseases; and is going to treat of plagues only, and to inquire into the causes of them. And here we may take notice, that physicians allow two sorts of diseases, which they call, "*communes, & sparsim vagantes*," common diseases, and such as wander here and there, and come not after an ordinary manner: these last Hippocrates in his language calls *σποραδικὰς* the diseases they call common, are those that are peculiar and naturally incident to one place or country; for which reason they are likewise called Endemii, that is to say, regional; and, because they often seize many persons, popular or vulgar; but by the Greeks *ἐπιδημικαὶ*, i. e. public or universal. Now if these diseases, besides that they seize many persons at the same time, and in one and the same place, have this to boot, that they kill many persons likewise, they are then called a plague; by the Greeks *λοιμὸς*; by the Latins "*pestis, à pascendo*," in like manner as, according to Isidorus, *pestilentia* is said, "*quasi pastulantia, quod veluti incendium depascit*," because it consumes and devours like a burning flame. But in the art of physic, diseases likewise admit of another distinction; taken from their longer or shorter duration; for some diseases are lingering, and of long continuance; for which reason, they are

called chronic, from *χρόνος*, time: others dispatch the patient in a little time, or else he recovers, and therefore they are called acute: I now return to Lucretius, who seems to imply, that the only tokens of an offended and angry deity, that he has left unmentioned, are epidemical diseases and plagues: and if there be nothing wonderful and divine in these things neither, we may then indeed disclaim, and bid adieu to all providence. But our poet tells us, that there is no need of much ceremony, nor to beat about the bush, to discover the causes of plagues: for, says he, in eight verses, as in the universe, there are many corpuscles that are healthful to man, and other animals, so there are many too that are noxious and deadly. Now, when these noxious corpuscles, whether they arise out of the earth, or whether they fall down from the skies, fill the air, it grows diseased and infectious; and thus plagues and contagions enter into the bowels of men and other animals. If we will not allow of these foreign corpuscles, he bids us, in seven verses, search into the air itself, and we shall find the cause of this great calamity and destruction: for the air of different countries is different, and that which is healthful to the native inhabitants, is unhealthful to foreigners, who are not used to it: and this, says, our poet, in nine verses, is the reason, that certain diseases are peculiar to certain countries: then he teaches, in seven verses, that when the air of our region is blown into another, the whole air of the sky must of necessity be corrupted; and thus, says he, in twelve verses, the springs and herbs are infected; or the corrupted air itself proves mortal. Lastly, he confirms this disputation, by the example of that memorable plague which happened in Athens, during the heat of the Peloponnesian war, and describes it at large in one hundred and sixty-five verses.

Here we must observe, that our translator has not fully rendered the beginning of this disputation; which in the original is as follows:

Nunc, ratio quæ sit morbis, aut unde repente
Mortiferam possit cladem conflare coorta
Morbida vis hominum generi pecudumque cater-
vis,
Expeditam.

In which verses the poet proposes, that he is now going to treat of the causes of those diseases, that are mortal both to men, "*pecudumque catervis*," and to beasts: of which last our interpreter has taken no notice; though it be certain, that plagues are not peculiar to man alone; but promiscuous and common to beasts likewise; as shall be shown by and by in our note on ver. 1087.

Ver. 1053. In these eight verses the poet says, that the cause of diseases may be ascribed to the very noxious nature of the air itself; and teaches, how the air comes to be morbidiferous: for, says he, many atoms, that bring both disease and death, are continually flying to and fro in the air; as many others are likewise, that are healthful and vital, or conducing to the maintenance and preservation of life: but those diseased and sickly

atoms fall from without into the air; being either sent from above out of the sky, or raised up from beneath out of the earth, whenever it has contracted any filthy and unwholesome stench, by being drenched with excessive and unseasonable rains, and pierced by the scorching beams of the sun. Hippocrates too held the air that surrounds us, to be the most general and common cause of all diseases: for the air, says he, varying from its proper nature, whilst it is altered, corrupted, or defiled, infects almost all the animals that breathe within the circuit of it: but whether there be any other common causes of diseases, or the air alone be to blame, we will examine by and by.

Ver. 1061. In these seven verses, the poet being about to advance a position, that may seem incredible to such as have had no experience of it, concerning the diseased and noxious power, that by some means or other is imparted to the air, and perceptible to none of the senses, alleges by way of example, the inconveniencies and harms, that happen to us in an air, to which we have not been accustomed, even though that air be not in the least tainted or corrupted: and he confirms, that the air of one climate is different from that of another: for, no doubt, the air, that surrounds Great Britain, says he, is quite different from the air of Egypt: nor is the air in Pontus less different from that of Gades and Æthiopia: the truth of which is daily experienced by such as travel into foreign countries; and from this difference of air proceed the different colours and complexions of men. Aristotle too argues to the same purpose in his treatise, "de aëre, aquis, & locis."

Ver. 1063. This reason is not to be controverted; for the difference of air, and change of water, are often prejudicial to travellers into foreign countries: the banished Ovid had therefore just reason to complain, that

"Nec cælum ferimus, nec aquis affuescimus istis."

Ver. 1064. This, and the three following verses run thus in the original:

Nam quid Britannis cælum differre putamus,
Et quod in Ægypto est, quâ mundi claudicat axis?
Quidve, quod in Ponto, est differre à Gadibus, at-
que

Usque ad nigra virûm percoctaque sæcla calore?

In which verses the poet confirms by examples, his last assertion, concerning the difference of air in different climates: and instances in the air of Egypt as opposed to that of Great Britain; from whence Egypt is distant the whole extent of the Mediterranean sea: besides, by Egypt, which is a country of Africa, he means the south part of the world, and by Britain the north: by Pontus which is a country of Greece, he means the east part of the world; and by the Gades, which are islands in the occidental ocean, where Europe is divided from Africa, he means the west part of it: for he chose to mention those four places, because they were the most noted, that in his days were believed to be the farthest distant from one another: that is to say, two from the north to the south,

Britain and Egypt, which is the distance of latitude: and two from the east to the west, Pontus and Gades, which is the distance of longitude.

Ver. 1065. Nile.] Of this river we have spoken at large in the note on ver. 722. of this book.

Ver. 1066. Pontus is a country of Asia the Less, lying between Bithynia, Paphlagonia, and the Euxine sea.

Ver. 1067. Lucretius means the air of Mauritania, or Æthiopia, in which countries the natives are black.

Ver. 1068. In these nine verses the poet produces instances of certain countries, that are obnoxious to certain diseases, by reason of the very nature of the air: thus, says he, the leprosy is frequent in Egypt only; the Athenians are subject to the gout, &c.

Ver. 1070. Galen seems to subscribe to this opinion of Lucretius, who believes, that the leprosy is a disease that infects the country of Egypt only; for, in his second book to Glaucô, chap. xiii. he says, That in Alexandria, a city of Egypt, many are afflicted with the leprosy, by reason of the food they eat, and of the heat of the country: But in Germany and Mysia the disease is very seldom known; nor has it ever appeared among the Scythians, who are drinkers of milk: Yet it is very frequent at Alexandria, for the reason above mentioned; for they feed upon boiled meal, and lentiles, and periwinkles, and eat many things that are dried with salt: nay, some of them eat asses flesh, and some other things; that breed a thick and melancholic humour. And the air of the country being hot, the motion of the humours is driven towards the skin. Thus Galen. But Celsus, lib. iii. cap. 24, is more in the right as to this disease; for, though he says indeed, that it is almost unknown in Italy, yet he owns it to be very frequent in several other countries. In the last age, the leprosy was not uncommon in Germany; and A. Pareus relates, that in Spain, and all over Africa, there are more lepers than in the rest of the world; and more in Guienne, and the south parts of France, than in all the other parts of that kingdom. If we may believe Pliny, lib. xix. cap. 16. it was altogether unknown in Italy, till the time of Pompey the Great; when it was first brought thither, but soon cured and extinguished. Yet history informs us, that it broke out again in that country, in the days of Constantine the Great, who was himself afflicted with it; till, having refused to make use of the impious bath of human blood, that was prescribed to him as a remedy for that disease, he was, in the Lateran church, bathed in the fount of holy baptism, by the Roman pontiff Sylvester, and cured at once of either leprosy. Nor is it unlikely, but that the emperor might have been advised to that cruel immersion in the blood of infants, by some Egyptian or other; especially if what Pliny says be true: That when this disease, which was peculiar to Egypt, happened to seize any of the kings of that country, it was fatal to their subjects; for to cure it, they were wont to bathe their thrones in human blood: "Ægypti

peculiare hoc malum, et cum in reges incidisset, populis funebre: quippe in balneis folia temperabuntur humano sanguine ad medicinam eam." Plin. Nat. Hist. lib. xix. cap. 16. Moses in Exod. chap. ix. ver. 10. calls it "ulcus inflationum germinans in homine;" which Jun. and Tremel. explain, "erumpens multis pustulis" sprouting out with many blains, &c. This disease is one of the curses with which the disobedience to God is threatened. Deut. chap. xviii. ver. 27 "The Lord shall smite thee with the blotch of Egypt," &c. which likewise confirms what Lucretius here says; and perhaps gave occasion to the calumny which Trogus Pompeius, Diodorus Siculus, Tacitus, and other heathens cast upon the Hebrews, that they were expelled out of Egypt for being scabby and leprous; which mistake was easy: instead of being dismissed for having brought those diseases upon the Egyptians. The Latins call it "elephantiasis," because it makes the surface of the body rough with black wannish spots, and dry parched scales and scurf, like the skin of an elephant. It is a contagious disease, and incurable, if not taken in time; for it spreads over the whole skin, almost like a cancer.

Ibid. *Egypt.*] This country was so called from Ægyptus, the brother of Danaus, whom the same Ægyptus slew, and reigned there sixty-eight years. It was called before, Melas, Aëria, Aëra, Ogygia, Hephæstia, Melamboles, and by several other names. The Hebrews called it Misraim and Chus. It is divided by Mela into two parts, Delta and Thebais: In the time of Amasis it had 2000 cities, and in the time of Pliny 3000. It is bounded on the east with the Red Sea; on the west with Cyrene, on the north with the Mediterranean, and on the south with Habassia.

Ver. 1071. *Nilus.*] Of this river see above, in the note on ver. 922.

Ver. 1072. *Athens.*] Of this city we have spoken in the note on the first verse of this book.

Ver. 1073. *Offends the feet.*] In like manner as the Ægyptians, says Lucretius, by reason of the air of their country, were subject to the leprosy, so too were the Athenians, for the very same cause, subject to the gout.

Ibid. *Achaia hurts the sight.*] A part of Peloponnesus was called by this name; as was likewise the whole country of Greece; from one Achaus, the son of Jupiter, or Zuthus, who reigned there. What Lucretius says of the countries being hurtful to the eyes, we must take his word for. I know nothing to the contrary.

Ver. 1074. What our poet says in these three verses, may be confirmed by many examples: The air of Florence is prejudicial to the brain, but very beneficial to the legs; and the air of Pisa is diametrically opposite to that of Florence, notwithstanding that those two cities are not at most above forty miles distant from each other, says Nardius. Thus too the air of Paris, says Fayus, is very dangerous to wounds in the head, &c.

Ver. 1077. In these four verses, he concludes, that all pestilential distempers proceed from the inclemency of the air; which, being unhealthful

to us, creeps unheeded by us into our limbs and bodies, in like manner as a mist, or smoke; and wherever it enters, it disturbs and changes all things, and causes us all to fall sick. Or, that when that infected air comes into our country, it corrupts the whole air of it; from whence arises a regional distemper, which spreads itself through many places.

Ver. 1081. In these twelve verses the poet, lest those seeds of pestilence should be thought to be grown weary with the length of their journey, and to remain pendulous in the lazy air, assigns them fixed and certain stations, where they fall and settle: For, says he, some of them fall into the waters, others on the fruits of the earth, and the several sorts of the foods of animals: And this is the reason, why a plague sometimes equally seizes both men and cattle. Thus he acknowledges the air to be the sole cause of plagues.

WHETHER PLAGUES ARE PROMISCUOUS AND COMMON TO ALL SORTS OF ANIMALS.

Our authors of best credit testify, that murrains, which are plagues in cattle, precede, accompany, or follow any pestilential mortality in men. They precede, when noxious and sickly vapours exhale from the earth; which vapours, the cattle, as they feed, receive first into their bodies, and are seized with a deadly disease. A mortality of this nature was observed to happen in the kingdom of Naples, in the year 1617; when, after excessive rains, that had continued for many days together, without almost any intermission, and had laid under water all the plains of the country, the cattle eat the grass, as it sprung out of the ground, while it was yet slimy, and full of mud: This caused a putrilaginous disease in their jaws and throats, which soon suffocated and killed them; and necessity compelling the Neapolitans to slaughter some of these infected cattle for the butchery, whoever eat of the flesh of them, were seized with the same disease, which by this means spread itself in a short time over the whole kingdom, and swept away a vast number of the inhabitants. Pliny too mentions a like pestilence, which fell on beasts one year, and on men the next; "quæ priore anno in boves ingruerat, eo verterat in homines," says he, Nat. Hist. lib. xli. cap. 9. And Silius Italicus, speaking of a plague, says,

Vim primam sensere canes; mox nubibus atris
Fluxit deficiens, penna labente, volucris;
Inde feræ sylvis sterni

And Ovid to the same purpose sings:

Strage canum primò, volucrumque, aviumque,
boumque,
Ipque feris subiti deprensa potentia morbi est.

To which I add the following verses of Dryden, describing the plague at Thebes, in his tragedy of Oedipus:

—The raw damps
With flaggy wings fly heavily about,
Scattering their pestilential colds and rheums
Through all the lazy air : Hence murrains follow
On bleating flocks, and on the lowing herds :
At last the malady——
Grew more domestic ; and the faithful dog
Dy'd at his master's feet ; and next, his master :
For all those plagues, which earth and air had
 brooded,
First on inferior creatures try'd their force,
And last they seiz'd on man.—

Besides, as the murrain in brute beasts often precedes the plague in man ; so too, as most authors have rightly observed, it no less frequently accompanies it ; and the rational and irrational animals mutually impart the infection to one another. Thus Thucydides, speaking of the plague of Athens, which our poet is going to describe, says, That the birds and beasts, that use to feed on human flesh, though many bodies lay above ground unburied, either avoided to come at them, or, if they tasted, perished : *Τὰ γὰρ ὄρνια, καὶ τὴν ἄποδα, ὅσα ἀνθρώπων ἀπὸ τῆς πόλεως, πολλὰν ἀτάφον γιγνομένων, ἢ ἐπὶ προσήτοι, ἢ, γινώσκοντα διφθέρητο.* Thucyd. To which he adds, That by the dogs this effect was seen much clearer, because they are familiar with men : *οἱ δὲ κύνες, λέγει, μάλλον αἰσθάνοντο παρῶν τῷ ἀποβαίνοντι, διὰ τὸ ζυγιάσθαι.* Boccace, in the Proemium to his Decameron, speaking of the violent plague that raged in Italy, in the year 1348, says expressly, and of his own knowledge, that the nature of the pestilence was such, that it imparted its contagion not only from man to man ; but that if the clothes of a person infected with that disease, or dead of it, were touched by any animal of another species, it not only infected that animal with the same distemper, but killed him in a very short time. Then he adds, what he had been an eye-witness of : That the tattered clothes of a poor man, who died of that pestilence, being thrown into the highway, two hogs came up to them, and after they had, as their custom is, tumbled them about with their snouts, taking them in their teeth, and shaken them about their cheeks, they in a very little time, after several times turning round, both dropped down dead upon them, as if they had eaten poison. “ Dico,” says he, “ che di tanta efficacia fù la qualità della pestilentia narrata, nello appiccarsi da uno all' altro, che non solamente l' huomo à l' huomo, ma questo, che è molto più, assai volte visibilmente fece, cioè, che la cosa dell' huomo infermo stato, o morto di tale infermità, tocca da un' altro animale fuori della spetie dell' huomo, non solamente della infermità il contaminasse, ma quello infra brevissimo spatio uccidesse, di che gli occhi miei, si come poco davanti è detto, presero tra l' altre volte un' di così fatta esperienza, che essendo gli stracci d' un povero huomo, da tale infermità morto, gittati nella via publica, et abbatendosi ad essi due porci, e quegli secondo il lor costume prima molto col grifo, et poi coi denti presigli, et scossigli alle guancie, in

piccola hora appresso, dopo alcuno avvolgimento, come se veleno havessero preso, amenduni sopra gli mal tirati stracci, morti caddero in terra.” Hippocrates nevertheless, will not allow contagious diseases to be promiscuous and common to all sorts of animals ; for he, in his Treatise de Flatibus, having asked this question, Why infectious distempers seize not all animals alike, but only some one species of them ? immediately answers : That one body differs from another body, one nature from another nature, and one nutriment from another nutriment : Nor are the same things alike beneficial or hurtful to all the several species of animals ; but some things agree with some animals, better than they do with others : Therefore, when the air is filled with such filth and pollutions, as are noxious to human nature, men only fall sick ; but when it is hurtful and offensive to any one of the other species of animals, then the disease seizes that species only. Thus Hippocrates ; and indeed the proposition he advances is true, whenever a disease seizes one sort of animals only, and leaves all the other safe and unhurt : But when several sorts of them labour under one common disease, that disease must have proceeded from the like cause ; and therefore their natures in some respects may be said to be alike also : And hence it is, that contagious diseases in brute animals sometimes precede, sometimes march hand in hand with, and sometimes follow, pestilential distempers in the human kind. Lucretius, therefore, is in the right to say, that plagues are promiscuous and common

—Hominum generi, pecudumque catervis.

WHETHER THE AIR BE THE SOLE CAUSE OF PLAGUES.

LUCRETIIUS, as we have already seen, is of opinion, that all infections and pestilential diseases and plagues owe their origin to the iniquations and corruptions of the air : But, before him, Hippocrates himself had advanced the same doctrine ; for, in his Book de Flatibus, after a long narration of the effects that the air produces, as well in the great world, as in the lesser, the body of man, he at length falls on the subject of diseases, all which he affirms to be bred and generated in the bodies of animals by means of the air : First, says he, I will begin with the most common feverous disease, which accompanies in some measure all diseases whatever. For there are two sorts of fevers ; one, that is promiscuous and common to all, and is called the plague ; the other, by reason of unhealthful diet, is peculiar only to such as use that diet ; but of both these kinds of fevers, the air is the sole author and cause : For the common fever, or plague, therefore happens to all, because they all breathe the same air ; and it is certain, that the like air, being alike mingled in like bodies, must beget the like fevers. Thus the great Hippocrates, whose authority nevertheless is not of such validity, as

to command our assent to this primacy of the air in all manner of pestilential diseases; for, let us grant, that a pestilent fever may be caused by the air, will it follow from thence, that every pestilent fever is so? and that they all proceed from the air only? In the first place, the logicians allow, that an indefinite proposition, when the consequent is not of necessity, is not of the same force with an universal: therefore, though we will admit, that a common fever is sometimes caused by the air, there is not any necessity, from the testimony alleged, but that we may substitute other causes of a pestilent fever, and even of the plague itself. Galen, in his *Treatise de diff. Febr.* observes, that pestilential fevers proceed sometimes from a great abundance of humours, whenever those humours have acquired, from the ambient air, the least tendency to corruption. And the same author, speaking of the above-cited opinion of Hippocrates, says: He was mistaken in ascribing the cause of epidemical diseases to the air only; for, when a famine raged in *Ænus* in Thrace, all that fed upon roots, lost the use of their legs; and such as eat vetches, were seized with violent pains in their knees. I have known too, continues he, that when, in a famine, people have been forced to eat corn that was half-rotten, they have fallen into a common disease, from that common cause; and sometimes too, when a whole army had been compelled to drink corrupted water, all the soldiers have been alike afflicted with a like disease. Thus Galen, who lived himself at Rome, when, in the reign of Marcus Antoninus, a raging plague, that was occasioned by a famine, desolated that city, and swept away multitudes of the Roman citizens. This, therefore, may suffice to invalidate the prerogative, which Hippocrates acknowledges to be due to the air, of its being the only promoter of plagues, since it is evident, that unwholesome food, and vitiated waters, have no small share in causing epidemical diseases. Let us now inquire, what, how much, and how, the air contributes to the communicating, or promoting of a plague.

Though the air be not the sole cause of a plague, yet it cannot be denied, but that it is very instrumental, as well in continuing its duration, as in bringing it into a country: But an universal plague, generally speaking, can owe its origin to nothing but contagion; for it must of necessity be first introduced, either by contact, or what foment and cherishes the infection. Nor is it in the least repugnant to this, that a particular plague is caused by the ambient air, provided it be granted, that such an infectious air comes from a near, not from a far distant, country; the want of reflecting on which distinction has, perhaps, been the cause of the mistake, and variance of opinions: For that tainted air, being agitated by the winds, blended with the immense mass of pure air, and coming from a great distance, cannot retain its ancient pravity; but the iniquations it had contracted, must be entirely broken, dispersed, and dissolved; which nevertheless, it cannot wholly lose in a short time, and coming

from a moderate distance. This is demonstrated by the example of strong odours, which strike the sense, if they come from a near place, but not when they come from one that is far distant; for those vapours, being agitated for any length of time, will be lost and destroyed; and their most tenuous substance will, according to the custom and nature of mixtures, convert and resolve it into its proper element. And therefore the air succeeds, but not precedes, a contagion, and may propagate a plague peculiarly, and by degrees; but not bring it universally, and all at once, into a healthful and uninfected country: In a word, the sum of all is, that the air does not begin, but propagates the contagion, that is already begun; especially when it is tainted with the pollutions, that proceed from the corruption of infected bodies.

Ver. 1089. In this and the three following verses, the poet says, that we incur a like danger, when we travel into a country, whose air is unhealthy, or disagrees with our constitution, as we do, when nature introduces into our bodies a tainted and corrupted air, or any other new thing, to which we have not been accustomed, and that is hurtful to us.

Ver. 1093. Hitherto he has been treating of the corruption of the air, or the cause of a plague, which is a disease that gains ground in such a manner, that, arising for the most part from small beginnings, it increases by degrees, and spreads itself far and wide. Now, from this verse to the end of the book, the poet gives us a description of that memorable plague, which broke out in Attica, in the first year of the Peloponnesian war; and laid waste that whole country, as well as the city of Athens, the metropolis of it. Thucydides, who was himself both a spectator and sharer of it, has described it no less accurately than elegantly, in the second book of his history: Hippocrates too, who was likewise an eye-witness of it, not only, as a private man, lent his assistance, and, for the public good, extinguished and put to flight that raging pestilence, for which reason he obtained divine honours of the Athenians; but has also left a lively relation of it in his third *Book de Morb. Popul.* Our Lucretius embraced the same argument, and, in the following description of that plague, has copied after those two authors, but more particularly after Thucydides, whom he has imitated so happily, that Macrobius *Saturnal. lib. vi. cap. 2.* says that Virgil has borrowed from him in his second *Georgic*, as Ovid most visibly has in his seventh *Metamorphoses*. Now, in these twelve verses, Lucretius teaches, that the plague of Athens, which he is now beginning to describe, proceeded from the same causes, he has mentioned already; but plagues generally come from foreign countries, and therefore he says this came from Egypt to Athens; yet, according to Thucydides, it came from a remoter distance; for he brings it from *Æthiopia*, which is beyond Egypt.

Lucretius says,

Finibu' Cecropiis funestos reddit agros.

For Athens was first called Cecropia, from Cecrops, who built it, and was the first king, and legislator of the people of Attica, whom, says Suidas, he assembled together, and divided them into twelve tribes; but before his days they lived scattered up and down in villages.

Ver. 1095. *Poisonous wind.* This Lucretius calls "morbifer æstus;" but what he means by it is uncertain, though he seems to intend that deadly heat and strength of the disease, which, like a raging fire, consumed and destroyed all it seized on. Therefore, by the word "æstus" may be understood, either the heat of the plague; since a plague is either a fever, or never without a fever: or else we may understand the great abundance of the infectious air; since the poet has above imputed the cause of the plague to the very corruption of the air; and this seems to have been the opinion of our translator: or, lastly, and rather than any of the two other explications, we may interpret it to mean the vehement heat of the air; since Æthiopia and Egypt, from whence the plague came to Athens, are countries excessively hot.

Ver. 1097 Thus too Thucydides "Ἡρξάτο δὲ τὸ μὲν πρῶτον αἷς λήγεται ἐξ Ἀιθιοπίας τῆς ὑπὲρ Αἰγύπτου ἔπειτα δὲ καὶ ἐς Αἰγύπτου καὶ Λιβύην καὶ ἐς τὴν Βασιλίαν γῆν τὴν πολλήν· ἐς δὲ τὴν Ἀθηναίων πόλιν ἔξαπναιώς ἐνίσταται. It began, by report, first in that part of Æthiopia, that borders upon Egypt, and then fell down into Egypt and Libya; and into the greatest part of the territories of the king. It invaded Athens on a sudden.

Ver. 1099. Lucretius has given no occasion for this and the following verse; which are borrowed from the bishop of Rochester's plague of Athens, where, in Stanza iv. we read,

The loaded wind went slowly on,
And, as it pass'd, was heard to sigh and groan.

Ver. 1101. Hitherto the poet has been treating of the causes of plagues in general: and particularly of that of Athens, which he is about to describe: Now the learned in physic tell us, that an infectious disease may be caught three several ways: the first they call, "per distantiam," by which they mean, when the tainted or corrupted air is breathed and swallowed by such as are at some distance from the persons infected: the second, "per contactum," that is, when we are near, and touch those that are visited with the plague. Hence, as Ovid says,

—Inque ipfos sæva medentes
Erumpit clades; obsuntque auctoribus artes.

To which he adds soon after;

Quod proprior quisque est, servitque fidelius æ-
grum,
In partem lethi citius venit.——

The third they call, "per fomitem," by which they would have us understand, when the vitiated, infectious air is a long time preserved in clothes, wool, &c.

Ver. 1103. To the same purpose Dryden, describing the desolation and havoc of a plague, says finely:

And then a thousand deaths at once advanc'd,
And ev'ry dart took place; all was so sudden,
That scarce a man fell: one but began
To wonder, and straight fell a wonder too:
A third, who stoop'd to raise his dying friend,
Dropp'd in the pious act. Heard you that groan?
A troop of ghosts took flight together there:
Now death's grown riotous, and will play no
more

For single stakes, but families and tribes:
With dead and dying men our streets lie cover'd;
And earth exposes bodies on the pavements,
More than she hides in graves.——

Between the bride and bridegroom have I seen
The nuptial torch do common offices
Of marriage and of death. Cast round your eyes,
Where late the streets were so thick sown with
men,

Like Cadmus' brood, they jostled for their pas-
sage,

Now look for those erected heads, and see them,
Like pebbles, paving all our public ways.

Tragedy of Oedipus.

For it is the nature and property of a plague, grown adult, and in the height of its raging, that many persons should be visited by it at once, and many die of it: But it has been disputed by physicians, whether it can be called a plague at its first breaking out, and while only one or two are sick of it; which some positively affirm, but others as strenuously deny. It cannot indeed be controverted, but there are definitions of things grown to perfection: Thus mankind, while yet in their infancy, can scarcely be said to be endued with reason. In like manner a plague, just breaking out, is not indeed common, but will be so, unless it be timely prevented: However, it is truly a plague, though but ten persons are sick of it, nay, if but one.

Ver. 1105. Here the poet, in eighteen verses, enumerates the several and chief symptoms and tokens that were observed in those that were visited with this plague of Athens. I. An extreme heat in their head. II. An inflammation of the eyes. III. Ulcers in the throat, and an emanation of blood from thence. IV. A roughness of the tongue, and such a heaviness, that they could scarce move it; together with ulcers; and putrid blood flowing from thence likewise. V. A noisome stinking breath. VI. Fainting fits, or swoonings. VII. Dejection of the mind. VIII. Groans and complainings. IX. Frequent, convulsive yexings, or hickets.

Thus too Thucydides: Πρῶτον μὲν τῆς κεφαλῆς θερμαὶ ἰσχυραὶ, καὶ τῶν ὀφθαλμῶν ἐρυθρίσματα, καὶ φλόγαις ἱλάμβανεν. They were first taken with an extreme heat in their heads, and with a redness and inflammation of the eyes. Thus, says that historian, upon whom the bishop of Rochester has paraphrased as follows:

Upon the head, first, the disease,
As a bold conqueror, does seize,
Begins with man's metropolis;
Secur'd the capitol, and then it knew,
It could at pleasure weaker parts subdue:
Blood started through each eye:
The redness of that sky
Foretold a tempest nigh.

Ver. 1107. This verse our translator has added to his author.

Ver. 1108. In like manner Thucydides: *Καὶ τὰ ἐντὸς, ἥτε φάρυγξ, καὶ ἡ γλῶσσα ἐκθύς αἱμαίνοντο*. i. e. And inwardly their throats and tongues grew presently bloody. This third is indeed a dreadful symptom, and an infallible mark, that the economy of the whole body was vitiated. Mattheus Villanus relates, that in the plague which raged in Italy in the year 1348, they were afflicted almost in the same manner; and that when they were seized with the disease, they either died suddenly, or the next day, or lived but to the third at farthest. This too is confirmed by Guido Cauliacus, lib. ii. cap. 5. the Pope's surgeon, and an eye-witness of it; who, besides, voluntarily deposes, that the mortality was so great in all the places infected, that scarce a fourth part of the inhabitants were left alive.

Lucretius says,

Sudabant etiam fauces intrinsecus atro Sanguine. —

i. e. And inwardly their jaws and throats sweated out black blood: where the word "sudabant," they sweated, is not spoken figuratively, but properly, for the blood was forced out "per diapedesim," i. e. by transcolation, or exudation; for so they generally interpreted that word. Now this sweating, or oozing out of blood, was occasioned by the weakness and decay of the retentive power that resides in the small veins; besides, the whole mass of blood being enormously vitiated, it stimulated and urged nature to that excretion.

Ver. 1109. This fourth symptom of the Athenian plague, of which Thucydides is silent, Lucretius has taken from Hippocrates, de Morb. Popul. lib. iii. cap. 3, 10, 11. where that author represents it to be no less fatal than the former, and says it proceeded from the same cause.

Ver. 1111. Lucretius says, "motu gravis," heavy in motion. Galen, in Com. 1. takes notice of this symptom, and says, it was caused by the imbecility of the animal faculty, and the exorbitant plenty of the humours that the tongue had imbibed.

Ibid. *Rough.*] Though the tongue, says Galen in the place above cited, had imbibed a great abundance of humour, yet that humour being exceeding hot, hindered not the tongue from being rough and scurfy, as it constantly was, by reason of the too much heat that exhaled from the "præcordia."

Ibid. *Scarce could make a moan.*] This thought our translator has added to Lucretius, and taken

it from the B. of R. who, in his plague of Athens, Stanza 11. says,

The tongue did flow all o'er
With clotted filth and gore;
As does a lion's, when some inn'cent prey
He has devour'd, and brought away.
Hoarseness and fores the throat did fill,
And stopt the passages of speech and life:
No room was left for groans or grief:
Too cruel and imperious ill,
Which, not content to kill,
With tyrannous and deadly pain,
Dost take from men the very power to complain?

Ver. 1113. What Lucretius represents in these seven verses, Thucydides relates as follows: *Καὶ ἐν ἑπολλῷ χρόνῳ κατὰβαινον ἐς τὰ στήθη ὁ πόνος μετὰ βήχος ἰσχυροῦ, καὶ ὅποτε ἐς τὴν καρδίαν σφραζαίνοντο, ἀνίσταί τε αὐτὴν, καὶ ἀποκαθάρσις χολῆς παύσαι, ὑπὲρ ἰατρῶν ἀνομασμέναι εἶσιν, ἰπήμεσαν καὶ αὐτὰς μετὰ ταλαιπωρίας μεγάλης* that is to say, not long after the pain, together with a mighty cough, came down into the breast; and, when it once settled in the stomach, it caused vomit; and all manner of bilious purgation that physicians ever named came up with great torment. Lucretius takes no notice, neither of the vehement coughing, which no doubt proceeded from a convulsion of the trachea or windpipe, nor of the other symptoms of sneezing and hoarseness, which are likewise mentioned by Thucydides. *Ἐπειτα*, says he, *ἐξ αὐτῶν πῦρμος καὶ βράγχος ἐπιγίγντο.*

Ver. 1114. *The heart*] He means the stomach: For here our translator has literally followed his author, who makes use in this place of the word "cor," which sometimes signifies the stomach; as the *καρδία* of the Greeks, which signifies likewise both "cor" and "stomachus." Thus the Scholiast, on the foregoing passage of Thucydides says, *Οἱ παλαιοὶ ἰατροὶ τὸν στήμαχον καρδίαν ἐκάλεον, καὶ καρδιαγμον τὸν πόνον τῆς στήμαχος*. i. e. The ancient physicians called the stomach the heart, and a pain in the stomach, a pain in the heart.

Ver. 1115. When the disease was got down into the stomach, there followed a stinkingness of breath, says Lucretius, like the stench that exhales from dead bodies. Thus too the B. of R.

Then down it went into the breast;
There all the seats and shops of life possess'd:
Such noisome smells from thence did come,
As if the body were a tomb.

Now these offensive smells must have proceeded, either from the putrefaction of the humours, or of the lungs, or rather of both, which seems more consonant to reason, as well as to the opinion of Hippocrates, who, Epidem. 3 5. 3 relating the symptoms of this plague, makes mention of many putrified parts: nor can it be doubted but that the infected Athenians were then troubled with a peripneumony, by reason of the great defluxion of vitiated blood that fell upon the lungs. Now a stinking breath is held to be an ill symptom in all diseases, but worst in epidemical: For, if what Galen, 3 de Prælag. ex

Pulſib. cap. 4. obſerves, be true, that whatever is vitiated does not putrify, but that noiſome ſmells are a certain mark of putrefaction; a rottenneſs of humours, or of parts, muſt have been added, by way of over-measure, to this fatal corruption. It has been obſerved, that many, who, when they were in health, had ſtinking breaths, have died a ſudden death; the reaſon of which was, becauſe the whole ſubſtance of their lungs was by degrees putrified; but, what a long catarrh can perform in the courſe of a man's life, a plague may accompliſh all at once, by reaſon of its greater efficacy; and therefore a ſtinking breath is certainly a dangerous ſymptom in peſtilential diſeaſes.

Ver. 1118. What Lucretius here ſays of the general dread that had ſeized the Athenians, affords us an opportunity to make the following inquiry.

WHETHER FEAR PROMOTES AND PROPAGATES A PLAGUE.

CONSTERNATION and dejection of mind are never beneficial, not even in health; but they are prejudicial in all diſeaſes, and worſt of all in a plague: Hence Lucretius more than once makes mention of it; and gives us a handle to inquire, I. Why is it ſo? And, II. Whether what ſome have aſſerted to be true, viz. That the plague is caught by bare imagination only? To begin with the laſt: They who hold the affirmative, are not content it ſhould be granted, that, by the ſtrong apprehenſion of the patient, an infectious diſeaſe may be brought upon him; but they inſiſt likewiſe, that it may be imparted to him by witches, or other ill-minded perſons: theſe opinions ſpring from this belief; that our fancy can affect, and work upon, not only our own body, but thoſe likewiſe of others. Theſe things might paſs for idle tales, were it not, that, under the mask and diſguiſe of imagination, were concealed the arts of the ſworn enemy of mankind, by whoſe perſuaſion and aſſiſtance plagues and ſorceries are ſometimes propagated in the world: I doubt not of the ill, malicious habit of mind which his votaries may have contracted; but that alone, without his more powerful aid, to whom, for the horrid ſins of mankind, is permitted a power to do hurt, is unable to affect others.

The other opinion, which imputes the infection of a plague to the ſtrong apprehenſion of the patient, ſeems, at firſt ſight, to carry with it a greater ſemblance of truth; for no man ever controverted the ſtrength of imagination in regard to its operations on a man's own body; thus we ſhudder, and our very blood cruddles within us, on the bare remembrance of any horrible action; we rejoice, even when the object of our joy is abſent; we grow angry, though no man provokes us; let us but fancy ourſelves applauded, we exult for joy; and Nardius relates, that he knew a fanciful ſilly woman, who ſoon experimented in her own body the diſeaſes under which ſhe had heard her acquaintance or relations were

labouring. Such things have certainly a reliſh of hypocrify or madneſs: For what the ſticklers for the ſtrength of fancy fooliſhly allege, of I know not what intentional form, as they term it, that is able to introduce itſelf into any matter that is prepared and made ready to receive it, are mere trifles, and fictitious day-dreams of ſuperſtitious men: For no man in his ſenſes ever threatens, or heartily wiſhes ill to himſelf; nor does he wilfully and induſtriouſly endeavour to increaſe a peſtilential diſeaſe; but he hates, abhors, and fears it; which laſt is, perhaps, the trueſt cauſe of the propagation and continuance of a plague.

Fear and ſorrow are powerful agents, and produce wonderful effects in the minds of men: for, as Galen obſerves, a violent fear kills immediately; and one that is leſs vehement, but of long duration, is no leſs fatal. Fear dejects the mind, and dimin iſhes the ſtrength; even at the firſt aſſault it overwhelms the ſpirit, and contracts the blood, cauſing a refrigeration and chillneſs of the exterior parts of the body: For theſe reaſons, in ſuch as are ſeized with fear, the pulſe, as well of the arteries as of the heart, is very ſmall, and extremely weak. Vide Galenum, 12. Meth. cap. v. 5. de loc. Off. cap. i. 4. de Ca. Pulſ. cap. v. 2. de Symp. Caſ. cap. ii. de Tre. Rig. cap. ii. 2. de Symp. Ca. cap. v. And the ſame author, in his Treatiſe de Pul. ad Tyr. and in his fourth de Caſ. Pul. cap. iv. accurately diſtinguiſhes the difference of pulſes, according to the nature and quality of fear. In a ſudden and violent fear, he believes the pulſe to be quick, quivering, diſordered, and unequal; in a fear of long continuance, he holds the pulſe to be little, languid, ſlow, and rare: This laſt ſort of pulſe he aſcribes likewiſe to the effect of ſorrow, between which, ſays he, and a fear of long duration there is no difference: for in both of them the ſtrength is impaired; and that failing, the pulſes cannot be unlike; becauſe, according to the ſame author, in thoſe whoſe ſtrength is infirm, and, by reaſon of their ignorance, the affections and paſſions of the mind, forceful and ſtrong, the eſſence of the ſoul may eaſily be diſſolved. Now, that by the word ſoul he means the life itſelf, is manifeſt from what he ſays, 12. Meth. cap. v. that the eſſence of the life of man is corrupted by the affections of the mind; and that all great fears, though they do not kill outright, yet they certainly render the ſpirit infirm, and eaſy to be diſſolved; but ſorrow and anxiety are hurtful, becauſe they impair the ſtrength. And to theſe opinions of Galen, Lucretius himſelf ſubſcribes, in theſe verſes:

Verum ubi vehementi magis eſt commota metu
mens,
Conſentire animam rotam per membra videmus:
Sudoremque ita, palloremque exiſtere toto
Corpore, et infringi linguam, vocemque oboriri,
Caligare oculos, ſonere aureis, ſuccidere artus:
Denique concidere ex animi terrore videmus
Sæpe homines. — Lib. iii. ver. 153.

The interpretation of which the reader may find above, book iii. ver. 150.

These, then, are the effects that fear and imagination produce in the body they seize on: and if an infectious pestilential air meet with a body thus ill-disposed already, that body will soon imbibe the contagion, and fall sick of the disease, being unable to struggle against it, by reason of the weakness it has already contracted. Rightly, therefore, has Thucydides, taking notice of the two greatest miseries of the Athenian plague, the *ἀθυμία*, or consternation of the mind, and the inevitableness of the contagion, given the preference to the consternation of mind, and assigned it as one of the chief causes of the mortality that raged among them. Δεινότατον, says he, δι παντός ἦν τῇ κακῇ ἢ τῇ ἀθυμίᾳ, ὅποτε τις αἰσθάνοιτο κέμενων, πρὸς γὰρ τὸ ἀνέλπιστον ἐνθὺς τραπέμενοι τῇ γνώμῃ, πολλὰ μάλλον προέειρε σφᾶς αὐτὰς καὶ ἐκ ἀντέειχεν. i. e. But the greatest misery of all was, the dejection of mind in such as found themselves beginning to be sick; for they grew presently desperate, and gave themselves over without making any resistance. And, in the last age, during the siege of Breda, it was observed, that the plague which then raged, either abated or increased as the minds of the soldiers were either raised with hope or depressed with fear. So great are the effects of consternation of mind!

Ver. 1120. These so many and so intolerable ills of the body were attended, says the poet, with a perpetual anguish of mind, which occasioned unmanly groans and complainings. Plutarch relates of Pericles, that though, with unweeping eyes, he had beheld the funerals of so many of his friends and relations, yet the death of his only surviving son extorted from him some unwilling tears: and that the plague, that malignant inmate, had by little and little corrupted the body of that magnanimous man, and overcome his fortitude and strength of mind: for, while he was languishing under that disease, he showed a friend, that came to visit him, some charms and incantments that hung about his neck, and women had tied upon him; which evidently prove the disorder of his mind, that could be prevailed on to condescend to such superstition. Thus says Plutarch, in his Life.

Ver. 1122. Lucretius says, "Singultus frequens," a frequent hicket: And for the better understanding of this ninth symptom, it will be necessary to recite the words of Thucydides, relating to it, and that are as follows: Λύγξ τε τοῖς πλείουσιν ἐνίσταται κινή, σπασμὸν ἐνδιδύσα ἰσχυρόν, τοῖς μὲν μεταστᾶντα λωφίσαντα τοῖς δὲ καὶ πολλὰ ὕστερον that is to say, most of them had likewise an empty hicket, which brought with it a strong convulsion, and in some it ceased quickly, but in others was long before it gave over. Now, according to the common opinion of physicians, the hicket is a convulsion of the stomach: but Galen, weighing the matter more narrowly, and considering that the muscles only are convulsed, and that neither the ventricle, nor the mouth of it, are either muscles, or perform the function of muscles, says, in his third book, de Sympt. Caus. cap. 4. that the hicket is only a depraved motion

of the mouth of the ventricle, that endeavours to expel what is offensive and troublesome to it, which could not be wanting in our case; for the pestilential defluxion falling down through the throat, and a great quantity of bilious matter regurgitating from the liver, into the stomach, were certainly offensive to it, and sufficient to cause the hicket, which was of longer or shorter continuance, according to the greater or less quantity and protervity of the offending matter. But to whom are we to give credit; to Lucretius, who calls it "frequens singultus," a frequent hicket; or to Thucydides, who calls it λύγξ κινή, an empty hicket? Lambinus, overcome, perhaps, by the difficulty of the matter, as it often happens to such as meddle with the affairs of others, very boldly corrects the historian, and gives more credit to a poet that lived long after, than to an eye-witness that writes what he saw. The learned F. Paulinus comes nearer to the point, and believes that the hicket is said to be empty from the cause that produces it, that is to say, exinanition: for both Hippocrates and Galen allow, that there are two causes of convulsion, the repletion, and the exinanition, or emptiness of the nerves. And the last of those authors admonishes, that a convulsion, proceeding from the exinanition of the nerves, is the worst symptom in a hicket. But in this case of the plague of Athens, there cannot be the least ground to suspect any emptiness; since, as we said before, there was a copious and continual defluxion of humours. Besides, it is notorious, that there are other causes of convulsions, than those before mentioned; and from which it is more probable, that the violent and laborious hicket proceeded: for why might not they who were visited with a plague, have a frequent and empty or fruitless hicket? The first was a token of the pertinacity of the molesting cause, the other of the ineffectual fatigation: for, as Galen, 3. de Sympt. Caus. cap. 1. witnesses; in vomits, those things are thrown up that are in the cavity and space of the ventricle; in hickets, those that adhere to the very body of the ventricle, the disposition and motion being both alike. As, therefore, what the physicians call *nausea*, is a vain and fruitless vomit, and consequently the more fatiguing; so too is a hicket, when nothing is brought up.

Ver. 1125. In these eighteen verses, the poet takes notice of several other symptoms and tokens, that happened to those who were visited with this plague. First, says he, the exterior parts of their bodies were not hot to the touch, but only warm; yet they looked somewhat red, and were beset with small pustules, as is the body of those that have the St. Anthony's fire: nevertheless they burned inwardly to such a degree, that they could not endure to wear the slightest clothes, nor any the thinnest covering upon them: and it availed them nothing to expose their bodies to the cold and wind, nor to leap into rivers, or go down into wells; nor could any quantity of water quench their thirst.

Hippocrates, in 3. Epidem. c. 34. speaking of

this plague, says, that the fever which attended it was *ὁξὺς*, not acute: and Galen, 9. de Sympt. Caus. cap. 9. says of pestilential fevers in general, that they are not violently hot. Now the reasons that physicians give us, why some bodies in pernicious diseases are barely warm, and the extreme parts of others even cold, are these: Some, say they, are warm, by reason of their small provision of natural heat, or because of their age; as in the old, in whom, according to the observation of Hippocrates, 6. Epidem. cap. 19. fevers are the less acute, because, says he, their body is cold: others are warm in fevers, by reason of their natural constitution, having from their birth laboured under a want of spirits and blood: besides, in some diseases, the like disposition is acquired: sometimes too the humours, stagnating in the outmost little vessels, hinder the inwardly conceived heat from breaking out; and the same humours, whenever they are heated, do, according to the difference of their nature, impart a different degree of heat; for one sort of heat attends an adust choler, another a putrifying phlegm: Tepidity is likewise caused in a malignant corruption, by reason of the inwardness and profundity of the fire, and the nature of the disease, which threatens death to the patient, not by manifest symptoms, but by a clandestine corruption of the whole substance. The extreme parts and members of the body are cold and livid in those whose vital faculty is utterly decayed, and dying away. They likewise are cold outwardly, whose almost total natural heat is retired to, and gathered about their inflamed entrails, in order to succour decaying nature. And one or more of these reasons concurring, will cause the patient to be either barely warm, or even cold, outwardly, and to the touch.

Ver. 1128. *The sacred fire*] "Sacer ignis," says Lucretius, by which name the Latins know the disease, which the Greeks call *ἑρπιδίαι*, and we St. Anthony's fire, of which, according to Celsus, there are two sorts, thus described by him. "Sacer quoque ignis malis ulceribus annumerari debet; ejus dux sunt species: alterum est subrubicundum, aut mistum rubore, atque dolore, exasperatumque per pustulas continuas, quarum nulla altera major est, sed plurimae perexiguæ: alterum autem est, in summæ cutis exulceratione, sed sine altitudine, latum, sublividum, inæqualiter tamen," &c. Celsus de Re medicâ, lib. vi. cap. 28. But in this passage of our author, we are to understand the first sort of that disease, which, as described above by Celsus, is an ulcerous eruption, reddish, or mixed of pale and red; and painful to the patient, by reason of the continued pustules or wheals, not one of which is bigger than another, though there be an infinite number of them, and all extremely small. Which description of Celsus seems to represent to us the disease that physicians commonly call "herpes miliaris," from the figure and frequency of the small blisters or wheals, which, rising on the uppermost skin, and standing out but very little, are not unlike to millet seed, sown or scat-

tered thick upon the ground. The disease which they call Herpes only, is likewise a kind of St. Anthony's fire, and seems to be the same that Pliny, lib. xxvi. cap. 11. calls Zoster, and Scribonius Largus, c. 106. Zona: this disease comes on the middle of the body, and, if it compass it about, is mortal; as, in the last age, according to J. Langius, epist. 32. it proved to be to the Marquis of Brandenburg. Some call it the shingles; some, the running-worm; and some, wild-fire. But the erysipelas, that afflicted the infected Athenians, though but a cutaneous disease, must nevertheless have been very troublesome to them, both on account of its filthiness, and because it incommoded them, either standing or lying down.

Ver. 1129. Thucydides in like manner describes this outward tepidity, and inward burning of the infected, in these words *Καὶ τὸ μὲν ἔξωθεν ἀπτομένη σῶμα, ὥς ἂν θερμὸν ᾖ, ὅτι χλαρὸν, ἀλλ' ὑπὸ ὄψεσιν, πικρὸν, φλυκταίναις μικραῖς καὶ ἰλκυσιν ἑρπητοῦσιν: τὰ δὲ ἐντὸς ὕπαις ἰκαίτο, ὥς μήτε τῶν πάντων λεπτῶν ἱμαστίων καὶ συνδόνων τὰ, ὑπὸ ὄψεσιν, μήτ' ἄλλ' ὅτι, ἢ γυμνὸν ἀνίστασθαι.* Their bodies, says he, outwardly to the touch, were not very hot, nor pale, but reddish, livid, and beset with little pimples and wheals; yet inwardly, they burned to that degree, as not to endure any the lightest clothes, or linen garments to be upon them, nor any thing, but mere nakedness. Thus Thucydides: to which I add what Hippocrates, Aph. 48. teaches, that in fevers, which have no intermission, it is a fatal symptom, when the outward parts of the body are cold, and the inward burning.

Ver. 1131. This thought our translator has not copied from his author, but is beholden for it to the Bishop of Rochester, who, in his Plague of Athens, stanza 17. says,

So strong the heat, so strong the torments were,
They, like some mighty burden, bear
The lightest covering of air:
All sexes and all ages do invade
The bounds which nature laid,
The laws of modesty, which she herself had made:
The virgins blush not, yet uncloth'd appear;
Undress'd they run about, yet never fear:
The pain and the disease did now
Unwillingly reduce men to
That nakedness once more,
Which perfect health and innocence caus'd before.

Ver. 1135. Diodorus Siculus, in the twelfth book of his History, speaking of this plague, says, that the sick felt so intolerable a heat within them, that many cast themselves into the very wells and fountains, hoping to cool and refresh their bodies. But Thucydides relates this better, and more consonantly to truth. "Ἦδιστα, says he, τὰ ἂν ἐς ὕδωρ ψυχρὸν σφῶς αὐτὰς ρίπτειν, καὶ πολλὰ ἰδρασμένους φρέσιν τῇ δίψῃ ἀπαύσαντες ἐπιχόμενοι καὶ ἐν τῷ ὁρώσῳ καθεύδειν τὰ τε πλεον καὶ ἔλαττον ποτόν." That is to say, they would most willingly have cast themselves into cold water; and many of them, that were not looked to, possessed with in-

fatiable thirst, ran to the wells; and to drink much or little was indifferent. This insatiable thirst with which they were tormented, is finely described by the B. of R. in the poem above cited, stanza 16.

The streams did wonder, that so soon
As they were from their native mountains gone,
They saw themselves drunk up, and fear
Another Xerxes' army near.
Some cast into the pit the urn,
And drink it dry at its return;
Again they drew, again they drank:
At first the coolness of the stream they thank;
But strait the more were scorch'd, the more did
burn,
And, drunk with water, in their drinking sank.
Some snatch'd the waters up;
Their hands, their mouths the cup:
They drunk, and found they flam'd the more,
And only added to the burning store.
So have I seen on lime cold water thrown;
Strait all was to a ferment grown,
And sudden seeds of fire together run:
The heap was calm and temperate before,
Such as the finger could endure;
But when the moistures it provoke,
Then did it rage, and swell, and smoke,
And move, and flame, and burn, and strait to
ashes broke.

—The heat,
Or still increas'd, or still remain'd as great.
Lucretius says,
*Insedabiliter sitis arida corpora mersans
Æquabat multum parvis humoribus imbrem.*

i. e. So great and so unquenchable was their thirst, that a great quantity of water seemed to them to be but a little water. But some, instead of *parvis*, read *pravis*; and then the sense must be this: The malignancy of the humours, which were the cause of their thirstiness, equalled, and at length eluded the great plenty of water they drank: Hence it came to pass, that they who drank but little, underwent the like danger with those who drank a great deal; for their thirst was not extinguished, though they drank ever so much. This last interpretation seems to agree best with the passage of Thucydides next above cited.

Ver. 1137. This and the three following verses our translator has added, by way of paraphrase, to his author.

Ver. 1141 In these three verses, he teaches that no remedy could be found to expel this disease, so new and unknown till then was this raging pestilence. Thus too Manilius, speaking of this plague:

*Qualis Eriethæos pestis populata colonos
Extulit antiquas per funera pacis Athenas,
Alter in alterius lubens cum fata ruebat;
Nec locus artis erat medicæ: nec vota valebant:
Cesserat officium morbis, & funera decrant
Mortibus & lacrimæ: fessus defecerat ignis,
Et coacervatis ardebant corpora membris.*

Which Sir Edward Sherburne thus renders:

Through Erethean lands when that plague
stray'd,
And Athens waste by peaceful fun'erals lay'd,
When each contracted others death, then art
No cure could find, nor pray'rs could help impart:
Care to the sick, and fun'erals to the dead, [shed:
Ev'n tears were wanting: those no mourners
The weary'd flame did from its office cease,
And heaps of fir'd bones burnt the dead carcases.

But if our poet in this place, as in others, imitates Thucydides, then this is not his meaning: for that historian only says, that whatever remedy was applied to procure sleep to the sick, they were still as far from ease, and the power to sleep, as ever.

Ver. 1144. Hippocrates, Epidem. 6. says, that nothing is more destructive of human nature, or impoverishes and wastes the spirits, blood, and strength more, than watching, and want of sleep. Truly therefore does Ovid sing,

*Quod caret alternâ requie durabile non est:
Hæc reparat vires, fessaque membra novat.*

Heroid. Epist. 3.

See the note on book iv. ver. 905. And the physicians observing this fatal symptom, had reason, as Lucretius expresses it, "*tacito mullare timore*," to mutter to themselves for fear: for, being at a stand what to do, they went away without prescribing, and left their patients in despair of relief. This symptom too, and the effects of it, are finely described by the Bishop of Rochester.

No sleep, no peace, no rest,
Their wand'ring and affrighted minds possess'd:
Upon their souls and eyes
Hell and eternal horror lies:
Unusual shapes and images,
Dark pictures and resemblances
Of things to come, and of the world below,
To their distemper'd fancies flow.
Sometimes they curse, sometimes they pray
The gods above, the gods beneath;
Sometimes they cruelties and fury breathe:
Not sleep, but waking now, was sister unto death.
Plague of Athens, stanz. 17.

Ver. 1146. In these fourteen verses, he mentions many other tokens of death, that happened to those who were visited with the plague: and which he has chiefly taken from Hippocrates, in Prognost. For Thucydides scarce mentions any of them.

Ver. 1148. Lucretius says,

"*Perturbata animi mens in mœrore metuque*:"

In which the poet intimates, a total dejection of mind, occasioned by too deep a sense and apprehension of the dangerous state they were in, and which was inevitably followed by desperation; and all this was only the necessary effect of their disease: for the attrabileous blood, that was engendered by the violent adustion, irrigated the internal parts of the diseased: and, by the unanimous consent, and constant observation of phy-

cians, melancholy, fear, sorrow, and the like, are the necessary consequences of such blood, as well as of any other melancholic, excessive humour: I say, excessive: for, though men, in whose bodies any melancholic humour prevails, are naturally inclined and subject to grief and fear; yet, if that humour be not excessive, and, either in quantity or quality, transgress not the bounds of nature, it never seduces or overthrows the mind.

In the original we read,

"Triste supercilium; furiosus vultus, & acer."

i. e. Disconsolate eyes, and frowning eye-brows, together with a sternness and wildness of look. These symptoms, of which Thucydides is silent, Lucretius has borrowed of the Coan dictator, who, in Coac. Præfag. lib. i. sect. ii. cap. 3. teaches, that a good colour in the face, with a wildness of aspect, is an ill sign in acute diseases; in which too, frowning eyebrows are a mark of frenzy. But, as we shall hear by and by, the constitution of the whole face was altered and amiss; therefore it portended something worse than frenzy. But though a frowning forehead presage a frenzy, in acute diseases; because the blood, by reason of its corruption is degenerated into a plenteous quantity of bileous and melancholic humour; yet it is often observed in some, even when they are in perfect health; nor does it portend any thing dreadful in them; though some are apt to be shy of their conversation. But the sternness and wildness of countenance, mentioned by Lucretius, was a most certain token, not of an eminent, but of a present frenzy, occasioned by the inflammation of the bileous humour, accompanied by the corruption that bred it, either in the præcordia, or in the brain, that already sympathized with the inferior parts.

Ver. 1149. Lucretius says,

"Creber spiritus, haud ingens, raroque coortus."

For the better understanding of which, we must take notice, that the respiration in animals, which is truly a mixed function, it being both natural and voluntary, was excellently instituted by provident nature, chiefly for the refreshment of the heart: for when she had made the heart the chief seat and residence of the innate heat, from whence that vivifying and lively power is, through the tubes of the veins and arteries, as likewise through invisible pores, communicated to the body of the animal, it was of necessity, that this member should be hot, and, in some measure, inflamed itself, that it might supply with warmth all the other members. But this inflammation would have been fatal, or, according to the nature of all fires, a most certain suffocation had ensued, had she not wisely provided against it, as well by the introduction of cooling air, as by the expulsion and excretion of the fuliginous vapours, engendered in the heart; the first of which is performed by inspiration; the last, by what we call expiration. But between both these reciprocating and alternate motions two rests or intervals necessarily intervene: wherefore the chief differences of respi-

ration are distinguished, in regard to the time of the motion, into

Quick moderate, slow,

In regard to the rests, or intervals, into

Thick, moderate, rare:

And, in regard to the extension of the organs into

Great, moderate, small.

Now, the organs of respiration are the whole thorax, but chiefly the midriff; on whose motion the lungs are extended every way, and receive the external air: but when the midriff ceases to move, the lungs fall down, and breathe out the superfluous air, together with the humid nocent exhalation; and by these alternate breathings, the indemnity of the ever-burning heart is wisely secured. Since, therefore, by the common consent of all, the vital faculty, and even life itself, are chiefly due to this member, it is consonant to reason, that they, who, by rules of art, are to judge of the issue of a disease, and to the state of their patients, should, almost preferably to the motion of their arteries, observe the manner of their breathing, which nature governs, according as the heart requires. With good reason, therefore, has Lucretius, enumerating the fatal symptoms of those who were visited with this plague, taken notice of this difficulty and disorder of their respiration, which he expresses after the manner of physicians, making a threefold distinction of it. These several disorders of their respiration he has borrowed from Hippocrates, and the first he takes notice of, is, "creber spiritus," a thickness or frequency of breathing, which is spoken in regard to the rests or intervals: and this, says Hippocrates, in Prognostic. cap. 24. denotes a pain, or an inflammation in the parts that are above the præcordia: secondly, "haud ingens," not great, which admits of a double interpretation: either that, in regard to the extension of the organs, their respiration was moderate, and in due order; or small: both which nevertheless contradict Hippocrates, who, in the place above cited, says in express words, that their respiration was great and strong, with long intervals interposing: however, as Galen, in Prog. Com. observes, in the torment they suffered, their respiration might be both frequent and small, nature already growing weak, and tending to a decay; and their organs being disordered with inflammations. Thus too Hippocrates himself, in Coacis Prænotion, teaches that a frequent and small respiration betokens an inflammation and pain in the principal parts: now, we have heard already, that they were afflicted with a peripneumony and frenzy; wherefore their respiration, as Lucretius says, might be, "haud ingens," not great, but moderate; or, even in the other extreme, small, and below the due mediocrity, the third and last difference of their difficult respiration, and which Lucretius expresses by "raro coortus," a rareness or seldomness of breathing, relates to the time of the motion, and is explained by Galen, in Com. t. 24. Progn. where he teaches, that a rareness of breath,

that is to say, when the rests or intervals are long, if the respiration be great and strong in regard to the extension of the organs, indicates a delirium; if small, an extinction of the innate, or natural heat.

Ver. 1150. Lucretius says:

"Sollicitæ porro, plenæque sonoris aures:"

These were tokens that the humours were crept upwards by the duct of the arteries: and Hippocrates, in "Coacis Præfagiis," teaches, that sounds and noises in the ears, are a deadly symptom in acute diseases.

—Much and frothy sweat,
Spread o'er the neck;] Lucretius says,

"Sudarisque madens per collum splendidus humor."

And this too he borrowed from Hippocrates, in Progn. who there teaches, that sweats are very good in all acute diseases, if they happen at a critical time, and entirely allay the fever: that they are good likewise, if they come from the whole body, and make the patient the more easily bear his disease: but if they effect nothing of this, they are not in the least beneficial: that cold sweats, and such as come only about the head, face, and neck, are the worst of all, and, for the most part, very dangerous symptoms. Besides; those that labour under imposthumations, especially such as are caused by a pleurisy, or by an inflammation of the lungs, are subject to sweat about the neck. Thus Hippocrates: and from hence we see, that the peripneumony, or inflammation and imposthume of the lungs, under which the infected Athenians laboured, was the cause of this fatal symptom.

Ver. 1151. The words in the original are,

Tenuia sputa, minuta, croci continctâ colore,
Salsaque, per fauces raucas vix edita tussi.

Which is taken almost word for word from Hippocrates, in the place above cited: where he says, that the worst sort of spittle are those that are yellow, or of a reddish colour; or that cause a violent coughing, and that are thin, and come away in little quantity. Now Lucretius calls these spittles "tenuia," thin, which is a mark of their crudity, in regard to their substance; "minuta," that is to say, fewer than they ought to be, in regard to their quantity; "croci continctâ colore," yellowish, which was a mark of their bilious nature; and, "salsa," salt, which quality was due to the corruption of the humours, or to a mixture of salt and serious humidity: for these are the causes, that Galen himself, 2. de diff. Feb. cap. 6. assigns, of the saltness of humours. And then the poet, to show us that these were not only the excrements of the brain, that are often purged away by spitting, and are called spittle, adds, "per fauces raucas vix edita tussi," i. e. that they could scarce be thrown up, by coughing, through their hoarse sounding jaws: for it is the proper function and sole business of a cough, to serve the members that are employed in respiration, and to

TRANS. II.

extrude and throw from thence whatever is molesting to them; and the hoarseness Lucretius mentions, proceeded from the exasperation of the larynx, occasioned by a defluxion of salt phlegm, which likewise fell upon the lungs, and then caused a violent cough.

Ver. 1154. Lucretius says,

"In manibus vero trahier nervi."—

This contraction of the nerves of the hands was a sure token of present convulsions, which, as we have seen already, proceeded, according to Thucydides, from what he calls *λύγξ πνιγ*, an empty hicket. See above in the note on ver. 1122. Now a convulsion is an involuntary contraction of the parts, that communicate and partake with the nerves, proceeding from a preternatural cause. But whether some of our modern physicians, who differ from the ancients, in assigning several other causes of convulsions, than those which these last allowed of, be in the right, it is not our business in this place to inquire. Hippocrates, 8. de Comp. Med. positively asserts, that there are but two causes of convulsion; viz. Repletion and inanition: and Galen too, firmly avouches, that no third cause can be found out for the ficcidity or dryness, which the same author more than once affirms to be the cause of spasms, is included in, and reduced to inanition. The hands, therefore, of the infected were convulsed, by reason of the dryness and inanition of the nerves, and of the whole inflamed body, that was weakened and brought low by a manifold evacuation: besides; an erysipelas, from whence proceeded a frenzy, had seized the brain, and all its membranes; hence the pernicious filthiness of the corrupted blood was imparted to the marrow of the spina, or back-bone, from the first knuckles or joints of which arise the nerves of the hands and fingers. Thus that corruption, falling down, doubled the difficulties, irritating, and filling, or choking up the ducts of voluntary motion.

Here our translator has omitted the latter part of the verse above cited, in which his author mentions another symptom, that attended this disease: viz. a trembling of the joints,

"In manibus vero trahier nervi, tremere artus."

Now, according to the definition of physicians, "Tremor est symptoma in actione læsa;" and this happens when the voluntary motive faculty is depraved, by reason of its disproportion to its own object, which is the body. For, since, in the concretion of animals, the elements of earth and water are predominant, and since they are for that reason by nature heavy, whatever moves, would by natural inclination always descend, unless the motive faculty sustained and kept it up: and if that faculty be strong, and in due order, all things are performed aright, and according to the strict command of the will: but if that faculty be weakened or disordered; then there immediately arises a complicated motion, which is called a trembling; and that proceeds from the motive

X x

faculties endeavouring to lift up the member, which, at the same time, by its own natural inclination, is striving to sink down. Galen, in his Treatise, de Trem. Palp. cap. 3. brings a very evident example of this alternate endeavour of the faculty and member: I presume, says he, you have seen, how a man's legs will tremble, if he strives to run apace with a weighty burden on his shoulders: and how his hands too will tremble, if he attempts to lift up, and carry, a weight superior to his strength. Thus Galen: and this shows the reason of the trembling of the joints, as well in old age, as in diseases: well, therefore, might their limbs and joints tremble, the strength of whose motive faculty in so great and various a conflict, was extremely impaired, and carried headlong to utter destruction.

Ver. 1155. This verse runs thus in the original:

*A pedibusque minutatim succedere frigus
Non dubitabat.*—

The symptoms grow still more and more dangerous: for, though it cannot be controverted, that the feet are cool not without reason; inasmuch as, by nature, they are both thin of flesh, and abound with nerves; yet they grow cold besides, by reason of their distance from the warmest parts of the body: the heat retreating to, and gathering itself together in, the breast, in almost all fevers, except in the bilious and burning; and unless too the disease be malignant, as this at Athens was. Galen, in his Comment on epid. 3. teaches the causes of this coldness of their feet: If the disease, says he, be malignant, the extreme parts grow cold, by reason of the decay of strength, and the greatness of the inflammation, that attracts the whole mass of blood to itself; for without these, the disease is never mortal. And the same author, in his comment on this Aphorism of Hippocrates, in great pains of the belly, a coldness of the extreme parts is an ill sign, comprises this whole matter in a few words. The coldness of the extreme parts, says he, is caused by the violence of the inflammation in the bowels. It proceeds likewise from the defection and decay of the vital faculty; which happens whenever the natural heat is either extinguished, or suffocated, by reason of the great quantity of it, then chiefly, when it becomes cold. It is occasioned, besides, by any violent pain, that seizes the middle parts of the body, and by means of which, nature is contracted into itself, and the blood repairs to it, abandoning not only the extreme parts of the body, as the feet, the hands, and the head; but the whole skin likewise. Thus Galen: and hence we see, why the natural heat, that was attacked by so many enemies, languished and decayed, "minutatim," as Lucretius expresses it, by little and little, till at length a coldness of the extreme parts succeeded in its place: and that too, perhaps, not without a lividness of colour, both which are fatal tokens in all acute diseases.

Ver. 1156. Here the poet begins to describe symptoms of an imminent and near approaching death, which discovered themselves in the face of

the infected. Now, of all the several parts that compose the human face, the preference is justly due to the nose and nostrils, because of the comeliness they add to, or detract from, the whole structure of the face: according to which opinion Horace sung long ago;

*Non magis esse velim, quam pravo vivere naso
Spectandum nigris oculis, nigroque capillo.*

But though as Galen, in his book de opt. sec. cap. 26. truly observes, accumulated nostrils, and hollow eyes, are, in some, tokens of death, but natural in others; yet in the diseased Athenians, of whom our poet is speaking, they were preternatural, and proceeded from the force of the disease, which had overpowered the strength of the body: Since, therefore, the countenance of the sick was very unlike, and different from the aspect of the healthy though but in one part of it, we may well, with Hippocrates, in Progn. c. 5. call it a most dangerous symptom: for a sharp nose and compressed nostrils, on many accounts, portend the worst that can happen. The nose itself is composed of two substances: the one cartilaginous, the other bony: The bony part of it remains always firm and unshaken; nor is it exposed to any motion or damage; but the cartilaginous or gristly substance of it is subject to both: for, in the first place, the wings, or round risings on either side of the nose are moved naturally by their own muscles: of which you may consult at large Julius Casserius, in his accurate treatise, de Fabricâ Nasi; but with this caution, nevertheless, not to take the two muscles, which he lately invented, for the janitores, as he calls them, porters of the nose, till use and experience convince us, that we can, whenever we list, compress the nose, and contract or straiten the passages of it. But that extreme part of the nose, because it is more carneous, and contains more humidity than the other, is sooner affected by diseases: and what great necessity soever urges, the innate power of motion is taken away from the muscles, whenever nature is overpowered and worn out by disease: Hence the nostrils are compressed; and, what necessarily follows, the cartilage and muscles of the nose being grown dry, the globulous part of it is attenuated and contracted.

Ver. 1158. The causes of these events we learn from Galen, who, in Comment. Progn. teaches, that such accidents proceed, either from some cause that wastes and corrupts the carneous parts of animals, or from the weakness and decay of the natural heat, which can no longer extend itself into the extreme parts of the body; but remains in little quantity confined to the bowels only. Besides, it always happens in these cases, that so great a portion of blood and spirits flows not to the extreme parts of the body, as did before, when nature was fully provided with them: for which reason, a great alteration of the natural habit of body is apparently discerned in the face; and these are the causes that the eyes first of all are contracted and hollowed: For, being of a softer substance than the other parts, they swell and

protuberate when they are supplied with a sufficient quantity of spirits; but, for want thereof, they sink and subside. Add to this, that the muscles of the temples are consumed and wasted away, by the malignancy, or by the diuturnity, of the disease; and disabled nature is rendered incapable to repair that loss: Hence the temples are hollowed, and, the jugal bone being prominent, the eyes seem to be sunk within their sockets.

Ver. 1159. These effects, according to Galen, proceeded from the same causes we mentioned in the note on ver. 1155. where we produced the authority of that author.

Ver. 1160. In these two verses the poet tells us, that they died generally the eighth or ninth day after they were taken sick: from which Thucydides varies a little: for his words are as follows: *καὶ τὸ σῶμα, ὅσον πρὶς χρόνον καὶ ἡ νόσος ἀκμάζοι, ἐκ ἐμαραινέτο, ἀλλ' ἀντὶ τοῦ παρὰ δόξαν τῇ καὶ αἰσχροῖα, ὥστε ὁ φθέρωντο οἱ πλεῖστοι ἑναεῖαι καὶ ἰσδομαῖοι ὑπὸ τῷ ἐνὶ στήθεσσι καύματι, ἔτι ἔχοντες τι δυνάμειος*: that is to say, as long as the disease was at the height, their bodies wasted not, but resisted the torment beyond all expectation, insomuch, that most of them died of their inward burning, in nine or seven days, and whilst they yet had strength. Whoever desires to be satisfied of the power of these critical days, in judging of diseases, may consult Galen, de Crisibus de dieb. decretor. where his curiosity will be abundantly contented. I will only take notice, that the pestilence, which raged in Italy, in the year 1548. was much more violent at the time of its first breaking out: for, as Guido Cauliacus relates, they died within three days after they fell sick: and the Florentine historian, Mattheo Villano, speaking of the same plague, says, "e morivano, chi di subito, chi in due, e chi in tre di:" i. e. and they died, some suddenly, some in two, and some in three days. And the plague that desolated the same country in the year 1631, was scarce less violent; for it snatched them away in three or four days at most, say the authors who have written of it.

Ver. 1162. Here the poet tells us in thirteen verses, that if any chanced to escape, yet even they were forced to compound for their lives, with the loss of some of their members, either their eyes, or their privy parts, or feet, or hands for the whole virulence of the disease, falling upon those parts of the body, caused so great a corruption, that, for fear of death, they were necessitated to submit to an amputation of them. Nay, says he, so great an oblivion of all things seized upon some, that they knew not even their own selves, nor remembered who they were.

Ver. 1163. This too Lucretius has taken from Thucydides, who says, *Ἐν διαφύγειν ἐπιπλεονέχοντες τῆ νοσήματος εἰς τὴν κοιλίαν, καὶ ἡλικόσεως τὴν αὐτῇ ἰχυρᾷ ἐγγιγνομένης, καὶ διαρροίας ἅμα ἀκράτη ἐπιπλοῆσης, οἱ πολλοὶ ὕστερον διὰ τὴν ἀσθενεῖαν διεφθέρωντο* 1, says he, they escaped that (their inward burning) then the disease falling down into their bellies and causing there great exulcerations, and immoderate

looseness, they died; many of them, afterwards through weakness.

Ver. 1165. A pain in the head is very frequent in all pestilential diseases: nay, some have thought fit to place it among the forerunning tokens of an approaching plague. But the pain, mentioned by Lucretius, proceeded not from a cold, or vaporous cause; but from too great a quantity of corrupted blood, which oppressed the head with its weight, inflamed it with its heat, and, by its malignancy, disordered the membranes of the brain. Hence nature, rousing up to her own relief, endeavoured to expel the offensive humour through the passage of the nostrils, which are the proper emunctories of the head: But since the blood, besides its over-abundance, was replenished with a certain virulency, it grew extremely refractory and rebellious to nature, and the whole mass of it, all at once, flowed to the place where it had found an open passage; and there discharged itself, even as a rapid torrent whose mound is thrown down, pours out all its waters through the gaping breach: No wonder, therefore, that, as Lucretius says;

Huc hominis totæ vires, corpusque fluebat.

Ver. 1167. The loss of their members, which Lucretius mentions in these six verses following, is described by the historian, in these words:

Διζήκει γὰρ διὰ παντὸς τῷ σώματι ἀνωθεν ἀρχόμενον τὸ ἐν τῇ κεφαλῇ πρῶτον ἰδρὺν κακὸν, καὶ εἰ τις ἐκ τῶν μεγίστων (κινδύνων δηλονότι Schol.) περιγένοιτο τῶν γε ἀκρωτηρίων ἀντίληψις αὐτῇ ἰπισήμειν, κατέσκηψε γὰρ καὶ εἰς τὰ αἶδοι καὶ εἰς ἀκράτε χεῖρας, καὶ πόδας· καὶ πολλοὶ περισκόμονται τέτοιον διέφυγον, εἰς δὲ οἱ καὶ τῶν ὀφθαλμῶν. Thucyd. For the disease, says he, which first of all took the head, (see above ver. 1104.) began above, and came down, and passed through the whole body: and whoever overcame the worst of it, was nevertheless marked with the loss of some of his extreme parts; for, breaking out both at their privy members, and at their fingers and toes, many escaped with the loss of these only: There were some likewise that lost their eyes. Thus Thucydides: Yet it might, one would think, have been expected, that they, who had had so copious a discharge of corrupted blood through the nostrils, would, for the future, have been exempted from any fresh attack: but Galen, lib. i. de Crisib. cap. 3 solves this difficulty, and teaches, that bleeding at the nose may be beneficial, if it happen at a due time; but that otherwise it is rather prejudicial. Humours, that wandered all over the bodies of the infected, may, with reason, be believed to have fallen upon some of the members, rather than upon others and particularly, as Lucretius, after Thucydides, says,

— in partes genitales corporis ipsas,

Of which our translator takes no notice. But the reason why the corruption fell chiefly on those parts, is, because of the familiarity and sympathy between them, and the members that serve to respiration: For, we have heard already, that the greatest part of the diseased laboured under a pe-

ripneumony, or inflammation of the lungs, which had occasioned a violent cough; and in those cases, as Hippocrates says, several times of his own experience, the matter generally discharges itself on the privy parts: therefore it is not strange, that, for fear of death, those wretches suffered an amputation of their pudenda; and, as Lucretius sings,

Vivebant ferro privati parte virili;

Of which too our translator is wholly silent. And we may easily believe, that the defluxion of humours on those parts, occasioned such a corruption, as reduced physicians to their last remedies, amputation and fire, since Galen, in his comment. on epidem. 3. firmly avouches, that even where there is no pestilential infection, if an inflammation, or an erysipelas, seizes on these parts, they very soon corrupt, and affect the superior parts of the body: so that we are necessitated, says he, to cut away the putrefaction, and to sear the place, as being the root of the disease.

Ver. 1171. Galen, in com. epidem. 3. ascribes the cause of this loss of members, only to the putrefaction of the humours; the nature of which is to corrupt the parts on which it seizes, Here Lucretius is carped at by P. Victorius, in var. lection. for not having, as he pretends kept close enough to the narration of Thucydides: He is excused, however, by Lambinus, whom Hieronymus Mercurialis, lib. iii. var. lection. cap. 12. accuses of being a plagiarist, in the defence he makes for our author.

Ver. 1173. Thucydides in like manner, τὰ δὲ καὶ λήθη ἐλάβαν παραύσια ἀνασάντας (ὑγιάντας Schol.) τῶν πάντων ὁμοίως, καὶ ἠγνόησαν σφᾶς τε αὐτὰς καὶ τὰς παρηδεύς: that is to say, and many of them, presently upon their recovery, were taken with such an oblivion of all things whatsoever, that they neither knew themselves nor their acquaintance. Though the loss of memory be not uncommon in acute diseases, yet it is frequent in chronical distempers, that are of a long duration. It is related of Benedictus Floretius, a person of universal learning, who lived in the last age, that having long struggled with a disease of eight months continuance, he at length overcame his adversary; but in the conflict had entirely forgot the Greek tongue, of which he had been a great master; as likewise the rules of metrical numbers in all languages whatsoever. Nor does the memory decay through the means of diseases only, but of old age likewise; and sometimes too it is lost even in the vigour and full strength of life, either by external or internal causes? Well, therefore, may we declaim with Pliny: "Memoria nihil æquè fragile est in homine, morborum, et casus injurias, atque etiam metus sentiens; aliàs particulatim, aliàs universim," cap. 24. There is nothing, says he, in man so frail as his memory, it being obnoxious to the injuries of diseases and accidents, nay, even of fear: sometimes it is lost in part, sometimes totally. We need not, therefore, be astonished, that they, who were visited with the most acute of all diseases, a virulent plague, lost their memory.

The only cause of which was the corruption of the humours, which had, as I may say, laid violent hands on nature, and alienated the parts from their due constitution. It is indeed hard to explain the manner how this comes to pass; but it is almost generally held, though some few are of another opinion, that loss of memory proceeds, not only from a cold and humid distemperature, but from a dry likewise; for Galen. 3. de loc. aff. relates of his own knowledge, that this misfortune happened, through dryness, to a certain studious, sedentary person, and to a sturdy, labouring peasant. The bishop of Rochester, in the following verses, finely describes these miseries of the surviving Athenians, who had been visited with that fatal pestilence,

But if through strength, or heat of age,
The body overcame its rage;
The vanquish'd evil took from them,
Who conquer'd it, some part, some limb:
Some lost the use of hands, or eyes;
Some arms, some legs, some thighs.
Some all their lives before forgot;
Their minds were but one darker blot:
Those various pictures in the head,
And all the num'rous shapes were fled:
And now the ransack'd memory
Languish'd in naked poverty,
And lost its mighty treasury:
They pass the Lethe lake, although they did
not die.

Plague of Athens, Stan. 13.

Ver. 1175. In these twelve verses, the poet describes the great corruption that attended this pestilence; and which, says he, was so excessive, that even the birds and beasts of prey, but especially the dogs, who had tasted of the dead bodies, dropt down dead immediately: Nay, so noisome was the stench of the unburied carcases, that neither in Athens, nor around the city, were any ravenous birds seen by day, not any wild beasts by night. In like manner Thucydides, τὰ γὰρ ὄρνια καὶ τεύχεα ποτα, ὅσα ἀνθρώπων ἔσθεται, πολλὰ ἀτάφων γιγνομένων, ἢ ἡ προσήτοι, ἢ γευσάμενα διαφείρητο, i. e. The birds and beasts, that used to feed on human flesh, though many bodies lay abroad unburied, either came not at them, or, if they tasted, perished. Thus too the bishop of Rochester, in the poem above cited, Stanza 18.

Statter'd in fields the bodies lay:
The earth call'd to the fowls to take their flesh
away:
In vain she call'd; they came not nigh,
Nor would their food with their own ruin buy;
But, at full meals, they hunger, pine, and die;
The vultures afar off beheld the feast,
Rejoic'd, and call'd their friends to taste:
They rally'd up their troops in haste:
Along came mighty droves,
Forsook their young ones, and their groves;
Each one his native mountain, and his nest:
They come; but all their carcases abhor;
And now avoid the dead men more

Than weaker birds the living men before:
But if some bolder fowl the flesh essay,
They were destroy'd by their own prey.

Ver. 1178. Thucydides says only that they came not near the dead bodies, but gives not the reason of it; that is to say, whether it happened out of any natural instinct, which is often observed in brutes; or whether any of their senses gave them notice of the danger. But Lucretius takes away this difficulty, and says, that the wary birds and beasts of prey were admonished by their smell to keep away from the dead carcases, "*ut arcem,*" says he, "*exirent odorem.*" Now, of all the feathered kind, the vulture is said to have the most exquisite smell, or even to know beforehand where he shall find his prey. This is confirmed beyond all dispute, if we may credit *Horus Ægyptius*, a very ancient author, who says, that in time of war, vultures repair, seven days before, to a place where a battle will be fought; and even that they haunt chiefly about that part of the army where the greatest slaughter will be made. But, allowing this to be true, it cannot be ascribed to their smell, or any other of their senses, but rather to a presaging instinct that nature has conferred upon them: a credulity, which *Plautus* long ago derided, when he said,

Quasi vulturii, triduo prius divinabant, quo die esituri fient.

And, indeed, who but a superstitious augur can give credit to so extravagant a notion, or believe that vultures, by their smell, can distinguish between bodies that are to die in a few days, or to live a longer time. The truth is, that they generally keep with armies, because they feed on the garbage and offals of beasts, a great number of which are daily slain for the subsistence of such a multitude of men.

Ver. 1181. *Lucretius* says,

*Nec tamen omnino temerè illis solibus ulla
Comparebat avis:—*

This too is confirmed by *Thucydides*, in these words: *Τεκμήριον δὲ (viz. modò dicta vera esse) πῶν μὲν τοιούτων ἐνέθων ἐπίσπειψις σαφὴς ἐγένετο, καὶ ἐκ ἐωρῶν τε ἕτε ἄλλως, ἕτε περὶ τοιούτων ἔδιν' i. e.* An argument that what I said, touching the birds, is true, was the manifest defect of such fowl, which were not then seen, neither about the carcases nor any where else.

Ver. 1182. *Lucretius*, to augment the horror, adds this circumstance, of which *Thucydides* is silent, that even the wild beasts hid themselves in their dens, where, nevertheless, they died at length of the infection: a most certain argument that the disease overcame the strength of all mortal animals; and that too not only of the body but of the mind: insomuch that its rage and cruelty far surmounted all expression of words, as *Thucydides* observes, and made it appear to be a kind of sickness which exceeded human nature in the fierceness with which it handled every one; and likewise to be none of those diseases that are bred

amongst us. But from this passage of our author, we make two observations: First, That a plague is common to all animals, and propagated from men into beasts; and, on the contrary, from beasts into men. Secondly, That a pestilential venom does not end with the life, but remains in the dead body, though it be not so virulent by reason of the want of heat: But when the putridinous heat has succeeded in the place of the natural, it emits a pernicious and fatal infection, as may be proved by many experiments. This is indeed controverted by some, but to no purpose; for their main argument is, the example they bring of venomous animals, which, nevertheless, they say, retain no poison after they are killed; but common observation abundantly evinces the contrary.

Ver. 1185. It is generally testified by all authors, that dogs have been first infected with, and before any other animals, have felt the first fury of a coming plague. Thus *Homer*, in *Iliad*. H. exposes, *κύνας ἀργούς*, the white dogs first to the infection. And

Strage canum primò,

says *Ovid*, *Metam.* lib. viii. after whom *Silius Italicus* has copied,

Vim primi sensere canes.—

Lib. xiv.

And the reason why dogs feel the first attacks of a pestilential contagious disease, according to *Eustathius*, is, because of their exquisite sense of smelling; of which *Ælian* likewise approves. Others blame the pestilent exhalations of the earth, to which, say they, the dogs, by reason of their proximity to it, are most obnoxious. But the opinion of *Thucydides*, which we mentioned before, seems the most plausible. *Οἱ δὲ κύνας*, says he, *μᾶλλον αἰσθῆσιν παρ' ἄλλων τῷ ἀποβαίνοντες διὰ τὸ συνδιαί-
τῃσθαι*, which *Hobbes* thus renders. But by the dogs, because they are familiar with men, this event was seen much clearer. For so *Hobbes* has rendered it: But why may not the *διὰ τὸ συνδιαί-
τῃσθαι*, be rather interpreted, "*ob convictum,*" because of their eating of the same sort of food? For it not only indicates the contagion, which is the most potent propagator of plagues, even into men, but a certain, I know not what, sickly preparative, or analogy, as they call it, proceeding from a common food with particular men. *Nardius* relates, that he knew a certain prince, who was taken with a violent vomiting of blood, that was occasioned by an external cause: this prince was extremely fond of one of his greyhounds, who, not long after, of his own accord, and without having received the least hurt, vomited blood likewise; till at length he died, wasted with a long disease, and swelled with a dropsey; all which accidents had likewise happened to his master: and, what is yet more strange, the bowels of both of them were observed to be tainted with a like corruption.

Ver. 1187. Here the poet describes the neglect of funeral rites during the time of the plague: However, it is most notorious, how much soft

and ceremony the ancients, and more particularly the superstitious Athenians, were wont to bestow on the funerals of their dead. Of which we shall have occasion to speak more at large on ver. 1246. Mean while what Lucretius here intimates is, That no solemn pomp or rites were observed; that no friends or relations attended the dead bodies to their funeral piles; but either suffered them to lie abroad unburied, or cast them carelessly on the piles that had been prepared for others. This tumultuous disorder of their funerals, is finely described by the Bishop of Rochester.

Mountains of bones and carcases
The streets, the market-place possess,
Threat'ning to raise a new Acropolis.
The woods gave fun'ral piles no more;
The dead the very fire devour,
And that almighty conqu'ror overpow'r.
The noble and the common dust
Into each others graves are thrust:
No place is sacred, and no tomb;
'Tis now a privilege to consume:
Their ashes no distinction had:
Too truly all by death are equal made;
And poor mens bones the noble urns invade.

Plague of Athens, Stanza 30.

Ver. 1188. Tears and bewailing the dead were no small part of funeral exequies; whence Servius on Virgil, *Æn.* II. says, "Sine fletu non est sepultura:" the want of tears being accounted as great a misfortune, as even the deprivation of funeral itself. Therefore Virgil, in *Æn.* II. joins them as alike calamitous:

Nos, animæ viles, inhumata, inflataque turba:

And Ovid, in *Metamorph.* II. introduces the drowned Ceyx appearing, and speaking thus to Halcyone:

Surge, age, da lacrymas, lugubriaque indue, nec
me

Indeploratum sub inania Tartara mitte.

Which Sandys thus renders;

Rise, weep, and put on black; nor undeplor'd,
For pity, send me to the Stygian ford.

For the ancients believed the dead to be comforted and delighted with the tears of their surviving friends: And this is the reason, that, in the ancient inscriptions on tombs, we so frequently find,

LACRIMAS POSUIT.

CUMLACRIMIS POSUIT.

LACRIMIS ET OPOBALSOMO UDUM
CONDIDIT.

TUMULUM LACRIMIS PLENUM DE-
DIT.

and the like; of which Gutherius, de Jure Manium, lib. 1. gives many examples. And for this reason too Manilius, speaking of this plague, by the want of so mean and ordinary an obsequy, aggravates the miseries of a pestilential mortality,

by which mankind is deprived of all the tender resentments and benefits of commiserating humanity.

—Funera decrant

Mortibus, & lacrimæ: fessos defecerat ignis;
Et coacervatis ardebant corpora membris.

Manil. lib. i. ver. 886.

These, therefore, were a sadder kind of funeral than that which Virgil, *Æneid.* II. gives to the slaughtered Latines, for they had yet wood to burn them,

Cætera confusæque ingentem cædis acervum
Nec numero, nec honore cremant.

Upon which last words Gutherius observes; "Nec numero, nec honore combusti dicuntur, qui confuso lignorum acervo lento dabantur igni, multis corporibus simul congestis." And this, by Macrobius, is called "tumultarium funus," and only used in calamitous accidents. In which kind of promiscuous funerals, it is noted by the same author, that it was usual, to every ten mens bodies, to add one woman's, to make them burn the better. Of which he likewise gives this reason: "Quod muliebres corpus juvabat ardentem viros, non calor erat, sed pinguis carnis, & oleo similis." Vide Macrobius, Saturn. lib. vii. cap. 7.

Ver. 1190. In these six verses, the poet relates, that all the remedies of physic were applied in vain: for the medicaments that some found good by, were fatal, and brought death to others. In like manner too Thucydides: *Ἐν τῇ ἑκτῇ κατὰ τὴν ἰαμὰ, ὡς εἰπὼν ὅτι χρὴν προσφέρειν ὡφελῆν τὸ γὰρ τῷ ζυνεργόν, ἄλλον τὰτο ἰβλαπῆ, σῶματι αὐτοῦ ὃν ἑὸν διφάνη πρὸς αὐτὸ ἰσχυρὸς περὶ ἢ ἀσθενέας, ἀλλὰ πάντα ζυνήρει, καὶ τὰ πᾶσι διαίτη διασπινόμενα.* Nor was there any, to say certain medicine, that, applied, must have helped them. For, if it did good to one, it did hurt to another: nor any difference of body for strength or weakness, that was able to resist it; but it carried all away, what physic soever was administered. Thus Thucydides: And upon this passage of that historian, the Bishop of Rochester ingeniously paraphrases:

Physicians now could nought prevail;
They the first spoils to the proud victor fall:
Nor would the plague their knowledge trust,
But fear'd their skill, and therefore slew them
first.

So tyrants, when they would confirm their yoke,
First make the chiefest men to feel the stroke;
The chiefest and the wisest heads, lest they
Should soonest disobey,
Should first rebel, and others learn from them the
way.

No aid of herbs, or juices pow'r;
None of Apollo's arts could cure,
But help'd the plague the speedier to devour.
Physic itself was a disease;
Physic the fatal tortures did increase:
Prescriptions did the pains renew:

And Æsculapius to the sick did come,
As afterwards to Rome,
In form of serpent: and he brought new poisons
with him too,

Plague of Athens, Stanza 15.

The natural remedies that are used in extinguishing and driving away a pestilential disease, are of two sorts: for some are called common, others particular. The common remedies are fires, odours, firing of guns, a strict regimen of life, and, what is more than all the rest, an avoiding of the contagion, together with an extermination and utter destruction of all things that may retain and preserve the infection, as clothes, bedding, and the like: as likewise to absent from all company whatever for a certain time. And, whatever Lucretius advances to the contrary, Hippocrates is said to have bethought himself of a common remedy for this plague viz. by burning piles of scented wood at the corners of the streets. The particular remedies are those that are adapted to the constitution and habit of body of each person infected: and these in the case of the Athenian plague, as both the historian and our poet inform us, were all used in vain. And, indeed, in vain hitherto have proved all the cares and endeavours of men: and the Divine Providence has eluded the attempts of those bragging Charlatans, who boast of their panaceas, amulets, and infallible remedies against the plague, and often compels them dearly to rue their enormous temerity: Not that I would be understood to mean, that the care of the sick ought to be committed to fortune only: for there is an honour justly due to medicaments that support the vital faculty, and contain it within its due bounds; as there is likewise to topics, when experience has once established and confirmed the usefulness of them. But what I say is, that the Supreme Wisdom has hitherto denied to mortals, to find out any universal and certain alexicacon for the plague. And therefore Mattheo Villano, speaking of the plague that raged in the year 1348, says, That the physicians, in any part of the world, could not, either by natural philosophy, or by physic, or by the art of astrology, find out any remedy, or certain cure for it: That some of them indeed, out of covetousness, went to visit the sick, and gave them their remedies; but that by their own death they evinced the vainness of their art, leaving their lives as a restitution for the money they had unjustly taken. "E i Menici," says he, "in catuna parte del Mundo, per philosophia naturale, ò per Fisica, ò per arte d' Astrologia, non hebbono Argomento ne vera cura. Alquanti per guadagnare andarono visitando, e dando loro argomenti, i quali, per loro morte, monstrarono l' arte esser ficta, e non vera affai per Conscrienza lasciaronò à restituerè i danari, che di ciò havevano presi indebitamente."

Ver 1192. From what Lucretius, after Thucydides, says in this and the three following verses, we may gather this observation, that in each plague there is not one only manner of corruption, but that it differs very much, according to

the various dispositions of the bodies and humours; even though it derives its origin from one and the same cause.

Ver 1196 In these six verses the poet teaches, That the greatest calamity of all was; that as soon as they perceived themselves seized with the disease, they fell into a despair of recovery, and neglected to take care of themselves; a neglect that sometimes is more fatal than the force of the disease. Thus too the historian: Δεινότητα δὲ πάντες ἦν ἢ τὸ κλυμμία, ὅποτε τίς αἰσθῆτο κάμνον, πρὸς γὰρ τὸ ἀνέλπιστον ἑὸς τραπέμενοι τῇ γνώμῃ πολλὰ μᾶλλον προΐντο σφᾶς αὐτὰς, καὶ ἐκ ἀνείχεον. Thucyd. That is to say But the greatest misery of all was the dejection of mind, in such as found themselves beginning to fall sick: for they presently fell into despair and gave themselves over without making any resistance. Now this consternation and dejection of mind was prejudicial to them on a double account: For, beside, that it very much impaired their strength, it brought with it this additional mischief, that, despairing of recovery, they thought it to no purpose to take care of themselves. And thus the disease raged uncontrouled, and soon was fatal to such as neglected the means of their own safety, and gave themselves over for lost. And here we might take occasion to inquire narrowly into a question, which some have started, viz. Whether an absent person can catch the plague by the strength of imagination? The affirmative has many sticklers for it, as may be seen in Fab. Paulinus, lib. 1. and the negative is no less strenuously asserted by others: Imagination may indeed operate on our own bodies, by reason of the mutual consent and sympathy that each part has to the other. But what strength can it have to work on the bodies of others? Whoever yet heard of a pick-pocket, who, by the intenseness of his fancy only, could get the money out of another's purse? Or, of a hunger-starved wretch, who, by the strength of his imagination, could get into his own clutches the bread he saw lying at a distance on a baker's stall? Besides in this case of the Athenian plague, both the historian and our poet expressly say, That the disease preceded the dread and apprehension of it.

Ver. 1198. This verse our translator has added to his author.

Ver. 1202. Here the poet, in these thirteen verses teaches farther, that some, though they came not to visit their friends and relations, or had neglected to tend them, caught nevertheless the contagion, and died like infected sheep or cattle: and, because they had neglected to take care of their friends, they too, in their turn, were neglected by them. Thus too Thucydides, "Ἐμερος ἀφ' ἑτέρου θρασείας ἀνατιμυλάμενοι ὥσπερ τὰ πρόβατα ἔθνησκον καὶ τὸν πλείονα φθόρον τῶν ἱεροῖσι εἴη γὰρ μὴ δέλοιεν διδόντες ἀλλήλοις προσίεναι, ἀπώλλυντο ἑρμῶς, καὶ ἐκίαι πολλὰὶ ἐκινώθησαν ἀπορί τῷ θρασυψανίῳ. They died, says he, like sheep, being infected by mutual visitation: And if men, for fear, forbore to visit them, then they died forlorn: so that many families became empty, for want of such as should have taken care of them. Thus Thucydides.

des: And were there no other testimony for contagion to be found, than this of that historian and our poet, it would be abundantly sufficient, evidently to convince their peremptoriness, who obstinately hold, that it was unknown to the ancients: and them too, who as positively assert, that the air only is the cause of epidemical diseases; and will not admit of contagion, except only when substituted in the place of the air. But how much they are mistaken will manifestly appear by the following animadversion.

OF CONTAGION,

THE CHIEF CAUSE OF A PLAGUE.

As the ancients were not ignorant of, so they always apprehended, contagions; whatever some modern authors have believed to the contrary. Lucretius, who copies after Thucydides, freely confesses in this place, That the effects of contagion are felt from far; and to him subscribe several of the ancients; as Livy, lib. iii. cap. 25. Diodorus Siculus, lib. 14. Dionysius Halicarnassus, lib. 10. and Eusebius, lib. 7. but, that they affect, when near at hand, is allowed by all: for none deny, that to tend and touch the sick, will spread abroad the disease, and render it epidemical: Hence Virgil in Georg. iii.

Ne mala vicini pecoris contagia lædant.

And our Lucretius, ver. 1241. of this book,

Qui fuerant autem præstò, contagibus ibant.

And yet L. Septulius, in lib. 2. de Peste, cap. 8. too confidently affirm, That the third manner of contagion, which, as we said before, the physicians call *per fomitem*, was unknown to the ancients, and never thought of by them. But, among many other testimonies that might be alleged, this mistake of his is evident from the following verses, with which Virgil concludes his third Georgic:

*Jamque catervatim dat stragem, atque aggerat
ipsis*

*In stabulis turpi dilapsa cadavera tabo:
Donec humo tegere, ac foveis abscondere discunt.
Nam neque erat coriis usus; nec viscera quisquam,
Aut undis abolere potest, aut vincere flamma:
Nec tondere quidem morbo, illuvieque peresa
Vellera; nec telas possunt attingere putres:
Verum etiam invisos si quis tentarat amictus,
Ardentes papulæ, atque immundus olentia sudor
Membra sequebatur: nec longo deinde moranti
Tempore, contactos artus sacer ignis edebat.*

Which is rendered by Dryden, as follows;

At length she strikes an universal blow:
To death at once whole herds of cattle go:
Sheep, oxen, horses fall; and, heap'd on high,
The differing species in confusion lie:
Till, warn'd by frequent ills, the way they found,
To lodge their loathsome carrion under ground:

For, useless to the currier were their hides;
Nor could their tainted flesh with ocean tides
Be free'd from filth: nor could Vulcanian flame
The stench abolish, or the savour tame:
Nor safely could they shear their fleecy store,
Made drunk with poisonous juice, and stiff with
gore,
Or touch the web: but, if the vest they wear,
Red blisters rising on their paps appear,
And flaming carbuncles: and noisome sweat,
And clammy dew, that loathsome lice beget;
Till the slow creeping evil eats his way,
Consumes the parching limbs, and makes the life
his prey.

The ancients therefore knew what contagion is, though, perhaps, they were not fully aware of its great power, nor of the many ways of its imparting, and spreading itself abroad: and this is the reason, that this chief begetter of a plague was then scarce held to be a propagator of it. But in the last age, its power was so manifestly discovered, as to make the modern physicians believe, that true plagues, or those infections at least, which they call bubonic, are disseminated by contagion only. In Florida, the seasons of the year, the fruits of the earth, the winds, the rains, all come regularly, and at due and constant times; nor is there the least suspicion there of infectious damps or exhalations; yet, upon the arrival of an ordinary fellow, who brought thither some considerable merchandise from an infected place, the whole country soon caught the contagion, and essayed the fury of a pestilential disease, till then, in those parts, unknown before. Contagious diseases, unless a timely stop be put to them, depopulate provinces and whole kingdoms, by sweeping away their inhabitants. And this observation is one of the reasons, that, though but of late days, contagion has been held to be the chief instrument, in beginning, and propagating a plague. The ancients indeed could scarce be reconciled to the setting a private and particular cause at the head of a public and general, or common effect; but this difficulty would not have startled them, had they reflected, that even that cause may be said to be common, by whose efficacy a disease becomes epidemical. Pliny, lib. 16. informs us, that they either banished the lepers, or shut them up, and debarred them from all manner of conversation, that they might not infect the sound; and if, through negligence, this care was at any time omitted, the whole society was infected with that most filthy disease; of which no common cause could be assigned, besides contagion. We read, that, in the last age, a secretary of the Pope's treasury, being returned from Perugia to Rome, brought the itch along with him; which foul disease, in a few days, by that means spread itself through the whole city; and that, when Lautrecchus besieged Naples, a small number of harlots, that were in the camp, gave the venereal disease, till then unknown in those parts of the world, to his whole army; from whence it has since spread itself into Africa, Asia,

and all over Europe; treating foreigners with greater severity indeed, than its native Indians, among whom it was first known. And were not these common causes, the first of which infected the whole city of Rome, the other almost the whole world? Then, not to dwell too long on so evident a matter, let us call to mind this maxim of Lucretius:

Tangere enim, et tangi, nisi corpus nulla potest
res. *Lib. iv. ver. 305.*

Nothing, but body, can be touch'd, or touch.

Whatever things, therefore, meet, are bodies; not a naked quality. But, according to Aristotle, lib. i. de Generat. et Corrupt. things then touch one another, when the extremest parts of them are together, be it done at what distance you will. Contagion thus is not an empty sound, but expresses the manner, by which an infection, by the means of corpuscles, that exhale from an infected body, communicates itself to one that is sound; and, though it not unfrequently touches, yet it sometimes imparts its virulence through another medium.

There are some, nevertheless, who will not be reconciled to contagion; and pretend to compel us to a necessity of owning, whether we will or not, and against truth and observation, that a plague sometimes is bred, without any previous contagion, otherwise it would be perpetual. To make this assertion good, they bring, for instance, a country, where a new plague is broken out, and ask us, whether it be just then bred in that country, or brought thither from elsewhere? If we grant the first, then indeed adieu to all contagion: if the last, they bid us name the originary place where it was bred; which would oblige us to the same concession as the former. Therefore, say they, contagion will propagate, but not begin, a plague. Though this be not argued amiss, yet it is not so conclusive, as to hinder us from believing, that the whole earth is at no time free from a plague; and that there are certain places, where the seeds of plagues are preserved, in order to break out at a certain time. *Æthiopia* has an ill name on this account; nor are *Grand-Cairo* and *Constantinople* much better spoken of; nay, almost all that vast extent of land, which the *Turks* inhabit, in some part or other of it, ever has had, and ever will have, more or less, the plague among them; and this too through their voluntary neglect; for they think it impious to struggle against fate. But the reason, why it does not always rage with the same fierceness among them, is, the various disposition of their bodies, and the different state of the air.

It is likewise observable, that every contagious disease rages with greatest violence at its first breaking out; but in length of time grows mild, and abates of its first fury. Whoever doubts of this, let him compare the mischiefs, that heretofore were caused by the venereal disease, with the harms, that, now-a-days, attend it; let him weigh, besides, the devastation, that in the last age, the

small-pox brought upon the *Indies*, where, at its first coming, it swept away, in a few days, a hundred myriads of *Mexicans*. The seeds, therefore, of pestilential diseases decay, and wear away by degrees; till, having found proper humours to work on, and spirits that make but weak resistance, they break out afresh, and with greater violence in other bodies. To this opinion subscribes the learned *Felix Platerus*, who, in his *Treatise of the Causes of Fevers*, after having made many observations, that well deserve to be known and remembered, argues to the following purpose: It seems more reasonable, says he, to believe, that, in like manner as other venoms, which, from the beginning of the world, are innate and natural to certain bodies, inhere and reside in them, so too this pestilent venom may lurk, not only in the bodies of such as are visited with the plague, but of others likewise, who are not yet taken with a fever; or even in clothes, or any thing of like nature; and that it may be imparted and transferred from body to body; not only by mutual contact, but by the intermediate air intervening, and taking those invenomed seeds from one body, and wafting them into another. Besides, a pestilent venom, if it be attracted by inspiration, chiefly affects the heart, and kindles a fever in a moment; or, if it be caught by any other means, and possesses any other part of the body, it either makes the same progress to the heart by inspiration, or through some blind passages; or else it stays for some time in the part it first seized on; and even in that case, though it be propagated no farther, and though no pestilent fever yet appear, the body nevertheless is rendered infected by that venom; which, sooner or later, may affect likewise the bodies of others. And this is the reason, that such as fly from infected places into others, that are free from the plague, and stay there some time, are often, even after many days, taken first with the plague; or, if they are not taken themselves, they may nevertheless infect others. In like manner too, experience teaches, that a lewd woman, who lies with a man, tainted with the venereal disease, though she be not yet so infected by him, as to be sick of that disease herself, may nevertheless infect others, who afterwards lie with her, with the same disease. This too is attested by *Fernelius*; and, therefore, we dare confidently affirm, that the seeds of plagues, like other venoms, are always residing in certain bodies, in some country of the world or other; and that they are propagated from thence into other places, in the manner above spoken. Even as we know for certain, that the venom of the venereal disease, which is well nigh as contagious and noxious, at least to mankind, came first of all, creeping from body to body, from the *Indies* even to us; and now subsists no where but in bodies, and wanders by contagion out of some into others. Which venereal disease, manifesting itself in this manner, resides nevertheless, in other places, in other bodies; and, by some one or other of them, is carried back again into the same country. Thus too the plague, though it has often ceased to rage

for a long time together, in certain places, is nevertheless inherent in certain bodies, in some part of the earth or other; and, as is said above, is, in its due time, derived from thence, and breaks out in those bodies, in which it lay dormant. Infomuch, that no necessity obliges us to hold, for this reason, viz. because we hear nothing of it, nor where it rages, as if it were totally extinguished, and that the whole world were free from it; that therefore when it returns again, it is engendered anew in the air, and falls down from thence upon us; though, notwithstanding all this, it cannot in the least be doubted, but that the air is imbued with a malignant quality, with which it may, and does sometimes, affect the bodies of animals: in like manner as we grant, that they are affected by a pestilent contagion, proceeding from infected bodies, and insinuating itself into other bodies, in the method abovementioned; but that the origin of this contagion is due to the air, can in no wise be granted, for the reasons before given. Thus far Platerus, with whom the generality of physicians agree. For the objections, which D. Sennertus, in lib. i. de Caus. Pestil. cap. 21. has brought against him, are held to be trifling, and of no validity.

Ver. 1204. This and the two following verses are a paraphrase of our translator on his author.

Ver. 1207. Hence we see, that the saying of the comic poet has still prevailed:

Proximus sum egomet mihi,

That charity begins at home, as our ill-natured proverb expresses it, and, consequently, that men are more careful of their own health than that of others. To abandon friends in sickness, is a piece of cruelty detestable even in heathens; how much more then is it to be abhorred in Christians? Yet Guido Cauliacus tells us, that in the plague that raged in the year 1348, the living, that they might not endanger their lives by the contagion, avoided to come near the infected; infomuch, that whole families died without attendance, and were buried without priests: the father visited not the son, nor the son the father: Charity was extinguished, and hope overthrown. "In tantumque," says he, "gentes moriebantur sine famulis, et sepeliabantur sine sacerdotibus: Pater non visitabat filium, nec filius patrem: caritas erat mortua, et spes prostrata." Mattheo Villano acknowledges this to be true; and though he endeavours to lay the blame on the Barbarians, after whose example the Christians no less inhumanly abandoned their friends; yet he omits not to brand them with infamy, as men guilty of a barbarity truly detestable, and till then unheard of among the professors of Christianity.

Ver. 1215. In these ten verses, the poet tells us, that such of them, as came to tend the infected, were exposed to a double destruction. For, either they caught the contagion of the sick, and underwent the like fate with them, or else, worn out with the fatigue of tending them, they at length fell sick of the same disease. But shame as well as piety excited them to serve their friends

in so great distress; and thus the most virtuous among them exposed their lives to this danger, and chiefly assisted their dying friends. In like manner, Thucydides: "Εἰς. προσίαιεν διαφθέρουσα, καὶ μάλιστα οἱ ἀρεστῆς τὴ μεταποιούμενοι, αἰσχύνη γὰρ ἡφείδων σφῶν αὐτῶν ἰσχύοντος περὰ τῆς φίλης, ἵπαι καὶ τὰς (περὶ τὰς Schol.) ὀλοφύροισι τῶν ἀπογιγνομένων τελευτῶντες καὶ οἱ δίκαιοι ἐξέκαμνον, ὑπὸ τῇ πολλῇ κακῇ νικώμενοι." That is to say, if they forbore not to visit them, then they died themselves. For, out of shame, they would not spare their own persons, but went into their friends; especially after it was come to this pass, that their own domestics, wearied with the lamentations of them that died, and overcome with the greatness of the calamity, were no longer moved with it.

Ver. 1217. Upon this calamity, the Bishop of Rochester thus paraphrases:

Here others, poison'd by the scent,
Which from corrupted bodies went,
Quickly return the death they did receive,
And death to others give:
Themselves, now dead, the air pollute the more,
For which they others curs'd before:
Their bodies kill all that come near;
And, even after death, they all are murd'ers here.

Plague of Athens, Stan. 19.

Ver. 1221. This and the following verse run thus in the original:

*Inque aliis alium populum sepelire suorum
Certantes, lacrymis lassī, luctuque redibant:
Inde bonam partem in lectum mærore dabantur.*

i. e. After they had striven and contended to bury the bodies of whole families of their friends among those of the friends of others, they returned wearied with grief and weeping; and hence most of them took to their beds for sorrow.

Ver. 1225. The poet having laid before our eyes the lamentable and tragical condition of the city of Athens, he now brings upon the stage the herdsmen, shepherds, and peasants, who, being visited with this cruel infection, in want of all necessities, destitute of friends, and despairing of relief, shut themselves up, some of them in their narrow huts, where they died by heaps, destroyed no less by famine than the plague; while others, for fear of the enemy, who were laying waste the whole country, and destroying all with fire and sword, with the disease upon them, fled into the city; and others, whose strength would not permit them to reach thither, lay languishing in the highways, naked, full of ulcers, &c. What more dreadful, what more dismal, can imagination figure to itself?

Ver. 1228. This observation is the translator's, not his author's.

Ver. 1229. The Bishop of Rochester describes this circumstance very pathetically in the following verses:

Here lies a mother and her child ;
The infant suck'd as yet, and smil'd,
But strait by its own food was kill'd :
There parents hugg'd their children last ;
Here parting lovers last embrac'd ;

But yet not parting neither :
They both expir'd, and went away together.
The friend does hear his friends last cries ;
Parts his grief for him, and then dies ;
Lives not enough to close his eyes.

The father, at his death,
Speaks his son heir, with an infectious breath :
In the same hour the son does take
His father's will, and his own make :
The servant needs not here be slain,
To serve his master in the other world again ;
They languishing together lie ;
Their souls away together fly :
The husband gasps ; his wife lies by :
It must be her turn next to die :

The husband and the wife
Too truly now are one, and live one life :
That couple who the gods did entertain,
Had made their prayers here in vain :
No fates in death could them divide ;
They must, without their privilege, together both
have dy'd.

Plague of Athens, Stan. 19. & 20.

Ver. 1231. Thus Thucydides : 'Επίσει δὲ αὐτὸς
μᾶλλον πρὸς τῷ ὑπάρχοντι πόνῳ καὶ ἡ ζυγκομιδὴ ἐκ
τῶν ἀγρῶν ἐς τὸ ἄστυ, καὶ ἔχ' ἥσσαν τῆς ἐπιλαθόντας,
δικίων γὰρ ἔχ' ὑπαρχουσῶν, ἀλλ' ἐν καλύβαις πνιγνῆαίς
ἄρα ἔσται διαβήμενον, ὃ φθόρος ἐγγίγνισθ' ὅδινι κόσμῳ, ἀλ-
λὰ καὶ νεκροὶ ἐπ' ἀλλήλοις ἔκειντο. This is to say :
Besides the present affliction, the reception of the
country people, and of their substance into the
city, oppressed both the citizens, and much more
the people themselves, that thus came in : For,
having no houses, and dwelling at that time of
the year (for it was in the summer), in stifling
booths, the mortality was now without all form,
and dying men lay tumbling, one upon another,
in the streets. And Tit. Livius describes the like
event in almost the same colours. " Grave tem-
pus," says he, " et fortè annus pestilens erat urbi,
agrisque, nec hominibus magis, quam pecori : et
auxere vim morbi terrores populationis, pecoribus
agrestibusque in urbem receptis : Ea colluvio mix-
torum omnis generis animantium, et odore inso-
lito urbanos, et agrestem confertum in arcta tecta,
æstu, ac vigiliis angebat, ministeriaque invicem,
ac contagio ipsa vulgabat morbos Lib. iii.

Ver. 1232. It is highly probable, that the great
concourse of country people that flocked into the
city, for fear of the Lacedæmonians, who had then
invaded Attica, and were putting all to fire and
sword, was the chief cause of this plague; and
that what Lucretius related before of the city of
Athens, was spoken by a certain way of antici-
pation, which is not unfrequent with poets; as if
he had considered with himself, that he should
not have explained the matter equal to its digni-
ty, if, setting less by the metropolis than the
whole province, he had begun his narration of
this disease by the country. The testimony of

Thucydides, from whom our author has taken
this description, is alone sufficient to justify this
opinion, which, nevertheless, may be confirmed
by other undeniable proofs. For, in the first
place, the Athenians would otherwise have been
very injurious to their Prince Pericles, whom, as
Plutarch tells us in his life, they accused of hav-
ing been the cause of the plague, by admitting
into the city, and in the heat of summer, the
great multitude of peasants, and other country
people; where they, who had been accustomed
to labour, and living in the open air, led lazy and
idle lives, and were crowded and shut up together
in narrow and stifling habitations: Of all which
he had been the occasion, who, during the war,
had received those who had fled from the enemy
within the walls of the city, where he took care
to find them no manner of employment, but suf-
fered them, like brute beasts, enclosed in narrow
grounds, mutually to infect one another; and al-
lowed them no change of air, or scarce the liber-
ty of breathing. Thus Plutarch. Now let it be
even granted that the Athenians were in the
wrong as to the cause of this plague; yet they
had no pretence of reason to lay the blame on Pe-
ricles, if Athens was afflicted with that pestilence
before the peasants and other inhabitants of the
country fled thither: but they were not mistaken
in believing that the plague had invaded the city
by the means of this new increase of dwellers :
for sultry heat, and an impure corrupted air may
favour and promote a plague, but are altogether
incapable of first kindling and introducing a pesti-
lence. Diodorus Siculus, though he adheres too
obstinately indeed to the then commonly received
opinion of the ambient air, yet favours our asser-
tion concerning the contagion, by means of the
country people that flocked into Athens: for,
speaking of this plague, he says, that the great
multitude of all manner of people, who, out of
fear, were fled from the country into the city,
where, by reason of the narrowness of the place,
they were promiscuously, and without any order,
crowded together, not without good cause, fell
into diseases; for, breathing nothing but noisome
stenches, that were occasioned by filth and nasti-
ness, and the air besides being grown sultry, and
almost suffocated by the heat of the season, they
received within their bowels the contagious ve-
nom. Thus we see what is the chief cause of
plagues, and from whence this of Athens took its
origin. Even Lucretius himself, whatever he said
to the contrary, of the air, in the beginning of
this narration, yet in this place he seems to own,
that the plague proceeded chiefly from the con-
tagion which the country people brought into the
city. His words are as follows:

Nec minimum partim ex agris ægoris in urbem
Confluxit, languens quem contulit agricolarum
Copia, conveniens ex omni morbida parte.

There is, therefore, no reason to dispute, for the
future, the most ancient prerogative and efficacy
of contagion, in all plagues; but chiefly not in
this most memorable plague of Athens.

Ver. 1234. Thus too the Bishop of Rochester :

There was no number now of death :

The sisters scarce stood still themselves to breathe :

The sisters now, quite wearied in cutting single thread,

Began at once to part whole looms :

One stroke did give whole houses dooms.

Plague of Athens, Stan. 21.

Ver. 1235. In like manner Thucydides : *Kai*

ἐν ταῖς ὁδοῖς ἐκαλινδύνθη, καὶ περὶ τὰς κρήνας ἀπάσας κρηθνήτες, τῇ τῇ ὕδατος ἐπιθυμίᾳ. That is to say : And they lay half-dead in the ways, and about every conduit, through desire of water. The greatest relief of an inflamed heart, is, without doubt, to breathe in a cool and pure air : but the heart is always inflamed in a burning fever, with which the Athenians were then afflicted : and hence proceeded that implacable thirst which made them make what haste they could to the fountains ; but some of them, through weakness, fainted and fell down by the way, while others, who had more strength, lay near the fountains, suffocated with the great plenty of water they had poured down into their burning entrails. Now the fountain Callirhoes, that without the walls, broke out in seven streams, and was conveyed into Athens by as many pipes, supplied with water the upper part of the city : in the lower part of which, towards the Piræus, there were no fountains, but only wells, as has been said already.

Ver. 1237. Lucretius omits nothing that may create horror, and provoke commiseration in the minds of the readers. To this end, he now exposes to their eyes the streets of Athens, thick strowed with dead and dying bodies, half naked, and half-covered with filthy weeds, and wallowing, nay, almost buried in their own corruption.

Ver. 1242. Here the poet teaches, that necessity had reduced the Athenians to such hard extremities, that the ædiles, whose office it was to take care of the temples, had permitted those that fled into the city to take up their abodes in those holy places, where they built tents for themselves and families, and perhaps too for the cattle they brought with them. This profanation of sacred things, and contempt of all religion, proceeded from the highest desperation, if we may give credit to Thucydides, who relates it as follows : *Τὰ τε ἱερά, ἣν οἷς ἐσκήνηθη, νεκρῶν πλῆθὺς ἦν, αὐτῷ ἱναποδνησκόντων, ὑπερβαλλομένη γὰρ τῇ κακῇ, εἰ ἀνθρώποι ἐκ ἔχοντες ὅτι γίνονται ἐς ἐλπίσφιαν ἱεράποντες καὶ ἱερῶν καὶ ὁρίων ἰμοίων.* i. e. The temples also where they dwelt in tents were all full of the dead that died within them ; for, oppressed with the violence of the calamity, and not knowing what to do, men grew careless of holy and profane things alike.

Ver. 1243. For this thought our translator is not so much obliged to his author as to the Bishop of Rochester, who, on this particular, paraphrases as follows :

The gods are call'd upon in vain :
The gods gave no release unto their pain :

The gods to fear ev'n for themselves began :

For now the sick into the temples came,

And with them brought more than a holy flame :

There, at the altars, made their pray'r :

They sacrific'd, and dy'd too, there :

A sacrifice not seen before ;

That Heaven, us'd but to the gore

Of lambs or bulls, should now

Loaded with priests see its own altars too.

Plague of Athens, Stan. 29.

Ver. 1244. Thucydides, after having acquainted us that the great licentiousness which was practised in the city proceeded, and began at first from this disease, adds immediately, that what any man knew to be delightful, and conducive to pleasure, that was made both profitable and honourable : Neither the fear of the gods, says he, nor laws of men awed any man : not the former, because they concluded it was alike to worship, or not to worship, seeing that they all alike perished : not the latter, because no man expected that his life would last till he received punishment of his crimes by judgment : But they thought there was now hanging over their heads some far greater judgment decreed against them ; and, before it fell upon them, they thought to enjoy some little part of their lives. *Ὅτι δὲ ἤδη τε ἡδὺ, καὶ, πανταχόθεν τὸ ἐς αὐτὸ κερδαλέον, τῷτο καὶ καλὸν καὶ χρησίμον καίεσθαι, Θεῶν δὲ φόβος, ἢ ἀνθρώπων νόμος, ὕδεις ἀπέργε, τὸ μὲν κρίνοντες ἢ ὁμοίᾳ σκεῖν καὶ μὴ, ἐκ τῷ πάντας ὁρᾶν ἢ ἴσως ἀπολλυμένους· τῶν δὲ ἀμαρτημάτων ὕδεις ἐλπίζων μέχρι τῷ δίκην γινέσθαι εἰς αὐτὴν τιμωρίαν ἀντιδρᾶναι· πολὺ δὲ μείζων τὴν ἡδὴ καίεσθαι φισμίνην σφῶν ἐπικραμασθῆναι, ἢν πρὶν ἱμπίσθαι, εἰκὸς εἶναι τῷ εἶναι τὴν ἀπολαύσαι.* Thus Thucydides : Upon which passage of that historian the Bishop of Rochester finely paraphrases, and concludes his poem :

But what, great gods ! was worst of all,
Hell forth its magazines of lusts did call ;
Nor would it be content
With the thick troops of souls were thither sent ;
Into the upper world it went :
Such guilt, such wickedness,
Such irreligion did increase,
That the few good, who did survive,
Were angry with the plague for suff'ring them
to live,
More for the living, than the dead, did grieve :
Some robb'd the very dead,
Though sure to be infected e'er they fled ;
Though in the very act sure to be punished :
Some, nor the shrines, nor temples, spar'd,
Nor gods, nor heav'ns they fear'd,
Though such examples of their pow'r appear'd :
Virtue was now esteem'd an empty name ;
And honesty the foolish voice of fame :
For, having pass'd those tort'ring flames before,
They thought the punishment already o'er ;
Thought heav'n could have no worse in store :
Here having felt one hell, they thought there was
no more.

Plague of Athens, Stanza 31.

Ver. 1246. In these twelve last verses the poet relates, That the Athenians were not content with polluting their holy places with dead bodies, but transgressed likewise all their laws concerning funerals, which they had till then observed, and buried their dead, as they could, wherever they found room. Thus too Thucydides: Νόμοι πὶ πάντες συνιερὰ χέθησαν, οἷς ἰχρῶν τε πρότερον περὶ τὰς ταφάς· ἰθαπτόν δὲ ὡς ἕκαστος ἠδύνατο. Now by the unanimous consent of all authors, the Athenians were of all people the most ceremonious in the funerals of their dead, whom they honoured even to the highest superstition. If any one neglected to pay the rites of funeral to these who were slain in war, he was punished with death: And the pomp and expence of funerals grew at length to such excess among them, that Solon was forced to put a stop to it by laws; but when this plague was raging at Athens, no funeral rites were observed: For, as the historian, from whom our poet has taken this passage, relates, many, for want of things necessary, after so many deaths before, were forced to become impudent in the funerals of their friends: For, when one had made a funeral pile, another, getting before him, would throw on his dead, and set it on fire; and when one was burning, others would come, and, having cast upon it the dead they brought, go their way again. Καὶ πολλοὶ ἐς ἀναίσχυντος θήκας ἰσθράποντο, σπέντες τῶν ἐπιηδείων, διὰ τὸ συχνὰς ἤδη προσηθάναι σφίσιν, ἐπὶ πυρῆς γὰρ ἄλλοτρίας, φθάσαντες τὰς νοσήσαντας, οἱ μὲν ἐπιθέντες τὸν ἑαυτῶν νεκρὸν, ὑφῆπτον· οἱ δὲ καί μιν ἄλλα ἀνωθεν ἐπιβαλόντες ὅν φέροιεν, ἀπῆσαν. Thucyd. But this calamity of the Athenians will more visibly appear, by giving at large the laws and ceremonies, that they thought themselves religiously bound to observe in the sepulture of their dead; and which are recorded by Nardius in the following, no less learned than accurate, animadversion on this passage of our author.

ANIMADVERSION

OF JOANNES NARDIUS, CONCERNING THE FUNERALS OF THE ATHENIANS.

CICERO, in his oration for Flaccus, acquaints us, That humanity, learning, religion, laws, civil societies, and the use of corn, began first among the Athenians, and from them were distributed over the whole earth: Hence Lucretius says of them:

Et recreaverunt vitam, legesque rogârunt.

Lib. vi. ver. 3.

But nothing seems to have been more anciently practised among them, or more religiously observed, than the paying the just dues of funeral to their dead; especially to those, who had been slain in fighting for their country: Of this we have a famous example, recorded by Xenophon, lib. i. Ἑλληνικῶν, and by Valerius Maximus, who

tells us, that the Athenians condemned, and put to death, ten of their captains, who returned to Athens after a great victory they had gained at sea over the Lacedemonians, only because they had not paid the last duties to the dead bodies of those that had been killed in the engagement, even though they had this to plead in their defence, that the tempestuous weather had rendered it impossible: "Decem imperatores suos, et quidem à pulcherrima victoria venientes, capitali judicio exceptos necârunt, quod militum corpora, licet, sævitia maris interpellante, sepulturæ mandare non potuissent, sed in fluctus, necessitate adaçti, projecissent." Valer. Max. lib. ix. cap. 8. Deterred by this severity, Chabrias, who commanded the Athenian fleet, was more wary: For he, having defeated and put to flight the fleet of the Lacedemonians at the island Naxos, instead of pursuing the routed enemy, minded only to gather up the dead bodies of the slain; and, fearing the superstition of the people, chose rather, says Diodorus Siculus, lib. xv. to let the enemies of the republic escape, than that their dead friends should be deprived of the rites of funeral; otherwise he might easily have destroyed the whole naval force of the Lacedemonians. Nicias, the great general of the Athenians, commanded his whole army to halt, only to bury two of his soldiers. Isocrates in Panegy. relates, That Adrastus, king of Argos, having been unsuccessful in a war against the Thebans, and not being able to carry off the dead bodies of the slain, besought the Athenians, and their king Theseus, to commiserate the public calamity of the Argives, and to assist them to compel the Thebans, to allow the ceremonies of sepulture, to those who had been killed in the battle: This the Athenians deemed a just cause of war, and the success seemed to justify their opinion; for, taking up arms against the Thebans on no other pretence but this, they defeated them, and would hearken to peace on no terms whatever, till the Thebans, by way of preliminary, had paid the due rites of sepulture to the slain Argives. Nor may we forget the piety of Cimon, who, that he might bury his father, who was dead in prison, submitted to be a prisoner himself, and redeemed the body at the price of his own liberty.

But they extended this piety not only to those who had sacrificed their blood in defence of the public safety, but likewise to their kindred, and men of the meanest condition; whose relations the Demarchus, or chief of the people, could oblige to bury the dead body, by laying a heavy fine on those that neglected to do so within a certain time: that magistrate had likewise the power to limit and fix the expence of a funeral, as also to contract himself for it with the public undertakers. Eustathius, in Com. II. ad calcem, celebrates Pisistratus, for having always two or three servants attending him, whose business it was to carry money for him to bestow on the funerals of the poor. The charity of Simon to the dead poor, who left not enough to bury them, and whom he interred at his own expence, is likewise

extolled by Æmilus Probus; and Plutarch, in his life, records of him, that, having with great care and trouble, got together the bones of Theseus, he brought them to Athens. Nor may we forget a signal office of piety, mentioned by Demosthenes, advers. Matartat, and enjoined by an Attic law, which commanded every passenger, who happened to see upon the road a dead body, though of a person unknown to him, to throw at least three handfuls of earth on the face of the defunct for his sepulture, since at that time he could not have the means of burying him otherwise. This is attested likewise by Ælian. Var. Hist. lib. 5. and by Phocylidas, Moschus, Sophocles, and Acron. And this custom was so generally received, and deemed so indispensibly necessary, that it was expected even of those who were going on business that required the greatest haste, as Quintilian says, lib. 1. Decad. 5. and Horace, Carm. lib. 1. Od. 28. alludes to it in these express words of Archytas the philosopher, to the seamen:

At tu, nauta, vagæ ne parce malignus arenæ,
Ossibus & capiti inhumato

Particulam dare.——

Quamquam festinas, non est mora longa, licebit
Injecto ter pulvere curras.

Which Creech thus interprets,

But seamen, pray be just; put near the land;
Bestow a grave, and hide my limbs in sand.
'Though hasty now, driv'n by a prosp'rous gale,
'Tis quickly done, thrice throw the sand; and sail.

Nor, as the Scholiast on the Antig. of Sophocles informs us, were they permitted to throw clods of earth, but what they called *χῆρος*, mould, or crumbled earth: and this office they called *ἐπιβάλλειν γῆν*, or *κίνειν τάλυνας*. They feared, perhaps, that if they had thrown solid clods of earth, they would have lain heavy on the dead body. Let this suffice for the piety of the Athenians towards the dead: I will now, that I may not seem tedious to the reader, nor create in him a suspicion of truth in a matter so very obscure, select only the most remarkable ceremonies, which they observed in funerals, as I find them recorded in the most authentic authors.

First, then, to begin my intended discourse with what was practised in the last agonies of the dying person; I find in Diodorus Siculus and Valerius Maximus, that when the sick person perceived his end draw nigh, he took a ring off his finger, and gave it to the slander by, who was dearest to him; historians report this to have been done by Alexander. Then pronouncing these last words, "Vive ac vale," (vide Servium in Æneid. 5.) he breathed out his soul, embracing and kissing his best beloved. For they believed the mouth to be the passage through which the soul went out of the body, and therefore endeavoured to catch it as it fled, by holding their mouth open close to that of the person expiring. Thus Antigone in Euripides, in Phœniss. says, O my dearest, and my best beloved, I will put

thy mouth to mine. After whose example, perhaps, Anna in Virgil, Æn. iv. ver. 684.

—— Et extremus si quis super halitus errat,
Ore legam.——

And Livia in the Epicedium of Albinovanus:

Sospite te, saltem moriar, Nero: tu mea condas
Lumina, & excipias hanc animam ore pio.

Hence, at Rome, as we learn from Seneca, in Epist. 30. and from the Tragedian of that name in Herc. Fur. it was proverbially said of the old, who were worn out with age, that their soul was in their mouth: thus the Romans derived this credulity from the Greeks; and Aristotle, in his Treatise de Insp. et Resp. says, That inspiration is the protasis, and expiration the catastrophe of life.

But the wishes of the abovementioned Livia, suggest to us another office that was applied to dying persons, and which the Greeks, in their language, called *καθαίρειν τὰς ὀφθαλμούς*, the Latins, "condere," or "tegere oculos;" to close their eyes. This was the duty of the nearest relation, or of the dearest friend, who immediately closed the eyelids of his departed relation or friend: for, as Pliny teaches, lib. xi. cap. 37. they held it a crime against the gods to see the eyes of a dead person. And that the custom, of which we are speaking was religiously observed, as a pious office, that ought not to be neglected, we have the testimony of many of the ancients; particularly of Euripides in Hecuba, and in Phœnissa, of Homer Odyss. x. and Iliad. 1. and of Plato in Socr. While these things were doing, all who were present called with a loud voice, and by his own name, the person, who was dead, and immediately with wailings and tears ran to embrace the corpse: this we learn from Servius on the 4th Æneid, and from Propertius, lib. iv. eleg. 6. For, as Alcinius, de doct. Plat. cap. 12. says he, who with dry eyes, can behold the death of his relations and friends, has a mind insensible and void of all affection. Hired women attended to take care of the body, and these shut the mouth of the dead person, while the body was yet warm: yet Crito performed the last offices to the condemned Socrates, that women, by their unavailing laments, might not shake the constancy of his undaunted soul. Then they laid out the other members, and washed the corpse with warm water: because, says Cicero, lib. 1. de Leg. they believed the vital spirit to be shut out, and often to deceive them; for which reason, they were wont to wash the bodies of their dead with warm water; in the next place they anointed the body with oil, if the person were free, and not of a servile condition: for unction was forbid to slaves by the laws of Solon: who likewise prescribed bounds to tears and mourning; but to public indeed, rather than to private. Even he himself, as Stobæus, Serm. 276. witnesses, wept for the loss of his son; and when it was told him, That weeping would avail him nothing, I know it well, said he, and for that very reason I weep. And indeed,

*Quis matrem, nisi mentis inops, in funere nati
Flere vetat?*

says Ovid, de Remed. Amor. Especially when, as the custom was, they placed the child, after it was washed and anointed, on the knees of the sorrowful mother, who, taking it into her lap, and cherishing the cold limbs in her trembling bosom, clothed it at length in its funeral attire; as we learn from Lucian, de luctu, and from Herodotus Mus. 5. The Romans called the mother of a dead child, "funera mater," and that too very properly, since the whole funeral, the loss and the grief were chiefly hers: this is attested by Pliny, lib. xi. cap. 45. and by Servius in Eclog. 6.; confirmed likewise by the mother of Euryalus, who, in Virg. Æn. 9. hearing of the death of her son, cries out in the bitterness of anguish:

— Nec te tua funera mater
Produxì, pressive oculos, aut vulnera lavi,
Veste tegens. —

But by the laws of the twelve tables, it was forbid among the Romans, to take into their laps, the body of any who were killed with lightning; or to allow to such the accustomed rites of funeral: because, according to the doctrine of the Greeks, they were esteemed holy, and worthy of divine honour; of which we have spoken above, p. 629. Vide etiam Artemid. lib. ii. cap. 8.

The funeral vestment, or shroud, was made of fine white linen, and they called it *λαύκη σόλη*. In weaving one of these, the chaste Penelope employed many years, to get rid of her importunate wooers, to whom she pretended she was making that winding-sheet for her husband Ulysses. Thus Homer, Odyss. B. Nor in the camp of the Greeks did any take offence at Hippodamia and Diomedea, the last of whom Patroclus, when alive, loved even to madness; and who, both of them, adorned his funeral with the richest of vestments, as Dictys Cretensis has it in lib. 4. Nor can we doubt, but that, in process of time, when corruption of manners had crept in among the Athenians, even they too made use of costly dresses for their dead. We read in Ælian. Var. Hist. cap. 16. and in Diogenes Laertius in vit. Socr. that Apollodorus offered Socrates, after this philosopher had swallowed the poisonous draught, and was in his last agony of life, a white vestment and robe: and Plutarch, in vita Lyfandri, tells us, that Philocles, the Prætor of Athens, after having washed his body, put on his richest robes, and, thus attired, underwent with an undaunted mind the death to which his conqueror Lyfander had doomed him. Certain it is that they adorned their dead with crowns and garlands, made of the leaves of olive, and sometimes of parsley, as Suidas reports, that Dares delivered in his book de Certaminibus; and Lucian de Luctu adds, that they stuck in among the leaves the flowers that the season afforded. This garland was put on by the nearest relation: and Plutarch relates of Pericles, that, though he strove to retain his gravity, and laboured not to discover his inward anguish, yet

he could not refrain from tears, when he crowned with this funeral garland the head of his dead son Patolus. Lastly, they put into the mouth of the deceased two pieces of money of the value of one penny each, to pay his passage over the river Styx; thus the expositor on the frogs of Aristophanes, who says besides, that the freight-money was in their mother-tongue called *Δανάη*; but the Attics called it *Κάρναδον*, and the Latins Naulum.

These ceremonies being thus performed to the body, it then was, by the permission of a law of Solon's, placed any where within the doors of the house: and this they called the collocation of the body: but the same law commanded that it should be carried out to burial the next morning after the collocation, and that too before daylight. This law was expired, or at least was grown out of use, in the time of Demetrius Phaleræus; and though it was then renewed, it hindered them not from keeping the body in the house, as the Romans likewise did, for the space of seven entire days: during which time frankincense, storax and other perfumes were continually burning on a little altar that was placed by the feet of the corpse. And this custom of keeping the body thus long was observed for this reason, to wit, because the presence of the deceased alleviated the sorrow of the mourners, and accustomed their mind by degrees to part for good and all with what they so dearly loved. For this reason the Greeks, when they were before Troy, buried not the body of Achilles, till after they had kept it seventeen whole days.

Besides, those who performed the meanest offices to dead bodies, as the washing and rubbing them with oils and ointments, and whom the Greeks called *Καταγνώται*, and *Νεκροβάπται*, and the Latins, Pollinctores, were, as P. Vict. lib. 2. var. lect. cap. 7. and Lilius Gyraldus observe, held in such abomination, that they were not permitted to have houses within the walls of the city; and Seneca, lib. 6. de Benefic. says, that Demades condemned at Athens a person who sold necessities for funerals; because it was evident that he intended, and wished to gain by his business, which nevertheless he could not do without the death of many.

There were several tokens, that gave notice of a house in which there was a dead body: before the door they placed boughs of cypress, and a large gor-bellied earthen pot, filled with holy water, and which was commonly called *Ἀρδάνιον γάστρα*, but by Aristophanes, *ὄστρακον*; and that water was always brought from another house: the hair likewise of the deceased was hung over the threshold of the door: and the reason of all this was, that none might be polluted, by going into the house unawares.

On these occasions the Greek matrons laid aside their usual apparel, and mourned generally in black, though sometimes in white; neglecting to set themselves off with ornaments, and despising their accustomed trim: their mourning garment was, by the decree of Solon, called *ἱμάτιον*. They

at by the corpse with dejected looks, and weeping around the bier, on which sat the keeper of the corpse, "capularis custos," some very old man or woman, that kept always next the deceased; the companions too of the deceased person stood around his body, overwhelmed with grief, together with weeping virgins, who often beat their breasts with their hands; and those of the weaker sex frequently tore off their hair for grief: for it was forbid to cut it quite off, except at the pile or tomb. It was an ancient custom too in mourning to take the hair off their eye-brows, and to do all things that might testify an irksomeness of life, and betray an anguish of mind. They scarce eat at all; what nourishment they took, was of the coarsest fare: nor is it improbable, that the cups they drank out of were black, as was the custom at Rome, where they were made of earth that came from Polentia. See Martial, lib. xiv. Epig. 157. and Euripides in Troad.

When the seventh day approached, the body was, by the friends of the deceased, laid on a high bier, and placed with the feet next the door; which last custom the Scholiast on the sixth Iliad observes, was not without mystery: for, says he, the dead were laid in that manner, to signify, that they were never more to return to the house again. But Pliny, lib. vii. cap. 8. gives a better reason, and says, that as by the decrees of nature man comes into the world with his head foremost, so he is carried to the grave with his feet in that manner. This ceremony was called *Πρόθεσις*, i. e. "collocatio," and was observed for this reason, that by thus exposing the body, it might be seen whether any violence had been offered to it: and though it was indulged by the Attic laws, that the body might be placed in any part of the house, yet this collocation, as they called it, was generally made in the "vestibulum," porch, or entry, and always with the feet towards the door; a custom frequent enough in our days. I may not omit their foolish custom of driving away the flies; and into which they were led, perhaps, by the example of the officious Thetis. See Hom. Iliad. 8. Socrates in Plato, in Minoe, takes notice of their observing an ancient Attic law concerning the "inferiæ," or sacrifices to the infernal gods; by which law it was enjoined, not to carry the body out of the house, till the victims were slain; no doubt for the expiation of the deceased. And since we are speaking of laws, I will mention the ordinance of Hippas the tyrant, who commanded, says Aristotle in *Œconom.* that for each dead person should be paid to the chief priests of the temple of Minerva, which was in the tower of Athens, two sextaries of barley, as many of wheat, and one penny in money. These things completed the domestic mourning, and the first part of the funeral; to which immediately succeeded the second in the following manner:

According to the laws of Solon, as Demosthenes affirms, but as Tully, of Demetrius Phalereus, in the hours of morning, that preceded daylight, especially if the person died an untimely or sudden death, the body was carried out of the house:

This they called *ἡμέρας ἀρπαγὴν*, "diei raptum," as if the deceased had not expired, but had been snatched or ravished away; or because they thought it not fit that the sun should behold so great a misfortune, and therefore they said, that they, "diem rapuisse," had ravished, had prevented the day. The procession began by a long row of torches, whose splendor dispelled the darkness of the night; and if the deceased had been killed, or had died a violent death, a spear was borne before the body; hoarse-sounding trumpets attended, especially at the funeral of a military man, or one who had deserved well on account of his signal services to the republic; and at the obsequies of such, the people were summoned to assist. Then came the *Τυμβαῦλοι*, players on the funeral pipes, which the Greeks by a word borrowed from the Phœnicians, called *Τιγῆλαι*, and which, after the Libyan mood, uttered a doleful sound, that excited the hired women to bewail the dead. These women the Greeks called *Σοφισταὶ θρηνηῶν*, the dissemblers, and the principals in the mourning, though they shared not in the grief. These the Latins called *Præficæ*. The chief of them was called *ἡγούμενη*, from a sort of song, which they termed *ἡλίκμος*, or *ἰάλικμος*, the Latins, *Lessus*, *Lausus* and *Mortualia*, a funeral dirge. With these mercenaries joined the virgins and matrons, that were related to the deceased, with their hair dishevelled, and besprinkled with dust and ashes, their face and bosom bare, beating their breasts, tearing their face, and each of them howling rather than yelling and wailing. But let us hear Bellonius, an eye and ear-witness of the funeral ceremonies observed at this day in Greece.

The custom, says he, of bewailing the dead, which took its rise from the ancient Heathens howling at funerals, remains among the Christians, even to this day. Now the Heathens of old were wont to lament and mourn their dead for many days; and Greece still retains this usage, which it derived from its ancestors. For in all places, by a certain promiscuous custom, when any of the family dies, whether it be the husband, or any other relation, for whom, according to the usage of the country, they are obliged to mourn, the women run up and down the streets bareheaded, with their hair dishevelled, their bosom naked, and piercing the air with their loud shrieks and yells: tearing likewise the hair off their heads, rending their cheeks, and striking their bare breasts, sometimes with one hand, sometimes with the other: with their right hand they tear the left side of their body, and with their left the right; in the same manner too they tear off their hair, from the left side of their head with their right hand, from the right with their left; and thus by turns, sometimes scarifying their cheeks, sometimes beating their breasts, and sometimes tearing off their hair, they perform this ceremony of mourning: but this custom of bewailing the dead, is permitted only to the women, of what rank soever they be; for the men are not suffered to bear a part in this sort of

mourning. I know all this to be true, not by hearsay, or the writings of others, but have often seen it practised of late in many places of Greece; the first time I was an eye-witness of it was in the month of March, 1547, and at Corcyra anciently, but now called Corfu. I had for many days together, before it was light, heard a great noise, which at first I took to be the howling of dogs, shut up in their kennels: but at length I got out of my bed to discover the truth of it, and to my great astonishment, found it to be a company of screaming and howling women. Now, that they may perform this yelling the better, they agree among themselves on a time and place, when and where they may twice a-day mourn and wail the death of the deceased. Moreover, she among these women, who has the best voice, and sings the loudest, begins the dirge alone, and in a dissonant voice from the others, recounts to his relations and friends the praises of the deceased: and if none of the female relations themselves be capable of performing this office, they hire another woman to do it. For in the towns of Greece there are many women, whose sole livelihood it is to wail the dead: in which they are so artful, that they excite even the unwilling to bear a part in their cries and yellings. And she of all the women, who excels the rest in reciting the praises of the deceased, is hired the dearest. And the other women, who assist in the ceremony, hearkening attentively to what she sings, and mixing with hers, their sighs and groans, chant out the funeral dirge, in the same doleful tune. She too, who with her nails scratches and tears her cheeks the most, is wont to receive the greatest reward. The virgins, above the rest, gain most honour by this dilaceration of the face. Thus P. Bellonius, lib. ii. de medicato funere, cap. 14.

Some footsteps of these dirges are still remaining in Grecia Major, the custom of lamenting the dead in rhyme being not totally abolished. A. Santorelles, in his learned *Postpraxis*, seu *de curando Defuncto*, records a dirge, still frequently used by the country people in Calabria: and Lilius Gyraldus witnesses, that that feminine custom of yelling and screaming, and of tearing their cheeks and hair, continued among the Sabines in his days, and almost throughout all Italy. But no where can we find a more pathetic and moving dirge than this in our Lucretius:

At jam non domus accipiet te læta, neque uxor
Optima: nec dulces occurrent oscula nati
Præripere, et tacitâ pectus dulcedine tangent:
Non poteris factis tibi fortibus esse, tuisque
Præsidio. Miser, ô miser, omnia ademit
Una dies infesta tibi tot præmia vitæ.

Which Dryden thus interprets:

Alas! thou'rt snatched from all thy household joys,
From thy chaste wife, and thy dear prattling boys;
Whose little arms about thy legs were cast;
And climbing for a kiss, prevent their mother's

haste;

TRANQ. II.

Inspiring secret pleasure through thy breast:

All these shall be no more; thy friends, oppress,
Thy care and courage now no more shall free:
Ah wretch! they cry: ah! miserable thee
One woeful day sweeps children, friends, and
And all the brittle blessings of thy life. [wife;

Solon, as Cicero, lib. ii. de Leg. and Plutarch in his life, informs us, forbid, indeed by law, this dilaceration of the cheeks, and beating of the breasts, which last they called *sigvovvria*: the people nevertheless could not be prevailed on to discontinue that custom: nor, as the abovesaid Bellonius relates, were the Venetians of late days more successful, in the late injunctions they gave to the countries of Greece, that are subject to their obedience. The reason, why the ancients adhered thus obstinately to this custom, was, because they credulously believed, that the manes, or ghosts of the dead, were appeased and satisfied with blood and milk: therefore, says Servius, the women, who assist at funerals, beat their breasts, that they may force out the milk, and all scarify their flesh, to make themselves bleed. But because a vast concourse of women, of all conditions, were wont to flock to the funeral house, it was forbid by a law, for any woman to come to a funeral, except such as were relations of the dead, and sixty years of age: thus the great resort of men and women was taken away to lessen the lamentation. For the men too flocked in crowds to funerals; and therefore Pittacus, as Cicero, 2. de Legib. teaches, forbid all manner of persons to attend burials, except the kindred of the deceased: which sanction Aristotle, in *Eth.* ix. cap. II. tells us, was continued, and in use, in his days. But it is not certain, whether besides the relations, who, clad in black, and with veils over their heads, marched in order before the women, the friends likewise, and all who had at any time belonged to the family of the deceased, as also the masters of defence, the players and dancers, the slaves manumitted by will, and those whom the deceased had made free before his death, the bearers of the beds, gifts, garlands, trophies, and waxen images, together with the lictors, and servants of the senate, which was the custom at Rome, made part of the funeral procession: but this is certain, that the magistracy of Athens sometimes honoured with their presence the funerals of the considerable citizens; on account of whose death they sometimes too very unseasonably prorogued the courts of justice. And Solon, in *Ezetzes*, hearing that the whole city attended the funeral of a young man, deceived by the cunning of his friend Thales, immediately concluded it to be his own son, whom they were attending to the grave. The friends and relations carried, on their shoulders, the bier; of which there were two sorts in use among the people of substance: the one was called *Αίχας*, the other *Κλίσιν*. The distinction was only in the size of them: and consequently in the number of the bearers: the *Αίχας* was the largest, and carried by an uncertain number of bearers, according to its size: the *Κλίσιν* also

X y

ways by six, or eight; whence it was likewise called *ἑξαφόρος*, or *ὀκταφόρος*. And a parcel of young men, chosen by the people, carried the bier of Timoleon, says Plutarch in his life.

The funeral pomp proceeded through the chief streets of the city, till it came to the forum, or market place, where the bier was set down, and an oration pronounced in praise of the deceased: this custom, as we learn from Anaximenes the orator in Plutarch, in *Vita Solonis*, was first instituted by Solon; and, being in process of time discontinued, was again revived, especially about the time, when the Greeks, at the passes of Thermopylæ, overthrew the Barbarians, who had invaded their country. When the panegyric was ended, the procession moved again in the same order, and went to the place of sepulture: which sepulture was not nevertheless performed always in the same place, nor after the same manner: for both place and manner differed, according to several laws, and the various superstitions that reigned in several ages. At first they carried back the dead to their house, and intombed them there; calling them the "lares," and tutelar gods of the house: but in process of time this custom was forbid by the laws, which declared it a crime to bury any man within the walls of the city; of which we will speak particularly hereafter.

It is agreed by all, that there were two sorts of sepulture among the Athenians: And to me, says Tully, that seems to have been the ancient way of burial, which Cyrus uses in Xenophon. For the body is restored to the earth, and being laid in it, is covered as with the covering of its mother. This custom of burying in the ground, says that author, 2. de Leg. was continued at Athens, as they say, from the days of Cecrops: the nearest relations laid the body in the ground, and the earth that was thrown over the dead body, was sown with corn. The other custom of burning the dead, began about the age of Hercules, who, to avoid being perjured, reduced to ashes the body of Archeus, the son of Lycymnus, and thus restored it to his father. This we learn from Andron. Hist. and Eustath. on Iliad. 4. And this last custom was observed not only at Athens, but by all the Greeks in general: for so says the Scholiast of Thucydides, lib. 2. ὅτι γὰρ ἦν νόμος Ἀθηναίοις καὶ πᾶσιν Ἕλλησι i. e. It was established by law among the Athenians, and all the Greeks. The reason of the institution of this custom was, because they believed the divine and immortal part of man to be by that fiery vehicle carried up to heaven; and that whatever was terrestrial and mortal, remained in the ashes. Besides, according to the testimony of Pliny, lib. vii. cap. 54. they conceived, that, by burning the dead bodies, they avoided the infection that might be caused in the air, by the putrefaction of buried carcases; but above all, the injury and ignominy which might be offered to the bodies of the dead, by taking them out of the grave before they were consumed. And for this reason the tyrant Sylla ordered his corpse to be burnt, lest he should be served in the same kind as he

before had served his enemy Caius Marius, whose body he caused to be dug up, and thrown into the river Aniene, now Teverone; as Cicero, in 2. de Legibus, and Plutarch, in his life, both witness. But we may observe, that either way of burial was continued down even to the age of Socrates. This we know from the dying words of that philosopher, as they are recorded by Plato in Phædone. Besides, though the Athenians gave answer to S. Sulpicius, as we find in his epistle to Cicero, that they were bound by their religion, not to bury the body of Marcellus within the city; yet authors of better credit, particularly Pausanias in Attic. Xenophon, Ἑλληνικ. lib. 7. Thucydides, lib. 5. Arnobius, lib. 6. advers. Gentes, and others assure us, that it was the custom of the Greeks to bury their eminent men in the midst of the city, even in the very forum. Plutarch, in the life of Theseus, acquaints us, that Cimon having in his galley brought his bones to Athens, the Athenians received them with solemn rejoicings and sacrifices, as if it had been himself who had returned alive to their city; and buried them within the walls, near the place, says he, where the Gymnasium now stands. It is certain, however, that it was more frequent among them to bury in their Ceramicus, by which name were called two several burying places in Athens: one without the walls of the city, and where they buried such as were slain in battle; the other within the city, where harlots also lived, and prostituted themselves. To which Martial, lib. i. epig. 35. alluding, says,

A Chione saltem, vel ab Helide disce pudorem;
Abcondunt spurcas hæc monumenta lupas.

And lib. 3. epig. 93.

Cum te lucernâ balneator extinctâ
Admittat inter bustuarias mœchas.

But we may take notice from Pausanias in Atticis, that all were not buried in the Ceramicus, but that most of the illustrious men had their sepulchres near the high ways and public roads that led to the city: adjoining to that which came from the port Piræus, were the tombs of Menander, of the son of Diopithes, and of Euripides. Besides, in the public enclosures without the city, and in all the roads, were temples dedicated to their gods and heroes, and the sepulchres of their great men; among which deservedly claim to be mentioned those of Thrasylulus the son of Lycus, as also of Pericles, Chabrias, Phormio, Conon, and Timotheus. But the tomb of Aristides, says Plutarch in his life, is remaining in the Phalerean port; which tomb is said to have been erected at the expence of the public, he having not left behind him enough to defray the charges of his funeral. And all who were slain fighting for their country, either in engagements at sea, or battles at land, had monuments set over their graves; those only excepted, who fell at the battle of Marathon; where, says Herodotus, lib. 6. there were killed of the Persians about six thousand three hundred, and of the

Athenians only one hundred ninety-two: And to these, in honour of their bravery, were erected sepulchres in the place where they were killed: but all the others are said to have been buried in the way that leads to the academy. Yet in great slaughters, the republic of Athens, that they might not be thought to fall off from their wonted piety and gratitude, took care that the common soldiers should be buried at least promiscuously, one with another, in the following manner, as it is recorded by Thucydides: Three days before the obsequies were to be performed, they built a shed with boards, into which they brought the bones; and every one was allowed to bring thither whatever he thought fit of what his friend had left behind him: When the funeral procession was made, the several coffins that contained the bones of each tribe were carried in a particular cart by themselves; and one bier besides, with coffins quite empty, was carried for those whose bodies were not found among the slain. Every man that pleased, whether a citizen or a stranger, attended the funeral, and some women, who were related to the deceased, went weeping, and bewailing the dead. The bones were carried to a public sepulchre in the suburbs of Athens, near the tomb of Callisthus. Let this suffice for public sepulchres. But private families had vaults, in which they were buried, in their own land, and on the utmost borders of it: And by this argument Marcellinus proves the relation there was between Thucydides and Cimon: and it was deemed dishonourable not to be laid in the sepulchre of their ancestors. But at Athens the bodies of criminals were projected, as they called it, thrown in a certain place, where they lay exposed above ground; nor was it permitted, even to the sons of such as had been executed, to bury them: The like treatment too was given to their bodies, who, for crimes discovered after their death, were condemned to be dug out of their graves. Plutarch, in the Lives of the ten Orators, mentions a decree of the Athenians, by which it was forbid to bury, neither in Athens, or within the limits of its jurisdiction, the bodies of Archeptolemus and Antiphon, who were convicted of conspiracy against the government. And the like fate, says the same author, in the place above cited, would have happened to the orator Hyperides, if his kinsman Alphenus had not burnt his body, that was given him by Philopites the physician, and brought his bones to Athens, contrary to the decrees, as well of the Athenians, as Macedonians: for he was not only banished, but forbid likewise to be buried in his own country. And the friends of Themistocles did him the like good office, says Æmilius Probus in his life; for they buried his bones privately, which was forbid to be done at all by the laws, because he was guilty of treason. And Plutarch, in the life of Phocion, takes notice, that his enemies commanded his body should be thrown out of the borders of the Attic territories, and that no Athenian should presume to set fire to his funeral pile: And for this reason the people conceived such a hatred

against him, that no man, who was free, durst to bury Phocion, insomuch that he was buried by slaves. Nor may we omit the severe treatment of the thirty chief judges, who, on the accusation of Myro the Phylensian, were banished the city; and when any of them died, and were buried, their dead bodies were dug up, and thrown out of the territories of Attica, as Plutarch reports in the life of Solon. And indeed, as Isocrates de Jugo, says, the people of Athens were so jealous of their liberty, and held tyrants in so great abomination, that when they seized their estates, they not only demolished their houses, but pursued their hate to their dead remains, and tore them out of their graves. Besides, it was permitted to no man, not even to an enemy, to go to sepulchres, except when they attended funerals. Yet Plutarch, in the life of Theseus, acquaints us, that his sepulchre was a place of refuge, to shelter slaves and persons of mean condition, who feared to be oppressed by the great, because Theseus had been remarkable for protecting the injured, for assisting the needy, and redressing their grievances. But Philip the Macedonian violated the sacred privilege of sepulchres, as if, says Livy, he had not been engaged in war against the living, but dead Athenians, and even against their tombs. The common way of burying was by heaping up earth over the dead body: the more costly was by keeping it in a coffin, especially of marble: but the most sumptuous of all was in a vaulted cell, in the midst of which the coffin was placed. One of these marble coffins is still to be seen among the rarities of the Grand Duke of Tuscany, with the following inscription engraved on it:

ΑΧΙΛΛΕΥΣ ΕΠΑΦΡΑ ΤΗ
ΙΔΙΑ ΓΥΝΑΙΚΙ ΓΕΜΙΝΙΑ
ΜΥΡΤΑΛΗ ΜΝΗΜΝΕ
ΤΕΛΕΤΤΑΙΑΣ ΧΑΡΙΝ
ΤΗΝ ΣΟΦΟΝ ΕΦ' Ω ΜΗΔΕ
ΝΑ ΜΗΤΕ ΠΩΛΗΣΑΙ
ΜΗΤΕ ΘΕΙΝΑΙ ΕΞΟΥΣΙΑΝ
ΕΧΕΙΝ ΠΑΝΝ ΕΙ ΜΗ ΤΙ
ΑΤΤΟΣ Ο ΑΧΙΛΛΕΥΣ
ΠΑΘΟΙΗ ΑΝΘΡΩΠΙ
ΝΟΝ ΕΙ ΔΕ ΤΙΣ
ΕΚΒΑΛΗ ΤΗΝ ΜΥΡ
ΤΑΛΗΝ ΔΩΣΕΙ
ΤΩ ΦΙΣΚΩ
Χ. Β. Φ.

Which is as much as to say, Achilles Epaphra gave this monument to his dear wife, Geminia Myrtale, for the sake of her eternal memory. No man has the power to sell it, or to place in it a dead body, unless the said Achilles in civility give him leave. But if any one throw out the body of Myrtale, he shall be fined x. clb. clb. lb.

Moreover, it was the custom of the Athenians to bury their dead with their face towards the west; but the Megarensians, on the contrary, interred theirs with their face towards the east. This, whatever Diogenes Laertius by a slip of memory says, is asserted by Plutarch, in the life

of Solon; by Eustathius on Homer, ll. T.; and by Ælian, lib. v. cap. 14. and lib. vii. cap. 19. Yet Hireas the Megarensian, in the Solon of Plutarch, says, that the Megarensians placed their dead turned to the west likewise. The Athenians also had a coffin for each corpse, contrary to the Megarensians, who were wont to bury three or four bodies in one coffin. This custom indeed was sometimes neglected: for we read, that Syrianus, the preceptor of Proclus, had, while he was yet living, desired of him, that he might be buried with him; and for that purpose had caused a tomb to be made, that would contain two coffins. But after his death, Proclus, doubting whether decency would allow two bodies to be laid in the same grave, for some time deferred his sepulture: upon which the ghost of Syrianus appeared to him in his sleep, and chid him for his scrupulous delay. Vide Enarratorem in Illius virâ, ex Versione I. Holstenii. Herodotus, lib. 16. says, that they sometimes buried their arms with them. Of this we have an eminent instance in Plutarch, who, in the life of Theseus, says, There was found the coffin of a great body, and in it a brass point of a spear, together with a sword. And Cimon was buried without the city, on one side of the road, called Diacæle, and, beside him, the mares that thrice had won the prize at the Olympic games.

But the way of burial, by burning of the body, required much greater ceremony, and more laborious were the preparations in order to it. I wilfully omit to describe the costly funeral of Hephestion, the favourite of Alexander, to which the greatest part of the world contributed; inasmuch that posterity never has pretended, nor ever will be able, to imitate it. It will be sufficient in this place to acquaint our reader, that they first got together a huge stack of sweet-scented wood, which, when laid in order, the Athenians called *πύρρον*, the Latins *rogus*, the funeral pile: This was always built in a quadrangular form, and equilateral, as we learn from Herodianus. And Homer, in the eighteenth Iliad, makes the Myrmidons prepare for Achilles a pile of a hundred foot in length on every side. It is not unlikely, that they were built high for the great, and low and unadorned for the common people. For funeral expences became so exorbitant, that the Athenians found it necessary to put a stop to them, and to forbid, by a law, the use of plained wood in the piles for the dead: And after their example, as Cicero, in 2. de Legibus, observes, the Decemvirate forbid the burning of plained or polished wood in funeral pikes: "*Rogum asciâ ne polito*:" not to mention the rings, garlands, number of minstrels, and other funeral gear, that were likewise abolished by that legislature; the very footsteps of which, through the injury, perhaps, of time, or the never enough to be lamented negligence of men, are scarce to be seen at this day in the Fragments of the Twelve Fables.

When they were come to the *Ustrina*, or place of burning, the funeral pomp stood still, and the

friends of the deceased coming up to the body, covered it with their hair, which they either plucked or shaved off in token of grief; and with olive branches also, which it was held a crime at Athens to convert to profane uses. This we learn from Sophocles in *Ajax* and *Orestes*, M. Tyrius, Orat. 8. and Dion. Hal. l. 11. And here too, as Thucydides acquaints us, funeral orations were sometimes pronounced, especially at the burial of soldiers. Then they were wont to weep over, to give the last embraces, and to speak to the dead body; to the end, that if any sense were remaining after death, it might at least be soothed and delighted with these tender offices of love. At length the relations laid the dead body on the top of the pile, together with the bier and funeral ornaments; but whether they unclosed his eyes, as Pliny, lib. x. cap. 37. says, it was the custom among the Romans, or expected that Mercury should do that office, is no where expressly delivered. Then it was covered with the fat of beasts that were slain, and which were also laid on the pile to be burnt; together with enemies, slaves, horses, dogs, and birds, that were likewise killed; as also with rich garments, with honey, wine, gold, amber, ointments, their own and their enemies arms, and the last and many gifts of their friends; inasmuch, that, according to Plutarch in the life of Solon, it was thought requisite to put a stop to this vain prodigality, and to forbid by a law; the sacrificing of more than one ox, or to throw on the pile above three suits of apparel. And hence, no doubt, proceeded the ridiculous superstition of burning the rich household-stuff of the deceased. And Herodotus, lib. 5. informs us, that Melissa, the wife of Periander of Thesprotia, on the river Acheron, appeared after her death, and complained of being cold, because the garments, that were interred with her, not being burnt, were of no service to her. Her husband, therefore, stripped all the Corinthian women, who were assembled at the temple of Juno, and, carrying their clothes to the grave of his wife, burnt them there, calling on Melissa. Moreover, the sanctions of the twelve tables, as mentioned by Cicero, in 2. de Legibus, give just grounds to believe, that the same legislator, prohibited the burning of gold, which would be of no advantage to the dead, and a great prejudice to the living, since the scarcity of it would be a hinderance to commerce. Lucian, "*de luctu*," says, that in their funerals they sacrificed sometimes the horses and concubines, sometimes the cup-bearers, of the deceased; and burnt or buried, together with the body, all their clothes and wearing apparel, as if they were to use and enjoy them in the infernal abodes. One of the relations of the dead, with a lighted torch, set fire to the funeral pile; but turning his face another way, to witness his reluctance to perform that sorrowful office. The pile was immediately in a blaze, the fuel being in great quantity, and proper to feed the flame. Meanwhile, they invoked the winds, calling on them to assist the fire, that the body, together with the wood, might be the sooner consumed. Diodorus Siculus, lib. v.

cap. 2. says, that the pile of Hercules was burnt in a moment by lightening, that flashed on all sides upon it. And now was the time, when the trumpets, in mournful sounds, gave notice to the assistants thrice to go round the pile; which they did sometimes divided into two bodies, and meeting in imitation of a flight. This ceremony, the Greeks called *περιδρομή*, and the Latins "decur-sio," a joust or tournament; but the time of this jousting in funerals was different among the ancients. For Homer, *Iliad* 23. makes it precede the burning of the body, in the funeral of Patroclus, and accompany it in the funeral of Achilles, *Odys.* 15. and sometimes it followed even the tumulation of the bones, as we find in Apollonius, *Argonaut.* lib. 1. They believed the dead to be purged of their offences by this ceremony; which nevertheless, according to some, was at first instituted, to divert and soothe the grief and wailings of the mourners, see Statius, *Thebaid.* lib. 6. and to detain the other spectators of the funeral, that they might not grow weary, and go away: for the ceremony lasted a considerable time, and they continued long in the open air, even though the pile was built of a great quantity of fuel, and that too, apt to burn. Therefore, Achilles, in the funeral even of his dearest friend, committed what remained unburnt at night, to the care of the "funeratores," buriers, who watched all the night, and laid together the wood of the pile. And we may observe, that the *ἔσολογία*, or gathering up of the bones and ashes, was deferred sometimes to the third day, though I am not ignorant that this ceremony was most commonly performed at the close of the same day. After the deflagration, they sprinkled the pile with old, deep-coloured wine, that they might the more safely tread on the cinders: for the nearest relations, with their feet bare, their gowns ungirdled, and flowing about their heels, and having first washed their hands, performed by night the last office of gathering up the bones. And this ceremony the Greeks called *ἔσολογία*, and the Latins "offilegium." And when they found any of them that were but half burnt, and covered with cinders and ashes, they wet them with wine, milk, and tears; then wrapt them up in linen towels, and having carried them in their bosom till they were dry, they put them into an urn, together with the ashes, with perfumes, and little vessels of tears. Two of which, made of glass, were lately found in an ordinary coffin, among the ruins of a wall, in the ancient town of Fesulæ, now Fiesoli in Tuscany, and are in the possession of the Grand Duke. These cinerary vessels or urns, the Greeks called *ἑσολοχῆαι*, or *ἑσολοχῆαι*, and they were not always of the same form, nor made of the same matter: for those of heroes were made of gold and silver; those of the rich of brass or marble; and the poorer sort were content with urns of earth or of wood. When the remains were put into the urn, they closed it up, covered it with a piece of purple or fine linen, and then laid it in the earth. Thus we learn from Plutarch, in *Vita Demetrii*, that when the

fleet of Antigonus approached the harbour of Corinth, the golden urn, in which were deposited the remains of Demetrius, and that was covered with purple, and had a regal crown upon it was discovered on the poop of the admiral galley; and a troop of young noblemen, and persons of quality attended in arms on the key, to receive it at landing; and Xenophantus, the most famed musician of that age, began a mournful song in praise of the dead, to which the rowers with sorrowful ejaculations made responses, their oars all the while in their strokes, keeping time with the doleful cadences of the music: insomuch that the pomp of his funeral was no less theatrical than dismal. Nor may we omit to mention the most pious obsequies, that were paid to Evagoras by his son Nicocles, and that were remarkable, no less for the great number and value of the sacrifices, than for the music, gymnastic exercises, horse-races, galley-prizes, and the like: for, as Diodorus Siculus, lib. 11. observes, some were so fortunate, as to have their funerals conclude with spectacles and games; which nevertheless happened not at all: but the Athenians, in gratitude to those who were slain in the Persian war, besides the ornaments of their sepulchres, instituted funeral games and exercises, that were performed at the place of sepulture.

After these sacred rites were ended, then followed the *ψυχάγωνία* which consisted in calling the dead thrice by his own name, bidding him eternally farewell, and praying that the earth might lie light upon him. And then, being dismissed by the "flamen," or the "funera mater," who first sprinkled them thrice with water, to purge them of the pollution they had contracted by the sight of the funeral, they went away. The word of dismissal used by the "flamen," among the Greeks, was, *ἀφαιρεῖς ἔστω* among the Latins, "Hicet." But besides this lustration by water, Festus takes notice of another, that was in use among the Romans, who were wont to walk over the place of sepulture: and this manner of purgation they called "suffitio," i. e. fumigation; but whether or no this custom was practised by the Athenians, I have no where observed.

The whole ceremony concluded with the *Πισιδαιον*, as the Greeks called it, but the Latins "siliernium; which were certain banquets given by the parents or relations of the dead, wearing garlands on their heads; at whose houses it was permitted to speak in praise of the dead, if they had any thing true to say of him; for they held it a crime to lie on this occasion, as Cicero acquaints us in these words: "Sequebantur epulæ, quas inibant parentes coronati; apud quos de mortui laude, cum quid veri erat, prædicatum; nam mentiri nefas habebatur: ad iusta conjecta erant." *De Legib.* lib. 2. in calce. The Athenians indeed, as Plutarch, in the life of Demosthenes says, departed from this laudable institution; insomuch that at length it grew to a proverb among them, praise no man, not even at a funeral supper.

They wore black apparel for the space of seven

days after the funeral; and to lay aside their mourning before that time was expired, was held a breach of decency. Thus Plutarch, in the place above cited says, that Æschines upbraided Demosthenes, for appearing in public, gaily dressed, and with a garland on his head, before the customary week of mourning was over, laying to his charge, and accusing him of hatred to his own children: yet Demosthenes only compelled his private grief to give way to the public joy. These funeral banquets, as Lucian, de Luctu, teaches, were designed to sooth and divert the grief of the sorrowful friends and relations; whom the guests were wont to exhort, nay, even to compel, to take some sustenance, that might refresh their bodies, that were wasted and grown dry with too long fasting: for no man, as that author expresses it, takes it amiss in good earnest, that he is compelled to eat and live. We learn from Pollux, that, at Athens, the funeral banquet was wont to be given by the chief managers and directors of the funeral, at the house of the nearest relation: but it is uncertain, whether it was an open feast, and free to all comers, like that which Achilles gave at the funeral of Patroclus, and those of the Romans, which they called "viscerationes," from the great number of beasts that were slain, and whose flesh was distributed among the people.

We will not speak of the many and costly ornaments of their tombs and sepulchres: which some however were wont to prepare for themselves before they died: Cicero, in 2. de Legib. says, that the expence of sepulchres grew at length to such excess at Athens, that it was enjoined there by a law, that no more cost should be laid out, nor more work employed on a sepulchre, than what ten men could finish in three days. Nor were they permitted to adorn their sepulchres with any pargetting or fret-work; nor to place upon them any *herma*, as they called them; and which, as they are described by Pausanias in Arcad. were certain images, ending in a quadrangular figure, and not polished down to the feet. Besides, they were not allowed to harangue in praise of the dead, except in public sepulchres: and even then too no other was permitted to speak, but he who was appointed by the public so to do: For, according to Diodorus Siculus, lib. 5. it was enacted by a law, that the chief rhetoricians only should make funeral orations, reciting the worthy actions of those who were honoured with public sepulchre. Now it was Demetrius who set bounds to, and prescribed the manner of, the new sepulchres: For he commanded, that nothing should be set up on the place of interment, except a pillar, not above three cubits high, or a hollow stone, made in the shape of a little cistern; or a square piece of board, the care of which he committed to a certain magistrate appointed for that purpose. We learn from Plutarch, in Lycurg. and in Isocra. that on the board were engraved the name and the effigies of the deceased: But we may observe, that even in ancient times, pillars were placed on graves of this nature: This Plutarch has taken notice of from Homer, Iliad. ii. ver. 674.

Ἐνθα δὲ ταχέως καὶ σφύρησιν τὸ ἔσται τι,
Τύμβῳ τε στήλῃ τε, τὸ γὰρ γέρας ἐστὶ θανάτου.

His friends and kindred here shall him inter,
And place a column on his sepulchre.

We learn from Pollux, lib. viii. cap. 7. that on the tombs of unmarried persons there stood the image of a young virgin, holding in her hand a water-pot, an urn, or a basin: and this image, whether it were one that bore water, or any other, Isæus called *Ἐνυμήμα*. Nor was the meanness of the structure ever thought to derogate from the glorious title of the trophy, which the grateful citizens had caused to be engraved for such as had fought bravely for their country: and Cicero, lib. 2. de Leg. teaches, that the pillar on the sepulchre of the geometrician, Archimedes, was laid upon the ground. Pausanias, in Atticis, relates, that the tombs, together with the pillars, on which were written the names and tribes of the slain, were still to be seen in the plains of Marathon: and that, in memory of their bravery, sepulchres were erected for them in the very place where they fell: though it was customary to erect a particular monument for every one who was killed fighting for his country, either in naval engagements, or battles at land. The epitaph on those who fell at Thermopylæ, is recorded by Diodorus Siculus, lib. xi. in these words: Stranger, tell the Lacedæmonians, that we lie here, who obeyed their commands, and their captains. Plutarch, in the life of Aristides, acquaints us, that, in the battle of Plataea, there fell two and fifty Athenians, all of them of the tribe Aiantis, which, as Clidemus says, fought very bravely: and that, in memory of their victory, sacred rites, that had been commanded by the oracle of Apollo, were performed, at the public expence, to the Nymphs Sphtagitides: but they were buried in the way that leads to the academy, and square or flat-sided pillars were placed upon their tombs, with inscriptions, declaring the name of each of them, and the ward or precinct where he lived: Nor may we forget that most equitable law made by the people; which decreed the honour of public sepulture to such servants and slaves, as had bravely and faithfully served their masters in battle; and that their names should be engraved in columns, to be set up over their place of burial: It cannot indeed be doubted, but these were honorary and empty sepulchres; unless, before the elation of the body, a finger, or, after the burning, some bone of it were purposely taken, and kept to be buried in the native country of the deceased. And hence we see the reason why the Decemviri, who, as they did perhaps in almost all things else, imitated the funeral rites of the Athenians, dispensed with the ceremony of the ossilegium, or gathering up the bones, when any one died in foreign wars. And that the Greeks had their *κενοτάφια*, or empty sepulchres can be doubted by such only as are ignorant of the piety of the Corinthians to the Argives, that were slain at Troy; of which Pausanias in Corinth, and of the great Cenotaphium, mentioned by the same author in

Atticis, that was made at Athens for soldiers, whose bodies were not found: not to mention the famous Cenotaphium of Cyrus, recorded by Xenophon in the sixth book of his Expedition; nor the sepulchre of Euripides, in the way that led from the Piræus to Athens; though, as Pausanias in the place above-cited, witnesses, Euripides went to Archelaus in Macedonia, and was buried there: But this difference may be observed, That the honorary sepulchres of soldiers, who were killed in a naval engagement, were marked with the emblem of a rudder, or of an oar, as that of Elpenor was in Homer, *Odyss.* 12. but the rest had no mark of distinction: though I am not ignorant, that, besides the inscriptions, emblems were likewise put on most monuments: as a globe and cylinder on that of Archimedes, (Cicero in *Tuscul.*) a dog on that of Diogenes, (Laertius in *ejus vita*) a ram on that of Isocrates, (Plut. *Rhat.* 10.) and owls very frequently, as we learn from Athenæus, lib. 13. to say nothing of the sepulchral statues, with which the monuments of the rich were adorned: as we find in Lycophron. in Pindar, *Od.* 10. Nem. in Plato, 12. de *R. P.* and in others. Nay, even on that of Æsop, though but a slave, the Athenians placed a great statue, that all might know, says Phædrus, that the way of honour lies open, and that glory is due, not to the race, but to virtue:

Igentem statuam posuere Attici,
Servumque collocarunt æternâ in basi,
Patere honoris scirent ut cuncti viam,
Nec generi tribui, sed virtuti, gloriam.

Moreover, the Athenians, when any of their relations were murdered, always carried a spear with the dead body to the place of sepulture: and this spear they stuck into the tomb, as a token, that they denounced vengeance to the murderers: This we learn from Suidas: And the Scholiast on the *Clouds* of Aristophanes teaches, That after the dead body was carried forth to burial, it was the custom for the relations and friends of the deceased to wash themselves by way of purgation. Then they renewed afresh their unavailing tears and wailings; while libations and the funeral supper were brought to the sepulchre: about which they believed the manes of the deceased to be always hovering; and that their senses still remaining alive, they wanted nourishment, and were delighted and soothed with their offices of tenderness and love. For these reasons too they instituted their *ἑννέαια*, as the Greeks called them, but the Latins "Novendialia," which were certain sacrifices used for nine days after the party was dead. The manner of them was this: about sun-set, being apparelled in black, they poured liquors in the coffins or urns: these liquors were honey, milk, wine, water, blood, ointments and tears: mean while they encompassed the monument with garlands of parsley and myrtle. But as we learn from Plutarch, in *Quæst. Græc.* the *encnisma* of the Argives was more full of ceremony. For the custom among them was, when any of them had lost a friend or relation, immediately

after the funeral, to sacrifice for thirty days together to Apollo, and then to Mercury: for they believed, that in like manner as the earth receives the bodies of the deceased, so Mercury does the souls. To the priest of Apollo they gave barley, and received from him the flesh of the victims: they extinguished the fire that had burnt the body, because they held it to be polluted; and kindled other to dress the flesh, which they called *encnisma*. Meursius, and others of the learned, observe, that if it was a man or a woman that was dead, then the water was brought by women, whom they called *ἑγχευτρίαι* if a batchelor or a virgin, then that office was committed to some boy, who was related to the deceased. And Libanus, in *Progymn.* takes notice, that Achilles acted not according to the custom of the Greeks, in offering human blood to appease the manes of the dead; and that he injured his own reputation, and the memory of his friend Patroclus by that cruel practice, which he had learnt from Barbarians, of burning, together with the pile, the bodies of men, as well as of other animals: for which he is blamed by Homer, as Plutarch, de *Homer.* observes. Iphigenia, in the *Electra* of Euripides, provides herself with the blood of mountain sheep and heifers; not, like him, of enemies butchered on the pile. And, indeed, as Libanius in *Progymn.* takes notice, an enemy, taken prisoner, ought no longer to be accounted an adversary, since the very victory changes his name, and of an enemy makes him be called a suppliant. I now return to the Athenian ceremonies.

They likewise strewed the ground around the monument with flowers of all sorts, but chiefly with roses, amarants, lilies, poppies and violets: with which they dressed up likewise the dish that was designed for the funeral banquet. Ovid, in *Fast.* lib. 3. enumerates the several sorts of viands they were wont to eat in these ceremonies; and so too does Lucian, de *Luctu*; and the same author in *Dialog. Car.* deriding the customs of his own age, says, That they crowned with garlands the stones of the monuments, and anointed them with rich ointments, and that some were wont to raise a pile before the monuments, and, digging a grave in the earth, threw in their costly dishes, and poured in a great quantity of wine.

The Athenians celebrated these parentations in the month Antestherion, says Hesychius; and the Romans, as we learn from Ovid. *Fast.* lib. ii. observed almost the same time in the celebration of theirs: for it was the custom among them to appease the manes of their parents and other relations on the eleventh of the calends of March. This ceremony began very early among the Athenians, as Lysias in *Or.* teaches; and that they were enjoined by a very ancient law yearly to deplore their buried friends; and on the same day to praise, in a public oration, those that had been slain in battle, as Cicero, in lib. de *Orat.* teaches. And Plutarch, in the life of Theseus, informs us, that, on the eighth of their month Pyanepsion, which was the day he returned with the young men from Crete, they performed their

chief ceremony in honour of him: and that they worshipped him likewise on the eighth day of each of their other months. The like testimony of gratitude was shown to the Greeks, who were slain by the Medes, and buried at Plataea, says Thucydides, lib. iii. in Orat. Platæen, of which Plutarch, in the life of Aristides, gives the following particular account: The Platæans, says he, are wont to offer yearly parentations to the Greeks, that fell in the battle, and were buried there, which custom, they continue even to this day, in the ensuing manner: On the sixteenth day of the month Maimacterion, which with the Bœotians is Alalcomenus, they make their procession, which, beginning by break of day, is led up by a trumpeter, sounding a point of war; then follow certain chariots, loaden with myrtle and garlands: and after them is led a black bull; next come the young men, of free birth, carrying libations of wine and milk in large two eared vessels, and jars of oil and precious ointments; nor is it permitted to any of servile condition, to have the least hand in this ministration; because the men, that were buried there, died in defence of their liberty. After all, comes the chief magistrate of Plataea, who, though it be unlawful for him at other times, either to wear any manner of arms, or to be clothed in any other coloured garment than white, is at that time, nevertheless, apparelled in a purple robe; and, taking a water-pot out of the city-chamber, proceeds, bearing a sword in his hand, through the middle of the town to the sepulchre; then, drawing water out of a spring, he washes, and anoints the pillars of the monuments; and, sacrificing the bull upon a pile of wood, and making supplications to Jupiter, and to Mercury of the earth, he invites those valiant men who perished in the defence of Greece, to the banquet and parentations; after this, filling a bowl with wine, and pouring some of it out by way of libation, he drinks the rest, and says, I drink to those persons, who lost their lives for the liberty of Greece. These solemnities, even to this day, do the Platæans observe. Thus far Plutarch.

Nor may we in this place omit the great honours that the republic of Syracuse decreed to Timoleon; whose bier being laid upon the pile, Demetrius, the loudest mouthed of all the criers of those days, recited a written decree to this purpose: The people of Syracuse have decreed, that this Timoleon, the son of Timodemus of Corinth, shall be buried at the public expence; that two hundred minæ shall be expended on his funeral, and moreover, that he shall be for ever honoured with musical, equestrial, and gymnical games and exercises: because, having pulled down the tyrants, overcome the barbarians, rebuilt the large cities, that were demolished, and rendered them again populous, he restored to the Sicilians their ancient laws and liberties. We learn from the Scholiast on the Frogs of Aristophanes, that the particular time when these annual solemnities were performed to the dead, was about noon; but that even then they were scarce safe from the

spectre of Empusa, that by various arts disturbed the ceremonies. The stories, that are told of Proculus Lycius, by his flatterer Cælius Rhodiginus, lib. vi. cap. 28. are made up of nothing but superstition and hypocrisy: for he tells us, that that blessed man, as he calls him, was more knowing in, and more zealous observer of, the rites and ceremonies, that are paid to the dead, than any other man whatever: for he never omitted at any time to perform that religious duty; but went yearly on certain days to the sepulchres of the Attic heroes and philosophers; and of all others, with whom he had had any friendship and familiarity, and offered the due sacrifices to them, not by the help and ministry of others, but by himself, and with his own hands. Then, after he had paid these rites to each of them, he went to the Academy, where he appeased, by sacrifices, the souls of his ancestors, and of all his relations, in one place; and in another, he performed the like ceremonies to the souls of all the philosophers; and more than all this, that most religious person sacrificed in a third place to the souls of all the dead. And these pious offices arose at length to such a height of superstition, that the Athenians, not satisfied with paying these honours to such as had deserved well of the republic, recorded their names among the number of their gods; and decreed them divine honours, as we learn from Aristophanes in Equitibus, and Pausanias in Atticis. Nay, it escaped very narrowly, that Alexander was not worshipped at Athens as a god: for we learn from Plutarch, in Orat. Lycurg. that adulation would have prevailed, and brought that infamous thing to pass, had not a prudent person prevented it, by scoffing at the populace, and asking them in a jeering manner, What a god, said he, will this be, into whose temple, whoever goes is polluted, and whoever comes out needs purgation? Thus we see how much the Athenians departed from their ancient rites of funeral, and what corruption of manners crept into the territories and city of Athens, during the time of this raging pestilence.

Ver. 1249. Boccaccio, that parent of the Tuscan eloquence, describes almost the like neglect and disorder, that happened even in a Christian country, in the burial of those that died of the plague at Florence, in the year 1348, and tells us, that few bodies were accompanied to their graves by more than ten or twelve of their neighbours; and those too were not of the better sort of citizens, but only a parcel of mob, that for hire, carried the body, not to the church where the dead person, before his death, had desired to be buried; but, for the most part, to that which was next at hand: preceded only by four, or six priests at most, with few, and sometimes no lights at all, and threw it hastily into any grave they found empty, or that had room to receive it. But let us hear how movingly he describes this calamity in his own words. "Et erano radi coloro, i corpi de i quali fosser più che da un' dieci, o dodici de suoi vicini alla chiesa accompagnati, de quali non gl' horrevoli, e cari cittadini, ma una maniera di

beccamorti sopravvenuta di minuta gente, che chiamar si facevano Becchini, la quale questi scruggi prezzolata faceva, sottentravano alla bara, e quella con frettolosi passi, non à quella chiesa, che esso haveva anzi la morte disposto, ma alla più vicina, le più volte il portavano, dietro à quattro, o sei clerici con poco lume, e tal fiata senz' alcuno, li quali con l' aiuto di detti Becchini, senza fatigarfi in troppo lungo ufficio, o solenne, in qualunque sepultura disoccupata trovavano, più tosto il mettevano. J. Boccacio, in Proem. Decam.

Ver. 1254. Thus too Ovid, who has most happily imitated both Thucydides and our author :

Ante sacros vidi projecta cadavera postes ;
Ante ipsas, quo mors foret invidiosior, aras :
Pars animam laqueo claudunt, mortisque timorem
Morte fugant, utroque vocant venientia fata :
Corpora missa neci nullo de more feruntur
Funeribus : neque enim capiebant funera portæ ;
At inhumata premunt terras, aut dantur in altos
Indotata rogos ; et jam reverentia nulla est ;
Deque rogis pugnant, alienisque ignibus ardent :
Qui lacryment defunt, indeffletæque vagantur
Natorumque, virumque animæ, juvenumque se-
numque :
Nec locus in tumultis, nec sufficit arbor in ignes.

Metam. lib. 8.

Which a late ingenious person has thus rendered :

Death stalk'd around with such resistless sway,
The temples of the gods his force obey ;
And suppliants feel his stroke, while yet they }
pray.
The rest, grown mad, and frantic with despair,
Urge their own fate, and so prevent the fear :
Strange madness that ! when death pursu'd so fast,
T' anticipate the blow with impious haste.
No decent honours to their urns are pay'd ;
Nor could the graves receive the num'rous dead :
For, or they lay unbury'd on the ground,
Or, unadorn'd, a needy fun'ral found :
All rev'rence pass'd, the fainting wretches fight
For fun'ral piles that are another's right :
Unmourn'd they fall ; for who surviv'd to mourn ?
And fires and mothers unlamented burn :
Parents and sons sustain an equal fate ; [meet :
'And wand'ring ghosts their kindred shadows
The dead a larger space of ground require ;
Nor are the trees sufficient for the fire.

All which calamities may the Almighty avert far from us ; and not from us only, but from the universal society of all mortals ; nor let us uncharitably join in wishes with the heathen poet, who sings,

Dii meliora piis, erroremque hostibus illum.

ANIMADVERSION,

BY WAY OF RECAPITULATION, ON THE SIXTH BOOK OF LUCRETIVS.

IN this book, Lucretius reasons of many things excellently well, but has miscarried in his main design, and does not so much as stagger the belief of Divine Providence, which he attacks with his utmost force : for let it be granted, that the causes he assigns of meteors are perspicuous and true ; that he has rightly explained the reason of thunder, lightning, and earthquakes ; in a word, that all things proceed from natural causes, and are continued and carried on by them : yet there is no nature without a Lord, nor does she herself at least reject or disown a ruler. For nature is only that disposition and order of the particles of senseless matter, which is the cause of these effects we call natural. Now, if that disposition was introduced by chance, it does not confute and overthrow Providence ; and if it was the work of reason and wisdom, it confirms it. Therefore these explications may amuse and delight natural philosophers ; but they cannot in the least avail atheists.

No man has more accurately collected, none more ingeniously explained, the ancient philosophers opinions concerning meteors : the modern, it is true, have added a few things to them ; but not better. And indeed, as this present age does, so many succeeding ages likewise will, seem to dispute, face to face, with Lucretius, concerning meteors. And this is what Vitruvius said long before me.

What he teaches of earthquakes, and of the sea is so rational, that the things themselves approve and confirm his doctrine : only there are some earthquakes that seem to surpass the strength of the causes he assigns them.

Ætna is a noble subject, but difficult : and in this the poet flags a little. But then he reasons of the increase of the Nile, of the Averni, and of the wonderful fountains, as if truth itself were speaking : but it may be observed that he does not give full satisfaction concerning the fabulous spring of Jupiter Ammon : for Lucretius always explains nature better than fables.

He would have written more at large of the loadstone, and have left us many things that we should read with pleasure, if the wonderful power of that stone had been known in his days. The explication he gives of plagues and diseases is pertinent and useful : and lastly, he interprets Thucydides in such a manner, that he expresses the energy, and surpasses the majesty, of that historian ; nor is the narration of Thucydides so clear or set off with so much brightness or wit.

Don.

GRAINGER'S TIBULLUS.

TO JOHN BOURRYAU, Esq.

SIR,

WHEN I first thought of prefixing your name to this translation of Tibullus, I found myself considerably embarrassed; as I would choose to avoid the strain of adulation, so common in addresses of this kind, on the one hand, without suppressing the just sense I have of your rising merit, on the other. I shall not, however, I flatter myself, incur the imputation of the first, by declaring, even in this public manner, my satisfaction at the progress you have made in every branch of useful and polite literature; and this too, at a time of life, when young men of fashion are generally engrossed by the idle amusements of an age abounding in all the means of dissipation.

If your maturer years answer, as I am convinced they will, so favourable a dawn, I need not a moment to hesitate, to foretel the happiness of your friends, in an agreeable companion, and polite scholar; and of your country, in a principled and unshaken patriot.

It is with particular pleasure, Sir, that I dwell, though but in idea, on this part of your future character. The time is not far off, when you will have finished the plan of your education, by a survey of foreign countries: and as it will then, of course, be expected from one of your opulent and independent fortune, you will, I hope, devote the fruits of your industry to the service of the public:

Hunc precor, hunc utinam nobis Aurora nitentem

Luciferum roseis candida portet equis.

Tibull.

When you become a member of the most august assembly of the nation, every wellwisher to the community will exult to see you unawed by

power, undazzled by riches, and unbiassed by faction: an impartial assertor of the just prerogatives of the crown, and the liberties of the people; equally a foe to corruption, and a friend to virtue.

Such, Sir, are the hopes which all your friends at present conceive of you: and as your talents, both natural and acquired, seem strongly to confirm these hopes, the more inexcusable you will prove, should they be hereafter disappointed.

In regard to the translation, with which I here take the liberty to present you; I will not pretend to say, I set no value upon it. My offering it to you is a proof of the contrary.—Indeed, the chief merit it has with me, is, that it formerly pleased you. It served also, to make many of my hours pass agreeably, which otherwise would have been extremely irksome, amid the din of arms and hurry of a camp life.

But while you peruse Tibullus as a poet, let not his integrity, as a member of the commonwealth, be forgotten. In this light he merits your highest regard: for though he justly obtained a distinguished rank among the great writers of the Augustan age; yet ought it more especially to be remembered to his honour, that neither the frowns of a court, nor the distresses of fortune, could ever induce him to praise those powerful but wicked men, who had subverted the liberties of his country: and this, at a time, when the practice of the poets his cotemporaries might have countenanced in him the most extravagant adulation.

I am, Sir,

Your most obedient

humble servant,

JAMES GRAINGER,

ADVERTISEMENT.

THE following version of Tibullus was begun and completed several years ago, when the author was in the army. A military man, even in the most active campaign, has many hours of leisure; and as these cannot be spent more rationally than in some literary pursuit, he employed that part of his time, which was not devoted to his profession, in perusing the classics.

Time and place influence us more in our opinions of, and relish for, particular writers, than is commonly imagined. Amid the horrors of war, the translator could most readily sympathize with, and best account for, his poet's aversion to a military life: and while exposed to all the hurry and tumult of a camp, could not but taste with a peculiar relish all descriptions of the unruffled and

tranquil scenes of the country : besides these, every motive conspiring to make him regard the fair sex as the chief ornaments of society, was it surprising that Tibullus, who abounds in sentiments of this kind, should soon become a favourite ; and that what delighted him, he should at last be tempted to translate ?

A pleasing employment is seldom neglected.—Those elegies which particularly touched him, were first rendered into English ; and as these make the greater part of Tibullus's poems, he was contented afterwards to complete the work, by finishing as a task, what he begun as an amusement.

A favourite author, on whom some labour has been employed, is not easily forgotten ; the version, therefore, was retouched as often as opportunity served. All this while, indeed, the translator had no intention to make the public acquainted with his poetical amusements : he knew his poet too well, and admired him too much, to think he had done him justice :—yet when Mr. Dart's translation of Tibullus was sent him, he was resolved to publish his own ; that those who did not understand the original, might not form an idea of the most exact, elegant and harmonious of the Roman elegiac poets from the most inaccurate, harsh, and inelegant verses of the present century.

The translator hopes he will be acquitted of vanity, in preferring his own performance to Mr. Dart's : indeed that gentlemen often missed the meaning of his author, while his poetry always escaped him. Neither does he appear to have been a competent judge of his own language : and from the little tenderness transfused into his verses, it may be concluded, that he was an utter stranger to that passion, which gave rise to most of the elegies of Tibullus.

What advantage the present translator may have over his predecessor in these respects, does not become him to determine : yet he is well apprised, that no translator, however qualified, can give Tibullus the genuine air of an Englishman.

It is true, that amorous elegy is less local than many other of the minor kinds of poetry, the passion of love operating pretty nearly the same upon the human mind in all ages. Yet as the modes of expressing that passion differ much in different countries, so these modes must not be confounded : a Grecian ought to make love like a Grecian, and a Roman like a Roman.

Besides this, Tibullus abounds in images of rural theology.—He has even preserved some superstitious usages, which are to be met with in no other poet : but as these are also characteristic, and must be preserved in the version, who can hope to give a translation of Tibullus the easy air of a modern original ?

Verbal translations are always inelegant, because always destitute of beauty of idiom and language ; for by their fidelity to an author's words, they become treacherous to his reputation : on the other hand, a too wanton departure from the latter, often varies the sense, and always alters the manner.

The translator chose the middle way, and meant neither to tread on the heels of Tibullus, nor yet to lose sight of him. He had not the vanity to think, he could improve on his poet : and though he has sometimes endeavoured to give a more modern polish to his sentiments, he has seldom attempted to change them. To preserve the sense of his original was his first care ; his next was, to clothe it in as elegant and becoming a dress as possible. Yet he must confess, that he has now and then taken the liberty to transpose, and sometimes paraphrastically to enlarge the thoughts. Where a sentiment was too much contracted by the closeness of the Latin idiom, to be unfolded in a correspondent expression in English ; or from its peculiarity, might, in a modern language, seem flat, he has endeavoured to inspirit it by collateral thoughts from other poets ; and where its colours were languid, to heighten them—with what success, the reader must determine.

The Hexameter and Pentameter is said to be peculiarly suited to plaintive subjects. The English have no stanza correspondent to that, but the alternate, which is supposed to possess a solemnity and kind of melancholy flow in numbers. This Mr. Hammond chose for his imitation of Tibullus ; and it must be confessed, that he has happily succeeded. Yet, as in this stanza, the sense naturally ends at the fourth line, the translator thought he could not in general have adopted it, without violence to the original : he therefore preferred the heroic measure, which is not better suited to the lofty sound of the epic muse, than to the complaining tone of elegy. The reader, however, will find one or two elegies rendered in the alternate stanza, which is by no means so difficult as the heroic.

As Tibullus wrote love poems like a Roman, any translation of them without notes, would have been extremely obscure to an English reader : most of his commentators are mere philologists, or at best they have only displayed their erudition in the history of a heathen god, or the topography of a river. From this censure, however, Broekhusius, his Dutch editor, and Vulpinus, his Italian commentator, may in part be exempted ; they have indeed sometimes entered into the propriety of our poet's thoughts. Yet even their chief excellence consists in arranging the text ; in selecting the most approved readings ; and in giving those passages, which they suppose Tibullus either borrowed from his predecessors, or the moderns copied from him. The design of the translator is very different ; he has commented on his author as a Roman poet, and as a Roman lover : and although he owns himself enamoured of his beauties, (as who can draw a pleasing resemblance of a face which disgusts him ?) he hopes he has not been blind to his imperfections. These, indeed, he has touched upon with the tenderness of a friend, not the acrimony of a critic.

Yet as most of the commentators were consulted, the translator has taken from each of them, such notes, as he imagined would be most serviceable to an English reader, always ascribing them

however to the author who furnished them. Thus, beside Broekhusius and Vulpus, the name of Mr. Dart will sometimes be found at the bottom of an observation. Nor must it be forgotten; that the translator has been obliged to that gentleman for ten or twelve lines in his version.

It has been judged necessary to print the Latin text along with the version: this the translator would willingly have declined, as his work can hope to find favour with those only, who understand not the original. Yet, when he considered, that the English press had afforded no one accurate edition of Tibullus: and that even the best of those printed abroad were not exempted from material errors; he surmounted his scruples, and has endeavoured to give a less exceptionable text of his poet, than any hitherto published*.

Before he concludes, the translator must return his sincere thanks to a worthy friend, for his ele-

gant version of the first elegy, and of Ovid's poem on the death of Tibullus. By what accident his own translation of the first elegy was lost, is of no consequence; especially too, as the reader, from a perusal of Mr. P***'s specimen, will probably be induced to wish, that more of those now published, had undergone a like fate, provided the same gentleman had likewise translated them.

Nor is that the only good office which challenges his gratitude: the translator is particularly obliged to his friend, for having procured him the valuable acquaintance of another learned gentleman; who not only took the trouble to compare his version of the three last books with the original; but who also favoured him with some notes, which constitute the chief ornament of the second volume†. Thus, like the Britains of old, the translator has called in auxiliaries to conquer him.

* *The insertion of the Latin text, in this edition, has been deemed unnecessary.*

† *This translation was first published in 2 vols. 12mo.*

THE LIFE OF TIBULLUS.

WE are not only unacquainted with the prænomens of Tibullus, but with the year of his birth. The biographers, from a line* in the fifth elegy of his third book, indeed informs us, that Ovid and he were born the day that Hirtius and Panfa were killed, viz. on the tenth of the calends of April, A. U. C. 710. This was the opinion of the learned for many centuries; nor was it controverted, till Joseph Scaliger first entertained some doubts of it; and Janus Douza the younger, about a hundred and seventy years ago, was induced, by comparing what our poet had said of himself, with what Ovid and Horace have wrote concerning him, to reject that line as spurious, and to assert that Tibullus must have been born almost twenty years sooner. Although we think some considerable objections may be raised against Douza's opinion†, yet as the old account is liable to still greater, we shall venture with that critic, to inform the reader, that Albius Tibullus, the prince of elegiac poets, was born at Rome, A. U. C. 590, six years after the birth of Virgil, and one after that of Horace,

Tibullus might say with his great admirer, Ovid,
—usque a proavis vetus ordinis hæres,
Non modo militiæ turbine factus eques‡.

being descended from an equestrian branch of the Albian family: and though some of the old biographers § assert, that his ancestors made a figure

in the forum and in the field, yet as history makes no mention of them, posterity would have been unacquainted with this branch of that illustrious house, had it not been for our poet.

As the ancient writers of Tibullus's life have favoured us with no particulars of his infancy, it is probable it was distinguished by nothing remarkable. The human mind does not always blossom at the same period; and it by no means follows that his childhood must have flourished, whose maturer age has produced fair fruits of science. Perhaps too, details of early excellence are less useful than is commonly imagined, as they often dispirit those who would otherwise in due time have expanded into an extensive reputation.

But if such accounts are less useful, it would have been no unprofitable gratification of curiosity to have known by what plan his studies were conducted, and who were his preceptors. Antiquity, however, having left us in the dark with regard to these matters, we can only suppose that as his father's condition was considerable, so nothing was omitted to render our poet an useful and elegant member of society.

The Romans possessed a real advantage over the moderns in point of education; for as the same citizen might plead causes, command armies, and arrive at the first dignities of the priesthood; so their literary institutions were made to comprehend these several objects. It is easy to see of what vast utility so general a plan must have been to a state; and perhaps it is not paying letters too high a compliment, to say, that the successes of the Romans were in a great measure owing to this advantage.

In the year of Rome 705, the civil war broke

* *Natalem nostri primum videre parentes
Quum cecidit fato consul uterque pari.*

† *See the arguments on both sides of the question in the notes to the fifth elegy of the third book.*

‡ *Amor. lib. iii. cl. 14.*

§ *Crinitus, &c.*

out between Cæsar and Pompey. The army and corrupt part of the legislature followed Cæsar; while the majority of the senate and of the knights, with all those who dreaded a perpetual dictator, sided with Pompey, as the person from whom the republic had less danger to apprehend. Of this number was the father of Tibullus; and there is reason to suspect, that he either fell in the field, or was butchered by proscription, for we know that a considerable part of his estate was left a prey to the rapacious soldiery*. These events probably determined our author's public attachments; but without these motives to revenge, it is not unlikely that Tibullus had, before this time, adopted the political opinions of his father†.

At what actions in the civil war our young knight was present, as it was not prudent in him to mention in his poems, so historians do not inform us; but as principle and revenge equally conspired to rouse his courage (and courage he certainly possessed‡), may we not safely infer, that Tibullus did not run away, like his friend Horace, from Philippi||, at which battle he was present with his patron the illustrious Messala Corvinus?

But the fortune of Octavius prevailing over the better cause of Brutus and Cassius, Messala too (who was next in command to these patriot citizens) going over with his forces to the conqueror, Tibullus, although he paid the greatest regard to the sentiments of that excellent soldier and orator, yet determined to leave the army; for as he would not fight against the party which his friends had now espoused, so neither could he appear in arms against those whom his principles taught him to regard as the assertors of liberty. Besides, the bad success of the patriot party and his own experience, had now inspired him with an abhorrence of the war; he therefore retired, A. U. C. 712, to his country seat at Penum, there, by an honest industry, to raise his impaired fortune to its ancient splendor, while his hours of leisure were either devoted to philosophy or the muses§.

But we are not to imagine that rural objects and study solely engaged our poet's attention; for being formed with a natural tenderness of disposition, he began to enlarge the sphere of his pleasures by conversing with the fair sex. The first object of his affection was probably Glycera; and we have Horace¶ on our side, when we add, that she at first gave him hopes of success: but though his person was elegant††, his fortune not

contemptible, and his life was then in the prime, Glycera deserted him for a younger lover*. As he entertained a real affection for that lady, her infidelity gave him much uneasiness: he therefore endeavoured, by exerting his elegiac genius, to reclaim her. But his poems producing in Glycera no change to his advantage, his friend and old fellow-soldier Horace advised him to abate of his sorrow for her loss, and send her no more elegies.

None of these elegies having come down to our times, Lilio Gyraldi† supposes that Nemesis and Glycera were the same—but the poems which are inscribed to Nemesis‡ do not favour this supposition; and, indeed, it seems more likely that Tibullus was so piqued at the ill success of his first amour, that he destroyed all those elegies which it gave rise to.

Some time after this (A. U. C. 718.) the fierce inhabitants of Pannonia rebelling, and Messala being one of the generals appointed by Augustus to reduce them, that nobleman invited Tibullus to attend him in the expedition. As this service was not against the Pompeian party§, and as he hoped in the hurry of a military life to find a remedy for his melancholy, he complied with his noble friend's request, and in every action behaved with his usual bravery. In proof of this, the commentators quote our poet's description of the old soldier of Arupinum.

Testis Arupinas, et pauper natus in armis.
Quem si quis videat, vetus ut non fregerit ætas,
Terna minus Pylæ miretur sæcula famæ,
Namque senex longæ peragit dum sæcula vitæ,
Centum secundos Titan renovaverit annos:
Ipse tamen velox celerem super edere corpus
Audet equum, validisque sedet moderator habenis||.

Besides these verses, some others may be brought from the panegyric, and in particular the three following, to strengthen their assertion:

Nam bellis experta cano, testis mihi victæ
Fortis Japidæ miles, testis quoque fallax
Pannonius, gelidas passim disiectus in Alpes¶.

In this manner did our poet subdue his passion for Glycera: but being by nature addicted to the love of the fair sex, at his return from the army, he fixed his affections on Delia.

Cyllenius, in his commentary on Tibullus††, conjectures, that she obtained the name of Delia

from the Greek word *δελειν*, on account of her surpassing in beauty the Roman ladies. But we have the more respectable authority of Apuleius*, for asserting that Delia was an appellation given her by our poet, her real name being Plania.

Some critics† contend, that Delia was a woman of the town:—but many passages in the elegies addressed to her‡, contradict this assertion. Which of these poems were first written, cannot now be determined; but it is certain, they were not composed in the order they are now printed.

It would seem, that some time after his attachment to Delia, Messala invited our poet to accompany him in some military expedition; but he was then too deeply enamoured of Delia to attend the call of honour. Tibullus, therefore, composed his first elegy, in which, as he prefers a country retirement with Delia, and a moderate income, to all the triumphs of war and allurements of fortune, so Corvinus could not well urge, with propriety, our poet's departure.

Messala having soon after obtained the consulship, Tibullus composed his panegyric. This poem is in heroic numbers, and though not destitute of poetical beauties, is inferior to his elegies: it seems rather an effusion of friendship than an effort of genius: it has, therefore, not been translated.

In the year of Rome 725 §, Messala being intrusted by Augustus Cæsar with an extraordinary command over Syria, insisted on Tibullus's accompanying him thither, to which our poet consented. This sacrifice to friendship was not, however, obtained without much reluctance; for Delia, it would seem, opposed his departure. But as Messala, in this expedition, was to visit Greece, Asia, &c. and as Tibullus, in his panegyric, had said,

Pro te vel rapidas ausim maris ire per undas,
Adversis hyberna licet tumeant freta ventis.
Pro te vel solus densis subsistere turmis:
Vel pavidum Ætnæ corpus committere flammæ
Sum quodcunque tuum est ||, &c.

he embarked with his patron. He, however, had not been long at sea, before he was taken so ill, that Messala was obliged to put him ashore, and leave him in Phæacia¶. In this island, so famous for the gardens of Alcinoüs, our poet composed the third elegy of the first book; which shows, that whatever effect this sickness had upon his constitution, it did not in the least impair his poetical talents.

* "In Apologia accusent—et Tibullum, quod ei sit Plania in animo, Delia in versu." Casaubon and Colvins think it should be read either "Flavia" or "Planca." In one of Fulvius Ursinus's MS. copies of the Apology, it was written "Plantia." "Plania," however, says Broekhusius, is found in Roman inscriptions, and therefore the name need not be altered.

† "Erat libertinæ conditionis muliercula." Broekh.

TRANS. II.

From the sentiments of tenderness expressed in that beautiful poem, it would not have been surprising, had Tibullus on his recovery returned to Italy: but he had too sincere a regard for his friend, to desert him: he therefore, as soon as he was able to renew his voyage, hastened after Messala, and with that nobleman* travelled through Cilicia, Syria, Egypt, and Greece, being then probably initiated into the Eleusinian mysteries at Athens†.

What were the political consequences of this expedition, historians do not mention: but the consequences to Tibullus were highly disagreeable; for, if any stress in this point is to be laid on his elegies, there is reason to suspect that Delia married before his return.

This, doubtless, occasioned much uneasiness to, and rendered our poet the less unwilling to embrace another offer made him soon after by Messala, of going to Aquitaine; which province having revolted (A. U. C. 726.), Augustus had intrusted that excellent officer with the important business of its reduction‡.

The Romans, says an elegant writer, fought with other nations for glory, but with the Gauls for liberty. This observation was at least verified at this time: for it was not till after many sharp actions, in which both the general and his soldiers distinguished themselves, that Messala completed the service he was sent upon. In all these battles, our poet signalized his courage in so remarkable a manner, that the success of the expedition was, in no small degree, owing to him.

Non sine me est tibi partus honos: Tarbella Pyrene

Testis, & oceani littora Santonici: [rumna,
Testis Arar, Rhodanusque celer, magnusque Gacarnuti & Flavi cœrula lympha Liger §.

For which reason, he had military honour conferred on him; "militaribus donis ornatus est," as the old writer of his life informs us ||.

The reduction of Aquitaine was so acceptable to the Emperor, that Messala had a triumph decreed him the year after¶: and as our poet had borne so distinguished a share in the war, it is not to be supposed, but he was present at that superb solemnity; which, as an ancient inscription** acquaints us, was celebrated on the seventh of the calends of October.

But his Gallic expedition not having banished

Delia from his breast, he again paid his addresses to her: and, from some passages in the second and seventh elegies of the first book, it would seem that they were but too successful.

When a woman has once so far forgot herself, as to bestow improper favours on a lover, nothing is more natural than for that lover to suspect he is not the only favourite. Our poet is an instance of the truth of this observation; for to such a height did his ungenerous suspicions of Delia arise (notwithstanding all her protestations of innocence), that he made her husband acquainted with his intrigue*. Whether Delia was innocent or not, she could never forgive this discovery. Or had she been willing to forget the past, we cannot suppose that her husband would ever admit Tibullus again into his house.

Such, then, was the extraordinary conclusion of our poet's intimacy with Delia; and therefore the poem which furnished these particulars is justly made the last of the poems inscribed to that beauty.

Although the elegies of Tibullus warrant, in some sort, these surmises, yet it ought to be considered, that poets write from imagination more frequently than from reality, because ideal subjects afford greater scope to their faculties, than occurrences in common life:—and indeed, if what Ovid tells us may be depended on, Delia was again enamoured with our poet at the time of his decease, when probably her husband was dead.

Some time elapsed, before Tibullus entered into any new engagements. In this interval, he composed his famous elegy on Messala's Birthday, the ninth and the following elegies of the first book, with the first and second of the second book; endeavouring to forget his disasters, by dividing his time between his country-seat and Rome, but chiefly by conversing, more than ever, with the learned and polite: of these the most eminent among his acquaintances were Messala, Valgius, Macer, and Horace.

Messala was now in the height of his reputation: in eloquence and military knowledge, he was excelled by none of his contemporaries; and yet the goodness of his heart surpassed his abilities. His house was the rendezvous of the the learned; and his patronage, as an admirable poet† expresses it, was

The surest passport to the gates of fame.

Happy in the approbation of all parties, his siding with Augustus, after the defeat at Philippi, did not lose him the esteem of his old friends; and his interesting himself in their behalf, to the honour of that emperor, made him not the less beloved by Augustus‡.

* Lib. i. El. 7.

† Dr. Young.

‡ Messala had a brother, who was also a polite scholar, as Horace informs us. According to St. Jerome, this illustrious Roman married Terentia, Cicero's widow, and by her had two sons, Marcus and Lucius,

J. Valgius Rufus was eminent, not only for heroic poetry, but also for his elegies, especially those on the death of his son Mystes*. He also wrote some excellent epigrams. But all his poems are now lost. As Tibullus thought him the best poet next to Homer, posterity has suffered much in their loss†.

Of Macer, all that is known, is mentioned in the notes to the sixth elegy of the second book.

But although Tibullus himself informs us of his acquaintance with these eminent scholars; yet should we not have known of the friendship which Horace and he entertained for one another, had it not been for Horace, who probably about this time sent our poet an epistle, which is thus translated by Mr. Francis.

Albius! in whom my satires find
A candid critic, and a kind,
Do you, while at your country seat,
Some rhiming labours meditate,
That shall in volum'd bulk arise,
And e'en from Cassius bear the prize;
Or, sauntering through the silent wood,
Think what befits the wise and good.

Thou art not form'd of lifeless mould
With breast inanimate and cold;
To thee the gods a form complete,
To thee the gods a large estate,
In bounty give, with skill to know
How to enjoy what they bestow.

Can a fond nurse one blessing more,
Ev'n for her favourite boy, implore,
With sense and clear expression blest,
Of friendship, honour, wealth, possess;
A table elegantly plain,
And a poetic easy vein?

By hope inspir'd, depress'd by fear,
By passion warm'd, perplex'd with care,
Believe that every morning's ray
Hath lighted up thy latest day;
Then, if to-morrow's sun be thine,
With double lustre shall it shine.

Such are the maxims I embrace,
And here, in sleek and joyous case,

who both attaining to the consulship, and were an ornament to their families, by their military and civil capacities. Messala himself was so old before he died, as to forget his own name. Pliny the elder tells us, that he would not permit a person of his family to have his statue placed among those of his ancestors, because he was a disgrace to them.

* We learn this circumstance from Horace, who wrote Valgius a beautiful consolatory ode on the occasion.

*Non semper imbres nubibus bispidos
Manant in agros, &c.*

Lib. ii. Ode 9.

† The critics have been able, from all antiquity, to glean only seven lines of Rufus's poetry, which the reader, if curious of such literary scraps, will find collected by Brockhusius, in his notes on Tibullus's Panegyric to Messala.

You'll find, for laughter fitly bred,
An hog by Epicurus fed *.

Francis.

Mons. Dacier † observes, that this epistle is all ironical; for Tibullus, according to him, having exhausted his fortune by extravagance, had now retired to the country, to recruit his finances, and avoid the importunity of his creditors.

To find out these things from the epistle before quoted, required a strange obliquity of understanding; as to support them, demanded some learning:—however, it must be confessed, that the French editor of Horace is not the first author who maintained this extraordinary opinion. An old grammarian ‡, whose comment on Horace, Caspar Barthius owns he perused, but to whom Dacier was willing to sink his obligations, though he also must have seen him, has out-done the French critic in what he writes of Tibullus. “Fuit hic Albius” (says this uncommon genius) “eques Romanus, qui primus in amatorio carmine habetur: eum per ironiam irridet Horatius, quasi rem bene gesserit, cum in juventa omnia prodegerit, et postea versibus victum quæsierit. Ergo ubi eum laudat, se innuit Horatius; ubi vituperat se, & Epicurum nominat, Albius intelligit, quem ridendum ait quod prodegerit omnia, jam nihil habens, quo, ut solebat, cutem curare posset: quod vero ait

Di tibi divitias dederint, &c.

manifesta ironia est, nam Epicuri non credentes deos habere curam rerum humanarum, omnia prodigunt; quod postquam factum est omnibus sunt ridiculi.”

Whence this “semi-priscus Grammaticus” (for so Brockhusius calls him) drew these particulars relating to our poet, is not known: but that Dacier should adopt them, is matter of wonder; as, in all probability, the Frenchman had read Tibullus's panegyric §, which plainly shows that the diminution of his fortune was not owing to his own intemperance. And if the grammarian had perused his elegies || with ever so little attention, he would have seen, that Tibullus was rather religious than otherwise, and by no means an Epicurean, at least in belief.

But, say some critics, who have too thoughtlessly embraced this opinion, does not Horace confirm it, where he tells us, that his father warned him, when a young man, from pursuing

extravagant courses, by setting before his eyes the infamy and miserable life of Albius,

Nonne vides Albi ut male vivat filius?

To make this objection decisive, the critics must first prove, that there were no other Albiuses in Rome than the father of Tibullus; which, by the way, is false: and then they must show, that this infamous and indigent son of Albius's was our poet; which cannot be done, especially as we know that he died a knight, and of course was worth upwards of three thousand pounds sterling.—There are also innumerable passages in his elegies *, which prove, that he was by no means in distressed circumstances, though less wealthy than his ancestors. Again, is it to be imagined, that the rich and generous Messala would have suffered so fine a genius, and one whom he regarded so much, to have been distressed by his creditors? And, to crown all, as Tibullus was confessedly some years younger than Horace, with what propriety could Horace's father propose Tibullus as an example not to be followed by his son?

When such were the friends of Tibullus, and his poetical abilities had long since obtained him universal applause, he could have found no difficulty in getting admission to the learned court of Augustus. How then, ask the commentators, has it come to pass, that he never once mentions either that emperor, or Mæcenas, both whom his brother poets celebrated with such a lavishness of praise? And yet, add they, there are many parts of his writings where those patrons of genius might have been introduced with uncommon propriety?

True to the principles of the republic, and a real friend to the liberties of the people, Tibullus never could prevail upon himself to flatter those, whatever affection they expressed for the muses, whom his principles taught him to detest as the enslavers of his country.

This, as Pope emphatically expresses it, “kept him sacred from the great,” who, doubtless, perceived with secret displeasure (for Augustus and Mæcenas well knew the importance of having the poets on their side), that no loss of fortune, and no allurements of ambition, could induce Tibullus to join in the general chorus of their praise. Although both the emperor and his favourite must in their hearts have applauded our poet's integrity; yet that mental applause, in all probability, would not have secured Tibullus from the effects of their displeasure, had it not been for the interest which he had with Messala.

Besides Messala, Valgius, and Macer, Tibullus mentions Cornutus, Marathus, Titius, and Messalinus. The conjectures of the critics concerning these Romans, are inserted in the notes to the elegies, where their names occur.

Soon after this, Tibullus fell in love with Neæra. It is true, that the elegies he wrote to Ne-

* See the notes on the first elegy of the first book, and on the first and third elegy of the second.

æra, in every edition of our poet, follow those, in which he celebrates Nemesis: yet as Ovid (who could not well be mistaken in what related to one whom he regarded so much as Tibullus) says that Nemesis was his last mistress, and as it is probable that the fifth elegy of the second book (our poet being then certainly very fond of Nemesis) was written between the years 732 and 734, when Augustus wintered in Samos, that is, a short time before our poet's death, we suppose, although the learned gentleman who favoured the author with the notes marked B, is of a different opinion, that Næra was the third object of his affections.

Fabricius conjectures, from her name, that she was a woman of the town; Næra, in the declension of the Roman empire, being a synonymous term for a courtesan*: but Fabricius should have considered that Tibullus wrote in the Augustan age. Besides, it appears from Homer†, from Valerius Flaccus‡, and from an old marble statue preserved by Pignorius§, that women of the first rank, and most unsuspected modesty, were called by that name. Without, however, these authorities, Tibullus himself screens this favourite from the imputation of libertinism, by bestowing on her the epithet *casta* ||: He also characterises her parents, as people of virtue and fortune.

It appears from the second and third elegy of the third book, that Næra, after a long courtship, having consented to marry Tibullus, was somehow or other forced away from him. This gave our poet an uncommon concern, which was redoubled, when he discovered, that she herself had not only been accessory to her being carried off, but meant also to marry his rival.

Mr. Dart, in his Life of Tibullus¶, is of opinion, that Næra was the same with Glycera. But why, then, does our poet not call her by that name? Besides, if any one will attentively peruse Horace's consolatory ode to our author on the infidelity of Glycera, and compare it with many passages in the third book of Tibullus, he will easily see, that Mr. Dart must be mistaken.

Tibullus, who had hitherto been unsuccessful in his addresses to the fair, was not more fortunate in his last mistress; for, if Nemesis (for so was she called) possessed beauties of mind and person equal to those of Delia and Næra, her extreme avarice obscured them all. And though Martial** founds Tibullus's chief claim to poetical reputation on the elegies he addressed to that lady,

Fama est arguti Nemesis formosa Tibulli,

* Thus Ifo, the old glossarist of Prudentius, interprets Næra by pellex and concubina.

† *Odys. lib. xii. ver. 133.*

‡ *Argonaut. lib. ii. ver. 141.*

§ *Epist. Symbolic. vid. Reines, Ep. 28.*

|| *Lib. iii. El. 4.*

¶ *P. 20.*

** *Lib. viii. Ep. 73.*

we have our poet's authority for asserting, that they produced no effect upon her.

Whether Nemesis ever abated of her rigour to Tibullus, his elegies do not inform us. It is indeed probable she did, especially since Ovid represents her as sincerely grieved at Tibullus's death, which, according to Marfus, a cotemporary poet, happened soon after that of Virgil:

*Te quoque, Virgilio comitem, non æqua, Tibulle,
Mors juvenem campos misit ad Elysiis:
Ne foret, aut elegis molles qui fleret amores;
Aut caneret forti regia bella pede.*

Thee! young Tibullus, to th' Elysian plain
Death bid accompany great Maro's shade;
Determin'd that no poet should remain,
Or to sing wars, or weep the cruel maid.

For Tibullus died either A. U. C. 735, the year of Virgil's death, or the year after, in the forty-fourth or forty-fifth year of his age.

Nor was Marfus the only poet who celebrated this melancholy event: Ovid*, who had no less friendship than admiration for Tibullus, has immortalized both himself and his friend in the following beautiful elegy: which, containing some further particulars relating to our poet, will make a proper conclusion to this life, which, from the scantiness, as well as the little authority of many of the materials, the author is sorry he cannot render more complete.

*If Thetis, if the blushing Queen of Morn †,
If mighty goddesses could taste of woe
For mortal sons; come, Elegy forlorn!
Come, weeping dame! and bid thy tresses flow:
Thou bear'st, soft mistress of the tearful eye,
From grief thy name, now name alas too just!
For see thy favourite bard, thy glory lie,
Stretch'd on yon funeral pile, ah! lifeless dust!
See Venus' son, his torch extinguish'd brings,
His quiver all revers'd, and broke his bow;
See pensive how he droops with flagging wings,
And strikes his bared bosom many a blow:
Loose and neglected, scatter'd o'er his neck,
His golden locks drink many a falling tear:
What piteous sobs, as if his heart would break,
Shake his swollen cheek? Ah sorrow too severe!*

*Memnena si mater, mater ploravit Achillem,
Et tangunt magnas tristia fata deos;
Flebilis indignos, Elegia, solve capillos,
Ah nimis ex vero nunc tibi nomen erit!
Ille tui vates operis, tua fama, Tibullus
Ardet in extracto corpus inane rogo.
Ecce, puer Veneris fert everfamque pharetram,
Et fractos arcus, et sine luce facem.
Adspice, demissis ut eat miserabilis alis;
Pectoraque infestâ tundat aperta manu.
Excipiunt sparsi lacrymas per colla capilli,
Oraque singultu concutiente sonant.*

* *Lib. iii. El. 8.*

† *Aurora.*

Thus, fair Iulus! for thy godlike fire*,
'Tis said, he weeping from thy roof withdrew:
Nor deeper mourn'd the queen of soft desire†,
When the grim boar her lov'd Adonis slew.

And yet we bards are fondly call'd divine,
Are sacred held, the gods' peculiar care:
There are, that deem us of th' ethereal line,
'That something of the Deity we share.

But what can death's abhorred stroke withstand?
Say what so sacred he will not profane?
On all the monster lays his dusky hand,
And poets are immortal deem'd in vain.

Thee, Orpheus, what avail'd thy heavenly fire?
Thy mother-muse, and beast-inchanting song?
The god for Linus swept his mournful lyre,
And with a father's woes the forests rung.

Great Homer see, from whose eternal spring
Pierian draughts the poet train derive,
Not he could 'scape the fell remorseless king‡,
His lays alone the greedy flames survive.

Still live the work of ages, Ilion's fame,
And the slow web by nightly craft unwove:
So Nemesis shall live, and Delia's name;
This his first passion, that his recent love.

Now what avails, ye fair! each holy rite,
Each painful service for your lover paid?
Recluse and lonely that you pass'd the night?
Or fought th' Egyptian cymbal's fruitless aid?

When partial fate thus tears the good away,
(Forgive, ye just! th' involuntary thought)
I'm led to doubt of Jove's eternal sway,
And fear that gods and heaven are words of nought.

Fratris in Æneæ sic illum funere dicunt
Egressum tectis, pulcher Jule, tuis.
Nec minus est confusa Venus moriente Tibullo,
Quam juveni rupit, cum serus inguen aper.
At sacri vates, et divum cura vocamur:
Sunt etiam, qui nos numen habere putent.
Scilicet omne sacrum mors importuna profanat:
Omnibus obscuras injicit illa manus.
Quid pater Ismario, quid mater prelois, Orpheo?
Carminibus quid victas obstupuisse feras?
Ælinon in sylvis idem pater, Ælinon, altis
Dicitur invitâ concinuisse Lyrâ
Adspice Mœonidem, à quo, ceu fonte perenni,
Vatum Pieriis ora rigantur aquis;
Hunc quoque summo dies nigro submersit Averno;
Effugiunt avidos carmina sola rogos.
Durat opus vatum Trojani fama laboris,
Tardaque nocturno tela retexta dolo.
Sic Nemesis longum, sic Delia nomen habebit,
Altera cura recens, altera primus amor.
Quid nunc sacra juvant? quid nunc Ægyptia
profunt
Sistra? quid in vacuo secubuisse toro?
Cum rapiant mala fata bonos, (ignoscite falso)
Sollicitor nullos esse putare Deos.

* Æneæ.

† Venus.

‡ Plato.

Live pious, you must die: religion prize,
Death to the tomb will drag you from the fane:
Confide in verse; lo! where Tibullus lies!
His all a little urn will now contain!

Thee, sacred bard! could then funereal fires
Snatch from us? on thy bosom durst they feed?
Not fanes were safe, not Jove's refulgent spires*,
From flames that ventur'd on this impious deed.
The beauteous queen that reigns in Eryx towers,
From the sad sight averts her mournful face;
There are, that tell of soft and pearly showers
Which down her lovely cheeks their courses
trace.

Yet better thus, than on Phæacia's strand,
Unknown, unpitied, and unseen to die:
His closing eyes here felt a mother's hand,
Her tender hands each honour'd rite supply.
His parting shade here found a sister's care,
Who sad attends, with tresses loose and torn:
The fair he lov'd his dying kisses share,
Nor quit the pyre afflicted and forlorn.

"Farewel, dear youth!" thus Delia parting cry'd,
"How blest the time, when I inspir'd the lay?"
"You liv'd, were happy; every care defy'd,
"While I possess'd your heart, untaught to stray."
To whom thus Nemesis, in scornful mood,
"Mine was the loss, then why art thou distress'd?"
"Me, only me with parting life he view'd;
"My hand alone with dying ardour press'd‡."

Vive pius; moriere pius: cole sacra; colentem
Mors gravis à templis in cava busta trahet.
Carminibus confide bonis; jacet ecce Tibullus,
Vix manet è toto parva quod urna capit.
Tene, sacer vates, flammæ rapuere rogales?
Pectoribus pasci nec timuere tuis?
Aurea sanctorum potuissent templa deorum
Urere, quæ tantum sustinere nefas.
Avertit vultus, Erycis quæ possidet arces,
Sunt quoque, qui lacrymas continuisse negent.
Sed tamen hoc melius, quam si Phæacia tellus
Ignotum vili subposuissent humo.
Hic certè manibus fugientes pressit ocellos
Mater; & in cineres ultima dona tulit:
Hic soror in partem miserâ cum matre doloris
Venit, inornatas dilaniata comas.
Cum tuis sua junxerunt Nemesisque, priorque
Oscula: nec solos destituere rogos.
Delia discedens, "Felicis," inquit, "amata
"Sum tibi; vixisti, dum tuus ignis eram."
Cui Nemesis, "Quid," ait, "tibi sint mea damna
dolori?"
"Me tenuit moriens deficiente manu."

* The Capitol.

† Alluding ironically to the following passage in the first Elegy, which Tibullus there applies to Delia;

Te videam suprema mibi cum venerit hora!

Te teneam moriens deficiente manu!

O may I view thee with life's parting ray!
And thy dear hand with dying ardor press!

And yet, if ought beyond this mouldering clay
But empty name and shadowy form remain,
Thou liv'st, dear youth! for ever young and gay,
For ever blest, shalt range th' Elysian plain.

And thou, Catullus! learned gallant mind,
(Fast by thy side thy Calvus will attend)
With ivy wreaths thy youthful temples twin'd,
Shalt spring to hail th' arrival of thy friend.

And Gallus, too profuse of life and blood,
If no sad breach of friendship's law deprive,

Si tamen è nobis aliquid, nisi nomen et umbra,
Restat; in Elysia valle Tibullus erit.
Obvius huic venies hederâ juvenilia cinctus
Tempora, cum Calvo, docte Catulle, tuo.
Tu quoque (falsum temerati crimen amici)
Sanguinis atque animæ prodige, Galle, tuæ.

This hand immortal of the blest and good,
Thy shade shall join, if shades at all survive.

Thou, polish'd bard! thy loss though here we
mourn,

Hast swell'd the sacred number of the blest;
Safe rest thy gentle bones within their urn!
Nor heavy press the earth upon thy breast!

His comes ubra tua est; si quæ est modò corporis
umbra;

Auxisti numeros, culte Tibulle, pios.
Ossa quæta precor, tuâ requiescite in urnâ;
Et sit humus cineri non onerosa tuo.

ELEGIES.

BOOK I.—ELEGY I.

THE glitt'ring ore let others vainly heap,
O'er fertile vales extend th' enclosing mound;
With dread of neighb'ring foes forsake their sleep,
And start aghast at ev'ry trumpet's sound.

Me humbler scenes delight, and calmer days;
A tranquil life fair poverty secure!
Then boast, my hearth, a small but cheerful blaze,
And riches grasp who will, let me be poor.

Nor yet be hope a stranger to my door,
But o'er my roof, bright goddess, still preside! 10
With many a bounteous autumn heap my floor,
And swell my vats with must, a purple tide.

My tender vines I'll plant with early care,
And choicest apples, with a skilful hand;
Nor blush, a rustic, oft to guide the share,
Or goad the tardy ox along the land.

Let me a simple swain, with honest pride,
If chance a lambkin from its dam should roam,
Or sportful kid, the little wanderer chide,
And in my bosom bear exulting home. 20

Here Pales I bedew with milky show'rs,
Lustrations yearly for my shepherd pay,
Revere each antique stone bedeck'd with flow'rs,
That bounds the field, or points the doubtful way.

My grateful fruits, the earliest of the year,
Before the rural god shall duly wait.
From Ceres' gifts I'll cull each browner ear,
And hang a wheaten wreath before her gate.

The ruddy god shall save my fruit from stealth,
And far away each little plunderer scare: 30
And you, the guardians once of ampler wealth,
My household gods, shall fill my offerings share.

My num'rous herds, that wanton'd o'er the mead,
The choicest fatling then could richly yield;
Now scarce I spare a little lamb to bleed
A mighty victim for my scanty field.

And yet a lamb shall bleed, while, rang'd around,
The village youths shall stand in order meet,
With rustic hymns, ye gods, your praise resound,
And future crops and future wines entreat. 40

Then come, ye pow'rs, nor scorn my frugal board,
Nor yet the gifts clean earthen bowls convey;
With these the first of men the gods ador'd,
And form'd their simple shape of ductile clay.

My little flock, ye wolves, ye robbers, spare,
Too mean a plunder to deserve your toil;
For wealthier herds the nightly theft prepare;
There seek a nobler prey, and richer spoil,

For treasur'd wealth, nor stores of golden wheat,
The hoard of frugal fires, I vainly call; 50
A little farm be mine, a cottage neat
And wonted couch where balmy sleep may fall.

"What joy to hear the tempest howl in vain,
"And clasp a fearful mistress to my breast:
"Or lull'd to slumber by the beating rain,
"Secure and happy sink at last to rest."

These joys be mine!—O grant me only these,
And give to others bags of shining gold,
Whose steely heart can brave the boist'rous seas,
The storm wide-wasting, or the stiff'ning cold. 60

Content with little, I would rather stay
Than spend long months amid the wat'ry waste:
In cooling shades elude the scorching ray
Beside some fountain's gliding waters plac'd.

O perish rather all that's rich and rare,
The diamond quarry, and the golden vein,
Than that my absence cost one precious tear,
Or give some gentle maid a moment's pain.

With glitt'ring spoils, Messala, gild thy dome,
Be thine the noble task to lead the brave:
A lovely foe me captive holds at home, 71
Chain'd to her scornful gate, a watchful slave.

Inglorious post!—And yet I heed not fame:
Th' applause of crowds for Delia I'd resign:
To live with thee I'd bear the coward's name,
Nor 'midst the scorn of nations once repine.

With thee to live I'd mock the ploughman's toil,
Or on some lonely mountain tend my sheep;
At night I'd lay me on the flinty soil,
And happy 'midst thy dear embraces sleep. 80

What drooping lover heeds the Tyrian bed,
While the long night is pass'd with many a sigh:
Nor softest down with richest carpets spread,
Nor whisp'ring rills, can close the weeping eye.

Of threefold iron were his rugged frame,
Who when he might thy yielding heart obtain,
Could yet attend the calls of empty fame,
Or follow arms in quest of sordid gain.

Unenvy'd let him drive the vanquish'd host,
Thro' captive lands his conquering armies lead;
Unenvy'd wear the robe with gold imbos'd, 90
And guide with solemn state his foaming steed.

O may I view thee with life's parting ray,
And thy dear hand with dying ardor press:
Sure thou wilt weep—and on thy lover's clay,
With breaking heart, print many a tender kiss;

Sure thou wilt weep—and woes unutter'd feel,
When on the pile thou seest thy lover laid!
For well I know, nor flint, nor ruthless steel,
Can arm the breast of such a gentle maid. 100

From the sad pomp, what youth, what pitying
Returning flow can tender tears refrain? [fair,
O Delia, spare thy cheeks, thy tresses spare,
Nor give my ling'ring shade a world of pain.

But now while smiling hours the fates bestow,
Let love, dear maid, our gentle hearts unite!
Soon death will come and strike the fatal bow;
Unseen his head, and veil'd in shades of night.

Soon creeping age will bow the lover's frame,
And tear the myrtle chaplet from his brow:
With hoary locks ill suits the youthful flame, III
The soft persuasion, or the ardent vow.

Now the fair queen of gay desire is ours,
And lends our follies an indulgent smile:
'Tis lavish youth's to enjoy the frolic hours,
The wanton revel and the midnight broil.

Your chief, my friends, and fellow-foldier, I
To these light wars will lead you boldly on:
Far hence ye trumpets sound and banners fly:
To those who covet wounds and fame be-
gone. 120

And bear them fame and wounds; and riches bear;
There are that fame and wounds and riches
prize.

For me, while I possess one plenteous year,
I'll wealth and meagre want alike despise.

NOTES ON ELEGY I.

IN this beautiful elegy, Tibullus prefers the retirements of a country life, with Delia and a moderate income, to all the honours of war and splendours of fortune.

According to Scaliger, this elegy, though placed the first in the book, was written, in order of time, the last of those inscribed to Delia. The poem itself, however, gives no sanction to this opinion.

Ver. 2. There is a great dispute among editors, whether the original of this line should be read,

Et teneat culti jugera multa soli:

Or,

Et teneat culti jugera magna soli:

The first, however, is the preferable reading, being best supported by MSS. Besides, had it been destitute of that authority, it would still merit that distinction, as Tibullus must either have been unacquainted with agriculture (every Roman acre being two hundred and forty feet long, and as many broad), had he applied *magna* to acres; or have used a superfluous epithet. *Vulp.*

But Broekhusius, although he reads *multa*, has yet proved, that Tully and Valerius Flaccus have used that adjective at least once in the sense of *magna*.

Ver. 6. The word *paupertas* in the original signifies, a mediocrity of fortune; for so Porphyrio interprets it in his Commentary on Horace, L. ii. Ep. 5. And, indeed, it is evident from Cicero, that this was the meaning imposed upon *paupertas* in the Augustan age. From this word, then, those who maintain, that our poet had spent his estate, and was obliged to retire to the country, can derive no support; as indeed the whole of this elegy contradicts that assertion.

Almost all the commentators on Tibullus have

observed, that he abounds in alliterations, and give the original of this line as an instance of it, *Me mea paupertas*, &c.

Nor is Tibullus singular in this; the best poets and orators of the Augustan age were fond of them; and hence these gentlemen conclude, contrary to the opinion of many of the moderns, that alliterations are beautiful in poetry. A sparing use of them, no doubt, adds to the melody of numbers; accordingly Pope, and the best English poets, practise alliteration.

Though Pontanus and others have wrote well on the subject of alliteration, they have not attempted to give a reason for its pleasing the ear. When the same letters begin succeeding words, these run more smoothly off the tongue, as the organs of speech are subjected to a smaller change in pronouncing them. Other causes may perhaps be assigned, but this appears to be the principal.

Ver. 7. The original of this line is variously read by the annotators.

Dum meus assiduo luceat igne focus

is maintained by Broekhusius, &c. while Scaliger and others substitute *exiguo* in the room of *assiduo*; both readings are supported by MS. authority; that, however of Scaliger's is retained as the most poetical.

Ver. 9. The goddess Hope had many temples and public gardens at Rome, for which the reader may consult Alexander Donatus, L. i. Romæ C. 9. L. 2. C. 25. L. 3. C. 13, 18, 23.

Boissard has given an elegant figure of the *specus*, T. 4. Ant. P. 130.

Ver. 17. Calphurnius, a Sicilian poet of some merit, has a good natured precept somewhat similar to this thought of our poet's.

*Te quoque non pudet, cum serus ovilia vises,
Si qua jacebit ovis partu resoluta recenti,*

Hanc humeris portare tuis, natosque repenti
Ferre sinu tremulos, et nondum stare paratos.

Ecl. v. ver. 39.

Humanity to brute creatures is the certain indication of a good mind. See an excellent paper on this subject in the *Adventurer*.

Ver. 21. Pales was the goddess of shepherds; some called her Magna Mater, and others Vesta. The festival instituted in her honour obtained the name of Palilia, or Parilia, and was celebrated on the eleventh or twelfth of the calends of May, the day that Rome was supposed to have been founded. At this solemnity the shepherds, leaping over bonfires of straw, &c. placed at regular distances, offered to their goddess milk and cakes of millet for the health of their flocks. This ceremony is thus described by Ovid in that wonderful effort of poetical genius his *Fasti*.

Pastor, oves saturas ad prima crepuscula lustra,
Uda prius spargat, virgaque verrat humum.
Fronibus, et fixis decorantur ovilia ramis:
Et tegat ornatas longa corona fores.
Cerulei fiant vivo de Sphure fumi;
Tactaque fumanti sulphure balet Ovis.
Ure maris rores, tædamque, herbasque sabinas;
Et crepet in mediis laurus adusta focis.
Libaque de Milio Milli fiscella sequatur:
Rustica præcique quo dea læta cibo est.
Adde dapes, mulctramque suas: dapibusque re-
fectis
Silvicolam tepido lacte precare palen.
Consule, dic, pecori pariter, pecorisque magistris:
Effugiat stabulis noxa repulsa meis.

L. iv. v. 735.

Thus we see that the fumigations used upon this occasion were sovereign for diseases of the skin.

Ver. 22. The original of this line has greatly puzzled the commentators: some of them understanding by "*Pastorem meum*," Pan, and others, "*Apollo nomius*." The true interpretation, however, seems to be that which is given in the translation. See notes to *El. v. b. 2*.

Ver. 23. We see from this passage, that a kind of adoration was paid to a stone, or a trunk of a tree, which divided the Roman lands. They perfumed them with essences, crowned them with flowers, and sacrificed round them in the month of February. They were shaped into odd figures, and called "*Panes Agrestes*;" as those which pointed out the road had the name of "*Compitalis*" bestowed on them.

The god Terminus of the Latins, or *Ζεύς ὁρίος* of the Greeks, had no animals sacrificed to him; because, as Plutarch observes in his *Ρωμαϊκά*, he prevented broils, and of course bloodshed, among neighbours.

By the laws of Numa, if any person drove his plough into his neighbour's field, both he and his oxen were accursed.

According to Arnobius, the Arabians and Peshenuntians paid divine worship to shapeless unformed stones; and if Regnard is to be credited, the Laplanders at this day deify any large stone

they meet with, provided it has any thing extraordinary in its figure. These people probably have neither painters nor statuary among them.

Ver. 26. Commentators are not a little divided in their opinions, who the "*Deus Agricola*" of the original was. According to Brockhusius the poet meant Vertumnus; and, it must be confessed, the husband of Pomona has a better right to this place than any other of the sylvan gods, whom the critics have recommended. See a beautiful description of this ancient Tuscan deity in Propertius, *Lib. iv. El. 2*.

Ver. 29. For Priapus, any of the common books of mythology may be consulted.

Ver. 30. Gebhardus, on MS. authority, (for what absurdities have not librarians committed?) reads,

Terreat ut scævas falce Priapes aves.

Which he interprets by birds of bad omen; not reflecting, that birds of good omen were no less destructive to fine fruit (the keeping of which was the province particularly assigned to Priapus), than his "*aves sinistrae*."

Ver. 32. The Lares were the offspring of the nymph Lara, whom Mercury ravished as he was conducting her to the Stygian lake, whither Jupiter had banished her for blabbing his amours.

Fitque gravis, Geminisque parit qui compita servant,

Et vigiles nostra semper in Æde Lares.

Fast.

They therefore had worship paid them in the houses, particularly of husbandmen and in the highways; and their festival was called "*Compitalitii*, *Compitalitia*," or "*Compitalia*." At these, the images of men and women made of wool were suspended, with as many balls also of wool, as there were slaves in the family, and as many "*simulacra perfecta*" as there were children. By this hanging in effigy, the ancients imagined, the Lares would be bribed (so true is it, that fear is the parent of Polytheism) to spare the living.

These deities were made of wood, stone, or marble, according to the wealth or superstition of the votary; and were either public or private. The former were those that watched over the safety of the whole, while the private only superintended a family. Both were clothed in a dog's skin, and sometimes had the head of a dog clapped upon human shoulders. Their common figure, however, was a grotesque "*caricatura*" of a man's countenance. Vid. Boxborn's *Quest. Romanæ*, P. 31. The place where the household gods stood was called *Lararium*. At first the only offerings made them were fruits, wine, and frankincense, but in time both lambs and hogs were sacrificed to them. They generally wore a chaplet of flowers; and when young gentlemen put on the "*toga virilis*" they dedicated to them their "*bullæ*;"

Ballaque succinctis laribus donata pependit.

Ver. 41. This simplicity in the worship of the gods, which Numa introduced, and which suited

the poverty of the primæval times, continued in practice till Paganism was lost in Christianity.

Vid. Valer. Maxim. L. iv. C. 4. at the end.

Ver. 52. Scaliger reads,

—et solo membra levare toro.

Supposing that our poet had only one bed left him, "Solum sibi superesse torum." But however exactly this circumstance may correspond with many of the modern inhabitants of Parnassus, yet the whole of this elegy shows, that our Roman knight was by no means so reduced; and indeed, as Broekhusius remarks, all the MSS. and best editions, read,

Solito membra levare toro.

Not a casual bed, such as campaigners must often put up with, but an accustomed fixed place of rest; such as the poet of Verona describes in the following beautiful lines, addressed, upon his return from Bithynia, to the Peninsula Sirmio, on which he had a villa.

O quid solutis est heatius curis?

Quum mens onus reponit, ac peregrino

Labore fessi venimus larem ad nostrum,

Desideratoque adquiescimus lecto.

Hoc est, quod unum est, quo laboribus tantise.

Cat. Carm. 29.

Those only can perceive the full force of this observation who have experienced it. Ovid, in his banishment, knew and lamented the want of a "consuetus lectus."

Non hæc in nostris, ut quondam scribimus hortis,

Nec consuecte meum lectule corpus habes.

Trist. L. i. El. 10.

And again,

Tam procul ignotis igitur moriemur in oris,

Et fient ipso tristitia fata loco?

Nec mea consueto languescunt corpora lecto?

Depositum nec me, qui fleat, ullus erit?

Trist. L. iii. El. 3. Broekhusius.

Quam juvat, &c.] The translator finding this passage so well rendered by the late Mr. Hammond, has taken the liberty to adopt it. The commentators say, that Tibullus borrowed this thought of rain assisting slumber from Sophocles; but could not our poet have observed, that rain, falling on the roof of a house, would compose to sleep, without having been obliged to that tragic poet for the observation? Antonius Musa, who did such honour to physic at Rome, cured Mæcenas of a three years watchfulness by the falling of water; and physicians at this day experience the soporific qualities of such a device; or of the sea breaking at a distance upon the shore.

Ver. 60. After the original of this line, Scaliger and Broekhusius place,

Quem labor assiduus vicino terreat hoste:

Martia cui somnos classica pulsa fugent.

Which they explain by the extraordinary duties, especially in the night-time, that soldiers undergo

in the neighbourhood of an enemy. It must be owned, that these lines fall in here very naturally; yet, as most editions rank them immediately after,

Et teneat culti jugera multa soli.

Lin. 2.

my friend has translated them in that place.

Ver. 61. The original of this line greatly perplexed the critics, till Joannes Brodæus first saw, that a second "non" before "contentus" was wanting. Manutius, in his commentary on Cicero's Familiar Epistles, and Muritus, in his Lect. Var. L. 10. produce many instances of this mode of writing from the best antiquity. *Broekb.*

Ver. 63.—In this, and some of the following stanzas, Tibullus represents that secure tranquillity of a country life, which innocence of mind bestows only on those, who live according to the laws of nature. "Neque enim facile," adds Broekhusius, "impurus quivis solitudini se committat, sub arborum umbra somnulum capturus in molli gramine. Hæret intus sempiterna scelerum comes mala conscientia."

—Non sicutæ dapes

Dulcem elaborabunt saporem, &c.

Lib. iii. Od. 1.

Nor dainties force his pall'd desire,

Nor chant of birds, nor vocal lyre,

To him can sleep afford;

Heart-soothing sleep, which not disdains

The rural lot, or humbler swains,

And shady rivers fair;

Or Tempe's ever-blooming spring,

Where zephyrs wave the balmy wing,

And fan the buxom air.

Francis.

"Ut præclare Horatius noster, ille optimus ille certissimus vivendi magister. Hanc sibi nunc vivendi rationem sequendam Tibullus proponit, æquissimo animo relinquens beatæ fumum et opes, strepitumque Romæ, qua quidem vita nihil convenientius sapientiæ studiosis, et musarum sacerdotibus, bonæque mentis candidatis." But this opinion of Broekhusius may be disputed; for, though a country solitude is necessary for the perfecting works of genius, yet the town is the best school for those who would excel in descriptions of human life.

Ver. 69. *Messala.]* This great soldier, patriot and critic (of whom so much has been said in Tibullus's Life) was in a high degree of favour with Tully; and though Mæcenas has been more praised by the poets than Messala, the historians show us, that our poet's friend was both a greater and better man than the favourite of Augustus. See the notes to El. 3. and El. 8. of the first book.

If the authority of Virgil is to be depended upon, the Romans derived the custom of adorning their houses with hostile spoils from the remotest antiquity. *Æn. 7. ver. 183.* And indeed it is natural to imagine, where the tradition is the chief spring from which the first unlettered nations drew their knowledge of past events, that these marks of conquest were the best authority for the oral historian.

When a Roman sold a house adorned with hostile spoils, either won by himself or his ancestors, the purchaser was not permitted to avail himself of the honour they bestowed, but obliged to take them down.

Ver. 81. The person alluded to in this passage was C. Sossius, who being Prætor when the civil war broke out, was afterwards sent by M. Anthony to command in Syria and Cilicia, when he first subdued the Aradians; and then Antigonus, having formerly butchered a Roman garrison, fled, after his defeat, to Jerusalem, which Sossius soon after took; and using the Jews with no less cruelty than avarice, he bestowed their kingdom on Herod of Ascalon: Neither did Antigonus escape the conqueror, who not only whipped, but crucified and beheaded him. These actions of barbarity, although they disgrace victory, yet procure Sossius the honour of a triumph at Rome, A. U. C. 719.

Brockhusius.

Ver. 89. We see, from this instance (and many such occur in our poet), that elegy, as well as comedy, sometimes raises her voice; and if Tibullus's panegyric had not come down to us, critics, no doubt, would have hence conjectured, that his genius was no less suited to the lofty than the tender subjects of poetry.

Ver. 93. This pathetic circumstance Ovid has applied to Nemesis in his fine elegy on the death of our poet.

Ver. 98. For the funerals of the ancients, see notes to El. ii. book 3.

Of all the methods practised by different nations in their disposal of the dead, the custom of the Calatian Indians, as Herodotus relates it, is the most extraordinary. Darius, says that elegant historian, having one day asked some of his Grecian subjects, what sum would induce them to eat their deceased parents (*τους πατερας αποβησκοντας κατασιτισθαι*), they instantly replied, that no bribe should ever make them do so horrid an action. Upon this, the same monarch, in the presence of the Greeks too, demanding, by an interpreter of some Calatian Indians, how much money they would take not to eat, for that was their custom (*οι τους γονιους κατασιτισουσι*), but to burn their dead parents; he

was entreated, with loud and earnest exclamations, not to compel them to do a deed which for ever must destroy their peace of mind! So justly, adds the historian, does Pindar call custom the sovereign of all. *νομον παντων βασιλεια*. Herod. Thal. C. 38.

Ver. 103. Those who indulged an immoderate grief for their deceased friends, were supposed by the ancients to injure their manes, and therefore Cornelia entreats her husband, Paulus the censor,

Define, Pauli, meum lacrymis urgere jepuicrum.

Propert. L. 4. E. 11.

And Lucian, in his excellent discourse on mourning (*περι πένθους*), makes a departed youth thus answer the frantic sorrowings of his father, *ω καιποδαιμον ανδραπε τε κικρυγας*, &c. Unhappy mortal why do you thus lament aloud? Why do you cause me so much pain? Cease to tear your hair and wound your face, I am far more fortunate than you. Why then do you call me names, and term me wretched?

Ver. 104. Turnebus was the first who explained this passage. The poet, though an enemy to extravagant grief, expected that Delia would show a tender concern when he died. *Brockhusius.*

Ver. 111. That pleasant versifier Malherbe, thus addresses the muses,

Quand le Sang bouillant en mes veines
Me donnoit de jeunes desirs
Tantot vous soupiriez mes peines
Tantoi vouschantiez mes plaisirs :
Mais aujourd'hui que mes années
Vers leur fin s'en vont terminées,
Sercit il bien a mes ecrits
D' Ennuyer les races futures
Des ridicules aventures
D'un Amoureux en cheveux gris?

The reader may see the miseries of an old man's falling in love well described in the elegies commonly imputed to Virgil's friend, the famous Cornelius Gallus. These elegies are a modern composition, the work of one Longinus Maximian a physician.

ELEGY II.

WITH wine, more wine, my recent pains deceive,
Till creeping slumber send a soft reprieve :
Asleep, take heed no whisper stirs the air,
For wak'd, my boy, I wake to heart-felt care.
Now is my Delia watch'd by ruthless spies,
And the gate, bolted, all access denies.
Relentless gate! may storms of wind and rain,
With mingled violence avenge my pain!

May forked thunders, hurl'd by Jove's red hand,
Burst every bolt, and shatter every band! 19
Ah no! rage turns my brain; the curse recal;
On me, devoted, let the thunder fall!
I then recollect my many wreaths of yore,
How oft you've seen me weep, insensate door!
No longer then our interview delay,
And as you open let no noise betray.

In vain I plead!—Dare then my Delia rise!
 Love aids the dauntless, and will blind your spies!
 Those who the godhead's soft behests obey,
 Steal from the pillows unobserv'd away; 20
 On tiptoe traverse unobserv'd the floor;
 The key turn noiseless, and unfold the door:
 In vain the jealous each precaution take,
 Their speaking fingers assignations make.
 Nor will the god impart to all his aid;
 Love hates the fearful, hates the lazy maid;
 But through sly windings, and unpractis'd ways,
 His bold night-errants to their wish conveys:
 For those whom he with expectation fires,
 No ambush frightens, and no labour tires; 30
 Sacred the dangers of the dark they dare,
 No robbers stop them, and no bravoes scare.
 Though wint'ry tempests howl, by love secure,
 The howling tempest I with ease endure:
 No watching hurts me, if my Delia smile,
 Soft turn the gate, and beckon me the while.

She's mine. Be blind, ye rambles of the night,
 Lest angry Venus snatch your guilty sight:
 The goddess bids her votaries joys to be
 From every casual interruption free: 40
 With prying steps alarm us not, retire,
 Nor glare your torches, nor our names inquire:
 Or if ye know, deny, by Heaven above,
 Nor dare divulge the privacies of love.
 From blood and seas vindictive Venus sprung,
 And sure destruction waits the blabbing tongue!

Nay, should they prate, you, Delia, need not fear;
 Your lord (a forcerefs swore), should give no ear!
 By potent spells she cleaves the sacred ground,
 And shuddering spectres wildly roam around! 50
 I've seen her tear the planets from the sky!
 Seen lightning backward at her bidding fly!
 She calls! from blazing pyres the corse de-
 scends,

And, re-enliven'd, clasps his wondering friends!
 The fiends she gathers with a magic yell,
 Then with aspersions frights them back to hell!
 She wills,—glad summer gilds the frozen pole!
 She wills,—in summer wint'ry tempests roll!
 She knows ('tis true), Medea's awful spell!
 She knows to vanquish the fierce guards of hell! 60
 To me she gave a charm for lovers meet,
 ("Spit thrice, my fair, and thrice the charm re-
 peat.")

Us, in soft dalliance should your lord surprise;
 By this impos'd on he'd renounce his eyes!
 But bless no rival, or th' affair is known;
 This incantation me befriends alone.
 Nor stopp'd she here; but swore, if I'd agree,
 By charms or herbs to set thy lover free.
 With dire lustrations she began the rite!
 (Serenely shone the planet of the night) 70
 The magic gods she call'd with hellish sound,
 A fable sacrifice disdain'd the ground—
 I stopp'd the spell: I must not, cannot part:
 I begg'd her aid to gain a mutual heart.

NOTES ON ELEGY II.

THE foregoing poem was written by Tibullus upon his being disappointed in getting admittance to the apartments of Delia.

Ver. 7. It was customary with the Roman lovers to address the gates of their mistresses: Many instances of this occur in the elegiac poets.

Ver. 13. This kind of gallantry was much practised by the Romans.

At lacrimans exclusus amator limina sæpe
 Floribus, et fertis operit, postesque superbus
 Ungit amaracyno. *Lucret.*

Meantime excluded, and expos'd to cold,
 The whining lover stands before the gates,
 And there with humble adoration waits;
 Crowning with flow'rs the threshold and the floor,
 And printing kisses on th' obdurate door. *Dryd.*

The Romans decked their doors with garlands upon many public and private occasions.

Ver. 24. The best comment on all this passage, is that elegy of Ovid's which begins
 Me specta, nutusque meos, &c.

Ver. 32. The civil wars, as they introduced a general dissoluteness of manners, so they also in-

creased the number of robbers; and we have clas-
 sical authority for asserting, that Rome, in the
 age of Cæsar, was as much infested with assassins
 as modern Italy. Propertius has thus improved
 upon this passage of our author:

Nec tamen est quisquam sacros qui lædit amantes
 Scyronis media sic licet ire Via:
 Quisquis Amator crit, Scythicis licet ambulet oris,
 Nemo adeo ut noceat, barbarus esse potest,
 Luna ministrat iter, demonstrant Astra salubras,
 Ipse Amor accensas percutit ante faces.
Lib. iii. El. 16.

Yet, after all, the thoughts of Tibullus appear
 more just. Mr. Prior has given us the same sen-
 timent, but in a different manner, using mytho-
 logy with more address than even most of the
 ancients.

For love, fantastic power, that is afraid
 To stir abroad till watchfulness be laid;
 Undaunted then through cliffs and valleys strays,
 And leads his votaries safe through pathless ways:
 Not Argus with his hundred eyes shall find
 Where Cupid goes, though he, poor guide, be
 blind.

Henry and Emma.

Ver. 36. Broekhusius's note on the original of this passage is so curious, that the reader shall have it in his own words: "Minus recte Turnebus (nam et Turnebus homo fuit) hanc digitorum concrepationem exponit de re, quam facile nulloque negotio adsequimur, et levi quodam velut sono et nutu jubemus et obtinemus." Adv. lib. 20. This explanation, adds our commentator, Turnebus confirms by a quotation from Martial, which, however, as Broekhusius sagaciously observes, only intimates the gesture of a person, "matulam poscentis." He then interprets the passage, and his interpretation the translator has adopted.

Ver. 38. This was a punishment supposed to be inflicted on those who beheld, though without design, any deity. The old priestess of the "bona Dea," in Propertius, thus addresses Alcides:

Parce oculis, hospes, luoque age sede verendo,
Cede aedum, et tuta, limina linque, fuga.

Lib. iv. El. 9.

Venus, in the end of the hymn ascribed to Homer, threatens Anchises, if he blabbed their intercourse, to strike him with thunder. The youth, having disregarded this warning, was thus deprived of one of his eyes. See Callimachus' poem intitled the Bath of Diana.

Ver. 49. The first description of a witch to be found in any Latin poet, is that which Virgil has given in his eighth eclogue. Those critics who are fond of tracing resemblances among poets, would be apt to assert, that our author had that passage in his eye; and yet, if it is considered, that popular prejudice imputed those very effects to witchcraft, there is no occasion for supposing that Maro's Maris assisted Tibullus in his description of his "Saga Verax." However dissonant to sound sense and philosophy magical descriptions may be, yet they have an excellent effect in poetry, where admiration is to be excited.

According to Marcellas, "saga," in its primitive meaning, signified "turpis amorum conciliatrix;" and as such bawds used spells and drugs to effectuate their illicit purposes, it came afterwards to be applied to a witch.

The Romans, according to Broekhusius, held magic in the utmost abhorrence. Would the reader view the full force ascribed by the ancients to witchcraft, let him turn to Horace's fifth and seventeenth Epodes. Ovid's Epistle to Hypsipyle, ver. 83. and El. viii. lib. i. and Metamorp. lib. vii. ver. 179. lib. xiv. ver. 43. Propertius, lib. iv. El. v. Seneca's Medea, ver. 675. and his Hercules Ceta, ver. 454. Lucan, lib. vi. ver. 431. Apuleius, lib. i. ii. iii. of his Metamorphosis. Petronius. Claudian, lib. i. in Rufin. ver. 146. Silius, lib. viii. ver. 496. Valerius Flaccus, lib. vi. ver. 439. and Nemesianus's fourth Eclogue. But Virgil's description (lib. iv. Æn. 487.) of a witch, though comprised in five lines only, is, by Broekhusius, preferred to all the rest.

However the moderns may be obliged in other respects, to yield the poetical palm to the ancients, yet the most bigotted to classical superiority must

confess, that the ancients themselves have been surpassed by us in the poetry of magic. Who, for instance, of the Greek or Roman poets, can be compared with our Shakspeare in this particular? Nay, they might be challenged to produce any magical rites equal in propriety and terror to those we find in Fletcher's Faithful Shepherdess; a poem from which, if Shakspeare did not transplant many a beauty, Milton certainly did.

Ver. 50. It was believed by the ancients, that magic could raise the manes of the dead, and that those ghosts could certainly inform inquirers concerning future events. Vid. Homer's Odyssey, lib. xi. Virgil's Æn. vi. Seneca's Œdip. Statius, lib. iv. Silius Italicus, lib. xiii. and Valerius Flaccus, lib. i. Nor did the Romans regard necromancy as an infamous or abominable art.

One of the usages practised to make the manes appear, was to shed human blood; and, if Cicero may be credited, (vid. Interrogat. Vatin.) the entrails of boys particularly were, on such occasions, offered up.

Ver. 52. Some editors read "fluminis;" and the reading is supported by MS. authority.

Ver. 55. These thoughts are thus assumed by Hammond.

A wizard dame, thy lover's ancient friend,
With magic charms has deafst thy husband's ear;

At her command I saw the stars descend,
And winged lightnings stop in mid career.

I saw her stamp and cleave the solid ground,
While ghastly spectres round us wildly roam;
I saw them hearken to her potent sound,
Till scarr'd at day they sought their dreary home.

At her command, the vigorous summer pines,
And wint'ry clouds obscure the hopeful year:
At her strong bidding gloomy winter shines,
And vernal roses on the snows appear.

She gave these charms, which I on thee bestow:
They dim the eye, and dull the jealous mind;
For me they make a husband nothing know;
For me, and only me, they make him blind.

El. v.

The whole of this fifth elegy of Hammond's is indeed a beautiful imitation of this second of Tibullus.

Ver. 54. The aspersion used to send those "inferna catervæ" back to hell was milk; and, if the translator is not mistaken, this is the only passage in the ancient poets where milk is taken notice of as used for this purpose. See note on the second elegy of the third book, for the use of milk at funerals; and elegy sixth of the same book, for its virtue in dispelling diseases, when offered along with blood and wine to the infernal gods.

Ver. 60. The unusual hissing in the original of this line

Sola feros Hecates perdumuisse canes,

was probably meant to give the reader a more terrible idea of those fierce attendants of Hecate; and hence the alteration of

Sola feros Hecatæ, &c.

offered by Broekhusius, seems improper.

Ver. 62. The reader who wants to be informed of the many uses made of spittle in medicine, in magic, in expiations, in averting witchcraft, in omens, and in conciliating love, may consult Pliny the elder, and those commentators whom Broekhusius has quoted. We shall only observe, that the belief of its being a preservative against fascination is very ancient, for Theocritus makes Damætas thus express himself in the sixth Idyl.

ὥς μὴ βασκανῶ δὲ, τρεῖς ἰταῦσα εἰς ἔμῳ κολπον.

Nor did only the shepherds of Sicily look upon spittle in this light, the Romans believed the same of it. Accordingly, on the day when an infant was named (which for girls was on the eighth, for boys on the ninth, after birth), the grandmother or aunt, moving round in a circle, rubbed, with her middle finger, the child's forehead with spittle, which was hence called "*Lustralis Saliva*."

The number three was of great import in almost all the religious and magical ceremonies of antiquity; for though, as Virgil expresses it, the gods were supposed to be pleased with all odd numbers, yet three was deemed the most pleasing to them. The number four was also of some estimation, as Macrobius, in his Commentary on the Somn. Scipion. informs us. Vid. cap. 5, 6. Our poet also uses the number four in one of his elegies.

Ver. 63. Ovid, who, without any ceremony, adopts our poet's sentiments, whenever they suit his purpose, has made use of the same argument to an over-vigilant keeper.

*Viderit ipse licet, credet tamen ille neganti
Damnabit oculos, et sibi verba dabit.*

Although it is with great reluctance that men credit any report injurious to the fame of one they love, yet nothing less than a spell was necessary to make a husband deny the testimony of his own senses.

Ver. 69. The lustration mentioned in the original was a torch of pine-tree; to which were added sulphur and bitumen, and, as Broekhusius conjectures, blood. A solemn washing, and the sacrifice of a black lamb, preceded the use of the torch. These ceremonies were also performed on a clear night, "*nocte serena*." The ancients thought them equally powerful either to bind the lover, or free him from the influence of love.

Pontanus and Amaltheus among the moderns, not to mention others, have given us an ample detail of the ceremonies practised on these occasions: but as most of them are unadapted to modern superstition, their accounts show some learning, but little judgment. Ovid laughs at all these ceremonies in his Remedy of Love.

Ver. 71. The best list of these deities is to be found in the seventh book of Ovid's Metamor-

phosis, ver. 192. and in the two Spanish poets, Seneca, Med. ver. 140. and Lucan, lib. vi. ver. 730.

Broekhus.

Ver. 74. Though this be evidently the conclusion of the elegy, yet some editors have strangely tacked to it,

Ferreus ille fuit,

and the thirteen following lines, which belong to the first elegy. Nor content with this, they have forced

Num veneris magnæ,

and the seven succeeding verses, from their natural place in the fifth elegy of this book, and have added them to the other transposition. Mr. Dart followed one of these editions.

May it not have been this inaccuracy of editors which induced that great poet, as well as critic, Mr. Dryden, to assert, that Tibullus, in composing, seldom looked farther than the next line; that he rambles from his subject, and concludes with something which is not of a piece with the beginning. Although it is granted, that no man understood the beauties of ancient poetry, and of course could draw the characters of ancient poets, better than Mr. Dryden; yet it is certain, that his sentiments on these subjects were not always the result of mature deliberation. In the general preface to the volume from which the above censure on our author is taken, Mr. Dryden complains of his want of leisure; and, indeed, this is too evident in the quotation above, as the arguments to Tibullus's elegies will show a beginning, a middle, and a conclusion, even more than can be found in Propertius, who yet, according to that critic, had always a plan when he sat down to write.

Let not, however, the reader imagine that this is meant as a censure on Mr. Dryden; that immortal genius had not time to correct his works. But what shall we say of the age which suffered its first pen to be hackneyed through necessity?

However, if Dryden's circumstances are an apology for his little incorrectnesses, Rapin cannot be pardoned on the same account: and yet that critic, who often characterizes books he never read, makes the following observation:

"Je sçai, qu'il y a des ouvrages qui doivent par la qualité de leur caractère être écrits d'un air libre sans autre dessein, que celui d'une naïveté naturelle, et sans contrainte, tels que sont les hymnes d'Orphée d'Homère, de Callimachus, tels que sont certaines Odes de Pindare, d'Anacréon, et d'Horace, qui n'ont de règle que l'enthousiasme, tels que sont aussi la plupart des *Élégies* de Tibulle et Propertius; mais il faut avouer, que ce ne sont pas les plus belies, et quand on fait *Reflexions* aux *Elegies* d'Ovide on y trouve toujours un tour secret qui en fait le dessein." What shall one say to all this critical jargon, but that

Ten censure wrong, for one who writes amiss.

Jo. Antonius Vulpius, a lawyer of Bergamo, who published an edition of Catullus, Tibullus,

and Propertius, A. D. x. 10. at Padua, concludes this second elegy with

— nec te posse carere vilim,

as Broekhusius has done; but then he immediate-

ly adds, though without any reason, "Videntur aliqua desiderari. Vulpus observes, that "posse carere" was a Roman colloquial expression, of which he produces two instances from Martial.

ELEGY III.

WHILE you, Messala, plough th' Ægean sea,
O sometimes kindly deign to think of me:
Me, hapless me, Phæacian shores detain,
Unknown, unpitied, and oppress'd with pain.
Yet spare me, death, ah spare me and retire:
No weeping mother's here to light my pyre:
Here is no sister, with a sister's woe,
Rich Syrian odours on the pile to throw:
But chief, my soul's soft partner is not here,
Her locks to loose, and sorrow o'er my bier. 10

What though fair Delia my return implor'd,
Each fane frequented, and each god ador'd:
What though they bade me every peril brave;
And fortune thrice auspicious omens gave:
All could not dry my tender Delia's tears,
Suppress her sighs, or calm her anxious fears;
E'en as I strove to minister relief,
Unconscious tears proclaim'd my heart-felt grief:
Urg'd still to go, a thousand shifts I made,
Birds now, now festivals my voyage staid: 20
Or, if I struck my foot against the door,
Strait I return'd, and wisdom was no more.
Forbid by Cupid, let no swain depart,
Cupid is vengeful, and will wring her heart.

What do your offerings now, my fair, avail?
Your Isis heed not, and your cymbals fail!
What, though array'd in sacred robes you flood,
Fled man's embrace, and sought the purest flood?
While this I write, I sensibly decay,—

"Assist me, Isis, drive my pains away: 30
"That you can every mortal ill remove,
"The numerous tablets in your temple prove:
"So shall my Delia, veil'd in votive white,
"Before your threshold sit for many a night;
"And twice a-day, her tresses all unbound,
"Amid your votaries fam'd, your praises sound:
"Safe to my household gods may I return,
"And incense monthly on their altars burn."

How blest man liv'd in Saturn's golden days,
E'er distant climes were join'd by lengthen'd ways.
Secure the pine upon the mountain grew, 41
Nor yet o'er billows in the ocean flew;
Then every clime a wild abundance bore;
And man liv'd happy on his natal shore:
For then no steed to feel the bit was broke,
Then had no steer submitted to the yoke;
No house had gates, (blest times!) and, in the
grounds

No scanty landmarks parcell'd out the bounds:
From every oak redundant honey ran,
And ewes spontaneous bore their milk to man: 50

No deathful arms were forg'd, no war was wag'd,
No rapine plunder'd, no ambition rag'd.
How chang'd, alas! Now cruel Jove commands;
Gold fires the soul, and falchions arm our hands:
Each day, the main unnumber'd lives destroys;
And slaughter, daily, o'er her myriads joys.
Yet spare me, Jove, I ne'er disown'd thy sway,
I ne'er was perjur'd; spare me, Jove, I pray.

But, if the sisters have pronounc'd my doom,
Inscrib'd be these upon my humble tomb: 60
"Lo! here inur'd a youthful poet lies,
"Far from his Delia, and his native skies!
"Far from the lov'd Messala, whom to please
"Tibullus follow'd over land and seas."

Then love my ghost (for love I still obey'd)
Will grateful usher to th' Elysian shade:
There joy and ceaseless revelry prevail;
There soothing music floats on every gale;
There painted warblers hop from spray to spray,
And, wildly-pleasing, swell the general lay: 70
There every hedge, untaught, with cassia blooms,
And scents the ambient air with rich perfumes:
There every mead a various plenty yields;
There lavish Flora paints the purple fields:
With ceaseless light a brighter Phœbus glows,
No sickness tortures, and no ocean flows;
But youths associate with the gentle fair,
And stung with pleasure to the shade repair:
With them love wanders wheresoe'er they stray,
Provokes to rapture, and inflames the play: 80
But chief, the constant few, by death betray'd,
Reign, crown'd with myrtle, monarchs of the shade.

Not so the wicked; far they drag their chains,
By black lakes sever'd from the blissful plains;
Those should they pass, impassable the gate
Where Cerb'rus howls, grim sentinel of fate.
There snake-hair'd fiends with whips patrol a-
round,

Rack'd anguish bellows, and the deeds resound:
There he, who dar'd to tempt the queen of heaven,
Upon an ever-turning wheel is driven: 90
The Danaids there, still strive huge casks to fill,
But strive in vain, the casks elude their skill:
There Pelop's fire, to quench his thirsty fires,
Still tries the flood, and still the flood retires:
There vultures tear the bow'ls, and drink the gore,
Of Tityus, stretch'd enormous on the shore.
Dread love, as vast as endless be their pain
Who tempt my fair, or wish a long campaign.

O let no rival your affections share,
Long as this bosom beats, my lovely fair! 100

Still on you let your prudent nurse attend;
 She'll guard your honour, she's our common friend.
 Her tales of love your sorrowings will allay,
 And, in my absence, make my Delia gay:
 Let her o'er all your virgin-train preside,
 She'll praise th' industrious, and the lazy chide.
 But see! on all enfeebling languors creep;
 Their distills drop, they yawn, they nod they
 sleep.

Then, if the destinies propitious prove,
 Then will I rush, all passion, on my love: 110
 My wish'd return no messenger shall tell,
 I'll seem, my fair, as if from heaven I fell.
 A soft confusion flushes all your charms,
 Your graceful dishabille my bosom warms, }
 You, Delia, fly and clasp me in your arms.
 For this surprise, ye powers of love, I pray,
 Post on Aurora, bring the rosy day.

NOTES ON ELEGY III.

THIS elegy was written in a dangerous fit of sickness, which detained our poet in the island of Corfu, anciently called *Phaacia*, and was apparently composed before the second.

The commentators pretend, that Messala was upon his Syrian expedition at this time; and that Tibullus recovering, followed his patron to Cilicia, Ægypt, &c. As this expedition took place A. U. C. 724, Tibullus was then only fourteen years old, if he was born in the consulship of Hirtius and Pansa; but as this is rather too fine an elegy for a boy of that age (and yet Pliny the younger had wrote a Greek tragedy before fifteen years), and as it appears, that he had been for some time in love with Delia; not to mention other arguments which the poem itself affords us, the translator is inclined to join issue with Douza, who places his birth A. U. C. 690, in the consulship of Cicero and of Caius Anthony. Vide the Life.

But whatsoever time this elegy was written, we may apply what Quintilian says of eloquence to this species of writing in particular, "*Pectus est, quod disertos facit.*"

Ver. 1. The original of these lines is quoted by Dr. Trapp, in his chapter on elegy, as an instance of the soothing graces of elegiac complaints, "*Quam jucundus est dolor poeticus,*" (says that critic, prælect. 13.) "*et quanta elegantia querelarum, morbum suum, terra peregrina ægrotus, sic deflet Tibullus.*"

The cohorts mentioned in the text, was Messala's retinue; which must have been very different from that of most modern generals, if made up of such men as Tibullus. But in those days a man was thought the better soldier for cultivating an acquaintance with the muses.

An abhorrence of our dissolution was implanted in us by the Author of Nature for the wisest purposes. Even the oldest, and most wretched, are, in general, unwilling to die. But to be snatched away in the bloom of life, and whilst in a foreign country, at a distance from one's relations, especially from a darling mistress, are circumstances peculiarly distressful. Homer, who knew the source of every passion, and could raise them all,

has beautifully inserted many such pathetic strokes in describing the deaths of his heroes: And if his battles make the reader regardless of danger, they also increase his humanity: And although Virgil is surpassed by Homer, in this respect, yet is the lamentation of Euryalus's mother, who had left her father's court to share the fortunes of her son, a masterpiece of the pathetic. Tasso has introduced many beautiful strokes of this kind into his *Il Goffredo*; but none of the modern heroic poets are in this particular to be preferred to the author of *Leonidas*; unless indeed we admit, that Dante's description of Ugolino surpasses any poetical picture of distress to be met with among either the ancients or moderns.

Ver. 14. The original runs thus:

*Illa sacras pueri sortes ter sustulit, illi
 Rettulit e trimis omina certa puer.*

Those who were superstitious, among the ancients, generally consulted the lots before they began any thing of importance. The first words spoken by the virgin in the temple of Juno, were the sortes, in cases of marriage; as the first spoken by a boy in the highway, gave the omen commonly depended upon before a journey was undertaken. An example will better explain this obscure piece of superstition. A lady who was betrothed, went, with a young companion, to the temple of the goddess of marriage, to watch the first words spoken by a woman. Anxiously attentive she seated herself, while the other stood. Two hours having passed, without a word's being uttered, or any body entering, the younger at last said, "My dear I am tired, will you permit me to sit in your chair a little?" These were the first words. The younger accordingly seated herself, and no body coming in, they both went away after having waited some time longer. The betrothed lady soon after died, and the other was married to the bridegroom in her stead.

There were other kind of sortes. The old Scholiast on the fourth Pythian ode of Pindar, tells us, that dice thrown upon a table were used as a lot; and if one particular side turned up, what

they wished would come to pass; but if it did not, their wishes should not be accomplished.

Εάν βαλλόντες μη ποδὶ ἀναβῇ, ἀποτελισθήσεται, τοδὲ μὴ, οὐκ ἀποτελισθήσεται.

Of lots, some were sacred to Apollo, some to Mercury; and they were sometimes to be cast into a deep well or fountain. We see an instance of this in Suetonius's Life of Tiberius, cap. 14. and Dempster in his Notes on Rosinus, informs us, that those who had success in this kind of divination, often bestowed gifts upon the fountain. See Pliny, Lib. viii. Ep. 8.

At Præneste was a temple, erected to fortune, where devotees used often to repair in order to have their future adventures told them. This temple was very magnificent, which made Carneades say, "He never had seen fortune more fortunate than at Præneste." In that temple the lots were blended together, thrown into an olive chest or urn, and drawn by a boy. This is probably the species of divination alluded to here by our poet.

Ver. 21. The striking the foot against the threshold, at the first going abroad, was, by the ancients, reputed a bad omen; and is one of the pretexts our poet used in order to delay his departure. The superstitious among ourselves have many as foolish observances.

Ver. 26. Jupiter, in one of Lucian's dialogues commands Mercury to hasten to the Nemean forest, there to destroy Argus, which done, he was to waft Io over sea to Ægypt, and there make an Isis of her, *Ἐσὶν θεαταὶ ἰσὶς, καὶ τὸν Νεῖλον ἀναγὰς καὶ τοὺς ἀνέμους ἀποπνέπεται, καὶ φορεῖται τοὺς πλεοντάς.* "Sit illis Dea, Nilumque attollat, et ventos immittat et navigantes servet." The same witty author also informs us, that the Ægyptians not only used to call their larger ships by the name of Isis, for good-luck's sake, but also to have statues of this tutelary deity placed in the stern and forecabin of their vessels. Vid. his piece intitled, *πλοίων η γυχαί.* This shows the propriety of Delia's addressing Isis to protect Tibullus in the voyage he was about to make.

Gruterus has transmitted to us the figure, &c. of a marble altar, dedicated to Isis, to which Broekhusius was obliged for the form he has given us of an Ægyptian Sistrum or Cymbal. Apuleius has described this instrument, Lib. 3. of his Metam.

Ver. 28. In the mysteries of Isis, it was customary for the votary to lie alone several nights successively. This custom Propertius rails at.

Tristia jam redeuns iterum solemnia nobis,
Cynthia jam noctes est operata decem;
At utinam Nilo pereat quæ sacra tepente
Misit matronis Inachis, ausonii!
Quæ Dea tam cupidos toties divisit amantes,
Quæcunque illa fuit, semper amara fuit.

Dart.

Ver. 32. Those who had escaped shipwreck, or any dangerous fit of sickness, usually hung up, in the temple of Isis, tablets, on which, say authors was described the manner of their deliverance:

TRANS. II.

But Broekhusius is of opinion, that, as sailors dedicated to Isis a representation in paint of the danger they had escaped; so those who recovered from any dangerous disease, by the assistance of Isis, suspended, on the walls of her temple, tablets, whereon was represented the form of the organ that had been principally affected, without any mention of the remedies used. Thus the old poet in the Priapeia has it.

Cur pictum memori sit in tabella
Membrum quæritis, &c.

Besides this, among the many votive inscriptions to Isis for health recovered, which Gruterus and others have preserved, we meet with no mention of the applications or medicines supposed to have been successful.

It is, however, an odd tradition, that Hippocrates was indebted to such tablets, in a temple in the island of Cos, for the best part of the Coacæ Prænotiones. Could this be proved, it would show, that great good may sometimes spring from superstition.

In Popish countries, many figures of wax, silver, &c. are at this day to be seen on the walls of their churches, chapels, &c.

Ver. 33. As the goddess herself was clothed in white linen; so those who returned her thanks for their own, or friends, recovery from sickness, were always veiled in the same manner, and sat on the ground before the porch of the temple. Her priests had their heads shaved, and also wore linen surplices. Hence they were called "Lingeri." See Martial's humorous epigram on that subject, Lib. ii. Ep. 29. Apuleius, in the eleventh book of his Metamorphosis, has given the fullest account of the worshippers of Isis.

Ver. 35. From the words "pharia turba," a great critic, as Broekhusius informs us, conjectured, that Messala attended Augustus Cæsar in his Ægyptian expedition against Mark Anthony. But the epithet "pharia" which is every where appropriated to Isis, and her worship, deceived him.

Ver. 39. Ovid has imitated the whole of this passage in the beautiful elegy, which he sent to Corinna upon her going abroad. Lib. ii. El. 11.

No poet, either ancient or modern, has surpassed Tibullus in his description of the golden age; yet how different that age was from the picture given us of it by Tibullus, the great rural and philosophical poet informs us in his Autumn,

Corruption still,
Voracious, swallow'd what the lib'ral hand
Of bounty scatter'd o'er the savage year;
And still the sad Barbarian, roving, mix'd
With beasts of prey; or, for his acorn meal,
Fought the fierce tusky boar; a shivering wretch!
Aghast and comfortless! when the bleak north,
With winter charg'd, let the mix'd tempest fly,
Hail, rain and snow, and bitter-breathing frost;
Then to the shelter of the hut he fled,
And the wild fordid season pin'd away:

For home he had not; home is the resort
Of love and joy, and peace and plenty, where
Supported and supporting, polish'd friends
And dear relations mingle into bliss.
But this the rugged savage never felt;
E'en desolate in crowds; and thus his days
Roll'd heavy, dark and unenjoy'd along,
A waste of time!

Ver. 65. This description of Elysium is not so poetical as may at first sight be imagined; since even the philosophers have painted that happy residence of the blessed in as lively colours. *Broekhus.*

Upon turning to the passage in Plutarch (Consol. ad Apollon.) cited by Broekhusius in defence of this censure, we were not a little astonished to find that excellent philosopher, borrowing the whole of his description of Elysium from Pindar's second Olympian ode; which, as it is one of the finest passages in the old Theban, we shall here transcribe.

ισον δε νυκτισιν αι-
εσα δ' εν αμφοισι αλι-
ον ιχοντες, απονευρον
εσθλοι νιμονται βιο-
τον, η χθονα ταρασσον-
τες αλλα χειρων
υδρ ποντιον υδωρ
κειναν παρα διαιταν, αλ-
λα παρ μιν τιμιοις
βιωσι οτινις ιχαι-
ρον ευορκιαις
αδακρυν νιμονται
αιονα, &c.

And especially in the succeeding antistrophe.

ινθα μακαρον
νασον Ωκεανιδες
αυραι περιπνεουσιν, &c.

Which passages are thus translated by the late Dr. West, in his admirable version of Pindar.

But in the happy fields of light,
Where Phœbus, with an equal ray,
Illuminates the balmy night,
And gilds the cloudless day.

In peaceful, unmolested joy,
The good their smiling hours employ:
Then no uneasy wants constrain
To vex th' ungrateful soil,
To tempt the dangers of the billowy main,
And break their strength with unabating toil,
A frail disastrous being to maintain.

But, in their joyous calm abodes,
The recompence of justice they receive;
And, in the fellowship of gods,
Without a fear eternal ages live.

Again, in the antistrophe, he says, that the good who have been three times purified in as many successive transmutations, &c. become then qualified to enter the fortunate islands, where

Fragrant breezes, vernal airs,
Sweet children of the main,
Purge the blest island from corroding cares,
And fan the bosom of each verdant plain,

Whose fertile soil immortal fruitage bears;
Trees, from whose flaming branches flow,
Array'd in golden bloom, refulgent beams;
And flow'rs of golden hue that blow
On the fresh borders of their parent streams;
These by the blest in solemn triumph worn,
Their unpolluted hands and clustering locks adorn.

But beautiful as this description is, it does not surpass that which Homer has given in the fourth *Odyssey*, line 564, which, as Mr. Spence justly observes, is the only passage where that father of poetry describes the regions of the blest. But to finish this long note, we shall only remark, that, as these last mentioned pictures of Elysium are suited to their different places, or the poems in which they appear, so is that of our poet appropriated to the elegiac muse; Dr. Trapp accordingly quotes it for its uncommon beauty. *Prælect.* 13.

Ver. 83. The first poetical description of hell is to be found in Homer; and though all the succeeding epic poets of antiquity have, in imitation of their great father, sent their heroes to visit those regions of woe, none of them have improved the original.

But although Homer's hell surpasses the hell of the ancients, it cannot however be compared with many passages in the *Inferno* of that great original poet Dante. Milton perhaps has not outdone him.

Voltaire's hell is as little terrible, as his *Masacre of St. Bartholomew* is unaffectedly told.

Ver. 86. Mythologists place a hundred hissing serpents round the head and neck of Cerberus, whom they also equip with the tail of a dragon.

Ver. 89. As the poet meant, not only to keep off every one from laying siege to his mistress, but also to preserve her constant in his absence; he has selected, from the amours of mythology, some incidents very proper to his purpose.

Yet the whole of this description is liable to the censure which Lucan, in his admirable *Treatise on the Manner of writing History*, passes on Parthenius, Euphorion, and Callimachus, who, wandering from their main subject, spend, according to that witty critic, many words in describing impertinences; but as the whole passage is admirable, the reader will not probably be displeased to see it translated.

You must be particularly cautious, how you launch out in describing mountains, rivers, and fortifications; lest, by an ostentatious display of eloquence, you entirely drop the thread of your history; whenever, therefore, perspicuity demands that the reader should, in some degree, be informed of such circumstances, let your description of them be comprised in as few words as possible. On occasions like these, place Homer before your eyes, who, though a poet, yet, in his account of hell, passes slightly over Tantalus, Ixion, Tityus, and the rest: all which particulars, were they to be described by Parthenius, Euphorion, or even Callimachus, what a profusion of verses would be employed in bringing the water to the lips of

Tantalus, and in turning round the wheel of Ixion?

The more judicious among the ancients saw, that under the fables of Tantalus, &c. were represented the torments of an evil conscience. See

Macrobius's sensible Commentary on the Somnium Scipionis.

Ver. 109. This is one of those thoughts, which, as Horace happily expresses it, Venus has imbued with a fifth part of her nectar.

ELEGY IV.

Poet.

So round, my god, may shady coverings bend,
No sun-beams scorch thy face, no snows offend!
Whence are the fair so proud to win thy heart,
Yet rude thy beard, and guiltless thou of art?
Naked thou stand'st, expos'd to wint'ry snows!
Naked thou stand'st when burning Sirius glows!
Thus I—and thus the garden-power reply'd,
A crooked sickle glittering by his side.

Priapus.

Take no repulse—at first what though they fly!
O'ercome at last, reluctance will comply. 10
The vine in time full ripen'd clusters bears,
And circling time brings back the rolling spheres:
In time soft rains through marble sap their way,
And time taught man to tame fierce beasts of prey.
Nor aw'd by conscience meanly dread to swear;
Love-oaths, unratified, wild tempests bear!
Banish then scruples, if you'd gain a heart;
Swear, swear by Pallas' locks, Diana's dart;
By all that's most rever'd—if they require:
Oaths bind not eager love, thank heaven's good
Sire! 20

Nor be too slow; your slowness you'll deplore;
Time passes; and, oh! youth's raptures soon are o'er:
Now forests bloom, and purple earth looks gay;
Bleak winter blows, and all her charms decay:
How soon the steed to age's stiffness yields,
So late a victor in th' Olympic fields?
I've seen the aged oft lament their fate,
That senseless they had learnt to live too late.
Ye partial gods, and can the snake renew
His youthful vigour and his burnish'd hue? 30
But youth and beauty past; is art in vain
To bring the coy deserters back again?

Poet.

Jove gives alone the powers of wit and wine,
In youth immortal, spite of years to shine.

Priapus.

Yield prompt compliance to the maid's desires;
A prompt compliance fans the lover's fires:
Go pleas'd where'er she goes, though long the
way,
Though the fierce dog-star dart his sultry ray;
Though painted Iris gird the bluish sky,
And sure portends, that rattling storms are nigh: 40
Or, if the fair one pant for sylvan fame,
Gay drag the meshes and provoke the game:

Nay, should she choose to risk the driving gale;
Or steer, or row, or agile hand the sail: [bear;
No toil, though weak, though fearful, thou for-
No toils should tire you, and no dangers scare:
Occasion smiles, then snatch an ardent kiss;
The coy may struggle, but will grant the bliss:
The bliss obtain'd, the fictitious struggle past;
Unbid, they'll clasp you in their arms at last. 50

Poet.

Alas! in such degenerate days as these,
No more love's gentle wiles the beauteous please!
If poor, all gentle stratagems are vain!
The fair ones languish now alone for gain!
O may dishonour be the wretch's share,
Who first with hateful gold seduc'd the fair!

Priapus.

Ye charming dames, prefer the tuneful quire,
Nor meanly barter heavenly charms for hire.
What cannot song? The purple locks that
glow'd
On Nisus' head, harmonious song bestowed! 60
What cannot strains? By tuneful strains alone
Fair iv'ry, Pelops, on thy shoulder shone!
While stars with nightly radiance gild the pole,
Earth boasts her oaks, or mighty waters roll,
The fair whose beauty poets deign to praise,
Shall bloom uninjur'd in poetic lays:
While she who hears not when the muses call,
But flies their fav'rites, gold's inglorious thrall!!
Shall prove, believe the bard, or soon or late,
A dread example of avenging fate! 70

Soft flattering songs the Cyprian queen ap-
proves;
And aids the suppliant swain with all her loves.

Poet.

The god, no novice in th' intriguing trade,
This answer, Titius, to my question made:
But caution bids you fly th' insidious fair,
And paints the perils of their eyes and air;
Nor these alone, devoted man subdue,
Devoted man their slightest actions woo.

Be cautious those who list—but ye who know
Desire's hot fever, and contempt's chill woe; 80
Me grateful praise—contempt shall pain no
more;

But wish meet wish, instructed by my lore:
By various means, while others seek for fame,
Scorn'd love to counsel be my noblest aim.

Wide stands my gate for all—I rapt foresee
The time, when I love's oracle shall be! [throng,
When round my seat shall press th' enamour'd
Attend my motions, and applaud my song.

Alas my hopes are fled, my wiles are vain;
The fair, I doat on, treats me with disdain: 90
Yet spare me, charmer, your disdain betrays
To witty laughter my too boastful lays.

NOTES ON ELEGY IV.

In this elegy the poet consults Priapus about the means to be used in order to become a favourite with the fair; and that god, in his answer, delivers an epitome of the art of courtship.

However immoral some parts of Priapus's directions may be, there are but too many among the modern men of gallantry, who implicitly obey them; for, if the translator is not greatly mistaken, perjury in love-matters prevails now as much in Britain as ever it prevailed in ancient Italy.

Those who understand the original, need not to be told the reasons which obliged the translator to alter and omit many passages of this elegy, which with some few others of the same stamp, were probably those parts of Tibullus, which made the pious Anthony Possevin apply to heaven in prayer, to preserve him from temptation whenever he purposed to read our poet.

Ver. 4. Priapus thus describes himself in an ancient author,

Parum est mihi, fixi quod hic miser sedem
Agente terra per canicula rimas
Siticulosam sustinens diu æstatem:
Parum, quod imi perfluunt sinus imbre,
Et in capillos grandines cadunt nostros
Horretque dura barba vineta chrystallo.

VULF.

Ver. 11. *The vine in time.*] This was so favourite an illustration, that Ovid has thrice inserted it in his *Art of Love*. Lucretius has also twice introduced the drop of water into his admirable poem *De Rerum Natura*; and Tasso, in his *Amynta*, has made it his own.

— O miserello
Non disperar ch' acquisterai costei;
La lunga etate a l' omine di porre
Freno a i Leoni, et a le Tigre Hyrcane.

Ver. 18. The ancients not only swore by particular divinities, but by those things which were supposed to be most acceptable to them. But whence was it, says Broekhusius, that lovers swore by the virgin goddesses? and adds this wise solution, "Credo, ob adamatum Endymiona."

Minerva was so fond of her hair, which it seems was very fine, and so highly resented all rivalry in that particular, that she turned the hair of Medusa, who had preferred her own to that of the goddess, into serpents. Vid. Serv. in 6. *Æn.* V. 289.

Before the virgins of Argos married, they hung up a lock of their hair in the temple of Minerva, who was thought in a peculiar manner to protect the "capillitium puellare." Broekhusius adds, "In vicem puellas Palladi crinem disponebant honorariæ psecades."

Ver. 20. *Oaths bind not eager love*] This sentiment is introduced by Plato in his *Symposium*.

ὁ δὲ δαιμότατος, οὕτως γὰρ λέγουσιν οἱ πολλοὶ ὅτι καὶ ἐμύνοντι μὴ ἐγγύνηται παρὰ θεῶν, &c. VULF.

See an epigram to the same purpose in Callimachus.

Ver. 26. *So late a victor.*] See an admirable dissertation upon this subject by the late Mr. West, prefixed to his translation of Pindar.

Ver. 29. It is reported by naturalists, that serpents or snakes, upon eating a certain herb, called Maratos, cast their skin and renew their age. Ovid has a thought like this in his *Ars Amand*.

Anguibus excutitur tenui cum pelle vetustas,
Nec faciunt cervos cornua jacta senes;
Nostra sine auxilio fugiunt bona, &c.

Lib. 3.

which Mr. Congreve has thus Englished,

The snake his skin, the deer his horns, may cast,
And both renew their youth and vigour past;
But no receipt can human kind relieve,
Doom'd to decrepid age without reprieve.

Dart.

This is a good poetical illustration, but philosophy disclaims it. Serpents, and most of the reptile kind, do indeed cast their coats (exuviae), but they do not thereupon grow young again, no more than a bird does after moulting.

The fugacity of beauty is a topic which almost every love-writer, since the days of Tibullus, has used to his mistress whenever she demurred; and yet Mr. Prior, in his manner of applying it, has made it entirely his own.

Take heed, my dear, youth flies apace;
As well as Cupid, time is blind;
Soon must those glories of thy face

The fate of vulgar beauties find:
The thousand loves that arm thy potent eye,
Must drop their quivers, flag their wings, and die.

Ver. 33. Bacchus was much celebrated, both by the Greek and Roman poets, for his beauty.

Anacreon honours him with the epithet *καλός*, and Naso makes him the following fine compliment.

—Tibi enim inconsumpta juvenus,
Tu puer æternus, tu formosissimus alto
Conspiceris cœlo, tibi cum sine cornibus adstas
Virgineum caput est.

Apollo's beauty is commonly known. Bacchus, as well as Cupid and Minerva, is always represented with long yellow hair; and hence the epithet *χρυσόκρομος*, which some of the poets have bestowed on him.

Ver. 37. *Go plias'd where'er she goes.*] This thought is finely imitated by that sweet elegiac poet Joannes Secundus.

Illius imperio ventres patiemur et imbres,
Ibimus et solas nocte silente vias,
Nec grave frigus erit, nec solstitium, licet in me
Fervidus ingeminet sidera sicca puer
Illa volet comitem sibi, me quocunque sequemur
Qua via nulla rotæ pervia nulla rati.

El. iii. Lib. I.

Ver. 48. *The coy may struggle.*] Horace has beautifully applied this thought to Lycimnia.

Dum flagrantia detorqueo ad oscula
Cervicem, aut facili sævitia negat.
Quæ poscente magis gaudeat eripi
Interdum rapere occupat.

Boileau has done great justice to this thought in his *L'Art Poétique*, Chant. 2. and Mr. Francis seems to have caught the soul of Horace when he translated it.

Ver. 65. If poetry bestows immortality on charms, which would otherwise fade, it is eminently the interest of the fair sex to keep well with the poets. Propertius and Ovid impute to their own verses, what Tibullus more modestly ascribes to poetry in general. Indeed beauty is the parent of poetry; and if the British bards have surpassed their brethren on the continent, it is chiefly owing to the superior charms of our fair country women.

The images, expressive of beauty, when immortalized by song, should here have been such as were more appropriated to elegy; for those, our poet mentions on this occasion, would better have suited pastoral.

Ver. 74. Broekhusius is of opinion, that the Titius mentioned in the text, was Titius Septimius, a man no less eminent for his friendship with Horace, than for his real poetical abilities; and whom that excellent judge of men, as well as of writing, thus characterizes,

Quid Titius Romana brevi venturus in ora?
Pindarici fontis qui not expaluit haustus,
Fastidire lacus et rivos ausus apertos:
Ut valet? ut neminit nostri? fidibusne latinis
Thebanos aptare modos studet auspice musa?
An tragica desævit et ampullatur in arte.

B. I. Ep. 3.

How fares my Titius? Say when he intends
To publish? Does he not forget his friends?
He who disdains the springs of common fame,
And dauntless quaffs the deep Pindaric stream:
Does he design, when all the muse inspires,
To tune to Theban sounds the Roman lyres?
Or, with the transports of theatric rage,
And its sonorous language shake the stage?

Francis

The old Scholiast accordingly informs us, that he published both lyric poems and tragedies. There is reason also to think, that he likewise wrote comedies; for the same Scholiast observes, on the following line of Horace,

Ut vinosa glomos furtivæ Pyrrhia lanae.

Ep. 13. B. I.

that the poet Titius introduces a servant of the name of Pyrrhia, stealing a ball of wool from her mistress. All his works are unfortunately lost. He had a noble monument erected to him in the neighbourhood of Aricia, ten miles from Rome.

Barthius, in his *Adversaria*, owns that he did not know who the Titius was, whom Horace mentions; and therefore Mr. Francis is the more excusably silent on this article.

After all, it is impossible for any modern to determine, whether Horace and Tibullus meant the same Titius; and indeed it is of no consequence.

Ver. 85. *Wide stands my gate for all.*] This is an image borrowed from the practice of the Roman lawyers. There is no word in the English language which fully expresses the meaning of the Latin verb "*deducere*." It implies that solicitous attendance which the younger paid to men of eminence, or clients to their patrons. To form a just idea of this custom, a modern must consult Juvenal, and Cicero de petitione consulatus.

TIBULLUS.

Tibullus probably had in his thoughts some verses of Callimachus, which Stobæus (*Serm. 114*) has preserved.

Γηρασκει δ' ὁ γέρον κινὸς ελαφροτέρων,
κούραι τον φιλοῦσι, νιοὶ δὲ μιν ὥς τε τοκῆα
χαίροντες ἐπ' οἰκίαν ἀχρεὶς ἀγούσι θυρῖν.

Vulph.

ELEGY V.

Or late I boasted I could happy be,
 Resume the man, and not my Delia see!
 And boasts of manhood and of bliss are vain;
 Back to my bondage I return again!
 And like a top am whirl'd, which boys, for sport,
 Lash on the pavement of a level court!

What can atone, my fair, for crimes like these?
 I'll bear with patience, use me as you please!
 Yet, by love's shafts, and by your braided hair,
 By all the joys we stole, your suppliant spare. 10
 When sickness dimm'd of late your radiant eyes,
 My restless, fond petitions won the skies.
 Thrice I with sulphur purified you round,
 And thrice the rite with songs th' enchantress
 bound:

The cake, by me thrice sprinkled, put to flight
 The death-denouncing phantoms of the night:
 And I nine times, in linen garbs array'd,
 In silent night, nine times to Trivia pray'd.
 What did I not? Yet what reward have I?
 You love another, your preserver fly! 20

He tastes the sweet effects of all my cares,
 My fond lustrations, and my solemn prayers.

Are these the joys my madding fancy drew,
 If young ey'd Health restor'd your rosy hue?
 I fondly thought, sweet maid, oh thought in vain!
 With you to live a blithesome village swain.
 When yellow Ceres asks the reaper's hand,
 Delia (said I) will guard the reaper's band;
 Delia will keep, when hinds unload the vine,
 The choicest grapes for me, the richest wine: 30
 My flocks she'll count, and oft will sweetly deign
 To clasp some prattler of my menial train:

With pious care will load each rural shrine,
 For ripen'd crops a golden sheaf assign,
 Cates for my fold, rich clusters for my vine: }
 No, no domestic care shall touch my soul;
 You, Delia, reign despotic o'er the whole!
 And will Messala fly from pomp of state,
 And deign to enter at my lowly gate?
 The choicest fruitage that my trees afford, 40
 Delia will cull herself, to deck the board,
 And wondering, such transcendent worth to see,
 The fruit present, thy blushing handmaid she.

Such were the fond chimeras of my brain,
 Which now the winds have wafted o'er the main.
 O power of love, whom still my soul obey'd,
 What has my tongue against thy mother said?
 Guiltless of ill, unmark'd with incest's stain,
 I stole no garland from her holy fane: 49

For crimes like these I'd abject crawl the ground,
 Kiss her dread threshold, and my forehead wound.

But ye who, falsely wise, deride my pains,
 Beware; your hour approaches—love has chains.
 I've known the young, who ridicul'd his rage;
 Love's humblest vassals, when oppress'd with age:
 Each art I've known them try to win the fair,
 Smooth their hoarse voice, and dress their scanty
 hair;

I've known them, in the street, her maid detain,
 And weeping, beg her to assist their pain.
 At such preposterous love each school-boy sneers,
 Shuns, as an omen, or pursues with fears. 61

Why do you crush your slave, fair queen of
 joy?
 Destroying me, your harvest you destroy!

NOTES ON ELEGY V.

TIBULLUS had unfortunately boasted, that Delia had not so great an ascendant over him as she imagined. Being willing to know the extent of her authority, she forbade him her presence. This he at first treated as an order which would give him no pain to comply with; but he was soon convinced of his error, and found that his felicity consisted solely in her converse. To restate himself, therefore, in her good graces, the following elegy was composed.

Ver. 5. No poet, perhaps, ever used fewer similes than Tibullus. The principal object al-

ways employed him too much to think of resemblances. Virgil has applied the simile of the top to Amata, in the seventh *Æneid*; as Valerius Flaccus does to Medea, in the eighth book of his *Argonautics*. Things, of no dignity in themselves, become important in the hands of a real poet.

Ver. 9. When the ancients begged a favour, they generally enforced their entreaties by alluding to the objects which were held in the highest esteem by those whom they petitioned. In amorous compositions, allusions to a person beloved

are introduced with most propriety. The three great elegiac poets abound with many happy instances of this kind.

Ver. 12. Not only the poets, but the physicians, supposed, that sulphur possessed a purifying virtue; whence probably it obtained the epithet *res Secura*. Indeed, if the infection proceeds from alkaline or putrid miasmata, the steams of brimstone may be antidotal.

Ver. 14. As many diseases were thought by the ancients to spring from supernatural causes, incantation was early introduced into medicine. This indeed was chiefly practised in Persia; but it soon spread, inasmuch, that, in the days of Pliny the elder, it became so common a practice in Britain, that the Persians themselves, according to that curious author, might seem to have borrowed incantation from our ancestors. "*Britannia hodie tam attonite celebrat tantis ceremoniis ut dedisse Persis videri possit.*" *Lib. xxx. C. 1.*

But had Pliny maturely considered the affair, he would have found, that as this, as well as every other superstition, is the offspring of ignorance and imposture, there was no occasion for making Persia its mother country.

Pomponius Mela informs us, that at Sena (which some call a maritime town in Britain, and others a British island opposite to France) there was a Gallic deity, whose virgin priestesses were called *Barrigenae*; and supposed to have the power, by incantation, (*carminibus*) of raising and laying storms, of curing diseases which none else could cure, and of predicting events. He adds, that they only exerted their magical abilities in compliance with the request of those seamen who came on purpose to consult them.

Lib. iii. C. 6.

The use of magic, in the medical art, continued long even among the Christians: and there was a time, says Broekhusius, when the inquisition regarded it as a trifling trespass.

If the ancient music cured so many, and such inveterate diseases, as Pliny, Aulus Gellius, and others, pretend it did, it must have been very different from that of the moderns.

Ver. 15. This cake, which (as Servius, ad *Ecl. viii. ver. 82.* informs us) was made three times a year by the vestal virgins, was a composition of flour and two kinds of salt.

Ver. 17. Scaliger was mistaken, when he supposed that these were infernal sacrifices; for Diana, who was none of the *Dii Inferi*, was the object of them.

Broekhus.

Nothing was bound in sacrifices, says Broekhusius, neither the victim nor the hair, the vestments nor feet: It is certain, too, that Servius has asserted the same. (*Æn. ii. ver. 133. &c.*) And yet some passages may be quoted from classic authors, and even from Virgil, where the hair appears to have been bound; as, for instance, the following from the twelfth *Æneid*:

*Alii fontemque ignemque ferebant,
Velati lino, et verbena tempora vincti.*

We also see that Dido sacrificed (*Æn. 4.*) with

one foot bare only; and it is known, that fillets were tied on the victim.

Dart.

Ver. 18. Trivia or Diana was applied to in diseases, on many accounts, but especially because infirm bodies were supposed to be greatly under the influence of that planet. Gruterus has preserved many addresses to this goddess in his inscriptions. Lovers, in particular, implored her assistance. See Seneca's tragedy of Hippolitus and the second idyllium of Theocritus.

Broekhus.

Ver. 25. No passion makes more frequent feasts on expectation, than love; and a wicked wit has said, that these are the most pleasing meals it enjoys. But, be that as it will, the whole of this passage exhibits a most amiable picture of country retirement, wherein religion, love, and rural affairs, equally conspire to make life truly desirable. Philosophers contend, that we ought not to indulge too flattering prospects of futurity, because, in that case, disappointments fall heavier. But although we may grant that it is an error to be too sanguine in our hopes, yet, when we consider that hope was implanted in us by the all-wise Creator, it will appear little less than a direct contradicting of Providence, to suppress it entirely. Our author was of this opinion. There are few passages in the elegiac poets which surpass this of Tibullus, in the warmth, as well as delicacy of its colouring.

Ver. 32. If it be considered with what harshness even the better sort of the Romans treated their slaves, the good-nature, so conspicuous in this sentiment of our poet, must give us an amiable idea of his benevolence.

The peasants, mentioned in the text, were slaves born on the estate. The Romans called them *Vernae*.

Ver. 33. Tibullus's mistress was not to be employed solely in acts of economy; devotion was also to accompany her thrift. The several offerings, enumerated in the original, are preserved in the version.

Daps, according to the ancient grammarians, signifies a sacred banquet; and in this sense Tibullus uses it here. Passages, however, occur in classic authors, where that word only means a common entertainment. M. Cato, in his treatise de *Re Rustica*, l. 83. tells us, that the offering for the health and fecundity of the herds, might be made either by a slave or by a freedman; but that, if they chose to succeed in their petitions, no woman should be permitted to be present at the ceremony. Tibullus therefore judiciously omits that circumstance of rural devotion.

Ver. 37. Martial improperly applies this line to Nemesis.

*Ussit Amatorem Nemesis lasciva Tibullum,
In tota juvit quem nihil esse domo.*

Lib. xiv. 193.

Ver. 38. Can any thing be more delicate than this compliment to his patron, that even Delia could give him no complete satisfaction.

without his company? His love, indeed, was the more violent passion; but friendship for Mefala had also rooted itself deep in his heart. Strokes of this exquisite nature are only to be expected from those who have access to the great, but whom the great have not infected with selfishness. Mr. Hammond has applied this thought to Lord Chesterfield.

Stanhope shall come and grace his rural friend;
 Delia shall wonder at her noble guest,
 With blushing awe the riper fruit commend,
 And for her husband's patron cull the best.

El. 13.

It is astonishing, that a late critic did not make Milton indebted to our author for the manner in which that great poet represented Eve attending on the angel Gabriel. Many of his alleged imitations are not half so well founded. But one who dealt in the rubbish of Staphorstius and Foxius, could have no taste for the elegancies of Tibullus.

Ver. 48. This is such an appeal to heaven, as must appear very becoming in a person conscious of his own innocence. The ancients imagined, that disasters were inflicted by the gods on mortals, as a punishment only for their failing in the duties of religion: But experience shows us, that the best men are often exposed to the greatest calamities. Prior has put a fine appeal of this kind into the mouth of Emma, in that beautiful poem of his, intitled Henry and Emma.

Let envious jealousy, and canker'd spight,
 Produce my actions to severest light,
 And tax my open day and secret night:
 Did e'er my eye an inward thought reveal,
 Which angels might not hear, or virgins tell?
 And hast thou in my conduct, Henry, known,
 That I, of all mankind, have lov'd but you alone?

Ver. 50. Who can read these ancient superstitious penances, and not agree with Dr. Middleton, that the Romish church is the daughter of the Pagan?

According to Broekhusius, the beating the head against the sacred threshold, was an expiatory ceremony brought from Ægypt along with the goddess Isis. This is the only passage of antiquity, where this extraordinary rite is mentioned; from whence that commentator concludes, that it neither prevailed long, nor was generally received, at Rome.

Ver. 54. The original is variously read by editors: that which the translator has retained, was the correction of Scaliger, and is approved of by Broekhusius.

Among the few natural descriptions to be found in the Pastor Fido, the following, which expresses the miseries to which an old man is subject, is one of the chief.

Non é pena maggiore
 Cb' en vecchie membra il pizzicor d' amore.

—S' e ti guinge in quella fredda etate
 Ove il proprio difetto
 Più che la colpa altrui spesso si piagne
 Al' hora insupportabili e mortali
 Son le sue piagge, al' hor le pene acerbe:
 Al' hor si pietà tu cerchi, male
 Se non la trovi, e se la trovi peggio, &c.

Ver. 61. Spitting, the ceremony used in the text, was supposed a preservative against bad omens, and is a gentler method than those prescribed by the profound authors of the fifteenth and sixteenth centuries as charms against witchcraft, which was to give a gash with a knife on any part of the face above the organs of respiration.

ELEGY VI.

WITH wine I strove to sooth my love-sick soul,
 But vengeful Cupid dash'd with tears the bowl:
 All mad with rage, to kinder nymphs I flew;
 But vigour fled me, when I thought on you.
 Balk'd of the rapture, from my arms they run,
 Swear I'm devoted, and my converse shun!

By what dire witchcraft am I thus betray'd?
 Your face and hair unnerve me, matchless maid:
 Not more celestial look'd the sea-born fair,
 Receiv'd by Peleus from her pearly chair. 10
 A rich admirer his addresses paid,
 And brib'd my mistress by a beldam's aid.
 From you my ruin, curst procurefs, rose;
 What imprecations shall avenge my woes?

May heaven, in pity to my sufferings, shed
 Its keenest mischief on your plotting head!
 The ghosts of those you robb'd of love's delight,
 In horrid visions haunt your irksome night!
 And, on the chimney, may the boding owl
 Your rest disturb, and terrify your soul! 20
 By famine stung, to church-yards may you run;
 There, feast on offals, hungry wolves would shun!
 Or howling frantic, in a tatter'd gown;
 Fierce mastiffs bate you through each crowded town!

'Tis done! a lover's curse the gods approve;
 But keenest vengeance fires the queen of love.

Leave then, my fair, the crafty venal jade:
 What passion yields not, when such foes invade?
 Your hearts, ye fair, does modest merit claim?
 Though small his fortunes, feed his gentle flame:
 For, genuine love's soft raptures would you know?
 These raptures merit can alone bestow: 32

The sons of opulence are folly's care,
 But want's rough child is sense, and honour's heir.
 In vain we sing—the gate still bolted stands:
 Come, vengeance, let us burst its sullen bands,
 Learn, happy rival, by my wrongs to know
 Your fate, since fortune governs all below.

NOTES ON ELEGY VI.

TIBULLUS's mistress had, it would seem, shown too great a regard to a richer gallant. This gave our poet uncommon uneasiness; to conquer which, he not only had recourse to the bottle, though otherwise temperate, but even attempted to forget her ungenerous behaviour in the company of the fair. Experience, however, soon convinced him, that nothing could make him either forget, or be happy without her; and gave occasion to this poem.

Some editors have most injudiciously tacked this elegy to the former.

Ver. 6. "Devovere," the word of the original, properly signifies, "frigore ferire eam partem, qua viri sumus; ut quantumvis cupiamus, tamen minime possumus." The French call it "nouer l'éguillette;" and the doctors of the canon law say, that such people are "frigidi et malificiati."

Broek.

Ovid has informed us of the various means by which such an imbecillity may be produced.

Num mea thessalico languent devota veneno
 Corpora? Num misero carmen et herba nocent?
 Sagave punicea defixit nomina cera
 Et medium tenues in jecur egit acus.

Lib. iii. El. 7.

So similar is superstition in all ages.

Apuleius Celsus gravely prescribes a remedy, by which the "vincula veneris" may be untied. *Lib. de Medic. Herb. c. 7.* See a curious story of this kind, which Herodotus relates of Amasis, the Egyptian king, in his *Euterpe*.

Ver. 8. The hair here mentioned by our poet, is that of a yellow colour, "flava coma;" and, indeed, yellowness may with propriety be called the classical colour of hair, since some of the greatest beauties of antiquity, both men and women, are represented by the poets with this sort of hair. So variable are our ideas of beauty! The Italians, however, even to this day, praise "chiome d'oro." See a curious dissertation on this subject by Jo. Arntzenius, intitled "De colore et tinctura comarum," &c.

Ver. 10. The heathen poets, in comparing a person to any of their deities, had a sure method of giving the reader a picture of that person, as the statues of their gods were known to every one, and their features ascertained; and this, says the ingenious author of the *Polymetis*, is one rea-

son, why families of this kind are so frequent in ancient authors. It is to be regretted, that Tibullus has not left us more of these resemblances. The few he has given us, are exquisite; but his heart was too engaged to wander abroad for foreign ornaments. Propertius and Ovid abound with them. The modern poets also seem fond of the same kind of comparisons, though they have not the same advantages, in this respect, as the ancients. Valerius Flaccus gives us a short but beautiful picture of Thetis, when going to be married, in the first book of his *Argonautics*. The reader may also see Catullus's fine poem on the same subject. *Poem. 62.*

Ver. 16. The original, literally interpreted, runs thus: May she eat raw flesh with a bloody mouth, and drink melancholy liquors mixed with much gall. This was no small curse, if the procuresses of old liked good cheer as well as the modern sisterhood. Ovid has concisely imitated this imprecation.

Di tibi dent nullos lares inopemque senectam,
 Et longas hyemes, perpetuamque sitim.

Propertius carries his malice still farther.

Terra tuum spinis obducat lena sepulcrum
 Et tua, quod non vis, sentiat umbra sitim.

The ancients believed, that nothing could prevent the curses of a person, unjustly injured, from taking effect. Of all the moderns, no poet surpasses Oldham in these sort of imprecations. Vulpius is of opinion, that the poet wishes the bawd to be affected with that species of madness, which makes the diseased think themselves metamorphosed into wolves. This is far-fetched.

Ver. 22. Commentators are greatly divided in their interpretations of this passage. The true meaning seems to be this: The Romans had private feasts upon the death of their friends, called "Silicernia," from "Silex" and "Cæna," or supping upon a stone; part of which they eat, and left the rest on the tomb for the ghosts to feed upon. And therefore it became proverbial, on extreme misery, to say, that one got his victuals from the tombs. *Dart.*

Ver. 29. This thought is one of the least delicate in Tibullus; and therefore the translator has not only omitted it, but given a different turn to the whole passage from "pauper erit," &c.

Ver. 35. —*the gate still bolted stands.*] The word used in the original, Servius (Ad. Lib. i. Æn. v. 127.) derives from "*fatim hiscere.*"

Ver. 36. The young people, both of Greece and Italy, when they went to visit their mistresses at night, often carried torches along with them, to burn the doors of those who should refuse to grant them admittance. This boisterous piece of gallantry, which the modern spirits call beating the rounds, puts one in mind of the answer made by one of the family of Huntly, who was taken prisoner at the battle of Muffelburgh, to the

Duke of Somerset, in consequence of that Duke's having asked his prisoner, how he stood affected to the marriage between Edward VI. and the young Mary of Scotland: "I have no objection, my Lord Duke, to the match, but like not your method of courtship."

Ver. 37. *Learn, happy rival.*] The original,
Mea furta timeto,

Broekhusius thus wisely interprets, Be assured that fortune and woman are mutable, as you yourself will soon experience.

ELEGY VII.

LOVE still invites me with a smiling eye!
Beneath his smiles, what pains and anguish lie?
Yet since the gods, dread power, must yield to thee!

What laurels canst thou gain from conquering me?
Me Delia lov'd; but by thy subtle wiles,
The fair, in secret, on another smiles:
'That my suspicion's false, 'tis true, she swears;
And backs her imprecations with her tears!
False fair, your oaths, and syren tears refrain;
Your syren tears, and oaths no credit gain; 10
For when your lord suspected me of yore,
As much you wept, as many oaths you swore.

Yet wherefore blame I love? the blame is mine;

I, wretched I, first taught her to design!
I first instructed her, her spies to soil!
Back on myself my wanton arts recoil:
Herbs of rare energy my skill supplied,
All marks of too-fond gallantry to hide!
More artful now, alone the wanton lies;
And new pretexts her cozening brains devise. 20
Uncautious lord of a too cunning spouse!

Admittance grant me, she shall keep her vows!
Be warn'd, my friend, observe her when her tongue

[young;
Commends in wanton phrase the gay-dress'd
O let her not her heaving bosom bare,
Expos'd to every sop's immodest stare.

When leaning on the board, with flowing wine,
She seems to draw some inconsiderate line;
Take heed, take heed (I know the warning true),
These random lines assign an interview. 30

Nor let your wife to fanes so frequent roam,
A modest wife's best temple is at home:
But if your prohibitions are all vain,
Give me the hint, I'll dodge her to the fane;
What though the goddess snatch my curious sight,
I'll bring her wanton privacies to light.

Some gem she wore, I'd oft pretend to view,
But squeez'd her fingers unperceiv'd of you:
Oft with full racy bowls I seal'd your eyes,
Water my bev'ridge, and obtain'd the prize. 40
Yet since I tell, forgive the pranks I play'd,
Love prompted all, and love must be obey'd!

Nay, 'twas at me (be now the truth avow'd)
Your watchful mastiff us'd to bark so loud;
But now some other, with insidious wait,
Intent observes each creaking of your gate,
At which, whoever of the house appears,
Passing, the mein of quick dispatch he wears;
But comes again, the minute they remove,
And coughs, sure signal of impatient love! 50

What boots, though marriage gave a wife so fair,

If careless you, or she eludes your care?
While men are artful, and your wife can feign,
Vain are your brazen-bolts, your mastiffs vain.
Cold to the raptures of the genial bed,
She lays the fault upon an aching head:
'Tis false; the wanton for some other sighs;
From this, her coolness, this, her aches arise.

Then, then be warn'd, intrust her to my care;
Whips, chains I laugh at, if you grant my prayer.

"Hence from my ward, ye sparkish essenc'd
"beaux;

"Illegal love oft springs from essenc'd clothes."

Where'er she walks, not distant I'll attend;

And guard your honour from the casual friend!

"Off, gallants, off: for so the gods ordain,

"So, the dread priestesses in unerring strain!"

(When holy fury fires the frantic dame,

She mocks all torture, and exults in flame;

Her snow-white arms and heaving breast she tears;

And with the gushing gore Bellona smears; 70

Deep in her side she plants the glittering sword;

And the dread goddess prompts each fateful word.)

"Ye youths beware, nor touch whom Cupid

"guards,

"Unpunish'd none attempt his gentle wards:

"As my blood flows, and as these ashes fly;

"Their wealth shall perish, and their manhood
"die."

She menac'd then the fair, with dreadful pain;

E'en were you guilty, may her threats be vain:

Not on your own account; your mother's age,

Your worthy mother, deprecates my rage: 80

When love and fortune smil'd, her gentle aid

Oft me conducted to the blooming maid;

My footsteps, wakeful, from afar she knew,
Unbarr'd the gate, nor fear'd the nightly dew :
Half of my life's long thread I'd pleas'd resign,
My sweet conductress, could I lengthen thine !
Still, still, though much abus'd, I Delia prize ;
She's still thy daughter, and enchants my eyes.

Yet though no coy cimarr invest the fair ;
Nor vestal fillet bind her auburn hair ; 90
Teach her what decent modesty requires ;
To crown my fire, alone, with equal fires.
Me too confine ; and if, in wanton praise
Of other maids, my tongue luxuriant strays ;
Let thy suspicion then no limits know,
Insult me, spurn me, as thy greatest foe !
But if your jealousies are built in air,
And patient love your usage cannot bear ;

What wrath may perpetrate, my soul alarms ;
For wrath, I warn you, heeds not female-charms.
Nor yet be chaste, from mean unamorous fear ;
Be still most modest, when I am not near. 102

For those, whom neither wit, nor worth secure,
Grow old, unpitied, palsy'd, worthless, poor ;
Yet with each servile drudgery they strive,
To keep their being's wretchedness alive !
The gay regard their woe, with laughing eyes ;
Swear they deserve it, and absolve the skies
Nor Venus less exults ! " May such a fate,
" (From heaven she prays) upon th' inconstant
" wait." 110

The same my wish ! but O, may we two prove,
In age, a pattern of unalter'd love !

NOTES ON ELEGY VII.

THE poet had taken it into his head, that he had a rival in the affections of Delia ; and notwithstanding all her asseverations to the contrary, was so hurried on, in this elegy, as to let her husband into the whole secret of their intimacy. Had not Tibullus been under the influence of a maddened jealousy, he must soon have recollected, that this confession must for ever terminate all his hopes from that quarter ; but so very far was our poet from perceiving this, that after an apology, which to every husband could not but appear highly impertinent, he proposes to him to be received into his family, and to become a spy on Delia's actions. Ovid justly observes on this overture of Tibullus, *Denique ab incauto nimium petit ille marito.*

Ver. 1. This censure of love is highly passionate. Jealousy, like certain diseases, converts the most wholesome nourishment into bad humours. The description probably alludes to the masks worn by love on the stage, viz. an infant's face, with the head and claws of a lion behind.

Ver. 4. Virgil, in the following lines, seems to have imitated this passage of our poet.

*Magnum et memorabile nomen
Una, dolo divum, si fœmina victa duorum est !*

This Mr. Addison somewhere calls the wittiest thought in the *Æneid*. But is not the

Attollens humeris famamque et fata nepotum

in the same poem, even more epigrammatic ?

Ver. 11. Ovid hints at this incredulity of our poet in his trift.

Credere juranti durum putat esse Tibullus.

Lib. 2.

Those who have been jointly engaged in actions, which it has been necessary to conceal by lies, or perjury, can never afterwards have a thorough

confidence in each other. So void of foundation is the friendship of the wicked.

Ver. 14. These thoughts Ovid has copied in various places of his amorous writings. The laborious Broekhusius having collected from Pliny the names of those herbs, which were supposed to produce the effects mentioned in the text, the reader, if he is curious in those matters, may consult him, p. 123.

The same critic is also very full on the "*mor-tiunculæ*" of the original, calling them, no doubt, very sagaciously, the certain marks of solid joy.

Ver. 22. Some editors change the "*minus*" of the original into "*nihil*," and thus explain the passage. "If you keep your wife from the company of other men, I shall be the less displeased to be debarred her presence ; it depends therefore entirely upon yourself, to prevent my approaching her." "*Servare*," understood in this manner, is the same with "*inspicere, observare, oculis notare*." But this interpretation, notwithstanding Virgil and Valerius Flaccus use "*servare*" in that sense, is more ingenious than just, being contradicted by the sequel of the elegy. One of the best methods of finding out the sense of any obscure passage, is to compare it with other parts of the original.

Ver. 31. It was not lawful for men to inform themselves of the real name of the "*bona dea*." Her sacrifices, called by Cicero the most ancient and occult of any in Rome, were performed once a-year by the vestal virgins in that consul's house, where the fasces happened to be deposited, "*quo mense sacrum fiebat pro populo universo*." During the celebration of this solemnity, not only the master of the house, and all other men, were excluded, but their very pictures and statues were carefully concealed. It was believed, that a sudden blindness would be inflicted upon any man, who, on that occasion, however accidentally,

should view those mysteries. It is true indeed, that the adventure of Clodius might have convinced even the vulgar, of the folly and superstition of such an apprehension; yet was the attempt itself regarded by all as the height of profanation; and if that turbulently frantic nobleman committed, at that time, in Cæsar's house, the crimes with which Cicero charges him, Cæsar was in the right to divorce Pompeia: as the reason he gave for it, viz. that Cæsar's wife was not to be suspected, ought to be looked upon as the result of that delicacy and superiority of genius, which raised him, even in domestic matters, above the level of other men.

Ver. 34. Scaliger, from the word "aram," which is found in many of the old MSS. and editions, conjectures, that the worship mentioned in the text, must have been at the consul's house; and infers, that, as none but women of the first rank had admittance there, Delia must have been a woman of fashion. Broekhusius, on the other hand, supported by an almost equal number of editions and MSS. read "aras," and contends, that Tibullus meant by that expression, one of the two public temples in Rome dedicated to the "bona dea," alleging, that Delia was a "muliercula imi ordinis." But should not Broekhusius have considered, that the poets often use the plural number for the singular. Vid. El. ii. Lib. 2. Lin. 1.

According to P. Victor, the "bona dea" had two temples, one in the 12th, and the other in the 13th region of Rome. This stood on that part of the Aventic Hill, which was called Remuria; and that at the foot of the same hill, whence, as Broekhusius remarks, it received the appellation of Subsaxana.

Ver. 37. In Helen's fine epistle to Paris, there is a thought of the same kind.

Tu modo me spectas oculis lascive protervis
Quos vix instantes lumina nostra ferunt,
Et modo suspiras, modo pocula proxima nobis
Sumis, quoque bibi, tu quoque parte bibis.
Ah quoties digitis, quoties ego tecta notavi
Signa supercilio pene loquenti dari,
Et sæpe extimui ne vir meus illa videret
Non satis occultis erubique notis.

Which is thus Englished by Dryden.

Sometimes you'd figh, sometimes disorder'd stand,
And with unusual ardour press my hand,
Contrive just after me to drink the glass,
Nor would you let the least occasion pass,
Which oft I fear'd, I did not mind alone,
And blushing sat for things which you have done.

We are not, however, to suppose, that Ovid borrowed the thought from Tibullus; for these are stratagems which have been practised by lovers in all ages.

Ver. 40. Broekhusius, whom few commentators have exceeded in the knowledge of ancient customs of no moment, informs us, that the practice of challenging to drink, was a fashion derived

to Rome from Greece. See the verses which Stobæus (Serm. xvi.) has preserved, said to be written by Panyasis the poet, who was either uncle or cousin-german to Herodotus the historian.

According to Theophrastus, (as Pliny remarks, l. 36. c. 21.) your boon companions of Greece, in their drinking-matches, used the powder of pumice, which had this recommendatory property, that they ran a risk of their lives, unless they swallowed after it an immense quantity of wine; for so cold is the pumice, adds he, that a little of it being thrown into must, will stop its fermenting.

Ver. 41. "Excusatio quam frequens, tum frivola," exclaims the good Broekhusius.

Ver. 61. Our poet's natural heat of disposition, transports him to think, that he is again admitted to the guardianship of Delia; and the more to influence her husband to intrust Delia to his care, he makes heaven and Bellona denounce vengeance against any gallant, who should make advances to her whilst abroad.

In the description of Bellona's priestesses (which resembles what we are told of Baal's priests in the first book of Kings, c. 18.), our author's language rises, and shows, that what Quintilian applied to Alcæus, may with equal propriety be said of Tibullus. "Si in lusus et amores descendat, majoribus tamen aptior est."

The Bellonarii were fortune-tellers; and their high priest, according to Juvenal, was an eunuch. They strolled about the streets, forboding diseases, &c. These the superstitious were fain to avert, by donations of eggs, and a particular coloured raiment, called zerampelina, which, when hung up in the temple of their goddess, had, it seems, the power of averting those calamities, with which the donor had been menaced. Vid. Juv. Sat. vi. Lin. 526.

Ver. 68. *She mocks all torture.*] Literally, she dreads not the twisted lash, which, according to Broekhusius, was the "flagellum" with which Bellona used to flog her votaries into madness, whence they received the appellations of "enthesati et fanatici."

Ver. 78. *E'en were you guilty.*] In the original, Si tamen admittas, sit tamen illa levis.

This passage is difficult. We have followed the interpretation of Broekhusius. Vulpinus thus explains it. "Conniveat delicto, nec extemplo velit supplicium sumere."

Ver. 86. The social and benevolent passions are every where resplendent in our poet; and these in some measure ought to compensate for his amorous failings. Let it be considered, that Augustus himself wrote some obscene poems: Example, however, is no justification of vice.

Ver. 89. By the "stola" and "vitta" mentioned in the original, the good Cyllenius "sacerdotum integritatem, et matronarum pudicitiam, intelligebat." But Broekhusius peremptorily insists upon it, that Delia was "libertinae conditionis," because virgins and matrons ("matronæ") wore the "stola" and "vitta." And yet it is cer-

tain, that dancers and citharædi wore also that garb.

Ver. 99. *What wrath may perpetrate.*] The literal interpretation is as follows: And if I be thought to have committed any fault, and in consequence of this, am, though innocent, either to be undeservedly dragged by the hair, or pushed down a declivity, I would not, even on such an occasion, wish to beat you; but should I become enraged, would sincerely wish to be deprived of hands. This will sound very odd in a modern fine lady's ears, and no wonder; for from this we have an undeniable proof, that the present age, in point of gallantry, has many advantages over the Augustan.

Ver. 105. The text says, May she in poverty and in age draw twisted threads with a trembling hand, or work on a borrowed loom, or gain a wretched subsistence by picking of wool. "Joannes Secundus" has happily imitated this imprecation.

Sera tibi veniet fastus vindicta protervi
Ætatis tenera crimina flebis anus.
Cum tibi cælatum laxis, pulcherrima, rugis
Luridus inficiet pallor anile caput.
Conductamque trahens tremebundo pollice lanam
Involves fuso stamina longa brevi.
Adspiciet lacrimas ridens Erycina Seniles
Et levis excussa plaudet amor pharetra.
Et juvenes omnes, et me, tua probra juvabunt.
Lux, precor, ô fato sit prior illa mea.

Lib. ii. E. 8.

Ver. 112. This is a most extraordinary conclusion. The original in Broekhusius is,

Exemplum cana stemus uterque coma.

Other editions read "simus," which, for obvious reasons, we have adopted.

Pedo Albinovanus, and Juvenal, use the word "exemplum" in the same sense.

ELEGY VIII.

"This day, (the fates foretold in sacred song,
"And singing drew the vital twine along),
"He comes, nor shall the gods the doom recal,
"He comes, whose sword shall quell the rebel
"gaul.
"With all her laurels, him shall conquest crown,
"And nations shudder at his awful frown;
"Smooth Atur, now that flows through peaceful
"lands,
"Shall fly affrighted at his hostile bands."
'Tis done! this prophecy, Rome joys to see,
Far-fam'd Messala, now fulfill'd in thee: 10
Long triumphs ravish the spectators eyes,
And fetter'd chieftains of enormous size:
An ivory-car, with steeds as white as snow,
Sustains thy grandeur through the pompous show.
Some little share, in those exploits, I bore;
Witness Tarbella; and the Santoigne shore;
Witness the land, where steals the silent Soane;
Where rush the Garonne; and th' impetuous Rhone;
Where Loire, enamour'd of Carnutian bounds,
Leads his blue water through the yellow grounds.
Or shall his other acts adorn my theme; 21
Fair Cydnus, winding with a silver stream?
Taurus, that in the clouds his fore-head hides,
And rich Cilicia from the world divides;
Taurus, from which unnumber'd rivers spring,
The savage seat of tempests, shall I sing?
Why should I tell, how sacred through the skies
Of Syrian cities, the white pigeon flies?
Why sing of Tyrian towers, which Neptune laves;
Whence the first vessel, venturous, stemm'd the
waves?

How shall the bard the secret source explore,
Whence, Father Nile, thou draw'st thy watery
store?
Thy fields ne'er importune for rain the sky;
Thou dost benignly all their wants supply:
As Egypt, Apis mourns in mystic lays,
She joins thy praises to Osiris' praise.
Osiris first contriv'd the crooked plough,
And pull'd ripe apples from the novice bough;
He taught the swains the savage-mould to wound,
And scatter'd seed-corn in th' unpractis'd ground.
He first with poles sustain'd the reptile vine, 41
And show'd its infant-tendrils how to twine;
Its wanton shoots instructed man to shear,
Subdue their wildness, and mature the year:
Then too, the ripen'd cluster first was trod:
Then in gay streams its cordial soul bestow'd;
This as swains quaff'd, spontaneous numbers came,
They prais'd the festal cask, and hymn'd thy name;
All ecstacy! to certain time they bound,
And beat in measur'd awkwardness the ground. 50
Gay bowls serene the wrinkled front of care;
Gay bowls the toil-oppressed swain repair!
And let the slave the laughing goblet drain;
He blythsome sings, though Manacles enchain.
Thee sorrow flies, Osiris, god of wine!
But songs, enchanting love, and dance are thine:
But flowers and ivy thy fair head surround,
And a loose saffron-mantle sweeps the ground.
With purple-robcs invested, now you glow;
The shrine is shown, and flutes melodious blow: 60
Come then, my god, but come bedew'd with wine!
Attend the rites, and in the dance combine;

The rites and dances are to genius due!
Benign Osiris, stand confess'd to view!
Rich unguents drop already from his hair,
His head and neck soft flowery garlands share!
O come, so shall my grateful incense rise,
And cates of honey meet thy laughing eyes!

On thee, Messala, ('tis my fervent prayer)
May heaven bestow a wife, a warlike heir: 70
In whom, increas'd, paternal worth may shine,
Whose acts may add a lustre to thy line,
And transports give thee in thy life's decline. }

But should the gods my fervent prayer deny,
Thy fame, my glorious friend, shall never die.

Long as (thy bounteous work) the well made
way

Shall its broad pavement to the sun display,
The bards of Alba shall in lofty rhyme,
Transmit thy glory down the tide of time:
They sing from gratitude: nor less the clown 80
Whom love or business have detain'd in town
Till late, as home he safely plods along,
Thee chants, Messala, in his village-song.

Blest morn, which still my grateful muse shall
sing,
Oft rise, and with you greater blessings bring.

NOTES ON ELEGY VIII.

In the foregoing poem, for it deserves a nobler appellation than that of elegy, Tibullus celebrates the birth day of his patron, the virtuous Messala; upon which occasion he introduces the Sister Fates as preordaining him to the conquest of Aquitain. As our poet attended Corvinus in that important expedition, he takes an opportunity of modestly mentioning his own share of the service. See the life.

From celebrating the reduction of Aquitain, and mentioning Messala's triumph on that account, our poet hints at his patron's transactions some years before, in Cilicia, Syria, and Egypt. This gives him an occasion of recounting whatever was most memorable in these kingdoms; and as Osiris was the chief god of Egypt, he enumerates the many favours which Osiris was supposed, by the Egyptian mythology, to have conferred on man; and solemnly invokes his attendance at the genial banquet.

The poem concludes with a wish, that Messala's posterity might resemble him in their actions and reputation; and promises him immortality from the noble public road which he had lately made at his own expence.

Ver. 1. The destinies, at every one's birth, were supposed irrevocably to determine their after actions, having in their possession the thread of life. Classic writers abound in imitations of this sort. Catullus, in his beautiful poem, intitled, *De Nuptiis Pelei et Thetidos*, introduces the fates singing the future glories of Achilles. The "Parcae" were three in number; their names were Clotho, Lachesis, and Atropos; Hesiod, in his theogony, calls them the daughters of Jupiter and Themis. Clotho held the distaff, Lachesis spun, and Atropos cut the thread.

Ver. 4. Aquitain was the third division of old Gaul, and reached from the Garonne to the Pyrenees, and comprehending Guiene, Gascony, &c.

Messala, upon his having reduced to obedience that extensive and important province, triumphed

A. U. C. 721, in the seventh consulship of Augustus, and third of Agrippa, on the seventh of the calends of October, when Tibullus was thirty-six years of age.

Ver. 7. This is a noble and poetical figure. Atur, (now Ador, or L'Ador), is a river of Aquitain, that runs into the ocean. Ausonius calls it Aturrus, and Ptolomy Aturius.

Ver. 11. Although no institution contributed more to the greatness of Rome, than the public honours bestowed on its conquerors, yet does humanity disapprove of their triumphs. Cleopatra destroyed herself, to avoid attending in chains the triumphal car of Augustus.

Ver. 13. The triumphal car was drawn by four white horses. Propertius, (l. 4. el. 1. ver. 32), attributes this institution to Romulus; but Broekhusius seems rather inclined to believe that Camillus, after having made himself master of the famous city of Veii, which had held out a ten years siege, was the first who invented, and put in practice this ceremony. Could any stress be laid on the authority of Statius, the custom would appear to be of a much more ancient date. For that poet describes (l. 12. v. 542.) Theseus triumphing over the Amazons, in a chariot drawn by white horses. But however this may be, we know that white horses were held in the highest estimation of old, since not only the kings of Persia used steeds of that colour in their chariots; but the conquerors, at the sacred games of Greece, were drawn by white horses, when they made their public entries into their several cities; and Curtius informs us, that the car, consecrated to Jove, had horses of that colour.

The triumphal car was ornamented with ivory and gold; but if the reader is curious to inform himself of all that can now be known concerning the vehicles of antiquity, he may consult Schefferus's book on that subject.

Broekhus.

Ver. 16. *Tarbella.*] This is a town in Gascony, at

present called Tarbe. Charles Stevens says, that it is the "Aquæ Tarbellæ" of Aufonius, and probably the "Aquæ Augustæ" of Ptolomy.

Ibid. *Saintoigne Shore*] A maritime province of Aquitain.

Ver. 17. *Witness the land, where steals the silent Soane;*

Ver. 18. *Where rush the Garonne, and th' impetuous Rhone.*

These rivers are finely contrasted. Every body knows them.

Ver. 21. Our poet having particularised most of the battles fought by Mestala in Aquitain, in which he himself signalized his courage, makes a transition to the exploits performed by the same illustrious general, three years before in Cilicia, Syria, and Egypt. This leads him to expatiate on that wonder of Egypt, the Nile; and to invite Osiris, the great god of that country, to come and celebrate the birth-day of his patron.

Broekhus.

Ver. 22. *Fair Cydnus.*] A noble river of Cilicia, which Curtius thus describes: "Non spatia aquarum, sed liquore memorabilis; quippe leni tractu, e fontibus labens, puro solo excipitur; nec torrentes incurrunt, qui placide manantis alveum turbent; itaque incorruptus, idemque frigidissimus, quippe multa riparum amœnitate inumbratus, ubique fontibus suis similis, in mare evadit." lib. 3. c. 4. So excellent a geographer is Tibullus; but he probably was an eye-witness of what he describes. Vide his life.

Ver. 25. *Taurus.*] So Broekhusius interprets the word Arat in the original; "Ducta tralatione," says he, "a porca, quæ grandioribus glebis latior eminent inter fulcos."

This is a vast range of mountains, which reaching semicircularly from sea to sea, divides Cilicia from Pamphilia, Pisidia, and the other surrounding kingdoms. Both Cilicia and Taurus are thus accurately described by Xenophon in his *Anabasis*. *Ενταυθεν δε κατεβαινον εις πιδιον μεγα, καλον και επιρρυτον και διδρον παντοδαπων εμπορων και αμπελων δε και Σησαμων και μελινην και κικυρον και τυρους και κρηνας, Φερν. Ορος δε αυτο περιχει οχυρον, και υπεψηλον παντη εκ θαλαττης εις θαλατταν.* Then the army descended into a spacious plain, which was beautiful and well watered, producing not only vines in great plenty, but every other kind of fruit trees, and corn of all sorts. This plain was surrounded from sea to sea, by a range of lofty mountains, of very difficult access.

When the Persians were masters of Asia, says the great Baron Montesquieu, they permitted those who conveyed a spring to any place, which had not been watered before, to enjoy the benefit of it for five generations; and as a number of streams flowed from Mount Taurus, they spared no expence in directing the course of their waters. And thus, at this day, without knowing how they were brought thither, streams are found in great numbers in the fields and gardens of Cilicia.

L'Esp. des Loix.

Ver. 28. *Palæstine* was a province of Syria. The Syrians abstained both from fish and pigeons

on a religious account. Hyginus has explained the reason of it in his 197th fable.

Broekhusius advises the reader, who is studious of Roman purity, particularly to observe, that in the original, the pigeon has three epithets bestowed on it, "Exemplo," says he, "non facile alias reperiundo."

Ver. 29. Although every nation may be supposed to have contrived and used vessels of one kind or another, to pass their great rivers, &c. yet the Phœnicians were the first who greatly improved the art of ship-building, and who made distant voyages for commerce. Tyre, in particular, was for a long time the mart of the world; and even in the time of Tibullus, notwithstanding it had been ravaged, and almost destroyed by Alexander, that city had few rivals in trade. See a truly poetical description of its grandeur in one of Dr. Young's Odes.

The houses in Tyre were built very high, whence Tibullus calls them towers. This was a circumstance which had more than once endangered the destruction of this city by earthquakes; as Strabo informs us, lib. 16. The reason assigned by Broekhusius, why the tyrants made their houses so lofty, is, that they might command a distant prospect of the sea. But might not also this be done for the sake of more accurately observing the motions of the heavenly bodies? especially if, with Mr. Glover, we look upon astronomy as the child of commerce. See Mr. Glover's elegant poem, intitled, *London*. The truth, however, I believe is, that building on a rock in a limited compass, the Tyrians supplied, like us in London, the want of room, by multiplication of stories.

Ver. 31. The annual overflowing of the Nile was a phenomenon which long puzzled the naturalists; and a variety of hypothesis were formed to explain the causes of it; all of which Diodorus Siculus has judiciously refuted in the end of the first book of his *Universal History*, except that of Agathargines the Cnidian, which ascribes the rising of the Nile in summer, to the rains that fall in Ethiopia, the country where the Nile hath its source.

The overflowing and course of the Nile, is thus explained by Mr. Thomson, in a manner no less poetical than just.

The treasures * these, hid from the bounded search
Of ancient knowledge; whence, with annual
pomp,

Rich king of floods, o'erflows the swelling Nile!
From his two springs, in Gojam's sunny realm,
Pure welling out, he through the lucid lake
Of fair Dambea rolls his infant stream.
There by the Naiads nurs'd, he sports away
His playful youth, amid the fragrant isles
That with unfading verdure smile around:
Ambitious, thence the manly river breaks,
And gathering many a flood, and copious fed
With all the mellowed treasures of the sky,

* Viz. *The Vapours.*

Winds in progressive majesty along; [maze,
Through splendid kingdoms now devolves his
Now wanders wild o'er solitary tracts
Of life-deserted sand; till, glad to quit
The joyless desert, down the Nubian rocks
From thundering steep to steep, he pours his urn,
And Egypt joys beneath the spreading wave.

Summer.

Norden in his travels relates the ceremony at present practised at Grand Cairo, at the opening the great canal of that city for the admission of the waters of the Nile. If the people express their gratitude by every instance of licentious joy, the government, it would seem from that traveller, is not profuse upon the occasion, though, indeed, Alpinus makes it a very splendid affair.

De Medicin. Egypt.

Norden also affirms, that notwithstanding the annual overflowing of the Nile, there is no country which requires more culture than the land of Egypt. No rains fall there in summer. Hence our poet says,

Arida nec pluvio supplicat herba Jovi.

This line, Seneca, through mistake, attributes to Ovid: and indeed, as Broekhusius well observes, Ovid much better suited the false epigrammatic turn of this philosopher, than our poet.

The Greeks honoured Jupiter Pluvius with a particular devotion. The friends of Polynices, who had united to restore that prince to the throne of Thebes, swore at the altar of this deity, that they would effectuate their purpose, or die in the attempt. See Pausan. in Corinth; who also informs us, in his *Boeotia*, that the worship of this deity was performed in the open air. According to Strabo, the Indians also worshipped Jupiter Pluvius, together with the river Ganges, and the "Genii Indigites." He was also honoured at Rome in a singular manner. It is said too, that in a great drought, the Romans dragged into their city a certain large stone, which lay originally near the temple of Mars, beyond the "Porta Capena;" and as rain immediately fell, the stone obtained the name of the "Saxum manale," and the ceremony itself was called "Aqualicium." See Festus. Was this stone a natural hygrometer? Even in our days, and in Romish countries, the catholic priests, in times of drought, seldom venture to lead forth their saints in procession till they have observed the fall of the mercury.

Ver. 35. The best comment on this and the twenty-five following lines, are two passages, one from the first book of Diodorus Siculus, and the other from the *Thalia* of Herodotus. That from Diodorus is as follows; *μῆτα δὲ ταῦτα* (says that curious and faithful historian) *τὸν Κρόνον ἀρξαι, καὶ γῆμαντα τὴν ἀδελφὴν Ρίαν, γίνεσθαι κατὰ μὲν τινὰς τῶν μύθολογῶν Ὀσίριν καὶ Ἰσιν, &c.* The other from Herodotus has thus been translated. Apis, whom

the Greeks called *εταφος*, was the calf of a cow incapable of bearing another, and no otherwise to be impregnated than by thunder, as the Egyptians affirmed. The marks that distinguished him from all others were these. His body was large and black, except one square of white on the forehead: He had the figure of an eagle on his back; a double list of hair on his tail; and a scarabeus under his tongue. *ἐπὶ δὲ τῇ γλώσσῃ κανθάρον.*

When this strange god manifested himself among the Egyptians, they put on their richest apparel, and feasted splendidly; and when he disappeared, their mourning was as extreme.

Ver. 37. Virgil and Ovid attribute the invention of the plough to Ceres. Mythologists say, she is the same with Isis, the sister and wife of Osiris. Triptolemus, whom Ceres instructed, taught the natives of Greece and Asia the art of husbandry. Those of ancient Italy were instructed in it by Saturn; and the Spaniards had for their teacher in agriculture one Hebades.

Broekb.

Ver. 65. The god mentioned in the text is Genius, or that power, who, as the Romans imagined, was the guardian of a man, from the hour of his birth to his death; hence called by the Greeks, *Δαιμον μετὰγωγὸς βίου*. These gods the ancients represent sometimes in the form of a serpent, sometimes in that of a boy, and sometimes in that of an old man, crowned with leaves of plain-tree. On several coins of Trajan and Adrian, Genius holds in his hand a "patera," over an altar adorned with flowers; and, from his left, hangs down a whip. The offerings presented to this deity, as Dart justly observes, were generally the salted cake (or *mola*), flowers, wine, and frankincense.

Ver. 76. Nothing, says Mr. Dart very truly, raises a higher idea among the moderns of the ancient Roman greatness, than their public ways.

When Augustus Cæsar perceived that the different roads leading to Rome were, through neglect, become of difficult passage, he took upon himself the reparation of the "via flaminia," as far as Arminium, and enjoined the senators to mend the other roads. This happened A. U. C. 727. as Dio Cassius, in the fifty-third book of his history informs us. The way which fell to the share of Messala, was a branch of the Latin road, which that excellent Roman either paved a-new, or repaired; for, from the situation of Tusculum and Alba, it could not be the "via valeria," as Pighius conjectured. See Bergerius, l. 2. on the Roman Military-ways.

Broekb.

Messala's road must have been esteemed a strong and durable work, since Martial, to represent that perpetuity of fame, to which, as a poet, he thought himself entitled, alludes to it in these words:

Et cum rupta situ Messalæ saxa jacebunt.

B. 8. E. 3.

ELEGY IX.

IN vain would lovers hide their infant-smart
 From me, a master in the amorous art;
 I read their passion in their mien and eyes,
 O'erhear their whispers, and explain their sighs.
 This skill no Delphian oracles bestow'd,
 No augurs taught me, and no victims show'd;
 But love my wrists with magic fillets bound,
 Lash'd me, and lashing, mutter'd many a sound.
 No more then, Marathus, indifference feign,
 Ene vengeful Venus will inhance your pain! 10

What now, sweet youth, avails your anxious
 care,

So oft to essence, oft to change your hair?
 What though cosmetics all their aid supply?
 And every artifice of dress you try?
 She's not oblig'd to breches, to gems, to clothes,
 Her charms to nature Pholoe only owes.

What spells devote you? say, what philtres
 bind?

What midnight forcerefs fascinates your mind?
 Spells can seduce the corn from neighb'ring plains!
 The headlong serpent halts at magic strains! 20
 And did not cymbals stop thy prone career,
 A spell thee Luna from thy orb would tear!

Why do I magic for your passion blame,
 Magic is useless to a perfect frame! [threw,
 You squeez'd her hands, your arms around her
 Join'd lip to lip, and hence your passion grew.

Cease then, fair maid, to give your lover pain;
 Love hates the haughty, will avenge the swain.
 See youth vermillions o'er his modest face!
 Can riches equal such a boy's embrace? 30

Then ask no bribe—when age affects the gay,
 Your every smile let hoary dotage pay;
 But you your arms around the stripling throw,
 And scorn the treasure monarchs can bestow.
 But she who gives to age her charms, for pay,
 May her wealth perish, and her bloom decay.
 Then when impatience thrills in every vein,
 May manhood shun her, and the young disdain.

Alas! when age has silver'd o'er the head,
 And youth that feeds the lamp of love is fled, 40
 In vain the toilette charms; 'tis vain to try,
 Gray scanty locks with yellow nuts to dye;
 You strip the tell-tales vainly from their place;
 And vainly strive to mend an aged face.

Then in thine eyes while youth triumphant
 glows,

And with his flowers thy cheeks my fair one sows,

TRANS. II.

Incline thine heart to love, and gentle play,
 Youth, youth has rapid wings, and flies away!
 The fond old lover vilify, disdain;
 What praise can crown you from a stripling's
 pain? 50

Spare then the lovely boy; his beauties die;
 By no dire sickness sent him from the sky:
 The gods are just; you, Pholoe, are to blame;
 His fallow colour from your coyness came.

Oh, wretched youth! how oft, when absent you,
 Groans rend his breast, and tears his cheeks be-
 dew?

"Why dost thou rack me with contempt? he cries,
 "The willing ever can elude their spies.

"Had you, O had you felt what now I feel, 59

"Venus would teach you from your spies to steal.

"I can breathe low; can snatch the melting kiss,

"And noiseless ravish loves enchanting bliss;

"At midnight can I securely grope my way;

"The floor tread noiseless, noiseless turn the key.

"Poor fruitless skill! my skill if she despise,

"And cruel from the bed of rapture flies.

"Or if a promise hap'ly I obtain,

"That she will recompence at night my pain;

"How am I dup'd? I wakeful listen round,

"And think I hear her in each casual sound. 70

"Perish the wiles of love, and arts of dress?

"In russet weeds I'll throwd my wretchedness.

"The wiles of love, and arts of dress are vain,

"My fair to soften, and admittance gain."

Youth, weep no more; your eyes are swollen
 with tears;

No more complain; for, O! she stops her ears.

The gods, I warn you, hate the haughty fair,

Reject their incense, and deny their prayer.

This youth, this Marathus, who wears your chains,

Late laugh'd at love, and ridicul'd its pains! 80

Th' impatient lover in the street would stay!

Nor dreamt that vengeance would his crimes re-
 pay.

Now, now he moans his past misdeeds with tears,

A prey to love, and all its frantic fears:

Now he exclaims at female scorn and hate;

And from his soul abhors a bolted gate!

Like vengeance waits you; trust th' unnering
 muse,

If still you're coy, and still access refuse!

Then how you'll wish, when old, contemn'd of all,

But vainly wish, these moments to recall! 90

3 B

NOTES ON ELEGY IX.

MARATHUS, one of the poet's friends, had lately become enamoured of Pholoe; but as that youth had formerly affected an aversion to love, he now wanted to conceal his passion. This, Tibullus tells him, was to no purpose, as he knew from his own experience, all the symptoms of an infant desire; among which he chiefly particularizes a sudden attention to dress. Tibullus informs his friend, that so extraordinary an application to finery was neither required in him, who was a fine figure, nor agreeable to Pholoe, who appears to have been a woman of sense; and asks him, how he expected that foppishness should make any impression on the heart of one who despised every thing else but an elegant simplicity in apparel? The poet next inquires, by what spells he enlisted himself under the banner of love? But immediately resolves the question himself, by emphatically calling beauty the most powerful of enchantments.

From some parts of the poem, it would seem that Pholoe had not always been so insensible to the merits of Marathus. This change of behaviour makes the poet warmly expostulate with her for his young friend, whom he introduces pathetically lamenting the rigour of his destiny. The poem concludes with a prediction, that unless Pholoe altered her conduct, heaven would undoubtedly punish her.

The commentators suppose that this is the Pholoe mentioned by Horace, in his beautiful ode addressed to Tibullus; and, indeed, it must be confessed, that these gentlemen have not always so good a foundation for their conjectures. They also take it for granted, that the Cyrus spoken of in the same poem, was our Marathus, whom they represent as a foreigner, and formerly a slave. Their arguments, however, in defence of this last supposition, are too trifling for confutation.

Ver. 6. The poet here mentions three sorts of divination; the oracular, that of inspecting the bowels of animals, and that called augury. This last, which consisted in deducing events from the manner in which birds fed, and from their flight or screaming, was so particularly regarded by the Romans, that few enterprises of consequence were begun, without the previous sanction of the holy chickens; and as these were under the management of the officers of state, and leaders of the army, they were employed generally to the purposes of policy. This kind of divination was not peculiar to the Romans; for we find from the Iliad, that their supposed ancestors, the Trojans, believed also in augury. Hector, indeed, seems to place no confidence in the flight, &c. of birds;

and as Homer every where represents him as a man of an excellent head and heart, we may readily suppose, that the old bard himself was of the same way of thinking.

Ver. 7. None but those who have felt love can be proper judges of that passion. Reading, indeed, may give some imperfect ideas of it; but experience is the only certain teacher. This is what Tibullus means by the magic fillets. Salmastius, therefore, is mistaken in making the "majicus nodus" of the text signify knots, such as are mentioned in the notes upon the fifth elegy.

Ver. 10. There is a sentiment, as Vulpinus justly observes, similar to this in Euripides.

Κυπρις γὰρ οὐ Φορητος ἦν πολλὰν εὐν
Ἡ τὸν μὲν ἱκόντ' ἤπυχ' ἡμιτελής
Ὅν δ' αὖτε περισσὰ καὶ Φρονοντὶ ἰνὴν μέγα
Τούτῳ λαβούσα πῶς δοκίμ' καθύρσιν.

In Hippolit.

Ver. 13. The original may be thus literally interpreted: Oh! what avails it now that you surcharged your cheeks with juices to make them smooth and ruddy? and what, that you have your nails paired by the learned hand of an expert artist? In vain you vary the parts of your dress, and in vain you confine your compressed foot within so neat a sandal.

The "succus splendens" of the text, if Broekhusius justly interprets it, was not an over-delicate preparation; for, according to him, it was "crassius sputum ex madido pane, quo illinebantur genæ." Some editions of merit read, "fucus splendenti."

Well-paired nails were regarded by the Romans as so essential to a genteel appearance, that Horace, to shock us at the witch Canidia, introduces her with unpaired nails; and yet we find that Mecænas was sometimes out of humour with this bard himself, for the same neglect.

Præsectum stomachicis ob unguem.

From the text, the learned conjecture, that none but the poorer sort of people paired their own nails, the rich having theirs cut by the barber; yet Mr. Dacier, upon the following lines of Horace,

Conspexit, ut aiunt,
Adrasum quemdam, vacua tonsoris in umbra,
Cultello proprios purgantem leniter ungues.—

remarks, that the Roman ladies had their nails paired by their waiting-maids; in proof of which he cites this passage of our poet,

Quid succo, &c.

Which he thus interprets :

"Pourquoy peindre vos cheveux ? Pourquoy vous faire couper les ongles par une femme adroite ?" and confirms this interpretation by adding, "Porcia s'étant coupé un jour, en se faisant les Ongles, Brutus la gronda d'avoir fait l'office de sa femme de chambre." But all that is here advanced (as Broekhusius remarks), is a blunder. For, in the first place, the French critic unaccountably metamorphoses Marathus into a lady ; again, Porcia used a barber's pairing knife, as Plutarch assures us ; and, lastly, Valerius Maximus thus relates the story of Porcia's wounding herself : "Quæ cum Bruti viri sui consilium, quod de interficiendo Cæsare, ceperit ea nocte, qua dies teterrimi facti secuta est, cognovisset," &c. When Porcia was let into the secret by Brutus her husband, of his intention to assassinate Cæsar the next day, she, as soon as Brutus left the room, called for a barber's knife, as if she meant to pair her nails ; which being brought her, she let it fall as though by chance, and wounded her thigh. Brutus being brought back into her chamber, by the screams of her maids, mildly rebuked her for endeavouring to perform the barber's office. But she whispered him, I wounded myself on purpose, as a trial of my love for you ; for should your enterprise fail, I wanted to know with what equanimity I could kill myself. Lib. 3.

The last line,

Ansaque compressos, &c.

Signifies the extreme care Marathus took in making the sandal sit neat on his foot, by tightening the straps tied to the ansæ or thongs, which came up on every side of the foot, and were fastened over the instep.

Ver. 18. Many editions read "pallentibus," and it is certain, that the epithet is classical. But we shall not enter into the merits of the two claimants, O and A ; but refer those who are fond of such altercation to the Dutch commentator.

Although almost every poet of antiquity has left us his testimony as to the efficacy of spells in producing love, it must not, however, be imagined, that they believed it in reality. For how should spells excite that harmony,

Attuning all their passions into love :
Where friendship full exerts her softest power,
Perfect esteem enliven'd by desire
Ineffable, and sympathy of soul, [will
Thought meeting thought, and will preventing
With boundless confidence.

Which Thomson makes the essence of love to consist in. But though spells cannot excite love, yet philtres, by stimulating, may raise desire.

Ver. 21. When the moon was eclipsed, the ancients imagined that she struggled with witchcraft ; and, therefore, to relieve her, struck upon instruments of brass and other sonorous bodies, thinking that sounds would accomplish her deliverance. In allusion to this custom, Ovid thus speaks of the blushes of Hermaphroditus :

Hic color aprica pendentibus arbore pomis,
Aut ebori tincto est ; aut sub candore rubenti,
Cum frustra resonant æra auxiliaræ, lunæ.

Met. lib. vi.

A red like this, the ripening apple shows ;
So with vermilion dyed, fair ivory glows :
Blushes like these do struggling Cynthia stain ;
When aiding brass, and cymbals ring in vain.

Addison.

And Juvenal, satirically describing a scold, says, that there was no need of a shrill noise of instruments to relieve the labours of the moon, the tongue of this woman being sufficiently qualified to produce such an effect.

Dart.

Travellers inform us, that this superstition is still practised in several parts of the east, &c.

Ver. 31. These lines are not only extremely indelicate, but gives us a displeasing picture of Pholoe's venality.

Ver. 39. *Alas ! when age.*] When the fair sex found their estimation upon beauty only, without aiming at any mental accomplishment, it is no wonder, in that case, that they dread old age, and endeavour, by artifices, to repay the decays of nature. Every stage of life has its proper bents and passions. A rational attachment to love and pleasure, is ornamental in youth, allowable in more advanced life, but preposterous in age. What character is more ridiculous than that of a coquette of sixty ? But, say the fair, can life be agreeable, when the power to raise love is gone ? Are then the matronly virtues of no consideration ? Are friendship and esteem, which can be enjoyed in full vigour even in the latest period of life, of no avail ? Mental perfection is the root from whence must spring all the doctors of old age ; and mental perfection must be planted in youth early, if it is ever meant to shoot up to maturity.

Ver. 41.

—'Tis vain to try,
Gray scanty locks with yellow nuts to dye.

Meursius and Duport are of opinion, that black is the dye which Tibullus mentions in the text ; but Broekhusius, and especially Arntzenius, prove, that walnut dyed the hair yellow ; which as has been observed before, is the classical colour. Vid. Dissert. de Col. Com. p. 114.

Ver. 52. "Sontica causa" here is the same as "morbus fonticus," which signifies any great disorder, such as the gods were supposed to inflict on the wicked : and hence the Greeks call it *λεπρος* ; and because it prevented the unhappy sufferer from attending on business, they also gave it the epithet of *αλγος*.

Vulpus justly observes, that our author is not the only one who uses "causa" for a disease ; for it is applied by Gratian, no contemptible poet of the Augustan age, to signify the same thing in the following line :

Causasque affectusque canum tua cura tueri est.

2 B ij

Hence those soldiers, who by infirmity were disabled from campaigning, were called "causarii milites," and their dismissal "causaria missio."

When the superstitious among the Athenians, saw a mad or epileptic person, they, shuddering, spit into their bosom to avert the mischief. And, indeed, while those disorders were reputed judgments of Heaven upon the persons affected, no wonder the poor sufferers were hated and shunned; but a sounder philosopher has taught us that such objects always deserve our pity, and have a right to all the relief human skill can procure them.

Ver. 70. *And think I bear her.*] J. Secundus has finely imitated this thought.

Dumque ego blanditeasque tuas, et roscida menti

Oscula praecipio multiplicisque viceis,

Dum vacuum falsis complexibus aera capto,

Dum mea in absenteis porrigo colla manus,

Et quem cumque movet strepitum levis aura per aedes

Dilectos dominae suspicor esse pedes.

El. ii. B. 2.

But Broekhusius very justly prefers a description of the same kind in the seventh canto of the Orlando Furioso, (Stanz. 24. & 25.)

Ver. 72. *In russet weeds.*] Mattaire and others have injudiciously inserted the original of this line, and the two following ones, at the end of the third elegy of the second book.

When that part of the Roman gown, which was commonly tucked under the right arm, and secured by the "umbo" on the left shoulder, was allowed to flow about the wearer; the "toga" was then said to be "laxa." This the Romans reputed a sign of effeminacy. Hence it is not surprising that Mecænas dressed in this manner; but that Julius Cæsar should do so, is more unaccountable. And although many instances occur

in a neighbouring kingdom, sufficient to convince us, that the fop and the brave soldier are not wholly incompatible; "Væ tamen istis!"

Ver. 88. All the ancient editions read,

Ni definis esse superba.

Although this may appear odd, says Broekhusius, to those who have ears like King Midas, it is, nevertheless, the genuine reading.

The following quotation from Ariosto is remarkable:

Pensò Rinaldo alquanto, e poi rispose:

Una donzella dunque de morire

Perche lascios fogar ne l'amorose

Sue Braccia al suo amator tanto desirè!

Sia maledetta chi tal puo patire.

Debitamente muore una crudele

Non chi da vita al suo amator fedele.

Cant. iv. St. 63.

After all, if Pholoe could find no love-worthy qualities in Marathus, it was ungenerous in our poet to insult her with such a prognostic. Love is the child of obsequiousness, and not the offspring of menace; accordingly, the fair Egyptian (in Prior) says, if not poetically, at least truly,

Soft love, spontaneous tree, its parted root

Must from two hearts with equal vigour shoot;

Whilst each delighted, and delighting, gives

The pleasing ecstasy, which each receives.

Cherish'd with hope, and fed with joy, it grows;

Its cheerful buds their opening bloom disclose;

And round the happy soil diffusive odour flows.

If angry fate that mutual care denies,

The fading plant bewails its due supplies;

Wild with despair, or sick with grief, it dies.

Solomon, Book ii.

ELEGY X.

WHY did you swear by all the powers above?
Yet never meant to crown my longing love.
Wretch, though at first the perjur'd deed you hide,
Wrath comes with certain, though with tardy stride;
Yet, yet, offended gods, my charmer spare!
Yet pardon the first fault of one so fair!

For gold the careful farmer ploughs the plain,
And joins his oxen to the cumbrous wain;
For gold, through seas that stormy winds obey,
By stars, the sailor steers his watery way. 10
Yet, gracious gods, this gold from man remove,
That wicked metal brib'd the fair I love.

Soon shall you suffer greatly for your crime,
A weary wanderer in a foreign clime;

Your hair shall change, and boasted bloom decay,
By wintery tempests, and the solar ray.

"Beware of gold, how oft did I advise?

"From tempting gold what mighty mischiefs rise?

"Love's generous power, I said, with tenfold

"pain

"The wretch will rack, who sells her charms

"for gain. 20

"Let torture all her cruelties exert,

"Torture is pastime to a venal heart.

"Nor idly dream your gallantries to hide,

"The gods are ever on the sufferer's side.

"With sleep or wine o'ercome, so fate ordains,

"You'll blab the secret of your impious gains."

Thus oft I warn'd you ; this augments my
shame ;

My sighs, tears, homage, henceforth I disclaim.

" No wealth shall bribe my constancy, you
" swore, 29

" Be mine the bard, you sigh'd, I crave no more :

" Not all Campania shall my heart entice,

" For thee Campania's autumns I despise.

" Let Bacchus in Falernian vineyards stray,

" Not Bacchus' vineyards shall my faith betray."

Such strong professions, in so soft a strain,

Might well deceive a captivated swain ;

Such strong professions might aversion charm,

Slow doubt determine, and indifference warm.

Nay more, you wept, unpractis'd to betray,

I kiss'd your cheeks, and wip'd the tears away. 40

But if I tempting gold unjustly blame,

And you have left me for another flame ;

May he, like you, seem kind, like you deceive,

And O may you, like cheated me, believe.

Oft I by night the torch myself would bear,

That none our tender converse might o'erhear ;

When least expected, oft some youth I led,

A youth all beauty, to the genial bed,

And tutor'd him your conquest to complete,

By soft enticements, and a fond deceit. 50

By these I foolish hop'd to gain your love !

Who than Tibullus could more cautious prove ?

Fir'd with uncommon powers I swept the lyre,

And sent you melting strains of soft desire :

The thought o'erspreads my face with conscious
shame,

Doom, doom them victims to the seas or flame.

No verse be their's, who love's soft fires profane,

And sell inestimable joys for gain.

But you who first the lovely maid decoy'd,

By each adulterer be your wife enjoy'd. 60

And when each youth has rifled all her charms,
May bed-gowns guard her from your loathed
arms !

May she, O may she like your sister prove,

As fam'd for drinking, far more fam'd for love !

'Tis true, the bottle is her chief delight,

She knows no better way to pass the night ;

Your wife more knowing can the night improve,

To joys of Bacchus joins the joys of love.

Think'st thou for thee, the toilette is her
care ? 69

For thee, that fillets bind her well-dress'd hair ?

For thee, that Tyrian robes her charms enfold ?

For thee, her arms are deck'd with burnish'd
gold ?

By these, some youth the wanton would entice,

For him she dresses, and for him she sighs ;

To him she prostitutes, unaw'd by shame,

Your house, your pocket, and your injur'd fame :

Nor blame her conduct, say, ye young, what
charms

Can beauty taste in gout and age's arms ?

Less nice my fair one, she for money can

Careless a gouty impotent old man ;

O thou by generous love, too justly blam'd ! 79

All, all that love could give, my passion claim'd.

Yet since thou couldst so mercenary prove,

The more deserving shall engross my love ;

Then thou wilt weep when these ador'd you see ;

Weep on, thy tears will transport give to me.

To Venus I'll suspend a golden shield,

With this inscription grav'd upon the field :

" Tibullus, freed at last from amorous woes,

" This offering, queen of bliss, on thee bestows :

" And humbly begs, that henceforth thou wilt
" guard

" From such a passion, thy devoted bard." 90

NOTES ON ELEGY X.

THE translator has been obliged to use pretty much the same freedom with this elegy as he used with the fourth. Had the other elegies of Tibullus been like these two, he had never taken the trouble of translating them. But, as both in this version are new-modelled, it is hoped that neither of them can shock the most delicate chastity.

Ver. 3. Although the justness of these moral reflections is not always discoverable on this side the grave, we have all reason to think that the perjured will meet with a deserved punishment in another state. Horace makes a remark, no less just than moral :

Raro antecedentem scellum

Deseruit pœna pede claudo.

When Jove in anger strikes the blow,

Oft with the bad, the righteous bleed,

Yet with sure steps, though lame and slow,
Vengeance o'ertakes the trembling villain's
speed.

Ariosto, according to Broekhusius, had this passage of Tibullus in his eye, in the beginning of the sixth canto.

Miser chi mal oprando si confida

Ch' ogn' her star debbia il maleficio occulto.

Sentences of this sort are to be met with in every author ; but are we thence to conclude that they imitated one another ? Such observations shoot up in the common of nature, and are to be plucked by every passer.

Ver. 13. The original, " *persolvo*," is a very emphatical verb, it importing a discharge of the whole debt, without the smallest diminution.

Broekhus.

Ver. 15. The delicate among the ancients, who had fine hair, were at great pains to prevent it from becoming red (*rufus*); an effect which they imagined the heat of the sun might occasion. Vid. Differt. de Color. Com. c. 3. p. 57.

Ver. 23. Almost all the old editions read,
Nec tibi celanti fas sit peccare paranti.

To find out the meaning of which long exercised the ingenuity of the learned; and no wonder, for if it is not nonsense, it is something very like it. At last, however, Scaliger restored the text; which, though supported by MS. authority, has been censured by some malevolent critics as an intrusion of his own. *Broekhus.*

Ver. 26. In the original,

Ipsæ Deo tacito permisit vela ministro
Ederet ut multa libera verba mero.

For this reading we are also indebted to Scaliger; yet the passage is far from being void of obscurity. Accordingly, the commentators, since his time, have all of them differed in their explanations of it. And although none of their explanations are satisfactory, yet that of Broekhusius is the least liable to objections. He says, that the "Tacitus Dei" minister, is the deceitful wine, by the vapours of which, drunkenness creeping on, obscures the mind, as with a veil; "tanquam velo quodam, aciem mentis obnubit subrepens sensim ebrietas." This, it must be owned, conveys some meaning; yet the idea conveyed by it appears to be farther fetched than those of Tibullus commonly are. Something like this is retained in the version.

Ver. 31. Campania was so called from its being a champagne (*campestis*) country. It belongs to the kingdom of Naples, and lies south of Abruzzo. It was formerly so fertile, that Pliny and Florus elegantly call it, "Liberi Cererisque certamen." Its present name is "Terra de Lavoro." It is still beautiful, though it has lost much of its classic amenity.

Ver. 34. Falernus was one of the most fruitful districts in Campania. Its wines were the most celebrated of any in Italy: Dart alleges, that it received its name from one Falernus, a husbandman, who, it seems first cultivated the vine there. It was anciently called Amineum; and hence the epithet "aminea" was applied to wines of that country; and not as Servius imagines, because there was no minium in them.

Ver. 35. Though the images in the original, are natural and obvious, yet as they are not appropriated to amorous compositions, the translator has ventured to insert others, which to him appeared to have a better title to the place.

Donec erunt ignes arcusque, cupidinis arma,
of Ovid, would have been more adapted to the subject, from whence the images ought ever to spring; and indeed no poet of antiquity has more exactly observed this rule than Ovid hath done, in the elegy from which the above line is taken, and in this view cannot be too carefully perused.

Pastoral poets frequently err, and even Virgil himself is not entirely blameless in this particular. Mr. Pope in this, and in most other cases, where correctness of judgment is requisite, has been surpassed by none. How excellent, for instance, are these lines in his Rape of the Lock!

This day black omens threat the brightest fair,
That e'er deserv'd a watchful spirit's care;
Some dire disaster, or by force, or flight:
But what, or where, the fates have wrapt in night.
Whether the nymph shall break Diana's law,
Or some frail china jar receive a flaw;
Or stain her honour, or her new brocade,
Forget her prayers, or miss a masquerade;
Or lose her heart, or necklace at a ball,
Or whether heaven has doom'd that Shock must fall.

Cant. 2.

Ver. 49. This elegy abounds in difficult passages; nor is the original of this passage the least obscure: should therefore the translator err here, the critical reader will, he more easily pardon him. He had, however, in his eye, the following elegant lines of Horace.

Nunc et latentis proditor intimo
Gratus puellæ risus ab angulo,
Pignusve dereptum lacertis,
Aut digito male pertinaci.

The laugh which from the corner flies,
To tell you where the fair one lies;
A ring or bracelet snatch'd away,
The sportive pledge of future joy;
When she with amorous dear delay,
Shall struggling yield the willing toy.

After all, the sentiment, as it appears in Tibullus, can boast of no delicacy.

Ver. 62. *May bed-gowns guard her.*] From this wish, and some others in Tibullus, many critics have conjectured that our poet's talent was no less suited to the satiric, than to the elegiac muse. The translator, however, would have been better pleased, had his author given no proofs of genius, in that disagreeable species of writing. He has therefore been less solicitous in rendering the full force of the original.

Ver. 63. *May she, O may she like your sister prove,
As fam'd for drinking, &c.*

The Romans entertained so great an abhorrence of drunkenness in a woman, that the laws of the twelve tables permitted the husband to punish his wife with death, if found guilty of that crime.

Ver. 85. "Faciunt hoc homines," says the moral Cicero, "quos, in summa nequitia, non solum libido et voluptas, verum etiam ipsius nequitiae fama delectat; ut multis in locis, notas ac vestigia scelerum suorum relinquere velint." But Vulpus thinks, that the poet did not mean a shield, but a hand (palma); which he proves the ancients used sometimes to hang up in their temples, to denote that it was now freed from the fetters of deceitful love. If this is the interpretation, it may be thus translated:

To love I'll dedicate a hand of gold,
And this inscription shall the cause unfold.

ELEGY XI.

Who was the first that forg'd the deadly blade?
Of rugged steel his savage soul was made;
By him, his bloody flag ambition wav'd;
And grisly carnage through the battle rav'd:
Yet wherefore blame him? we're ourselves to
blame;

Arms first were forg'd to kill the savage garae:
Death-dealing battles were unknown of old;
Death-dealing battles took their rise from gold:
When beachen bowls on oaken tables stood,
When temperate acorns were our fathers food; 10
The swain slept peaceful with his flocks around,
No trench was open'd, and no fortrefs frown'd.

O had I liv'd in gentle days like these,
To love devoted, and to home-felt ease;
Compell'd I had not been those arms to wear,
Nor had the trumpet forc'd me from the fair:
But now I'm dragg'd to war, perhaps my foe
E'en now prepares th' inevitable blow! [known

Come then, paternal gods, whose help I've
From birth to manhood, still protect your own, 20
Nor blush, my gods, though carv'd of ancient
wood,

So carv'd in our forefathers times you stood;
And though in no proud temples you were prais'd,
Nor foreign incense on your altars blaz'd;
Yet white-rob'd faith conducted every swain;
Yet meek-ey'd piety seren'd the plain;
While clustering grapes, or wheat-wreaths round
your hair,

Appeas'd your anger, and engag'd your care;
Or dulcet cakes himself the farmer paid,
When crown'd his wishes by your powerful
aid; 30

While his fair daughter brought with her from
The luscious offering of a honey-comb: home,
If now you'll aid me in the hour of need,
Your care I'll recompence—a boar shall bleed.

In white array'd, I'll myrtle baskets bear,
And myrtle foliage round my temples wear:
In arms redoubtable let others shine,
By Mars protected mow the martial line;
You let me please, my head with roses crown,
And every care in flowing goblets drown. 40

Then when I'm joyous, let the soldier tell,
What foes were captur'd, and what leaders fell;
Or on the board describe with flowing wine,
The furious onset, and the flying line.

For reason whispers, Why will short liv'd man,
By war contract his too contracted span?

Yet when he leaves the cheerful realms of light,
No laughing bowls, no harvests cheer the sight;
But howl the damn'd, the triple monster roars,
And Charon grumbles on the Stygian shores: 50
By fiery lakes the blasted phantoms yell,
Or shrowd their anguish in the depths of hell.

In a thatch'd cottage happier he by far,
Who never hears of arms, of gold, or war,
His chaste embrace a numerous offspring crown,
He courts not fortune's smile, nor dreads her
frown;

While lenient baths at home his wife prepares,
He, and his sons, attend their fleecy cares,
As old, as poor, as peaceful may I be,
So guard my flocks, and such an offspring see. 60

Meantime, soft peace, descend, O! bliss our
plains!

Soft peace to plough with oxen taught the swains.
Peace plants the orchard, and matures the vine,
And first gay-laughing prest the ruddy wine;
The father quaffs, deep quaff his joyous friends,
Yet to his son a well-stor'd vault descends.

Bright shine the plough-share, our support and
joy!

But rust, deep rust, the veteran's arms destroy!

The villager (his sacred offerings paid
In the dark grove, and consecrated shade), 70
His wife and sons, now darkness parts the throng,
Drives home, and whistles, as he reels along.

Then triumphs Venus; then love-feuds prevail;
The youth all jealous then the fair assail;

Doors, windows fly, no deference they pay,
The chastest suffer in th' ungentle fray: [tears;
These beat their breasts, and melt in moving
The lover weeps, and blames his rage and fears;
Love sits between, unmov'd with tears and sighs,
And with incentives fly the feud supplies. 80

Ye youths, though stung with taunts, of blows
beware:

They, they are impious, who can beat the fair:
If much provok'd, or rend their filken zone,
Or on their tresses be your anger shown:

But if nor this your passion can appease,
Until the charmer weep, the charmer tease!
Blest anger, if the fair dissolves in tears!

Blest youth, her fondness undisguis'd appears!
But crush the wretch, O war, with all thy woes,
Who to rough usage adds the crime of blows. 90

Bland peace, descend, with plenty on our plains,
And bless with ease and laughing sport the swains.

NOTES ON ELEGY XI.

THERE are very few of our poet's elegies, which surpass the following. By the words,

Nunc ad bella trahor,

it would seem that Tibullus was about to depart on some military expedition; Brockhusius conjectures, that it was written soon after his being appointed to follow Messala to Syria; and of course that it ought to take place of the third elegy of this book. But the translator cannot help differing from that learned commentator; for when the third elegy was composed, it is known, that Tibullus had been for some time in love with Delia; and yet in the following poem he makes no mention of Delia: besides Pocchi informs us, that in some of his old MSS. this elegy began the second book, and was intitled *De Amicibus Nemesis*. But be that as it will, the elegy itself is truly worthy of our poet, and contains a vast deal of the real Tibullus. In the beginning, he draws a fine parallel between the guilty horrors of war, and the innocent pleasures of a country retirement. His invocation to his household gods to preserve his life, in the dangerous employment he was forced into, is no less pious and pathetic, than his reflections on ambition, and its fatal consequences are just and moral.

From the whole of this elegy, it may reasonably be questioned, whether Tibullus was an academic philosopher, as Mr. Francis supposes, or rather whether he was not, at least in practice, if not in theory, of the sect of Epicurus. The cheerful enjoyment of the present hour was their fundamental maxim.

Ver. 1. *Who was the first that forg'd*] Authors differ greatly in their opinions about this matter. Aristotle asserts, that one Lydus of Scythia first showed the method of tempering and working in brass: Theophrastus ascribes this discovery to Dela a Phrygian. Callimachus, on the other hand, curses the Chalybes as the inventors of iron, and thus addresses Jove to destroy them,

Ζην πατερ ὡς χαλκῶν παν ἀπολοιτο γένος

While Hesiod lays this to the charge of the Dactyli Idei in Crete; as others say, that the Cyclops were the first who worked in that metal. The Lemnians, on the same account, are branded by many; and hence the proverbial expressions of *λεμνία παρὰ, λεμνία χεῖρ, and λεμνίων βλαστειν*. Bacchus is also said by some, to have invented the weapons of war; but Diodorus Siculus imputes their discovery to Isis and Osiris. But the true author was probably Jubal Cain.

Ver. 6. *Arms first were forg'd*] This, in fact, is not true, ambition first taught man the use of arms. Pliny tells us, that Prætus and Acrisius, when at war with one another, invented the shield; and that Midias the Messanian invented a coat of mail; and that the Lacedæmonians invented the helmet, sword and spear. Lib. 7. c. 56.

Ver. 8. Poets have generally given full scope to their indignation, when speaking of gold: they have looked upon it to be, what it indeed too often is, the destroyer of love, the support of unjust ambition, and the parent of luxury.

ἡ φιλοχρημοσύνη μητιρ, &c.

The worst of ills from sordid avarice flow;
And gold is but the glittering bait of woe.
Nefarious gold, with virtue's bane replete:
Oh! that thy fatal poison were less sweet!
Of thee are born wars, murders, and alarms,
Paternal curses, and fraternal arms.

Although it must be confessed, that all these mischiefs have, on some occasions, arisen from gold; yet he is but little acquainted with the history of human nature, who does not know that almost all the great passions to which man is subject, have at one time or another occasioned these very mischiefs.

Ver. 9. No poet, except Homer, abounds so much as Tibullus, in descriptions of primitive and rural simplicity of manners. To an unprejudiced mind, these are entertaining, and afford matter of curious speculation. Although our author, by his birth and abilities, might have shone in courts, and the polite scenes of active life, his good sense, poetical turn, and aversion to the villanies of office, led him to prefer the country: accordingly he never appears to more advantage, than when describing its pleasures, and the plain but honest devotion of its inhabitants.

Ver. 15. Almost all the old editions read,

Tunc mihi vita foret, vulgi nec tristia nossem
Arma.

This perplexed the commentators, who knowing, that the commons of Rome, in times of peace, or when acting in their civil capacity, neither wore arms themselves, nor had them to wear, much less to dispose of (for the arms of that people, as well as their military clothing, were placed in the custody of the supreme magistrates, who, from the public armories occasionally delivered them out); at last thus happily restored the passage,

Tunc mihi vita foret dulcis: nec tristia nossem.
An emendation which Brockhusius approves of.

—A boar shall bleed.] The whole of this address to his household gods is pathetic and animated. This line has been strangely corrupted in the original; the true reading however is,

Hostia erit plena rustica porcus hara.

As many from the old reading

Hostia e plena, &c.

supposed something wanting, Pontamus thus boldly endeavoured to supply the deficiency;

At nobis ærata lares depellite tela;

Nec petat hostili missa sagitta manu;

Neu gladio celer insitet eques; profint mihi ad aras

Quæque tuli supplex munera quæque feram;

Thure pio callantque foci, pinguisque trahatur
Hostia de plena mystica porcus hara.

But the word "trahatur," as Broekhusius observes, betrays the forgery; for victims were not dragged, but led to the altar. Should not the "plena hara," in the original, have convinced those authors, who affect to represent Tibullus as poor, that his circumstances were far otherwise?

The ritual compiled by Numa, prescribed not only the ceremonies to be used, but the sacrifices to be offered, in the worship of each deity. The Romans, however, when they became more powerful and wealthy, added not only to the number of victims originally required, but enlarged also the species, or kinds of offerings. Whence this practice arose is not difficult to determine; yet, in spite of pontifical juggle, the Roman devotion always retained much of its primitive simplicity.

Ver. 35. Servius informs us, that the Roman priests always put on the white linen garment, bordered with purple, when they were about to sacrifice. It was called pure and unpolluted, according to the same author, "Quando non obstita, non fulgurita, non funesta, neque maculam habens, &c. R. homine mortuo."

Ver. 36. Hence says Broekhusius, we may remark, that myrtle was no less acceptable to the Lares than to Venus herself; and Horace informs us, that they were often crowned with this pleasant evergreen.

—Te nihil attinet

Tentare multa cæde bidentium,

Parvos coronantem marino

Rore Deos fragilique myrto, &c.

B. 3. l. 23.

The little gods around thy sacred fire,

No vast profusion of the victims gore,

But pliant myrtle-wreaths alone require,

And fragrant herbs the pious rural store.

A grateful cake when on the hallow'd shrine,

Offer'd by hands that know no guilty stain,

Shall reconcile th' offended powers divine,

When bleeds the pompous hecatomb in vain.

Francis.

Ver. 43. There is a fine and elegant improvement of this thought, in Mr. Tickle's poem on the peace of Utrecht.

See the fond wife, in tears of transport drown'd,
Hugs her rough lord, and weeps o'er every wound,
Hangs on the lips that fields of death relate,
And smiles and trembles at his various fate:
Near the full bowl he draws the fancy'd line,
And marks feign'd trenches in the flowing wine,
Then sets th' invested fort before her eyes,
And mines that whirl'd battalions to the skies,
His little listening progeny look pale,
And beg again to hear the dreadful tale.

There are also some beautiful strokes of the same nature in Mr. Addison's Latin poem, intitled *Pax Gulielmi Auspiciis Europæ Reddita*. Mus. Ang. Tom. 2.

Ovid has inserted this thought of Tibullus, in several parts of his writings, particularly in Penelope's letter to Ulysses.

At aliquis posita monstrat fera prælia mensa,
Pingit et exiguo, pergama tota, mero.

See also his *Metam.* Lib. 9. at the beginning, book xii. ver. 155. *Ars Amand.* book ii. ver. 127.

Ver. 48. *No laughing bowls.*] The author of the *Hercules Furens*, has stretched this single thought into ten long lines, ver. 698. Not so that excellent poet of Italy Sannazario.

Post obitum non ulla mihi carchesia ponet
Æacus, infernis non viret uva jugis.

Ep. Lib. I. Brock.

Are we then to place the chief joys of life in eating and drinking? Ought not our poet rather to have expatiated on the pleasures of learned society, or the charms of friendship, and the bliss of love? yet, after all, as the poet was only describing the happiness of rural life, these additional images were the less necessary.

Ver. 49. The "usti capilli et exesæ genæ" of the original, are far from being terrifying images. "Omnes imagines mortuorum calvæ finguntur, comis igne rogi consumptis." Vid. Luc. in *Dialog. Nir. Diogen. et Thers.*

Ver. 57. *While lenient baths.*] Shall we suppose that our poet had Ariadne's fine exclamation to Theseus in his thoughts.

Quæ tibi jucundo famularer serva labore?
Candida permulcens liquidis vestigia lymphis.

Catull.

Claude Lorraine himself could not draw a finer picture of a village-family, than our poet has given us in this place. There is another pleasing representation of the same sort in the *Gentle Shepherd*; a dramatic poem, which the translator is persuaded, every judge of poetry and nature will greatly prefer to the frigid Arcadian *Favole Boscorechie* of Italy.

This practice however of preparing warm baths, to ease the limbs of the fatigued husband, was not peculiar to the rural dame. Homer informs us, that Andromache commanded her maids to place on the fire, a large vessel full of water, to bathe her lord in, when he should return from the battle; she in the mean while, employing herself,

as Pope conjectures, in weaving a vestment to adorn him with. But alas, all her care was superfluous, Hector never came back. Il. x. v. 440. Homer is in nothing more admirable, than in his softening the ferocity of his battles, by the apt introduction of tender and domestic circumstances.

Ver. 61. *Meantime, soft peace descend.*] May not this signify that Tibullus was to have been employed in quelling some Italian commotion, and not in a foreign expedition?

Ver. 62. *Soft peace to plough.*] Many editors, and among the rest Broekhusius, read,

Duxit aratores sub juga curva boves.

But the adverb "primum," in the foregoing line, sufficiently authenticates our reading "aratuos:" for how could an ox when first put to the plough, with any propriety be called "arator," a term intimating that he had ploughed before; though he might well be called "araturus," as that gerund only points at his future employment and office. Besides, our reading is supported by the greatest number of manuscripts and editions.

Ver. 94. Casimir has a beautiful ode on peace, and the reader will find many fine thoughts on the same subject, in those poems of Mr. Addison's and Mr. Tickle's, which we have already praised.

Ver. 67. In the original,

Pace bidens, vomerque nitent, &c.

not "vigent," in opposition to Situs. This correction we owe to Heinsius.

Ver. 70. *In the dark grove*] That the Heathens, says Mr. Dart, had their religious rites in thick woods and groves, every one knows; the poet therefore describes those holidays, as the gay part of the farmer's life, when he and his family made merry, not unlike, adds he, to our country wakes and revels, when mirth is at its height, and the scuffles of love grow warm. There is a similar description in the eleventh Æneid, ver. 740.

At non in venerem segnes nocturnaque bella;
Aut, ubi curva choris indixit tibia Bacchi,
Expectare dapes, et plenæ pocula mensæ
Hic amor, hoc studium; dum sacra secundus Haruspex

Nuntiet, ac lucos vocet hostia pinguis in altos.

Ver. 75. *Doors, windows fly.*]

Scissosque capillos

Fimæna perfractas conqueriturque fores.

On which Scaliger thus superciliously remarks, "Copulativa verbo addita vehementer apud me male audit; quod tametsi a magnis poetis, et a Nobis quoque factum est; nunquam tamen, ac ne tunc quidem, quum facerem, probavi."

If the young rakes of Rome sometimes broke open their mistresses doors, Dr. Bentley informs us from Plautus and Seneca, that the women sometimes returned the compliment. This, in Horace's court-language, was called, "expugnare juvenum domos."

Neither was this boisterous method of getting admittance entirely unknown to the old Sicilians,

as we may perceive by Daphnis's threat to Simætha.

εἰ δ' ἀλλὰ μ' ὠβριτε καὶ ἅ θύρα ιεχίτο μοχλῶ
παντὶ καὶ πύλαις καὶ λαμπίδας πύθον ἐφ' ἡμᾶς.

Theocrit.

Ver. 79. *Love sits between.*] "Totus hic locus," says Broekhusius, very justly, "tam venusto artificio est pertractatus, ut melius non queat pingi. Flet puella, male habita ab-ebrio amatore; flet amator, pigetque eum tam turpis victoriæ. Adfidenter utrumque Cupido, nihil motus his lacrymis: quinimo, ut ne pax desubito confiat, insidiosè cavet, subjectis utrimque novæ rixæ alimentis. Nihil poterit amænus excogitari, nihil exprimi vividius." He then desires us to compare this short picture of our poet's with another in Ovid. B. i. El. 7. and adds, "Fallor aut illius (meaning Ovid) artis immensam varietatem magis miraberis; hic vero non minus te dilectabit invidendus ille nitor nativæ simplicitatis."

This picture would afford an excellent subject to a Guido Rheni.

Ver. 82. The original literally translated, intimates, that whoever beats his mistress, is of a temper as rigid and inflexible as stone or iron; and were it in his power, he would dethrone the gods themselves, and expel them from heaven. This furnishes us with a strong proof of the want of gallantry of those times! Ovid, according to his own confession, was not over scrupulous in his conduct to the fair sex; the sixth Elegy of the first Book being an apology to Corinna, whom he had been so barbarous as to beat. Many other passages might be adduced from ancient writers to corroborate this assertion. But the subject is unpleasing.

Ver. 84. *Or on their tresses*] This affords another disagreeable proof, that the moderns greatly surpass the ancients in point of gallantry.

Although nothing can be more acceptable to the lover, than a discovery of his being beloved; yet the method here made use of to arrive at that discovery, is wholly illiberal: for in spite of all that Propertius has wrote to the contrary, what pleasure can there be,

Aut in amore dolere, aut audire dolentem;
Sive meas lacrymas, sive videre tuas.

But crush the wretch] From these, and many other passages in Tibullus, it appears, that our author had not one ill-natured vice about him. Other poets we admire, but there is none of the ancients whom the translator should have wished to have been acquainted with so much as Tibullus. One cannot be very conversant in his writings, without acquiring a friendship for the man, and longing, to use Mr. Spence's words, to have just such another as he was for one's friend.

Ver. 91. The various figures which Broekhusius and others who have published antiques, have given us of this goddess, are the best comment upon the original of this passage. Theocritus puts ears of corn blended with poppies into both her hands. See his Idyll. entitled *Θαλασσία*.

BOOK II.---ELEGY I.

ADVERTISEMENT.

THIS book, though shorter than the former, is not inferior to it in point of poetical fancy and amorous tenderness; the numbers flow with the same easy correctness, and perhaps the sentiments are more delicate; for, being wholly dedicated to rural devotion, friendship, and love, the reader will meet with nothing in it, offensive to the strictest chastity.

If the version of the following books of Tibullus should be found less liable to censure, than that of the former, it is chiefly to be imputed to the kind observations of a friend, who also obliged the translator with the elegant notes marked *B*.

ATTEND! and favour! as our fires ordain;
The fields we lustrate, and the rising grain:
Come, Bacchus, and thy horns with grapes surround;
Come, Ceres, with thy wheaten garland crown'd;
This hallow'd day suspend each swain his toil,
Rest let the plough, and rest th' uncultur'd soil:
Unyoke the steer, his racks heap high with hay,
And deck with wreaths his honest front to-day.
Be all your thoughts to this grand work apply'd!
And lay, ye thrifty fair, your wool aside! 10
Hence I command you mortals from the rite,
Who spent in amorous blandishment the night,
The vernal powers in chastity delight.
But come, ye pure, in spotless garbs array'd!
For you the solemn festival is made!
Come! follow thrice the victim round the lands!
In running water purify your hands!
See! to the flames the willing victim come!
Ye swains with olive crown'd, be dumb! be dumb!
" From ills, O sylvan gods, our limits shield, 20
" To-day we purge the farmer and the field;
" O let no weeds destroy the rising grain;
" By no fell prowler be the lambkin slain;
" So shall the hind dread penury no more;
" But gaily smiling o'er his plenteous store,
" With liberal hand shall larger billets bring,
" Heap the broad hearth, and hail the genial
" spring.
" His numerous bond-slaves all in goodly rows,
" With wicker huts your altars shall enclose.
" That done, they'll cheerly laugh, and dance,
" and play, 30
" And praise your goodness in their uncouth lay."
The gods assent! see! see! those entrails show,
That heaven approves of what is done below!
Now quaff Falernian, let my Chian wine,
Pour'd from the cask in massy goblets shine!
Drink deep, my friends; all, all, be madly gay,
'Twere irreligion not to reel to-day!
Health to Messala, every peasant toast,
And not a letter of his name be lost!
O come, my friend, whom Gallic triumphs
grace, 40
Thou noblest splendour of an ancient race;
Thou whom the arts all emulously crown,
Sword of the state, and honour of the gown;

My theme is gratitude, inspire my lays!
O be my genius! while I strive to praise
The rural deities, the rural plain,
The use of foodful corn they taught the swain.
They taught man first the social hut to raise,
And thatch it o'er with turf, or leafy sprays:
They first to tame the furious bull essay'd,
And on rude wheels the rolling carriage laid. 50
Man left his savage ways; the garden glow'd,
Fruits not their own admiring trees bestow'd,
While through the thirsty ground meandering
runnels flow'd.
There bees of sweets despoil the breathing spring,
And to their cells the dulcet plunder bring.
The ploughman first to sooth the toilsome day,
Chanted in measur'd feet his sylvan lay:
And, seed-time o'er, he first in blithsome vein,
Pip'd to his household gods the hymning strain.
Then first the press with purple wine o'er-ran,
And cooling water made it fit for man. 60
The village-lad first made a wreath of flowers
To deck in spring the tutelary powers:
Blest be the country, yearly there the plain
Yields, when the dog-star burns, the golden grain:
Thence too thy chorus, Bacchus, first began,
The painted clown first laid the tragic plan.
A goat, the leader of the shaggy throng,
The village sent it, recompenc'd the song. 69
There too the sheep his woolly treasure wears;
There too the swain his woolly treasure shears;
This to the thrifty dame long work supplies;
The distaff hence, and basket took their rise.
Hence too the various labours of the loom,
Thy praise, Minerva, and Arachne's doom!
Mid mountain herds love first drew vital air,
Unknown to man, and man had nought to fear;
'Gainst herds, his bow th' unskillful archer drew;
Ah my pierc'd heart, an archer now too true!
Now herds may roam untouch'd, 'tis Cupid's
joy, 80
The brave to vanquish, and to fix the coy.
The youth whose heart the soft emotion feels,
Nor sighs for wealth, nor waits at grandeur's
heels;
Age fir'd by love is touch'd by shame no more,
But blabs its follies at the fair one's door!
Led by soft love, the tender trembling fair
Steals to her swain, and cheats suspicion's care,

With out-stretch'd arms she wins her darkling
way,

And tiptoe listens that no noise betray!

Ah! wretched those, on whom dread Cupid
frowns! 90

How happy they, whose mutual choice he crowns!

Will love partake the banquet of the day?

O come—but throw thy burning shafts away.

Ye swains, begin to mighty love the song,
Your songs, ye swains, to mighty love belong!

Breathe out aloud your wishes for my fold,
Your own soft vows in whispers may be told.
But hark! loud mirth and music fire the crowd—
Ye now may venture to request aloud!

Pursue your sports; night mounts her curtain'd
wane; 100

The dancing stars compose her filial train;
Black muffled sleep steals on with silent pace,
And dreams flit fast, imaginations race!

NOTES ON ELEGY I.

We may, without hesitation, embrace the opinion of Muretus, that this elegy is a description of the Ambarvalia, a festival instituted by Acca Laurentia, and honoured with a solemn sacrifice, for procuring a blessing on the fields. We may even, with great probability, suppose this poem to make a very interesting part of the festal entertainments. But it appears from it, that the Romans, in Tibullus's time, had added many a refined improvement from the Grecian ritual, to the plain institution of the good old nurse of Romulus; since we find our poet alluding to all the remarkable customs of the festal sacrifices of Greece. First the sacred silence is proclaimed, the *Euphrosyne* of the Greeks, which restrains the worshippers from the use of words of unlucky import. Next follows an address to the deities, to whose honour the festival is dedicated. The holiday being then proclaimed, and a strict rest enjoined, there follows the exclusion of all those, who had contracted any pollution, and an invitation of the pure to come with clean hands and vestments to join in the sacrifice. The victim is then introduced, going without any force to the altar, attended by a crowd of worshippers crowned with garlands, from the tree sacred to the rural deities. After this, is the prayer for blessings on the countryman and his fields, and prosperity to the growing crop. The offering up the victim succeeds, and lucky omens appearing, the worshippers are encouraged to indulge themselves in joy and festivity. The sacred hymn closes the whole, celebrating the honours of the rural deities recounting their various gifts, and the blessings which they have poured out upon the country. Whoever will look into the collectors of antiquities will find that these are the very particulars of the ritual of refined Greece. We may observe, that the processions, lustrations, as well as the business of the "fratres aruales," whose office it was, upon this occasion, to settle boundaries, have found their way into a religion which in its original institution, was little concerned with pomp and ceremony, but has been forced to receive many a scenical foolery from Pagan Rome. B.

Ver. 1. *Attend! and favour!*] The Roman poets also express this by

Dicamus bona verba.

Both these forms of speech intimate a desire, on the part of those who prayed at the festival, that all who were present would sincerely join with them in putting up the same petition.

The mythology of the ancients has been assigned as one of the causes which have contributed to render their poetical compositions superior to those of the modern.

And no doubt, that enthusiasm, which is so natural to every true artist in the poetical way, was considerably inflamed by the whole turn of their religious doctrines. When all nature was supposed to swarm with genii, and every oak and fountain was regarded as the haunt of some presiding deity; what wonder if the poet was animated by the imagined influence of such exalted society; and found himself, as a late writer elegantly expresses it, hurried beyond the ordinary limits of sober humanity. Hence arose the prosopopeia, which, as it is one of the boldest, so is it one of the most pleasing figures in poetry. But may not the Omnipresence of the one true God afford the Christian poet a more exalted assistance? When true genius is fired with devotion, poetry then shines out in all her splendour.

Ver. 2. *The fields we lustrate.*] Macrobius informs us, that the verb "lustrare" signifies to go round; especially on a religious or mystical account. The ceremony here alluded to, as has been said, was the "sacrum ambervale," which in some old MSS. is placed as a title to this elegy. This most solemn of the rural ceremonies had the morning and forenoon allotted for its celebration. Cato, de R. R. cap. 141. and Virgil, have particularly described it. And as it may not be unpleasing to most of our readers, to compare the different manners of Maro and Tibullus, in representing the same objects we shall here place before them the picture of this rural ceremony, as drawn by the great Mantuan.

Imprimis venerare Deos, atque annua magnæ
Sacra refer cereri, lætis operatus in herbis,
Extremæ sub casum hiemis, jam vere sereno,
Tum agni pingues, et tum mollissima vina:
Tum somni dulces, denique in montibus umbræ.

*Sancta tibi cererem pubes agrestis adoret,
Cui tu lacte favos, et miti dilue Baccho;
Terque novas circum felix eat hostia fruges;
Omnes, quam chorus et socii comitentur ovantes,
Et cererem clamore vocent in tecta.*

Georg. i. ver. 338.

Some critics contend, that Tibullus, in this elegy, does not describe the Ambarval ceremony, because he mentions some circumstances relating to it, which Virgil omits, and relates others differently from that poet. This argument needs no confutation.

Ver. 3. *Come Bacchus.*] This god is frequently called Tauricornis by the poets; but why horns were planted on his head mythologists are greatly divided. Some of them look upon horns as a mark of divinity; but why then do the other deities appear without this badge? Others of them assign horns to Bacchus, because drinking cups were anciently formed of horn; and there are, who contend, that he is thus distinguished, because he was the first who ploughed with oxen. Those who recollect the old sentence,

Sine cerere et Baccho friget Venus,

may haply be able to afford as satisfactory a reason for the cornuted appearance of this deity, as any suggested above. River gods are frequently represented with horns; but on a very different account. Pindar makes Bacchus the *ταυροειδής*, or assessor of Ceres: and in the Orphic hymn, addressed to that goddess, she is called *Βορρηνίου θυγατήρ*. They were commonly worshipped together. See Callimachus's sixth hymn.

Some critics, superstitiously bent to deduce from scripture the origin of every mythological practice, have, from the "cornuta facies," common to Moses and Bacchus, supposed, that the lawgiver of the Jews, and that heathen god, were one and the same person. But these peripatetic critics should have considered, that as adoration is natural to man, and ignorance and conjecture were prior to wisdom and philosophy, idolatry, which is the offspring of devotion and blind fancy, never was, nor could be, confined to those few regions bordering on Judea; nor consequently derived from the Jews, or any of their heroes. Were we permitted, because of some faint resemblances between them, to form one person out of two, we should rather choose, from the similar circumstances of their births, deaths, &c. to make a Romulus, than a Bacchus, of Moses. Chronology indeed forbids this odd incorporation; but writers would do better to interdict their pen, as Lord Bacon expresses it, all liberties of this kind, and not offer strange fires at the altar of the Lord. G.

The Grecians had most probably an hero-god of their own, named Bacchus, to whom they were indebted for some of the improvements of life. But it is very certain, that many of the actions, inventions, and symbols of the Egyptian Osiris, were, in after times, attributed to him. We have here one instance of it. The bull was the established hieroglyphic of Osiris, as the inventor of

agriculture. Greece adopted the invention for their own Bacchus; but not having the use of the hieroglyphic characters, they contented themselves with borrowing an attribute for their deity, and assigned him the horns of the animal, by whose labours he was supposed to cultivate and introduce agriculture into the country. I might add, that whenever Bacchus and Ceres are spoken of together, as rural deities, almost every thing applied to them, more properly belongs to Osiris and Isis. See a remarkable instance of this, Virgil's Georgics, B. i. L. 5. *et seq.* to the 9th.

Vos, oh Clarissima mundi, &c.

Here Bacchus and Ceres, the humble inventors of wine and agriculture, are exalted into the heavens, and become sun and moon, the great leaders of the year through its seasons. We know there is nothing in the Grecian mythology to support this; and that those heavenly luminaries are attributed to other deities. But it is certain, that the sun and moon were worshipped by the Egyptians under the denomination of their hero-gods, Osiris and Isis. Vid. Div. Legation, B. 4. Sect. 5. *et alibi passim.* B.

Ver. 7. It was usual at the time of these sacrifices, to dress the cattle with garlands, and to give them a respite from labour. Vid. Fast. lib. i. ver. 663. lib. vi. ver. 311.

The ploughing ox was held in great estimation among the ancients; respecting this, Varro, de R. R. lib. ii. l. 53. Columella in the preface to his sixth book, and Pliny, lib. viii. c. 45. may be consulted. But though we refer to these passages, the translator cannot deny himself the pleasure of transcribing from Ovid the following good natured apostrophe, in favour of those useful animals.

*Quid meruere boves animal sine fraude dolisque
Innocuum, simplex, natum tolerare labores?
Immemor est demum, nec frugum munere dignus,
Qui potuit curvi demto modo pondere aratri
Ruricolam mactare suum; qui trita labore
Illa, quibus toties durum renovaverat annum
Tot dederat Messes, percussit colla securi.*

Met. lib. xv. ver. 120.

How did the toiling ox his death deserve?
A down-right simple drudge, and born to serve?
O tyrant! with what justice canst thou hope
The promise of the year, a plenteous crop;
When thou destroy'st the labouring steer who
till'd, [field?
And plough'd with pains, thy else ungrateful
From his yet reeking neck to draw the yoke,
That neck with which the surly clods he broke;
And to thy hatchet yield thy husbandman,
Who finish'd autumn, and the year began.

Dryden.

Accordingly we find, that in the ancient times of the Roman republic, a person was publicly condemned, for having felled a labouring ox " (bos domitus)," in order to gratify the longings of one he was fond of. Valer. Maxim. lib. viii. lin. 1. And, in the declension of that empire, Constan-

tine ordained, that no ploughing ox should be either distrained for debt, or taken from the traveller, to supply the place of such as were wanting to complete the number required at the public sports and races.

Scaliger, on the authority of some old MSS. reads the original of the last line, as follows:

Plena coronato vertice stare boves :

Yet most MSS. and the best editions read it,

Plena coronato stare boves capite.

But without their concurrence, Broekhusius justly observes, that Tibullus must have thus wrote it, as his ear taught him solicitously to avoid every combination of harsh hissing consonants, such as SC. SP. SQ. ST.

Ex Tibullo probanda est Tibullianæ scriptionis consuetudo.

Ver. 10. There are some things, says Servius which, if done on a holiday, pollute it. Hence it was, that the pontiffs, when they were to perform a sacrifice, sent out their beards to prevent artificers from working, lest the sacred ceremony should be contaminated. Serv. ad G. lib. i. ver. 268. And Macrobius tells us, that a herald also was employed on these occasions to prohibit the people from all secular business. Those, who unknowingly transgressed, were obliged to purchase their expiation by sacrificing a hog; but the wilful guilt could not be expiated, in the opinion of Scævola the high-priest. Sat. lib. c. 16.

These heralds, from their office, had the names of "Præclamitatores et præciæ" bestowed upon them.

Yet was not all work forbidden to the husbandman; for as Cato de R. R. informs us, they might, even on the most sacred holiday, clean their ditches, mend the highways, cut down briars, dig their garden, burn thorns, weed their meadows, cleanse their fish-ponds, bind withies, and do every office of cleanliness in their house.

C. 2. Broekhus.

Pictures of life and manners, when truly copied from nature, however low the subject, never fail to delight us. And we have here a very faithful one exhibited to us. When the poet had dismissed man and beast to rest, proclaimed a general holiday, and a vacation from all business, he recollects that his last most difficult task was, to snatch the distaff out of the hands of the country housewife. Whoever has peeped into a farmhouse, must have observed the notable mistress, whatever the rest of the family were doing, always in an hurry, and acting as eagerly upon the leading principle of the country, frugality, as a court lady in pursuit of pleasure. Perhaps one general reason might be assigned for the impetuosity of both. And the fine lady Harriet, with the help of a little change of education, might have made a very notable Amaryllis in the country. B.

Ver. 12. All matrimonial converse with women was strictly prohibited, during a certain number of days preceding the Amberval sacrifices.

*Annua venerunt cerealis tempora sacri.
Secubat in vacuo sola puella toro.*

Complains the amorous Ovid, El. Lib. iii. El. 9. but not only the unchaste, but persons defiled with recent blood, or polluted with the touch of a dead body, were forbidden to approach the altar.

Ver. 14. The pure vestment mentioned in the original, was white, as Ovid, in that wonderful work of his, the Fasti, informs us.

*Alba decent Cererem, vestes Cerealibus albas
Sumite ; nunc pulli velleris usus abest.*

Lib. iv. ver. 619.

Ver. 16. Although the Ambarval sacrifice was, generally, either a sow with pigs, or a lamb, yet the goat and bullock were sometimes also used. But whatever was the animal, it was conducted thrice with great solemnity round the field! " (ter ambiens agros)" and thence obtained the name Ambarval.

If either in the procession, or at the altar, it spurned, or showed the least reluctance, they removed it, as displeasing to the deity; and substituted another victim in its stead. Hence the verb *eat*, in the original, and the epithet *willing*, in the translation. At the altar the victim was unbound; for, as Servius observes,

Piaculum est, in sacrificio aliquid esse religatum.

There is a sensible epigram in the Anthology, which informs us, that not only Ceres and Bacchus, but Hercules and Mercury had offerings made to them by the husbandman. Hermes indeed was contented with milk and fruits; but, to the former, sheep and oxen were sacrificed. This, it seems, disgusted the penurious farmer; who being told, Hercules deserved victims of that value, he made this spirited reply, what difference is there to me, whether my flock is destroyed by wolves, or by the keeper?

Τι το πλιον ει το φυλακτιν

Ολλυται υπο λυκου εις υπο του φυλακος.

Ver. 17. Clean hands were necessary in all sacrifices. Thus Hesiod,

Μηδε ποτ' εξ ηους Διι λειπειν αιθερα οινον

Χερσιν ανιπτοισιν, μηδε αλλοιστ' αθαναιοισιν.

Ου γαρ τοιγε κλυουσιν αποπτουσιν δι' τ' αρας.

Εργ. και Ημερ. Ver. 724.

According to Macrobius, when the Romans sacrificed to the "Di superi," they washed the whole body with river water; but, in sacrifices to the infernal gods, a bare sprinkling was sufficient. Sea water was also sometimes used for the same purposes.

Ver. 19. *From illis, O sylvan gods.*] The following is the form of prayer used by a farmer, upon a like occasion:

"O father, I conjure and entreat you, that you will be propitious to me, to my house and family; that you will disperse all maladies, known and unknown; calamities, barrenness, mortalities, and

pestilence; that you will give increase to my fruits, corn, trees, and vines; that you will preserve my shepherds and my flocks; and give health and safety to us all." Vid. Cat. de R. R. c. 141.

Ver. 24. *So shall the bind.*] I should not have hazarded an explanation of this passage, if I had not observed, that the meaning of it had escaped the notice of all the commentators. One of them has produced from Horace, by way of explanation,

Ædificare casae, postello adjungere mures.

And again,

Ædificante casae qui senior. Lib. ii. Sat. 3.

This is learning! this is that happy talent of criticism which explains a passage by authorities from his splendid fellows. But could this solemn trifler think that an action which Horace represents as the play of childhood, which he stigmatizes as a glaring mark of an unsound head in any one that had attained to manhood, could be considered by so exact a writer as Tibullus, as a proper expression of gratitude from a country village to its divine protectors? The words we see are part of an address to the "Dii patrii," upon a solemn lustration of the villagers and their fields. First, Their protection is invoked for their harvest and flocks, upon the grant of which, an assurance is given, that the happy farmer and his family would show their sense of the blessing by heaping high the hearth, and running up hasty huts of twigs; both of which must be supposed to be done in honour of those very deities to whom the promise is made. Consider then, that the Lares, the guardians, and protectors of families, must be especially designed by, or at least included amongst the "Dii patrii." Now, comfortable houses, and warm fires, were considered as their proper gifts, as peculiarly under their tutelage: And nothing could be more in the spirit of antiquity than for the farmer and his sportive family, in the midst of their festal joy, and in gratitude to the bounteous givers, to exhibit the representation of the very gifts which they were supposed to have received from them. The warm hut and the blazing fire were as proper expressions of gratitude to the Lares, as arms which had been used successfully to Hercules, the first fruits to Ceres, and the image of a restored limb to Esculapius, or the hermæ to Mercury, the guide and protector of travellers.

Ver. 28. *His numerous bond slaves all in goodly rows.*] These certain indications of a wealthy farmer, Horace, with his usual courtliness of expression, calls "Ditis examen Domus;" but as that would have appeared flat in English, Mr. Francis has judiciously passed it over in his version. So peculiar are languages!

The "vernæ" were slaves born of slaves.

Ver. 35. The original of this cannot be rendered into intelligible English. The Romans marked their wine casks with the name of him who was consul at the time when they were

filled. They then fastened them down with chains. The older the Falernian and Chian wines were, they became the more esteemed. They were often mixed together; and this heightened the flavour of both.

Might not these lines have convinced Dacier, and the other commentators, who represent Tibullus as an indigent person, of their mistake? A poor man could not have afforded to treat a whole village with old Falernian and Chian wines. G.

Though the Romans, by a very unlucky proverbial expression, used "Græcari" for playing the good fellow, yet I think that debauchery and intemperance were the characteristic manners neither of the Greeks nor Romans. At their festivals, they indeed thought them an indispensable part of their religious rejoicings; and if they were not wholly confined to these, it is certain, that by their means they first got footing amongst them. Athenæus Deipn. l. iii. ch. 3. tells us, that the ancients never indulged themselves with dainties, nor drank any quantity of wine, but at such times. As a convincing proof of which, he observes, that the very names for luxurious eating and drinking have some relation to their religious sacrifices. Thus *Θορν* a banquet, is so called, because they thought themselves obliged *δία Θους οινοςδε*, to be drunk in honour of the gods; and to be drunk they called *μεθυσιν* because they were most accustomed to do it, *μετα το θυσιον*, after sacrifice. The Romans had adopted the same principles and practice, as appears from this very sober exhortation of the poet. B.

Ver. 38. Upon certain occasions the Romans drank a bumper for every letter of their friend or mistress's name. They received this custom from the Grecians.

Ver. 40. The first Romans wore beards, and were represented accordingly in their statues and pictures. The "intonsis avis" of the original, therefore, shows the antiquity of Messala's family. Varro de R. R. informs us, that Fianius Mena was the first who introduced barbers into Rome; and he brought them from Sicily, A. U. C. 454. Such circumstances, though seemingly inconsiderable, are yet necessary for a thorough understanding of the classics.

Ver. 48. *And thatch it o'er with turf, or leafy sprays*] Such were the rude beginnings of architecture! and such wretched hovels are still to be seen in the barren and mountainous parts of this great and civilized island! See Vitruv. Archit. l. ii. c. 1.

Houses at first being only a defence from the weather, and built of whatever rude materials the country afforded, Rome was originally composed of mud-walled, straw-thatched cottages. Even Romulus's palace was a hut, and as ill furnished as those of his subjects.

Parva fuit si prima velis elementa referre,

Roma: sed in parva spes tamen hujus erat.

Mœnia jam stabant populis angusta futuris;

Credita sed turbæ nunc nimis ampla fuz;

Quæ fuerit nostri si quæris regia nati,
Adspice de canna straminibusque domum:
In stipula placidi carpebat munera somni.

Ov. Fast. l. iii.

We are certain, that Rome at first was only a huddle of cottages, without any regular openings and streets; nay, some philologists have conjectured, that that city never had regular streets like ours, as there is no Latin word which properly signifies a street: Neither were Rome's first places of worship much more superb than its houses, since we know, from Pliny, that, till after the conquest of Asia, the Romans had only wooden, or at best earthen gods in their temples.

The translator must finish this note by correcting an error into which he has fallen, in his notes upon the first elegy of the first book. There, it is asserted, that no purchaser was entitled to the spoils with which any house he might buy was adorned. But the fact is quite otherwise; for Pliny expressly says, it was unlawful to take down these trophies, "*Affixis hostium spoliis, nec emptori refigere liceret.*"

Nat. Hist. l. xxxv. c. 2.

Thus it was that the Romans endeavoured to perpetuate the martial glory of their ancestors.

Ver. 55. Broekhusius, contrary to the opinion of most of the commentators, joins "*verno*" to "*alveo*;" and, in a far-fetched manner, justifies this construction by a passage from Columella. The translator cannot, however, help joining "*verno*" with "*rure*." It is certain, that Martial couples "*æstivum*" to "*rus*," lib. viii. Ep. 61. Fruterius reads it,

Rure levis vernos flores, &c.

But the ear may easily convince any one, that Tibullus never wrote it so.

Ver. 59. *Pip'd to his household gods.*] A noble origin this of poetry! After the hymns and sacrifices were over, the villagers devoted the rest of the day to feasting and merriment. Their merriments, as Horace informs us, chiefly consisted in alternate, gay, extempore, innocent, and awkward jokes.

Versibus alternis opprobria rustica fudit.

This holiday wit, and rude species of poetry, was called "*Fescennine et Saturnine*," from the places in Tuscany and Latium, where it chiefly prevailed.

From being practised by rustics, and only on these occasions, this species of witty raillery soon became the entertainment of towns, at their public diversions. Then it was, probably, that music and dancing, with gestures suited to the subject, were added, and the raillery levelled not only at the actors, but spectators. The success of this motely entertainment suggested in time the idea of another poem, as various and sarcastic as the former.

From the country custom of making presents of baskets filled with fruits, flowers, &c. (*satura lanæ*) upon particular occasions, this new enter-

tainment assumed the name of "*satura poemata*," or satire. By degrees, both these kinds of raillery became so petulant, that worth and virtue were often treated by them with the same severity as vice and folly. This obliged the magistrate to interpose his authority; in consequence of which, a law was made, A. U. C. 302. subjecting not only the authors of these "*mala carmina*," but those also who recited and acted them, to a drubbing; and hence the punishment was called "*fastilegium*." Thus was illiberal and dangerous wit restrained; and chaste satire, by the successive endeavours of Lucilius and others, advanced to an eminent degree of perfection. But as policy soon discovered that theatrical entertainments of one kind or another was necessary, a company of Tuscan historians, or players (for the Tuscans were then the best actors), were invited to Rome about forty years after the law above-mentioned had passed. The language of these Tuscans not being understood at Rome, they endeavoured to supply this deficiency by a dumb sort of declamation, or eloquent action, wherein the motions and gestures of the body were regulated by the flute, in such a manner as to represent every sentiment and passion to the eye of the spectator. This pantomimical entertainment soon, however, fell into disuse, either through the death of the Tuscan performers, or because it possessed not the poignant raillery of the former pieces. Accordingly, we find, that in A. U. C. 390. when a pestilence (for so historians call it) raged at Rome, the magistrates were admonished to avert the anger of the gods by exhibiting plays. In consequence of this, a company was sent for from Tuscany; and now they began to act (as Mr. Dryden expresses it) a kind of civil cleanly farce, the music, dancing, and gestures being retained. These exhibitions, which had something in them to entertain the senses, and were not withal devoid of wit and ridicule, continued in quiet possession of the Roman theatre for 124 years. Livius Andronicus was the first who brought a regular play upon the Roman stage. His plays were divided into acts, and modelled after the old comedy. Andronicus was a Grecian by birth, and had been taken captive by the Romans. Having acquired a competent knowledge of the language of that people, he was presented with his freedom, by his master Salinator, whose children he had educated. This grand scenical revolution, as Tully informs us, happened a year after the first Punic war, and a year before Ennius was born. Now it was that, among the Romans, the learned began to study the Greek authors: and, as the tragic poets of Greece had carried the buskin to so great perfection, those among the Romans who wrote for the stage, thought they could not better employ their talents than in translating those great originals, for the entertainment of their countrymen: And it was not till the age of Augustus that any piece, entirely Roman, was introduced upon the stage.

Although Horace, as well as our poet, attribute the invention of poetry to the husbandman,

yet many critics, and especially Scaliger, bestow that honour on the shepherd: And, indeed, when we consider that flocks were tended before the earth was ploughed, their opinion is not improbable. But as poetry is natural to man, and peculiar to no nation, who can ascertain its inventor?

Ver. 64. *Blest be the country.*] Broekhusius says, the poet means the sun by the "calidum sidus." It seems rather that he meant the dog-star. Tibullus calls the growing corn the earth's annual hair. This metaphor will not do in English.

Ver. 66. Tragedy was at first nothing but an annual hymn, sung by peasants, in honour of Bacchus; and he who acquitted himself best upon this topic, was rewarded with a goat. Hence the Greek name *Τραγῳδία*. But as the sameness of the subject must at last have proved irksome, not only to the poet, but to the audience; it was no wonder that this entertainment was afterwards diversified. Thespis, a native of Icaria, a mountainous part of Attica, where this ceremony first obtained, interrupted the Bacchic chorus, A. Mund. 3530, by recitation, on pretence of easing the chorus, and varying the amusement. He happily succeeded; and what at first was only a subsidiary interlude, soon became the principal entertainment. Rude, doubtless, it was; for Thespis, as Aristotle hints, employed but one interlocutor. The entertainment yet scarce merited the name of tragedy, which cannot subsist without dialogue. Succeeding poets saw this; and, by improving on one another, carried tragedy to perfection. The chorus was retained; but then it was no longer a hymn in honour of Bacchus. The subject of the song arose from the subject of the play; and those who performed it in the chorus, became essential persons in the drama.

Although the Greeks fix upon Attica as the place where tragedy made its first appearance, yet as man is an imitative animal, the source of this species of poetry, as well as of the other imitative arts, is to be sought for in human nature. The Chinese, from the earliest antiquity, have had dramatic entertainments; and that excellent historian, Garcilasso de la Vega, informs us, in the first part of his *Commentarios Reales*, that the Peruvians composed and acted several tragedies and comedies.

The reason for sacrificing a goat to the god of wine, the antiquarians tell us, was this: Bacchus, having found out the secret of cultivating the vine, and of making wine from the grape, taught his discovery to one Icarus (Vid. Bulinger. de *Theat.* l. i. c. 1.) a native of Icaria, who successfully continued the practice. One day, as Icarus was visiting his vineyard, he caught a goat, which had made great havoc among his vines. Interest, and gratitude to his instructor, equally conspiring, he sacrificed the creature to Bacchus. His peasants, who doubtless had been invited to see the foe immolated, danced around the sacrifice, and joyfully sung the praises of the god. Institutions of this kind need but be begun to make them

continual. Hence what at first was merely accidental, became a part of annual devotion.

Ver. 71. See a fine description of wool-shearing in Mr. Thomson's *Summer*.

Ver. 74. Weaving was held in such estimation by the ancients, that the goddesses of wisdom patronized that art. Hence not only the greatest queens of old, but Circe, the daughter of the sun, and a goddess, practised it. The reader who chooses to see this subject treated of, with all the importance it deserves, must peruse that most elegant of didactic poems, the *Fleece*.

Ver. 76. The author of that delicate poem, the *Pervigilium Veneris*, also makes the god of love to have been born in the country.

*Ipse amor, puer Dionæ, rure natus dicitur.
Hunc ager, cum parturiret ipsa, suscepit sinu;
Ipsa florum delicatis educavit oculis.*

Which are thus elegantly translated by Parnell,
E'en love (if fame the truth of love declare)
Drew first the breathings of a rural air.
Some pleasing meadow, pregnant beauty prest,
She laid her infant on its flow'ry breast,
From nature's sweets he sipp'd the fragrant dew,
He smil'd, he kiss'd them, and by kissing grew.

G.

This birth of love is prettily imagined; and the episodical address to him, in a precatory hymn to the rural deities, is not without its propriety. We know, that to gratify the farmer's hopes, his cattle must increase, as well as his grain flourish, and that beasts as well as men were supposed to feel the influence of almighty love. Poetry animates every thing. In an heathen poet's creed, not only hills, trees, fountains, are inhabited by superior intelligencies, but the very passions themselves must be exalted into deities. If we strip the description of Tibullus of its poetical ornaments, it will be found to agree very well with truth and nature. The workings of the passions in minds rude and uncultivated, such as an heathen poet must suppose the first man to have been, must needs be tumultuous and undistinguishing. Love in this case would be mere lust, without either choice or discernment, raised and gratified by the first object that offered; and when exalted into a person, may justly be supposed to have his birth amongst beasts, or men little superior to them, and to throw his arrows about at random. But when the mind begins to admit of refinement, becomes curious about its objects, and delicate in its pursuits, then love will only be excited in it by excellence, either real or imagined; and, despising promiscuous concubinage, and the possession of easier gratifications, it will, with much pain and anxiety, and severe distress upon miscarriage, confine itself to the pursuit of some favourite object. When it is that the deified passion must be supposed to become skilful in its business to take exact aim, and neglecting the bestial throng, to wound those hearts deepest that are capable of the most exquisite feeling. Thus does our poet keep close to nature, even when

his language is most figurative, and speaks of the passions almost with as much precision as the most curious theorist. *B.*

Ver. 88. Ariosto, as Broekhusius remarks, has happily imitated our poet, in his fable of Jocondo and Astolphus.

Il Greco, sì come ella li disegna
Quando sente dormir tulla la torma,
Viene a l'uscio, e lo spinge, e quel li cede.
Entra pian piano, e va à tenton col piede.

Fa lunghi passi, e sempre in quel di dietro
Tutta si ferma, e l'altro par che mova
A Guisa, che di dar tema nel vetro
Non ch' il terreno habbia calcar, ma l'uoua:
E tien la mano inanzi simil metro
Va brancolando in fin che'l letto trova, &c.

Cant. 28. St. 62, 63.

Which is thus rendered by a late translator,

The Greek, just as she had designed at night,
When all the crowd he sleeping did perceive,
Came to the door, and push'd it, and it op'd;
He enter'd softly, and on tiptoe grop'd.

He makes long strides, still on his foot behind
Rests firm, and seem'd as if he cautious led
His t'other foot, as fearing glass to find,
And that an egg, not ground, he had to tread:
And forward, keeping time, his hand inclin'd,
Still tottering on, until he found the bed, &c.

This sweetness, however, the author of the *Per-
vigilum Veneris* has attained to.

Ipse Nymphas Diva luco jussit ire Myrteo,
It puer comes puellis, nec tamen credi potest
Esse amorem feriatum, si sagittas vexerit.
Ire Nymphæ, posuit arma, feriatu est Amor.
Jussus est inermis ire, nudus ire jussus est;
Neu quid arcu, neu sagitta, neu quid igne læderet.
Sed tamen Nymphæ cavete, quod Cupido pulcer est.
Est in armis totus idem, quando nudus est Amor.

Now fair Dione to the myrtle grove
Sends the gay nymphs, and sends her tender love.
And shall they venture? Is it safe to go? [bow?
While nymphs have hearts, and Cupid wears a
Yes, safely venture, 'tis his mother's will,
He walks unarm'd, and undesigning ill,
His torch extinct, his quiver useless hung,
His arrows idle, and his bow unstrung.
And yet, ye nymphs, beware, his eyes have charms,
And love that's naked, still is love in arms.

And again,

Ruris hic erunt puellæ, &c.

To fill the presence of the gentle court,
From every quarter, rural nymphs resort.
From woods, from mountains, from their humble
vales,
From waters curling with the wanton gales.
Pleas'd with the joyful train, the laughing queen
In circles seats them round the banks of green,

And "lovely girls, she whispers, guard your hearts,
"My boy, though stript of arms, abounds in arts."

Ver. 93. *O come—but throw.]*

Come Cupid then, but throw thy shafts away,
Thy burning shafts, &c.

"Hæc sunt bellissima," as Broekhusius justly remarks, "et amænæ simplicitatis lenocinio amabilissima. Frustra ad hanc suavitatem adspirant illi, qui perspicere non possunt, quid sit pulchritudo naturalis."

Ver. 97. When the superstitions among the ancients were solicitous to obtain what morality forbade them to desire, they put up private petitions to the gods, and imagined that the gods were, in that case, obliged to grant their requests; more especially when the offerings they presented were sufficiently costly. See this abominable superstition, forcibly redargued by that great moral satirist Persius, whom now the English reader may with pleasure peruse, in no less faithful than elegant poetical version. When the ancients were particularly anxious about the attainment of any thing, they used to bribe the keepers of the temple of their favourite god, to let them come nearest his statue, in order that their petition might be the best heard. Senec. Ep. 41.

Ver. 100. Evening and night are variously represented by both poets and painters: In one of the hymns usually ascribed by critics to Orpheus, the stars, as in our poet, are called the daughters of night. And Theocritus names them

Ευκῆλοι κατ' ἀντιγὰ νυκτός οπαδοί.

Id. 2.

Mr. Thomson's description of a summer's eve and night is exquisitely fine, containing many appropriated and original images: Neither is the following picture, by Mr. Smart, destitute of real poetry.

Night, with all her negro train,
Took possession of the plain,
In a herse she rode, reclin'd,
Drawn by screech-owls, slow and blind.
Close to her, with printless feet,
Crept stillness, in a winding sheet.

See his Orig. Poems, p. 13.

Mr. Spence, in the notes on his Dialogue of the Planets, Times, and Seasons, converts the "Matris" of the original into "Martis," and so applies it to the planet Mars. But as this reading is unauthorized by any MSS. or good edition, and in truth has no sort of connection with the context, night being there represented as the mother of the stars, we have been obliged to reject it.

Ver. 104. Statius and Claudian make sleep the charioteer of night. But the poet assigned Somnus by our poet, is both more poetical, and more consonant to truth.

This night-piece is worthy the pencil of a Claude Lorraine or a Guido Rheni.

ELEGY II.

Rise, happy morn, without a cloud arise!
 This morn, Cornutus blest his mother's eyes!
 Hence each unholy wish, each adverse sound,
 As we his altar's hallowed verge surround!
 Let rich Arabian odours scent the skies,
 And sacred incense from his altar rise;
 Implor'd, thou tutelary god, descend!
 And deck'd with flowery wreaths the rites attend!
 Then as his brows with precious unguents flow,
 Sweet sacred cakes, and liberal wine bestow.
 O genius, grant whate'er my friend desires:
 The cake is scatter'd, and the flame aspires! 10
 Ask then, my noble friend, whate'er you want:
 What silent still? your prayer the god will grant:
 Uncovetous of rural wide domains,
 You beg no woody hills, no cultur'd plains:

Not venal, your request no eastern stores,
 Where ruddy waters lave the gemmy shores:
 Your wish I guess; you wish a beauteous spouse,
 Joy of your joy, and faithful to your vows.
 'Tis done! my friend! see nuptial love appears!
 See! in his hand a yellow zone he bears! 20
 A yellow zone, that spite of years shall last,
 And heighten fondness, even when beauty's past.
 With happy sighs, great power, confirm our
 prayer,
 With endless concord bless the married pair.
 O grant, dread genius, that a numerous race
 Of beauteous infants crown their fond embrace;
 Their beauteous infants round thy feet shall play,
 And keep, with custom'd rites, this happy day.

NOTES ON ELEGY II.

THIS elegy celebrates the birth-day of Cornutus; and is addressed to genius, a sort of divinity, who was supposed constantly to attend every man through the whole course of his life. It exhibits a description of the rites usually performed on that occasion.

In some less perfect editions, the person, on whose birth-day this elegy was written, is called Cerinthus; but as the laborious Broekhusius has proved, that Cerinthus is the foreign name of a slave, and slaves, according to him, were not permitted to marry, "*servis enim non uxores, sed concubinales erant*;" a wife being mentioned by the poet as the chief boon his friend had to demand of his natal god: and as the oldest MSS. and least corrupted editions read Cornutus, we also have retained that name.

After all, as we know nothing certain of either Cerinthus, or Cornutus, the reader may adopt what name he shall think proper.

Ver. 1. The god meant in the text is Genius. Plutarch (in Lib. de Oracul.) and Plato inform us, that being of a middle nature between gods and men, the genii were supposed to be the secret monitors, by whose insinuations mankind were inclined to the practice of goodness. According to Varro, in his book intitled Atticus, the ancients abstained from all bloody sacrifices at the festival of Genius: and the reason given for this conduct is, that they might not deprive other beings of

life, on that day, wherefore they themselves joyfully commemorated the reception of it. They offered wine indeed, because that promotes hilarity; as also pulse, which they call "*tritilla*," that being in ancient times a child's first spoon meat. Vid. Censor de Die natal. & Boxborn. Quæst. Rom. p. 94.

Genius is derived from "*Gigno*;" and therefore Horace styles him

*Natale Comes qui temperat astrum,
 Humanæ Deus Naturæ.*

Vid. Notes on El. viii. B. 1. and El. v. B. 4.

Ver. 2. This Cornutus, if Broekhusius is not mistaken in his conjecture, is he who was prætor of Rome A. U. C. 710. in the consulate of Hirtilius and Pansa; who, in their absence, enjoyed the consular authority, and was appointed by the senate "*supplicationes per 50 dies ad omnia pulvinaria constituere*," for the victory obtained at Modena. Vid. Cicer. Lib. 10. Ep. fam. 12. & 16. See also the notes on El. v. B. 3.

However as this supposition is founded upon the sameness of name only, so the person, whose birth our poet celebrates, may have been some young nobleman of the Sulpician or Cæcilian families, Cornutus being a surname in both these houses.

It was the custom, says Dart, to enjoin silence at all religious invocations; the priest began with the known expression of "*Favete linguis*," lest

any words of ill omen should injure the sacrifice. Vid. Hor. Ep. Lib. iii. Ode 1. and Virg. *Æn.* Lib. 5. but as Tibullus enjoins "bona verba," which Ovid calls "bonæ preces:" it would seem, that silence was not so much expected, as that the words and prayers of the spectators should have a tendency to further the happiness of him, for whom the offering was made.

The different manners in which these two lines are printed in the original, have occasioned a variety of interpretations.

See a more particular account of the festival of Genius in Ovid Lib. 3. *Trist. El.* 13. Lib. 5. *Trist. El.* 5. also Lib. 1. *Fast.* V. 72. and Lib. 3. *Pont. Epist.* 4.

Ver. 9. Although among the Romans each person was supposed to have his own distinct genius, who was born and died with him, and consequently, though genius was but a plebeian divinity, yet it appears from this, and some other passages in the classics, that the genii were thought to have a power of bestowing important favours on those they attended. They seem, however, to be nothing else, but the particular bent of each person, made into a deity; and as every body's own temper is, in a great measure, the cause of his happiness or misery, they were supposed to share in all the enjoyments and sufferings of the persons they attended. Hence, probably, come those expressions among the ancients, of indulging or defrauding your genius. The Comes, or presiding genius of the sex, was a female, and called Juno. The women, as well as their admirers, used to swear by this deity. Of the latter we have an instance in the last elegy of the last book of Tibullus; and Petronius gives us a pleasant instance of the former, "*Junonem meam iratam habeam*," says the debauched Quartilla, "*si me unquam virginum fuisse memini!*" On medals these deities are sometimes dressed, like the persons over whom they presided. Thus the Juno of a vestal was habited like a nun of that order. There was no harm in this: but when the medallists represent the genius of that monster Nero, with the insignia of piety, plenty, and prosperity, we cannot help lamenting at least the depravity of these artists.

Ver. 16. *Where ruddy waters lave, &c.*] A quotation from that accurate and curious Roman traveller Pietro della Valle, will show the propriety of this expression.

"Mi maravigliai ben' assai del nome di Rosso, che si dà a questo mare: perche non è come il mar Nero, che per la sicurezza sua, che nasce dal fondo cupo e sporco, merita degnamente quel nome: in questo l'acqua è chiarissima, che si vede il fondo più, che non si fa a Posilipo la state; ed a vederla di lontano piglia, come gli altri mari, color di turchino. L'arena poi, dalla quale vogliono alcuni che il nome derivi, (son tutte bugie) è come le altre; anzi bianca assai più delle nostre: di maniera, che il nome non può venir da altro, che dal nome proprio di quel rè Eythra, sepolto in un' isola del oceano meridionale come dice Strabone, che significava Rosso; dal quale, come si vede in uso appresso i Latini, tutto quel mare, e

non il solo seno Arabico, che è una particella di esso, prese di Rosso il nome; che da' moderni poi, forse perche così lo chiama la Sacra Scrittura nel passaggio degli Ebrei, al seno Arabico, di cui parliamo, più spetialmente a stato appropriato."—Broekhus. p. 232.

Ver. 19. The original of this passage Mr. Dart, in conformity to Achilles Statius, interprets,

Alas your prayers are flighted, &c.

But the subsequent part of the elegy shows the mistake.

Besides, we know the ancients supposed, that genius was never complaisant upon those occasions, never refusing any petition. The nuptial bed was consecrated to this god.

Not only men, but cities and nations had their genii. The concealment of the names of the latter was looked upon as of the highest consequence; it being believed, that when a town was invested, or a country harassed by wars, if the enemy implored them by their right appellation, they would abandon that city or nation.

Cicero twice uses the word "*cadere*" in the same sense that our poet uses it.

Ver. 20. Yellow was consecrated, by the ancients, to the god of marriage.

Ver. 23. The original of this passage is variously read. According to Heinsius's correction it is,

"Huc venias natalis avi, prolemque ministros."

But Scaliger, and other editors, print it thus,

"Huc veniat Natalis avis prolemque ministret."

The natal bird, which this reading supposes, was, according to them, the crow. It is true, *Ælian* (*de Anim. Lib. iii. c. 9.*) tells us, he was informed, that the ancients, in their marriages, were wont to invoke that bird, after their addresses to Hymenæus, it being regarded as a symbol of concord by those who married on account of children. The passage, however, upon which they built this their interpretation, plainly shows, that the crow was not looked upon, in the days of Hadrian, as propitious to marriage; and we have the authority of Virgil and Horace, not to mention Pliny the elder, for asserting, that the crow was a bird of bad omen. The "*hac Avi*" then, of the original signifies "*hoc Augurio*;" as is expressed in the version, where something of Scaliger's interpretation is also retained.

According to Vulpius they used to observe at the birth of a child, what birds either flew past or made a noise, and from these circumstances predicted good or bad fortune to their progeny. But as Cupid some few lines before is represented with "*Strepitantibus alis*," that critic is of opinion that the "*Natalis Avis*" mentioned in the text, is the god of love, who, at the birth of Cornutus and his wife, gave happy omens. But though it is true, that Bion has represented love as a large bird, the interpretation seems too far-fetched for Tibullus.

ELEGY III.

My fair, Cornutus, to the country's flown,
 Oh how insipid is the city grown!
 No taste have they for elegance refin'd;
 No tender bosoms who remain behind:
 Now Cytherea glads the laughing plain,
 And smiles and sports compose her sylvan train.
 Now Cupid joys to learn the ploughman's phrase,
 And clad a peasant o'er the fallows strays.
 O how the weighty prong I'll busy wield!
 Should the fair wanderer to the labour'd field; 10
 A farmer then the crooked ploughshare hold,
 Whilst the dull ox prepares the vigorous mold:
 I'd not complain though Phœbus burnt the lands,
 And painful blisters swell'd my tender hands.

Admetus' herds the fair Apollo drove,
 In spite of medicine's power, a prey to love;
 Nor aught avail'd to sooth his amorous care,
 His lyre of silver sound, or waving hair.
 To quench their thirst, the kine to streams he led
 And drove them from their pasture to the shed: 20
 The milk to curdle, then, the fair he taught,
 And from the cheese to strain the dulcet draught.
 Oft, oft his virgin-sister blush'd for shame,
 As bearing lambkins o'er the field he came!
 Oft would he sing the lightning vales among,
 Till lowing oxen broke the plaintive song.
 To Delphi, trembling anxious chiefs repair,
 But got no answer, Phœbus was not there.
 Thy curling locks that charm'd a stepdame's eye,
 A jealous step-dame, now neglected fly! 30

To see thee, Phœbus, thus disfigur'd stray!
 Who could discover the fair god of day?
 Constrain'd by Cupid in a cot to pine,
 Where was thy Delos, where thy Pythian shrine?
 Thrice happy days, when love almighty sway'd!
 And openly the gods his will obey'd.
 Now love's soft power's became a common jest—
 Yet those, who feel his influence in their breast,
 The prude's contempt, the wise man's sneer despise,
 Nor would his chains forego, to rule the skies. 40
 Curs'd farm! that forc'd my Nemesis from town,
 Blasts taint thy vines, and rains thy harvests drown.
 Though hymns implore your aid, great god of
 wine!

Assist the lover, and neglect the vine;
 To shades, unpunish'd, ne'er let beauty stray;
 Not all your vintage can its absence pay!
 Rather than harvest should the fair detain,
 May rills and acorns feed th' unactive swain!
 The swains of old, no golden Ceres knew,
 And yet how fervent was their love and true? 50
 Their melting vows the Paphian queen approv'd,
 And every valley witness'd how they lov'd.
 Then lurk'd no spies to catch the willing maid;
 Doorless each house: in vain no shepherd pray'd.
 Once more ye simple usages obtain!
 No—lead me, drive me to the cultur'd plain!
 Enchain me, whip me, if the fair command;
 Whipp'd and enchain'd, I'll plough the stubborn
 land!

NOTES ON ELEGY III.

NEMESIS, to whom the remaining elegies in this book are addressed, had gone from Rome, to her estate in the country, to be present, as is supposed, at the festival of the god Terminus, which was annually celebrated about the 21st of February. As the poet was deeply enamoured of Nemesis, her departure gave him great uneasiness; but being informed, that she meant to continue at her seat till the vintage and harvest were past, he determined to follow her in the dress of a peasant, and by getting himself employed in her fields, thus to enjoy the satisfaction of beholding her undiscovered. Cornutus probably objected to the disgrace of this metamorphosis; but to this Tibullus gave an appropriated answer, the god of poets, Apollo himself, in circumstances analogous to mine, said he, abandoned heaven, and became

the herdsman of Admetus: Nay, so thoroughly was that deity mastered by love, that he withdrew his attention from the Delphian shrine, &c. and submitted to perform the meanest rural drudgeries.

As Tibullus deemed his friend's approbation of consequence, he enumerates these servilities, and therefore the translator cannot help thinking that the line

Ipse Deus, &c.

and the three following, being descriptive of these, are genuine. What farther confirms the translator in his opinion of their authenticity, is, that Ovid makes use of the same argument in his *Art of Love*.

But probably, the example of Apollo had not all the influence on the uninspired and laughing Cor-

Titus, that our poet could have wished. Tibullus therefore curses the occasion of his amorous travesty, exclaims against agriculture, and wishes for a return of the golden age; but suddenly changing his tone, he offers himself to the meanest and most laborious employments of the country, to enjoy the felicity of obeying his mistress.

Propertius's nineteenth elegy, Lib. 2. and Ovid's beautiful invitation to Corinna, from his country seat, may be compared with this.

Ver. 5. Hercules Strozza, no mean poet of Ferrara, has happily imitated this passage of Tibullus;

Rura peto; valeatque forum, valeantque sodales.

Et Venus et Veneris cessit in arva puer.

Pascit Amor pecus; at numerum Cytherea recenset:

Vomera dura gravi jugera findit Hymen.

Et dominam mirantur Oves, dominumque voluerem:

Vicinaeque rudis combibit agna faces.

Plus solito petulans aries salit; idaeque tellus

Sentit aratori numen inesse suo.

Lib. i. Am. El. 2.

Strozza inherited the poetical talent of his father Titus.

Ver. 7. It is not improbable, as Broekhusius remarks, that Tibullus was indebted to Moschus's Epigram *Eis iōta arotrionta*, for this thought.

Ver. 9. Hammond's seventh elegy is almost a translation of this.

Ver. 15. Mythologists assign different reasons for Apollo's absence from heaven; but whatever the cause was, love (according to these gentlemen) soon made him less solicitous to regain his native skies. Alceſtis, the wife of Admetus was his favourite; but it is probable, that all his endeavours to gain that lady proved ineffectual; for when Admetus, in a dangerous fit of illness, consulted the oracle for a remedy, and was answered, that he must perish unless another would die in his room, she, with a disinterestedness and love peculiar to conjugal fidelity, became the willing sacrifice, and by her death recovered her husband. It happened fortunately, that Hercules arrived at Admetus's palace the very day that Alceſtis was sacrificed; and having been well entertained by that prince, expressed his gratitude to him by descending into hell, foiling death, and bringing back again Alceſtis to her beloved husband. Upon this fable Euripides has founded one of his most pathetic tragedies.

The ladies are not greatly indebted to the mythologists, who have unanimously represented Apollo, though *αι καλος και αι νεος*, always beautiful, and always young, as unsuccessful in his amours: but whatever reason they have to complain, those who are fond of poetry have none; as the repulse that god met with from Daphne, hath given rise to a piece in Waller, which for ease of numbers, and happiness of fabulous allusion, is surpassed by few modern poems. Vid. his story of Daphne and Phoebus applied.

Ver. 19. If love had so much power over

Apollo, as to make him undergo, not only the most servile drudgeries, but also to neglect the fate of nations; surely, I may be excused, argues our poet, when the same passion obliges me to become a ploughman. But should not Tibullus have added, that as his Nemesis every way excelled Apollo's flame; so he himself, in acting the part he did, was more excusable than the deity? This gallant addition, Mr. Prior, had he produced Phoebus's conduct as an apology for his own, would not have omitted, though Mr. Hammond has.

Ver. 21. Homer, Il. 5. mentions the juice of the fig, as applied to this purpose. All acids coagulate milk.

Nor was Apollo only bountiful to the swains in those respects: Callimachus records many other instances of blessings, which, in his absence from heaven, he bestowed on the country.

Φαῖδρον καὶ Νόμιον κικλήσκουσιν ἔξ Ἰτι κῆρυξ
Ἐξοτ' ἵπ' Ἀμφρήσω ζυγῆτιδας ἱποφύιν ἱππας
Ἥβησ' ὑπ' ἰωῶτι κακὰ σμινος Ἀδμήτοις, &c.

Vid. his Hymn *Eis Απολλωνα*, V. 46. &c.

Which Prior has thus translated,

Thee, Nomian, we adore, for that from heaven
Descending, thou on fair Amphryſus' banks
Didst guard Admetus' herds; thence the cow
Produc'd an ampler store of milk, and the she-goat

Not without pain dragg'd her distended udder,
And ewes that erst brought forth but single lambs, [cattle
Now dropp'd their twofold burdens; blest the
On which Apollo cast his favouring eye.

Ver. 23. Valerius Flaccus has imitated this thought in the first book of his Argonauts; a poem, which, however little read, is by no means destitute of many striking poetical beauties.

Te quoque dant campi tauro pastore phœxi
Felices Admeti. Tuis nam pendet in arvis
Delius, irato Steropen quod fuderat arcu.
Ah quoties famulo notis soror obvia sylvis
Flevit, ubi Oſſæ captaret frigora quercus,
Pecderet et pingui mersos Bæbeide crines!

V. 444.

Ver. 31. As the ancients supposed, that Apollo showed a particular fondness for fine long curling hair, they never failed in their addresses to that god, to praise him, as possessing that ornament. Hence, in the hymns ascribed to Orpheus, Apollo is styled *χευσοκεμος*, and by other Greek poets *ακροκεμης* and *ακαιοκεμος*, and by the Latins *Crinitus*. In imitation of their patron-god, the bards of old affected to wear long hair. Thus Virgil represents Jopas.

Phavorinus, in a quotation which Stobæus has preserved of his, uses *Ζητεω* in the same sense as Tibullus uses "querere" in this passage. Serm. 64.

Ver. 34. Delos is an island in the Ægean sea, the most famous of the Cyclades, the birth-place of Apollo and his sister Diana; upon which account it was held in such reverence by the an-

cients, that when the Persians, in one of their expeditions against Greece, anchored there with a thousand ships, nought belonging to the island was violated by the army.

Etymologists say, it obtained the name of Delos, *απὸ τῆς Δηλῶν*, from its suddenly emerging from the waves at the command of Neptune. Latona, not daring to remain long during her pregnancy in a known place, the jealous Juno having dispatched the serpent Python in pursuit of her, was here safely delivered. Apollo afterwards flew this serpent. Vid. Ovid's Met. The Athenians, in performance of a vow made by Theseus, sent every year a sacred vessel to Delos, with offerings to that god. Till this vessel returned to Athens, the punishment of criminals, however guilty they were, was respited. As soon as Apollo's priest crowned the poop of the vessel, which was the signal for sailing, the city was purified.

Delphi was a city of Phocis, in the neighbourhood of Parnassus, built by Delphus the son of Apollo, or Neptune. It was of difficult access, being situated among rocks and frightful precipices. Here Apollo had a famous temple, to which other nations, as well as the Greeks, repaired in times of public distress, to learn, how an end might be put to their calamities, as also to be informed of the manner in which any enterprise ought to be conducted, or what would be the issue of any event. The pythoness, or priestess of this temple was famed for the ambiguity of her answers. As nothing is more profuse than superstitious credulity, the riches brought to this temple were immense; insomuch that the retainers to the temple could well afford to maintain spies every where, to inform them of what passed, or was likely to happen, as well as poets, to versify their responses. The name by which Delphi now goes, is *Salona*. Vid. Steph. Dict. See also the

Abbe Banier for the immense wealth of this temple.

Ver. 41. Editions in general read,

At tibi dura seges, &c.

And the commentators make "seges" here to signify Nemesis's estate; but as there is no authority for this application of that term in any other classic, Broekhusius adopts Heinsius's correction,

At tibi dura Ceres, &c.

And this the Dutchman thinks warranted by the immediate introduction of Bacchus in the original. The translator, however, has preferred the first reading, that being supported by most MSS.

Ver. 48. *May rills and acorns, &c.*] This thought shows the intenseness of our author's passion for Nemesis. The Romans highly esteemed agriculture. Cicero speaks of it as "*proxima sapientiæ*;" and Tibullus seems to have been of the same opinion.

The wise and good Boethius has drawn no contemptible picture of this primeval simplicity, Lib. ii. Carm. 5. although we cannot agree with him, when he wishes for a return of that state.

Ver. 55. *Once more ye simple usages obtain!*

No—lead me, drive me to the cultur'd plain!

This abrupt refusal of a state from which he expected so much happiness, is so strongly expressive of love, that it may be put in competition with any of the most boasted passages in the heroic poets, where a sudden change of impetuous desire is expressed.

Slaves were employed in performing the more servile offices of husbandry; and their most faithful labours seldom exempted them from the chain. It is indeed shocking to humanity to think, with what cruelty these unfortunate wretches were treated by their Roman masters. See Mr. Hume's entertaining Discourse on the Populosity of Ancient Nations.

ELEGY IV.

CHAINS, and a haughty fair I fearless view!
Hopes of paternal freedom all adieu.
Ah when will love compassionate my woes?
In one sad tenour my existence flows:
Whether I kiss or bite the galling chain,
Alike my pleasure, and alike my pain.
I burn, I burn, O banish my despair!
Oh ease my torture, too too cruel fair:
Rather than feel such vast, such matchless woe,
I'd rise some rock o'erspread with endless snow! 10
Or frown a cliff on some disastrous shore,
Where ships are wreck'd, and tempests ever roar?

In pensive gloominess I pass the night,
Nor feel contentment at the dawn of light.

What though the god of verse my woes indite,
What though I soothing elegies can write,
No strains of elegy her pride controul;
Gold is the passport to her venal soul.
I ask not of the nine the epic lay;
Ye nine! or aid my passion or away. 20
I ask not to describe in lofty strain,
The sun's eclipses, or the lunar wane;
To win admission to the haughty maid,
Alone I crave your elegiac aid;
But if she still contemns the tearful lay,
Ye, and your elegies, away, away!
In vain I ask, but gold ne'er asks in vain;
Then will I desolate the world for gain!

For gold I'll impious plunder every shrine;
 But chief, O Venus, will I plunder thine! 30
 By thee compell'd, I love a venal maid,
 And quit for bloody fields my peaceful shade:
 By thee compell'd, I rob the hallowed shrine,
 Then chiefly Venus will I plunder thine!
 Perish the man! whose curst industrious toil
 Or finds the gem, or dyes the woolly spoil;
 Hence, hence the sex's avarice arose,
 And art with nature not enough bestows:
 Hence the fierce dog was posted for a guard,
 The fair grew venal, and their gates were
 barr'd. 40
 But weighty presents vigilance o'ercome,
 The gate bursts open, and the dog is dumb.
 From venal charms, ye gods! what mischiefs
 flow!
 The joy, how much o'er-balanc'd by the woe!
 Hence, hence so few, sweet love, frequent thy
 fane,
 Hence impious slander loads thy guiltless reign.
 But ye! who sell your heavenly charms for
 hire,
 Your ill-got riches be consum'd with fire!
 May not one lover strive to quench the blaze,
 But smile malicious, as o'er all it preys! 50

And when ye die, no gentle friend be near,
 To catch your breath, or shed a genuine tear!
 Behind the corpse, to march in solemn show,
 Or Syrian odours on the pile bestow.
 Far other fates attend the generous maid,
 Though age and sickness bid her beauties fade,
 Still she's rever'd; and when death's easy call
 Has freed her spirit from life's anxious thrall,
 The pitying neighbours all her loss deplore,
 And many a weeping friend besets the door; 60
 While some old lover touch'd with grateful woe,
 Shall yearly garlands on her tomb bestow;
 And home returning, thus the fair address,
 'Light may the turf thy gentle bosom press.'
 'Tis truth; but what has truth with love to do?
 Imperious Cupid, I submit to you!
 To sell my father's seat should you command;
 Adieu my father's gods, my father's land!
 From madding mares, whate'er of poison flows,
 Or on the forehead of their offspring grows, 70
 Whate'er Medea brew'd of baleful juice,
 What noxious herbs Emathian hills produce;
 Of all, let Nemesis a draught compose,
 Or mingle poisons, feller still than those;
 If she but smile, the deadly cup I'll drain,
 Forget her avarice, and exult in pain!

NOTES ON ELEGY IV.

TIBULLUS, finding all his endeavours to gain the heart of Nemesis unavailing, determined to conquer his affection for her; he accordingly put his resolution in practice; but finding his every effort ineffectual, he gave over the struggle, yielded to his destiny, and sent her the foregoing beautiful elegy, in which he acknowledges the sovereignty which her charms had gained over him, and entreats her to mitigate her cruelty.

The whole poem is a tempest (if the expression may be allowed) of amorous and contrary affections. By these our author is particularly distinguished from Ovid and Propertius. These poets generally begin and end their elegies with the same passion; whereas, the reader will often find in one of Tibullus's, all those contrarieties and transitions, which peculiarly characterize the passion of love, and are so beautiful in poetry. This justifies the elegant encomium, which Joannes Baptista Pius bestows on our author; "*Princeps elegorum poetarum est dubio procul Al. Tibullus, quia vere amantem agit. Modo superbit, modo supplicat, annuit, renuit, minatur, intercedit, indignatur, devovet, orat, inconstans est, quod vult, non vult. quod optavit, refugit, secum dissidens, ut in vera Cupidinis rota circumagi credas.*"

Major Pack's version of this elegy, would have been more in the spirit of Tibullus, had he mingled less wit with it.

Ver. 1. Chains, imprisonment, flames, darts, have

been huddled together, by many a gentle writer, who imagined himself qualified for telling a curious love-tale; and probably they have drawn much self-complacency from this passage of Tibullus, who has expressed, and probably felt all the soft distresses of the tender passion, superior to every other writer. But whatever Tibullus feels, he never loses his judgment and correctness in writing. A little attention will convince us, that the metaphor here is simple, entire, and uniformly pursued throughout. The tyranny of the passion of love over reason; the waywardness of a love-stricken mind; and the distresses which it feels from the caprice and frowns of an haughty mistress, suggested to Tibullus, that the most abject state of slavery aptly represented the condition of a drooping lover. Let us not estimate the severity of this servitude by our own customs and manners. We must step into America to see cruel instances of it: or if we look into ancient times we shall find, that those, who were servants utterly lost their liberty, lost all power over their actions, and almost over their thoughts themselves: that those of them whose condition was the worst, were employed in the heaviest labours; were constantly kept in chains; had severe task-masters over them; and upon every slight occasion, were exposed to some of those sharp torments, which a slave in Plautus thus humourously describes:

—Stimulos, laminas, cruceſque compedeſque,
Nervos, catenas, carceres numellas, pedicas, beias,
Indoctrineſque acerrimos, gnaroſque noſtri tergi.

"Laminas" here answers to "faces" in Tibullus. They were heated bars of iron uſed in the puniſhment of ſlaves. Thus Cicero, in his accuſation of Verres, for treating a Roman citizen as a ſlave, charges him, "Quid, cum ignes et arden-tes laminæ, ceterique cruciatus admovebantur?" So that when Tibullus cries out, "io remove, ſæva puella, faces," he is ſtill deſcribing the metaphorical ſlavery he was fallen into. We ſhall now know what to do with the following line,
Et ſeu quid merui, ſeu quid peccavimus, uror.

One of the commentators thinking it hard that a man ſhould be burnt for his good deſerts, has explained "quid merui" by "quid deliqui;" he might as well have ſaid "peccavi;" but "peccavimus" followed, and the critic was reſolved to vary the word, if he could not the image; but Tibullus well knew how to do both. His deſign was to repreſent the hardneſs of his ſlavery; and to this purpoſe he declares, that ſuch was the capricious cruelty of his miſtreſs, ſuch the ſeverity of love his taſk-maſter and torturer, that he was not only cloſely kept in chains, but had the torture wantonly applied, whether he was faithful to the offices love enjoined, or was rebellious, mutinous, or negligent; that is, that his miſtreſs was cruel, and love a torment to him, as well when he attempted to pleaſe her, as when he was impatient under her harſh uſage, and endeavoured to regain his eaſe and liberty. B.

Ver. 10. As the ancients had but imperfect aſſurances of a future ſtate, many of them regarded mere animal life, as the greateſt of bleſſings, and dedicated every hour to ſome ſenſual gratification. This manner of living, at leaſt, was not unuſual among the Epicureans; a ſect, from which, we have reaſon to think, Tibullus was not averſe. His miſery, therefore, muſt have been extreme, when it forced him to wiſh for ſuch a metamorphoſis, as not only would have deprived him of every ſatisfaction of ſenſe, but rendered him an eternal curſe and reproach to all ſeaſaring people.

Ver. 17. Some critics contend, that Tibullus here aſcribes to Apollo the invention of elegy, and thereby determines the diſpute, which ſo warmly engaged the grammarians of the Auguſtan age; but others with more reaſon ſuppoſe that the poet, in this place, intended only in general to repreſent this god as the author and patron of poetry. The tranſlator has given the line a ſenſe different from both; with what propriety the reader will determine.

Ver. 29. The "facinus" and "cedes," in the original, allude to the many maſſacres and proſcriptions, which were the dreadful effects of thoſe civil wars, which at laſt extinguished the liberty of Rome. The butcheries by which Octavius acquired the ſovereignty of the world, fixed ſuch diſgrace upon himſelf, and ſo deeply ſtained his family with the imputation of cruelty, that even the mercies of Cæſar are become ſuſpected. In-

deed, neither Auguſtus nor Julius are to be accuſed of having been the firſt, who ſubverted the conſtitution of their country; for this was done in the days of Marius and Sylla: and if we conſider the venality of the people, the luxury of the ſenate, the ſmall number of good men, who ſurvived the public calamities; and add to this, the rapaciouſneſs of the generals, and governors of provinces; we ſhall be induced, perhaps, to allow, that Auguſtus had it not in his power to comply with Agrippa's advice, of reſtoring Rome to its old plan of government.

Ver. 30. Our poet ſeems here unjuſtly to accuſe the god of love; for no paſſion is leſs mercenary than that which he inſpires. It muſt be admitted, however, that Tibullus acts a gallant part at leaſt, in endeavouring to remove an aſperſion from his miſtreſs; though his regard for Cupid may be called in queſtion, when he attempts to fix this odium upon him. He ſeems to be aware of this, and therefore involves alſo in his cenſure thoſe who certainly better deſerved it.

Ver. 35. Propertius derives female infidelity, and female avarice, from the ſame ſources. See Lib. iii. El. 11. which is a keen and witty, if not a juſt invective.

Ver. 42. A bawd, in Plautus, thus deſcribes the behaviour of a new lover.

——— Ubi de pleno promitur
Neque illa ſcit quid det, quid damni faciat, illi rei
ſtudet.
Vult placere ſeſe Amicæ, vult mihi, vult pediſſequæ,
Vult ſamulis, vult etiam ancillis, et quoque catulo
meo [gaudeat,
Subblanditur novus amator, ſe ut cum videat,
Aſin, *Ad* i. l. 5.

Andreas Maranus, a poet of Vicenza, ſeems to have had this paſſage of Tibullus in his eye in one of his elegies.

Optamus ſero, quæ oblata remiſimus ultro.

Utere felici dum licet eſſe tibi.

Mox ſubeunt caſus, ſubeuntque pericula mille.

Advigelat cuſtos, advigelatque canis.

Intertia obrepunt morbi vel decolor ætas,

Blanditias nec fas dicere, nec facere.

Vulp.

But more correſpondent to our poet's ſentiments is the following Greek Epigram:

Ἦν μὲν το χαράσμα φέρης φίλος οὐτε θυμῶρος
Ἐν ποσίν, οὐτε κυνὶ ἐν προθύροις δίδεται.

Will the reader pardon me one quotation more? It is a humorous epitaph, on a dog which belonged to a married lady of intrigue.

Latratu fures excepi, mutus amantes,

Sic placui Domino, ſic placui Dominæ.

Ver. 48. By the pronoun "tibi," in the text, the poet ſeems to have had ſome particular perſon in his eye.

The ancients looked upon it as one of the moſt dreadful miſfortunes, which could befall any perſon, to be deprived of funeral honours.

The inculcating of this, was one of the wisest contrivances of ancient legislation, and was transmitted originally from Egypt to Greece. By it, not only private murders, but vices of all kinds, were, in a great measure, checked or prevented. For, as an ingenious writer observes, it was a custom among the Egyptians, before they interred their dead, to canvass over their actions, and to bring their whole past life to a trial, before judges appointed for that purpose. Those who, upon a fair and impartial examination, were found to have lived a virtuous and good life, were dismissed from the tribunal, with praises proportionable to their merit, recommended as worthy examples to posterity, and assigned over to the society of the blessed in the shades below; but others, in whose characters vice and mischief were predominant, were publicly branded with infamy, and assigned over to the regions of affliction. (*Diod. Sicul.*) As every one was convinced, that he should undergo this impartial trial after death, wherein his former abilities, power, and fortune, could avail nothing to avert a proper and just sentence; such examples were powerful checks to vice, and pleasing incentives to virtue. The legislators having found their end in this institution, enforced the observance of it, by the superstition already mentioned, that those whose bodies were unburied, should wander in a state of restlessness a hundred years on the banks of the river Styx. Now, this was invented to obviate by terror, the clandestine interment of those whom the surviving parents or relations were afraid to bring to this test of justice, being desirous to shelter the memory of the defunct from ignominy, by an omission of this ceremony. The public interment of the body, being first insisted upon, only as concomitant to the rites, and by corruption afterwards, made a necessary part of them.

Ver. 62. Joannes Baptista Pius (*Annot. poster. c. 115.*) imagines that these garlands were composed solely of parsley; but Magius has shown the falsity of this. Broekhusius is of opinion, that the poet, in this place, meant garlands of roses; and indeed innumerable quotations might be brought from the classics to prove, that roses were used of old in the adorning of tombs.

Ver. 65. Propertius says,

Sit tibi terra levis, mulier dignissima vita.

Hence we often meet with the initial letters S. T. T. L. upon ancient tomb-stones.

Ver. 98. Upon such verses of our author as these, have the commentators reared the trite opinion, that Tibullus, by his extravagance, squandered away his fortune. The text, however, cannot be construed into any such meaning. Ovid, with more justice, might be said to have spent his inheritance from the following lines;

Illud et illud habet, nec ea contenta, rapina est,
Sub titulum nostros misit avara lares.

Remed. Amor.

But, in truth, small stress is to be laid upon such expressions in the poets; and therefore Broekhusius might have spared the censure he passes on Tibullus, on account of this passage, elegy delighting in imaginary distresses.

Ver. 69. Critics are greatly divided in their opinions about the "hippomanes." Theophrastus, Aristotle, and Theocritus mention a plant of that name, the smell of which made mares run mad for the stallion. While some commentators assert, that it was a fig-like excrescence which grew on the forehead of a foal; and which being bit off and swallowed by the mother, made her passionately fond of her offspring. Hence it came to be used in philtres of old, and to be applied metaphorically, to express love. Others contend, that it was a poison, "quod equæ in libidinem excitatæ e locis emittebant."

Ver. 72. The Thessalians being a wild and uncivilized people, it is no wonder that they were addicted to the follies of witchcraft. Their country produced many powerful plants; and some of the first physicians we read of were born there.

The word "venenum" does not always mean poison, since Horace, and other approved writers, use it often to signify the juice of such magical herbs, as were proper to correct the malignity of poison. It also sometimes signifies a love-potion. In this place, however, it stands for poison, and not a philtre; for our poet at present was in no need of the latter, being already sufficiently fond of Nemesis: but whether he would have been in reality as good as his word, let the lover determine.

Mr. Hammond's first elegy is an imitation of this.

ELEGY V.

To hear our solemn vows, O Phoebus deign!
A novel pontiff treads thy sacred fane:
Nor distant hear, dread power! 'tis Rome's request,
That with thy golden lyre thou stand'st consent:

Deign mighty bard! to strike the vocal string,
And praise thy pontiff; we, his praises sing:
Around thy brows, triumphant laurels twine,
Thine altar visit, and thy rites divine:

New flush thy charms, new curl thy waving hair;
O come the god in vestment, and in air! 10

When Saturn was dethron'd, so crown'd with bays,
So rob'd, thou sungst th' almighty victor's praise.
What fate, from gods and man, has wrapt in night,
Prophetic flashes on thy mental sight:

From thee, diviners learn their prescient lore,
On reeking bowels, as they thoughtful pore:
The seer thou teachest the success of things,
As flies the bird, or feeds, or screams, or sings:
The sibyl-leaves if Rome ne'er sought in vain;
Thou gav'st a meaning to the mystic strain: 20
Thy sacred influence may this pontiff know,
And as he reads them, with the prophet glow.

When great Æneas snatch'd his aged fire,
And burning Lares, from the Grecian fire,
She *, she foretold this empire fix'd by fate,
And all the triumphs of the Roman state;
Yet when he saw his Ilion wrapp'd in flame,
He scarce could credit the mysterious dame.

(Quirinus had not plann'd eternal Rome,
Nor had his brother met his early doom, 30
Where now Jove's temple swells, low hamlet's
stood,

And domes ascend, where heifers crop'd their food.
Sprinkled with milk, Pan grac'd an oak's dun
shade,

And scythe-arm'd Pales watch'd the mossy glade;
For help from Pan, to Pan on ev'ry bough
Pipes hung, the grateful shepherd's vocal vow,
Of reeds, still lessening, was the gift compos'd,
And friendly wax th' unequal junctures clos'd.
So where Velabrian streets like cities seem,
One little wherry plied the lazy stream, 40
O'er which the wealthy shepherd's favourite maid
Was to her swain, on holidays, convey'd;
The swain, his truth of passion to declare,
Or lamb, or cheese, presented to the fair.)

The Cumæan Sibyl speaks.

"Fierce brother of the power of soft desire,
"Who fly'st, with Trojan gods, the Grecian fire!
"Now Jove assigns thee Laurentine abodes,
"Those friendly plains invite thy banish'd gods!
"There shall a nobler Troy herself applaud,
"Admire her wanderings, and the Grecian fraud!
"There, thou from yonder sacred stream shalt rise
"A god thyself, and mingle with the skies! 51
"No more thy Phrygians for their country sigh,
"See conquest o'er your shatter'd navy fly!
"See the Rutulian tents, a mighty blaze!
"Thou, Turnus! soon shalt end thy hateful days!
"The camp I see, Lavinium greets my view!
"And Alba! brave Ascanius! built by you:
"I see thee, Ilia! leave the vestal fire;
"And, clasp'd by Mars, in amorous bliss expire!
"On Tyber's bank, thy sacred robes I see, 61
"And arms abandon'd, eager god! by thee.
"Your hills crop fast, ye herds! while fate allows;
"Eternal Rome shall rise, where now ye brouze:
"Rome, that shall stretch her irresistible reign,
"Wherever Ceres views her golden grain;
"Far as the east extends his purple ray,
"And where the west shuts up the gates of day.

* The Sibyl.

"The truth I sing; so may the laurels prove
"Safe food, and I be screen'd from guilty love."

Thus sung the Sybil, and address'd her prayer, 71
Phœbus! to thee, and madding, loos'd her hair.
Nor, Phœbus! give him only these to know,
A farther knowledge on thy priest bestow:
Let him interpret what thy fav'rite maid,
What Amalthea, what Mermessia said:
Let him interpret what Albuna bore
Through Tyber's waves, unwet, to Tyber's far-
thest shore.

When stony tempests fell, when comets glar'd,
Intestine wars their oracles declar'd: 80

The sacred groves (our ancestors relate)
Foretold the changes of the Roman state:
To charge the clarion sounded in the sky,
Arms clash'd, blood ran, and warriors seem'd to
die:

With monstrous prodigies the year began:
An annual darkness the whole globe o'er-ran;
Apollo, shorn of every beamy ray,
Oft strove, but strove in vain, to light the day:
The statues of the gods wept tepid tears;
And speaking oxen fill'd mankind with fears! 90

These were of old: No more, Apollo! frown,
But in the waves each adverse omen drown.
O! let thy bays, in crackling flames ascend;
So shall the year with joy begin and end!
The bays give prosperous signs; rejoice ye swains!
Propitious Ceres shall reward your pains.
With must the jolly rustic purpled o'er,
Shall squeeze rich clusters, which their tribute
pour,

Till vats are wanting, to contain their store.
Far hence, ye wolves! the mellow shepherds
bring 100

Their gifts to Pales, and her praises sing.
Now, fir'd with wine, they solemn bonfires raise,
And leap, untimorous, through the strawy blaze!
From every cott unnumber'd children throng,
Frequent the dance, and louder raise the song:
And while in mirth the hours they thus employ,
At home the grandfire tends his little boy;
And in each feature pleas'd himself to trace,
Foretells his prattler will adorn the race.

The sylvan youth, their grateful homage paid, 110
Where plays some streamlet, seek th' embowering
shade;

Or stretch'd on soft enamell'd meadows lie,
Where thickest umbrage cools the summer sky:
With roses, see! the sacred cup is crown'd,
Hark! music breathes her animating sound:
The couch of turf, and festal tables stand
Of turf, erected by each shepherd-hand;
And all well-pleas'd, the votive feast prepare,
Each one his goblet, and each one his share.
Now drunk, they blame their stars and curse the
maid;

But sober, deprecate whate'er they said. 121

Perish thy shafts, Apollo! and thy bow!
If love unarmed in our forests go.
Yet since he learn'd to wing th' unerring dart,
Much cause has man to curse his fatal art:
But most have I; the sun has wheel'd his round
Since first I felt the deadly festering wound;

Yet, yet I fondly, madly, wish to burn,
 Abjure indifference, and at comfort spurn;
 And though from Nemesis my genius flows; 130
 Her scarce I sing, so weighty are my woes!

O cruel love! how joyous should I be,
 Your arrows broke, and torch extinct to see!
 From you, my want of reverence to the skies!
 From you, my woes and imprecations rise!
 Yet I advise you, too relentless fair!
 (As Heaven protects the bards) a bard to spare!
 E'en now, the pontiff claims my loftiest lay,
 In triumph, soon he'll mount the sacred way.

Then pictur'd towns shall show successful war, 140
 And spoils and chiefs attend his ivory car:
 Myself will bear the laurel in my hand;
 And pleas'd, amid the pleas'd spectators stand:
 While war-worn veterans, with laurels crown'd,
 With Io-triumphs shake the streets around.
 His father hails him, as he rides along,
 And entertains with pompous shows the throng.
 O Phœbus! kindly deign to grant my prayer;
 So may'st thou ever wave thy curled hair;
 So ever may thy virgin-sister's name 150
 Preserve the lustre of a spotless fame.

NOTES ON ELEGY V

MESSALINUS, to whom the following noble elegy is addressed, was the son of the illustrious Messala. This young nobleman, whom both historians and poets represent, as inheriting his father's eloquence, had been appointed one of the quindecemviral priests, to whose care the keeping and interpretation of the Sibylline oracles were intrusted. As these venerable writings had been deposited by Augustus, under the statue of Apollo, in his new temple, erected on Mount Palatine, and as Apollo was supposed to preside over vaticination, and in a particular manner, over these mysterious volumes, the poet begins his poem with an address to Apollo, whom he earnestly implores to be present at the inauguration of the new pontiff. Moreover, as these writings were never consulted, but in the greatest emergency, and then only when the senate passed a decree for that purpose; and as their interpretation, even then, was thought to be suggested by Apollo, Tibullus entreats the god to assist his young friend, whenever public calamities should render it necessary for the priests to have recourse to them.

The Romans were proud of being thought the posterity of the Trojans; and their poets embraced every opportunity of making their court to the people by adopting that notion. Nor was this prejudice confined to the meaner sort of Romans; Julius Cæsar, and his successor, either believed, or effected, from political motives, to believe that they were descendants of Æneas, (Vid. in Suet. in Vit. J. Cæs. et Aug.) Nay, so far was this folly carried, that Augustus entertained a design of transferring the seat of empire from Rome to Troy; which city, by his and Julius's attention, was again in a flourishing situation. This, the Romans dreaded not a little; and to such a height did their apprehensions increase, A. U. C. 734. when Augustus was in Syria, that Horace, all courtier as he was, is supposed to have written that noble ode, "Justum et tenacem," lib. 3. ode 5, obliquely to dissuade the emperor from that

measure. As this, however, was a very delicate subject, and none knew better to flatter his patron than Horace, he abruptly breaks off,

Non hæc jocosæ conveniunt Lyræ.

Tibullus, however, not lying under the same obligations to Augustus as the lyric poet, and neither courting the smiles, nor dreading the frowns of the court, he, like a true patriot, in all the enthusiasm of poetry, introduces the Sibyl, pushing on Æneas to the new settlement, destined by Heaven for him and his followers, in Italy. This event, says the prophets, whenever it takes place, will effectually recompense you for your present loss, and future disasters, you yourself being to become a god; as your posterity, the Romans are predestined to conquer the world, of which Rome is to be the capital.

This surmise, which no commentator has touched on, throws a particular beauty on the whole of the Sibyl's speech, which otherwise appears inaptly placed, where it now is inserted.

Shall we pay a compliment to Horace and Tibullus (who probably let one another into the full scope of their patriot-productions), and suppose, that these had some weight with the emperor of the world? At all events, as Augustus professed a great veneration for the Sibylline books, and was anxious to be thought the son of Apollo (see the notes), who, he said, fought for him at the battle of Actium; the people (whose prejudices, to the removing their seat of empire, must have been augmented by our poet's well-timed prophecy), would have regarded Augustus's breach of the Sybil's orders, as the most impious of violations. Besides so flagrant a disrespect, and in one too of such eminence, might have produced the most fatal consequences to his government, by weakening the reverence which his subjects entertained for the Sybilline writings. This Augustus was too sensible not to perceive, and too political not to avoid.

But if the translator is deceived in his con-

jecture of the design, which Tibullus proposed to himself, in writing this fine poem, he, however, sincerely wishes, that the nine may always devote their raptures to the service of their country, and never prostitute their talents, in flattering tyranny, or inflaming the passions of guilty greatness. The people shall then joyfully acknowledge the language of the gods, and own the muses for the legitimate daughters of Jove.

The remaining part of the elegy is thrown, we may suppose, on purpose into an artful obscurity of connection. Most of the prodigies, which the poet mentions, are said by historians to have happened at the death of Julius Cæsar; and may we not conjecture, that Tibullus meant, by recapitulating these, to insinuate, that the gods caused the tyrant to be slain, for his attachment to Troy? This circumstance could not fail to alarm his successor, especially too as he must have been conscious, that he even outdid Julius in his affection to that city; and it is certain, that he, by no means, equalled that usurper in point of personal courage.

But if Tibullus wrote with freedom, his freedom was accompanied with decorum; for, as a Roman expresses it, it is always dangerous, "*Scribere in eum, qui potest pro scribere.*"

So the poet supplicates Apollo to avert such presages for the future; by which means, peace would return to blest Italy, and rural devotion again flourish. Tibullus supposes, that the god grants his petition, and describes the joyful ceremonies, practised by the grateful villagers, upon the occasion.

These solemnities concluding, as usual, with mirth and wine, the young peasants begin to disclose their loves, and condemn the cruelty of their mistresses. This leads our poet insensibly into a recollection of his own amorous misfortunes; for Nemesis was still inflexible. This, he says, not only impaired his health, but affected his poetical powers, so that, far from being able to do justice to great subjects, he scarce could write a little elegy. This was an artful apology for the seeming inaccuracy of his present poem. Notwithstanding all the consequences of his ill requited passion, so thorough a lover was our poet, that he did not wish to shake off his love; but only begged, that Nemesis would at last condescend to abate of her rigour; for, as Messalinus, adds he, is pushing forwards in the lists of fame, the regard and friendship which I profess for his father and himself, absolutely require a total freedom of genius, that I may celebrate those triumphs which his grateful country will soon decree him.

In the conclusion, Messala is introduced as enjoying the felicity of seeing his son triumph; upon which occasion the poet supposes, that his patron will entertain Rome with magnificent spectacles.

The poem ends with a petition to Apollo, that these things might be accomplished.

History informs, that Messalinus, by steadily treading in the footsteps of his father, was honoured with a triumph; and A. U. C. 750, had the

consulship conferred upon him; but Tibullus died many years before these things happened.

It is not easy to determine how old Messalinus was, at the time this poem was written. He had not, probably, long put on the manly gown; for we find, that Lentulus, the son of Lentulus, was chosen into the college of augurs at 17 or 18 years of age; and from this college the quindécemvirs were elected. Upon these occasions the friends of the pontiff were invited to a magnificent supper; and it is probable it was at this entertainment, that the following poem was first recited.

Ver. 9. The original here would seem extremely ridiculous to a mere modern reader. Literally translated, it signifies neither more nor less, than an entreaty to his godship to put on his holiday suit, curl his hair, and wash his face. A strange hint this to so great, so young, and beautiful a divinity as Apollo. Is it from their patron god, that some of his modern vassals have derived their ideas of dress and cleanliness? The sublimest geniuses are not exempted from paying an attention to the little decencies of life, respecting which, the fair sex are our best instructors.

The polite Callimachus, in his hymn to Apollo, draws a more amiable picture of the god of poetry, in the following verses;

Τὸν χορὸν ὦ πολλὰν ὅτι οἱ πάντα θυμὸν αἰδεῖ
Τιμησὶ, δύναται γὰρ ἐπεὶ Διὶ δέξιος ἦται.
Οὐδὲ ὁ χορὸς τὸν φοῖβον ἐφ' ἐν μόνον ἡμᾶρ αἰεῖται
Ἔστι γὰρ εὐῆμος, τίς ἀν' ἡρεῖα φοῖβον αἰδοῖ;
Χρυσᾷ τῶ πολλῶνι τὸτ' ἐνδύσιν ἢ τ' ἐπιπορπίς
Ἡ τε λυρῇ, &c.

Ver. 28, 29. &c.

Immortal honours wait the happy throng,
Who, grateful to the god, resound the song:
And honours well Apollo can command,
For high in pow'r he sits, at Jove's right hand.
But in the god, such beaming glories blend,
The day unequal to his praise will end.
His praise, who cannot with delight resound,
Where such eternal theme for song is found;
A golden robe invests the glorious god,
His shining feet with golden sandals shod:
Gold are his harp, his quiver, and his bow;
Round him bright riches in profusion flow.
His Delphic fane illustrious proof supplies,
Where wealth immense fatigues the wond'ring eyes.

On his soft cheeks no tender down has sprung,
A god for ever fair, for ever young:
His flagrant locks distil ambrosial dews,
Drop gladness down, and blooming health diffuse, &c.

Dodd.

Ver. 12. Ariosto has imitated this passage in the beginning of his third canto. The proper emblems of Apollo the poet, lyrist, or festal Apollo, were a crown of laurel, his hair finely dressed, flowing at full length, a lyre in his left hand, and wearing a magnificent robe that fell down to his feet. In this manner was this god represented in the temple which Augustus dedicated to him in the Palatium: and thus it was,

that the poets of old were habited, when they sang to the lyre at the tables of the great. Hence, as Mr. Spence observes, the propriety of the epithet "crinitas" conferred on Jopas by Virgil, which some critics have too hastily censured, as wholly foreign to the purpose.

So fond was Augustus of Apollo, that, in the medals, and other representations of that emperor, his face is what the Romans called an Apollinean face. This we know from history, that Augustus was really very beautiful; and Suetonius informs us, that some writers had even asserted, that he was in fact the son of Apollo. Vit. Aug. sect. 94. Accordingly Servius tells us, that there were statues of Augustus in Rome, which represented him under the character, and with the attributes of that god. We also know, that in a certain infamous feast made by Augustus (at which he and five of his courtiers represented the six great celestial gods, as some of the ladies of his court represented the six great goddesses), he himself chose to appear with the emblems of Apollo. All these circumstances but too plainly show, that the successor of Julius gave in to the flattery that was paid him, and that he thought himself, at least loved to be thought by others, like Apollo. But the greatest absurdity of all, as Mr. Spence justly observes, was, that because Apollo was usually represented with a particular flow of light beaming from his eyes, he must needs have it supposed that his eyes also, which were really fine, darted forth so strong a brightness, as to dazzle those who looked upon them too nearly, or too steadily. "Oculos habuit claros, ac nitidos," says Suetonius, "quibus etiam existimari volebat inesse quoddam divini vigoris, gaudebatque si quis sibi acrius contuenti quasi ad fulgorem solis, vultum submitteret." To such a pitch of extravagance does absolute power lead even the well meaning!

Ver. 16. For the lots, see notes on the third elegy of the first book; and who the augurs were, hath been explained already. The Haruspices, to whom, according to the Tuscan discipline, belong the province of explaining prodigies, by inspecting the bowels of victims, were servants of the public, and had salaries for attending the magistrates in all their sacrifices. Hence they never failed to accommodate their answers to the political views of those who employed them.

As the order of priesthood, among the Romans, was, for some ages, conferred upon none but such as were of the first nobility; by their influence over a people naturally superstitious, the balance of power was thrown into the hands of the senate and optimates, who, by this means, as Cicero observes, *De Legib. lib. iii. cap. 12.* were often enabled to check the factious attempts of the tribunes.

Minutius Felix, and other Christian writers, ascribe oracles, &c. to the intervention of the devil, or other impure spirits.

Polybius very sensibly deduces that superiority, which the Roman state had over all others, from the superstition of its vulgar. This was carried

by the statesmen, says he, to such lengths, and so effectually introduced into the private lives of the citizens, and into public affairs, that one cannot help being surprised at it. This, continues our sagacious politician, was, as I take it, projected entirely for the sake of the vulgar; for if a society of wise men only could be formed, such a scheme would be superfluous: But since the crowd is always giddy, and often agitated by the most unruly passions, secret terrors and tragical fictions are necessary to restrain them within due bounds. Lib. iv.

Nor is the Greek historian singular in his opinion. Appian Claudius Crassus asserts, that the Romans owed the great success of their arms to their observance of the sacred chickens, &c. "Parva sunt hæc," as Livy makes him speak, "sed parva ista non contemnendo, majores nostri maximam hanc rem fecerunt."

While the augurs were taking the auspices, or observing the heavens, all public business was intermitted: Julius Cæsar first broke through this; and Clodius, to facilitate the banishment of Cicero, among other laws to decoy the people, enacted, that no magistrate should take the auspices, or contemplate the heavens, while they were actually assembled on public business. This regulation took place A. U. C. 695. But the people, not content with this, extended the privilege to the uninterrupted prosecution of affairs on the "Dies fasti."

Ver. 20. *The Sybil-leaves, if Rome, &c.*] These writings were kept anciently in a coffer of stone, and deposited in a subterranean place in the Capitol. But that noble pile of buildings being destroyed by fire, A. U. C. 671, and the Sibylline books along with them, Sylla rebuilt the Capitol, and sent deputies into Ionia, to collect all the Sibylline verses, which tradition had still preserved. They succeeded so well, that a volume, consisting of a thousand lines, was composed from their gleanings, and deposited in the Capitol. Augustus Cæsar, after the death of Lepidus, when he took upon himself the office of high priest, "quidquid fatidicorum librorum Græci Latineque generis, nullis vel parum idoneis auctoribus vulgo ferebatur, supra 2, millia, contracta undique, cremavit ac solos retinuit Sibyllinos." These, indeed, when purged of what he supposed to be spurious, Augustus placed in two golden lockers, under the statue of Apollo, in the temple he had dedicated to that god on Mount Palatine, A. U. C. 726. Vide Sueton. in Vit. Aug. cap. 31.

According to Lactantius, the only Sibylline verses which were preserved sacred from the imperfection of all, but that of the quindecimvirs, were those of the Cumæan Sibyl. Her verses, as well as those of her sisters, were composed in heroic numbers, "senis pedibus;" and, if Symmachus may be depended upon, were written on linen volumes. Lib. v.

In the second Punic war, when Rome was reduced to very great difficulties, the Romans consulted the Sibylline books. These made the expulsion of the enemy from Italy to depend upon

their instituting, with extraordinary pomp, certain annual games to Apollo.

The year in which the secular games were performed, the Apollinarian were blended with them, as Macrobius informs us, Lib. xvii.

The Sibylline books continued in high reverence, till about the time of Theodosius the elder, when the greatest part of the senate being converted to Christianity, they began to be regarded as fables; and at last, in the reign of Honorius, Stilicho burnt them.

The book which at present goes under the name of the Sibylline Oracles (*σιβυλλιακοὶ χρησμοὶ*) is plainly a modern counterfeit.

Ver. 24. Troy was destroyed, A. M. 2820, Æneas landed in Italy some years after, where he married the daughter of King Latinus, and in her right succeeded to his throne. His posterity enjoyed, from him, the sovereignty, by regular succession, till Aurelius seized on the crown, in prejudice of his elder brother Numitor, and continued in quiet possession of the regal dignity, till he was slain by Romulus and Remus, the sons of Illa, Numitor's daughter. These seated their grandfather upon the throne; and two years after founded Rome. Usher places this last event before the 8th Olympiad, A. M. 3250. Others, with Varro, fix it to the 3d Olympiad, and 433d year after the destruction of Troy, in the 3960th of the Julian period, 753 years before the nativity of our Saviour.

Ver. 29. Rome was usually called "Urbs æterna," as the antiquaries, poets and medals testify. But if Rome was predestined by the gods to last for ever, how vain, how impious, would it be to remove the seat of empire to any other place?

Ver. 31. Such, at that time, was the condition of those hills, on which Rome was founded. But Petrarch and Dyer, in describing their present state, present us with a very different prospect.

Qui fu quella di Imperio antica sede
Temuta in pace e triomphante in guerra.
Fu! perch' altro che il loco hor non si vede.
Quella che Roma fu guace, s'atterra
Quest' cui l'herba copre e calca il piede
Fur Moli ad ciel vicine, & hor son terra.
Roma che'l mondo vinse, al tempo cede
Che i piani inalza e che l'altezza alterra.
Roma in Roma non e, Volcano e Marte
La grandezza di Roma a Roma han tolta,
Struggendo l'opre e di natura e di arte.
Volio soffopra il mondo e'n polve e volta
E fra queste ruine a terra sparte
In se stessa cadea morta e sepolta.

But more solemnly picturesque is the following description of the ruins of Rome by Mr. Dyer:

The rough relics of Carinæ's street,
Where now the shepherd to his nibbling sheep
Sits piping, with his oaten reed: as erst
There pip'd the shepherd to his nibbling sheep
When th' humble roof Anthise's son explor'd
Of good Evander, wealth-despising king,

Amid the thickets: So revolves the scene,
So time ordains, who rolls the things of pride
From dust again to dust. Behold that heap
Of mouldering urns (their ashes blown away,
Dust of the mighty!) the same story tell;
And at its base, from whence the serpent glides
Down the green desert street, yon hoary monk
Laments the same.

Dodley's Collect. vol. 1.

By Jove's temple, the poet means the Capitol; which in the days of Augustus, was, for structure, embellishment, and riches, one of the most noble and magnificent edifices in the world. When it was destroyed by fire, an event which we have already taken notice of, Augustus undertook to rebuild it, but died ere it was finished: this, it is said, he, in his last moments, regretted as the only thing wanting to complete his felicity. It was not, however, wholly rebuilt till the consulship of Catulus, who had the honour to dedicate it, and to have his name inscribed upon it. And indeed Catulus well merited that distinction; for, besides many other marks of his munificence, he gilded over with gold all the copper tiles of the temple. Pliny observes, that this was the first time gold was used on the outside of buildings. Thus the fire, to speak in the beautiful words of Cicero, seemed to have been sent from heaven, not to destroy, but to raise to Jupiter a temple more worthy of his majesty. On the first of January, the consuls always went in procession to this temple; and all who entered the city in triumph, repaired thither in pomp to pay their solemn thanks to Jove.

Grammarians made a difference between "Arx" and "Capitolium;" but, if we are not mistaken, they are sometimes indiscriminately used.

The verses from line twenty-ninth of the version, to that where the Sibyl addresses Æneas, may appear too long, as it diverts the attention from the Cumæan Sibyl, who is about to prophesy: But as the prophetess's allusion to the particular place, where the descendants of Æneas were to found their eternal city, might have, perhaps, appeared obscure (a defect to which prophetic language is liable) without a previous and more full description; our poet's conduct, it would seem, is not so foreign to the purpose, as might at first be imagined.

See Ovid, Fast. and Propert. lib. iv. for similar descriptions.

Ver. 32. In a former note we have taken notice of the meanness of infant Rome: Neither did it greatly improve in magnificence till many centuries after. Their temples indeed were adorned with trophies; but these, as Plutarch observes in his life of Marcellus, made the city rather dreadful than pleasing. After the conquest of Syracuse by Marcellus, the Romans became acquainted with the finer arts, and no doubt their architecture was also improved. And yet Augustus boasted, that he had found Rome ill built of brick, but left a city of marble: "marmoream se relinquere, quam lateritiam accepisset." Suet. in Aug. § 28.

Ver. 33. It was customary to sprinkle the sylvan gods Pan and Pales with milk.

Plutarch informs us, that Rome was founded on the 21st of April; and that on that day a solemn festival was ever afterwards held. This festival was formerly called by the Romans Palilia; but, upon building a temple afterwards to Roma and Venus, they changed the name of this festival into that of Romana.

Ver. 36. The curious in antiquities may either consult Servius, or Virgil's *Bucolics*, or Julius Scaliger, lib. i. Poet. cap. 4. concerning the sylvan pipe of the ancient shepherds.

Some attribute the invention of it to Pan, and others to Marsyas. It consisted of seven reeds (joined together by thread and wax) equal at top, where the lips were applied, but unequal below, "qua exibat spiritus."

But no words can convey so distinct an idea of this ancient musical instrument, as the inspection of its figure upon antiques, of which many are to be found in Boissard, Goriæus, and others. It appears from § 9. of the second epistle of that famous Italian traveller, Pietro della Valle, that the Turks, in his time, used a pipe, which they called "muscab," and which very much resembled that played on by the ancients.

Ver. 39. *So where Velabrian streets, &c.*] This was a large street in the eighth, or as others say, in the eleventh division of Rome. The place which this street afterwards occupied, had been, in former times, a boggy lake, and exposed to frequent inundations from the Tyber; but Tarquinius Priscus having effectually drained it, it became, in process of time, one of the noblest streets in the city.

Ver. 45. In Virgil, Creusa appeared to Æneas, and prophesies to him his future settlement. The ancients generally suppose, that the souls of the departed are endowed with a power of predicting future events; but no prophecy was so awfully striking, none more to be depended upon, than what proceeded from the mouth of a Sibyl. Hence the reverence paid by the Romans to the Sibylline books; and hence it was that Augustus himself affected so much to rely upon their declarations. Thus has Tibullus happily blended sublimity with art. The Sibyl concludes her prophecy with a prayer to Apollo, by which she interests that god in the events of her prediction; and from this circumstance, the propriety of our poet's address to Apollo, in the beginning of the elegy, more conspicuously appears.

Poetical prophecy makes the reader acquainted, before hand, with some events, which are to happen in the progress of the poem: and prevention (as an elegant critic calls it) is when such things are spoken of at present, which nevertheless are not to come to pass for years or ages.

The same critic observes, that poetical predictions are generally uttered by superior beings; or if human beings are introduced, they are either such as are already in another state of existence, or just on the verge of quitting this. Thus, Hector, in Homer, foretels the death of Achilles; and,

in the same manner, Orodes, in Virgil, warns Mezentius of his fate. Both these kinds of prediction are great: and if the latter, as the same author alleges, is the greatest; the first, however, by his own acknowledgement, is the most poetical.

Nor are these two the only kinds of poetical prophecy. Heroic poets often use another, by foretelling the death of a hero, at a time when he is perhaps exulting in victory. Virgil affords us an instance of this, *Æn.* x. in relation to the death of Pallas by Turnus.

That form of prophecy, distinguished above by the title of prevention, gives an uncommon greatness and energy to the language: It places distant actions full before our eyes, and carries a certain boldness and assurance with it, that is wonderfully pleasing, prophecy being of great strength in possessing and captivating the reader, as we love to look into futurity. Thus it flatters the powers and capacity of our own minds, at the same time that it gives an air of superior knowledge and authority to the poet. This speech of the Sibyl includes in it all these advantages: It is not only preventive, but prophetic. Perhaps there are no speeches in the fourth book of the *Odyssey*, or sixth of the *Æneid*, more remarkable for their prophetic beauty, than this is. The subject of this is loftier, the speaker more venerable, and the design of the poet himself more truly great.

The terrifying raptures of Theochymenus, *Od.* xx. which represent the fall of the suitors, and which contain a higher orientalism than any we meet with in any other part of Homer's writings, may be compared, as Mr. Spence observes in his excellent *Dialogues on the Odyssey*, with what Joel says in a truly inspired language: "I will show thee wonders in the heavens and in the earth: Blood, and fire, and pillars of smoke: The sun shall be turned into darkness, and the moon into blood. I will cause the sun to go down at noon, and will darken the earth in clear day. All the bright lights of heaven will I make dark over thee, and set darkness upon the land." In that truly sublime passage, the sun and lights seem only to have left the heavens to shine with all their boundless majesty in the poet's mind.

Ver. 51. *There, thou from yonder sacred stream shalt rise*

A God thyself, &c.] The poet here plainly points out the river Numicius, which, as the Sibyl prophesied, washed away from Æneas all that was mortal, and fitted him for the company of the gods, as Ovid beautifully tells the story. Vide Ovid's *Metam.* book xiv. line 609.

Such is the poetical account of Æneas's departure from life; but antiquaries differ widely as to the manner of his death. Some assert, that his body was found drowned in the Numicius, after his rencounter with Mezentius; while others maintain, that he was indeed killed on the banks of that river, but that his body, tumbling into the stream, could never be recovered; and that it was hence artfully given out by his successors, that the gods had taken him to themselves. Accordingly he was honoured with the appellation of "Deus

Indiges," or *αἰθραιοδάμιον*; and Dionysius Halicarnassæus (lib. i. p. 40.) informs us, that not only a chapel was dedicated to him, with the following inscription :

PATRI DEO INDIGETI.
QVI. NUMICI. AMNIS.
VNDAS. TEMPERAT.

but that he had many monuments erected to him, in divers parts of Italy.

But why is Numicius called sacred? "(veneranda Numici unda)." Servius, in his notes on the seventh *Æneid*, ver. 150. assigns the following reason: "Numicius ingens ante fluvius fuit; quo repertum est cadaver *Æneæ*, & consecratum, post paulatim defcrescens, in fontem redactus est: qui ipse siccatus est, sacris interceptus, Vestæ enim libari, non, nisi de hoc flumine, licebat." *Broekb.*

Ver. 56. In the first battle, which *Æneas* carried on against the Latins and Rutulians, "propter fraudatus Lavinia nuptias," Latinus was slain; upon which, the Rutulian prince, Turnus, implored aid from Mezentius, king of the Tuscans; and fell in the second action: but *Æneas* never afterwards appeared, as the Scholiast tells us. In the third and last engagement, Ascanius revenged the death of his father, by killing Mezentius.

But why does the poet bestow on Turnus the epithet "Barbaro," since that prince, as Amata, in Virgil, informs us, was of Grecian original? Cyllenius endeavoured to solve this question, by supposing, that Turnus spoke bad Latin, "vel blæsus, vel balbus erat." But there is no occasion for any such hypothesis, since we find, from Plautus, that the Romans called both Italians and Latins, "Barbari." Vide Fesl. in voc. Barbar. *Broekb.*

Ver. 57. *Lavinium greets my view.* This is the city, which *Æneas* is said to have built in honour of his wife Lavinia. See more of this in the twenty-eight chapter of the first book of Dionys. Halicarnass. in Virgil, *Æn.* i. ver. 258. in Livy, book i. cap. 1. and 3. in the author of the book intitled, *De Orig. Roman.* and in Justin. lib. xliii. cap. 1. *Broekb.*

Ver. 59. *Broekhusius* is ample in citing authorities to prove, that *Ilia* was neither asleep, or ravished (contrary to what is asserted in the text), when Mars, or whoever was the father of *Romulus* and *Remus*, begot these twins upon her. After her delivery she drowned herself in the *Tyber*; and hence she is said, by the poets, to have been married to that river.

Ver. 62. Mars was so fond of his helmet, shield, and javelin, that he did not quit them, even when going upon his amours, of which he had several; but as the most famous of these was his intrigue with *Ilia*, or, as others call her, *Rhea*, *Sylvia*, the mother of *Romulus* and *Remus*, so it became a popular subject for the medalists, statuarys and painters, as well as poets, among the Romans. In a relievo, in the possession of the Mellini family, at Rome, we see Mars descended upon earth, and moving towards *Rhea*, who is

TRANS. II.

asleep on it. And on the reverse of a medal, which Mr. Addison mentions, and Mr. Spence has given an engraving of, that god is represented in an earlier point of time, in the air, as descending down to her. By means of this medal, that polite scholar, Mr. Addison (*Vide Travels*, p. 182) was enabled to explain the two following lines in the eleventh satire of *Juvenal*, which had puzzled all the commentators:

Ac nudam effigiem clypeo fulgentis & hasta,
Pendentisque Dei perituro ostenderet hosti.

For the Roman soldiers, who were not a little proud of their founder, and the military genius of their republic, used to bear on their helmets the first history of *Romulus*. On these occasions, the figure of the god was made as descending on, that is, as suspended in the air over the vestal virgin; in which sense, the word "pendentis" is extremely poetical.

Ver. 63. This apostrophe to the cattle that were feeding on the seven hills, where Rome afterwards stood, is highly picturesque; it more than places the object before the eyes of the reader: Such is the magic of poetry! The heroic poets, but especially the sacred and prophetic writers, abound with these bold sallies of imagination.

Ver. 65. The Romans were early made to believe the gods had predetermined that their city should be the metropolis of the world. Hence Horace writes,

Gentibus est aliis tellus data limite certo;
Romanæ spatium est urbis et orbis idem.

And Martial calls Rome

Terrarum domina gentiumque Roma.

Into how many misfortunes this belief plunged that state, and especially the nations around, let her own annals testify!

Ver. 69. A frequent chewing of the laurel was supposed to be of great efficacy in raising a spirit of divination and poetry. See Spanheim's learned notes on the ninety-fourth verse of Callimachus's Hymn to Delos. With a view to this, we may suppose it was that Commodus, as Xiphilinus tells the story, eat the laurel leaves with which he was crowned: *δαφνης φύλλα ἃ καὶ τὸ στέφανον ἔχον αὐτὸς διεσάσεν.*

Ver. 71. Critics differ greatly in the number, as well as in the names of the Sibyls; nor are they better agreed with regard to their parentage, country, reputation, and the age in which they lived. Varro makes them to have been ten in number, Suidas, in his catalogue of them, gives us only nine. *Ælian* and *Ausonius* limit them to four; while *Aulus Gellius* and *Pliny the elder* acknowledge but one. But *Rosinus* adopted Varro's opinion; and has, from good authority too, given us their several names. Lib. iii. cap. 24.

Our poet mentions four of the Sibyls by name, viz. *Herophile*, *Mermessia*, *Amalthea*, and *Albuna*. *Rosinus* makes the first and third of these to be the same with the *Cumæan Sibyl*; but we have

the authority of Pausanias for asserting that Herophile was born on Mount Ida, of a mortal father, but immortal mother; that she lived before the time of the Trojan war, and predicted the rape of Helen, and the fall of the Trojan empire. In her verses too, were probably scattered some admonitions, "admonuit," exciting the Romans, who by Æneas were of Trojan descent, to act a friendly part to the Phrygians, and by their good offices compensate to them all the losses they had sustained by the destruction of Troy; and therefore our poet mentions her, and desires Apollo to guide Messalinus also in the interpretation of her prophetic writings, as well as in those of the other three. This method of explaining

Quidquid Amalthea, quidquid Mermessia dixit,
Herophile Phœbo grata quod admonuit:
Quodque Albuna sacras Tiberis per flumina sortes
Portarit, sicco perlueritque sinu.

removes all the difficulty of connection, which commentators saw, but never offered to unriddle, till Vulpus, p. 259. by joining these four lines with

Phœbe sacras Messalinum sine tangere chartas
Vatis: et ipse, precor, quid canat illa, doce.

in one common petition to Apollo, made sense of the passage.

Herophile is called in the text, "Grata Phœbo;" and Pausanias, lib. x. cap. 12. tells us, that in her verses, she sometimes called herself the wife, sometimes the daughter, and sometimes the sister of Apollo. She visited Claros, Delos, and Delphi, where, from a stone, which that ancient Greek traveller saw, she uttered oracles: but she passed most of her time at Samos; and, dying at Troas, was buried in the grove of Smintheus, where he read her epitaph, which he has preserved.

Mermessia, although our poet makes her a distinct person, was probably the same as the former, since antiquaries inform us that she was born at Mermessus, a pastoral village of Mount Ida. She is also called Marpeffia; and we learn from Pausanias, lib. x. that in his time the vestiges of the ancient city of Marpeffus were still to be seen on Mount Ida.

Albuna was worshipped as a goddess at Tibur, upon the banks of the Anio, in whose stream her image was found, holding in its hand a book, which being uninjured by the water, was conveyed, according to Lactantius, to the Capitol. But our poet seems to insinuate, that she swam across the Tyber with her prophecies in her bosom; and that though its waters touched these compositions, yet had they not the power to wet them.

But though all these Sibyls were eminent, the Cumæan Sibyl was chiefly regarded by the Romans; who, according to Livy, brought nine books to Tarquinius Priscus, offering them to him for three hundred pieces of gold (*Philippi*). The king deriding her price, she instantly burnt three of them in his sight, and then demanded the same

sum for the six. Tarquin hereupon calling her an extravagant mad-woman, she committed three more to the flames, and asked him still the same money for the remainder. The king, astonished at this, paid her what she demanded; and receiving the volumes, which were supposed to contain the future destinies of Rome, deposited them in the Capitol, as above related.

Pliny, in talking of the oldest statues which were to be found in his time at Rome, has the following passage: "Equidem et Sibyllæ juxta rostra esse, non miror, tres sint, licet; una quam Sex. Pacuvius Taurus ædilis plebis restituit: duæ quas M. Messala (Corvinus's father) primas putarem has, et Actii Navii, positas ætate Tarquinii Prisci, nisi regum antecedentium essent in Capitolio." Lib. xxxiv. cap. 5.

Ver. 79. *When stony tempests fell, &c.*] See instances of all these prodigies in the sixth chapter of the first book of Valerius Maximus.

A late Italian author ingeniously accounts for showers of stones, and all the other kinds of showers, which historians and naturalists mention. See also Lucan's ninth book.

Ibid. *When comets glar'd.*] Few prejudices are more ancient than that which makes comets portend the downfall of empires. A sounder philosophy has at last taught us, that though they are less known, they are not more ominous than the planets; and yet Mr. Whiston was of opinion that this earth will be finally destroyed by a comet.

Ver. 83. *To charge the clarion, &c.*] Instances of this prodigy are frequent in both the Roman poets and historians, to the disgrace of the latter.

Ver. 86. Although an eclipse of the sun was ever regarded by the Romans as a prodigy; that which Tibullus speaks of, and which happened when Cæsar was killed, was, says Brockhusius, most prodigious, since it lasted almost a whole year.

What? and is nature then to be shook with convulsions, to be forced out of her natural course, when a tyrant is cut off? This is the language of base adulation, but not of sound philosophy. When, indeed, a friend to man perishes, all the elements may with propriety be introduced as lamenting his fall; and yet, as the author of an excellent ode to mankind sings, it too generally happens, that,

Those have no charms to please the sense,
No graceful port, no eloquence,
To win the muses' throng;
Unknown, unsung, unmark'd they lie,
But Cæsar's fate o'ercasts the sky,
And nature mourns his wrong.

Ver. 92. Monstrous births, by way of expiation, were either thrown into the sea, or burnt with "pyrum sylvaticum," and such like "plantæ infelices," as the Romans called them, from the supposed circumstance of their being under the protection of the "Dii Inferi et Avertentes." See instances of this in Livy and Julius Obsequens.

Ver. 102. Ovid, in that astonishing work of his, intituled *Fasti*, gives us the following accurate description of the Palilia.

Certe ego de vitulo, cinerem, stipulasque fatales
Sæpe tali plena februa casta manu.
Certe ego transilii positas ter in ordine flammæ;
Virgaque lauratas aurea misit aquas.

And again,

Tum licet, apposita veluti cratere camella,
Lac niveum potes, purpureamque sapam:
Moxque per arduas stipulæ crepitantis acervos,
Trajicias celeri strenua membra pede. *Lib. iv.*

Ver. 104. The original of this passage cannot be expressed in poetical English. It describes a method of kissing, wherein the person to be kissed, was, by the saluter, held and pulled forward by the ears till his lips met the others. This, according to Broekhusius, the Italians call a Florentine kiss. *Vide Kemp. Dissert. de Oscul.*

Ver. 106. Such domestic descriptions are often more pleasing than the boldest flights of poetry! Tibullus abounds in them: They are certain signs of the goodness of a writer's heart.

Ver. 121. The form of deprecation was this: To confess that the person injured did not deserve the curse; that they wished it had not been pronounced; and owned themselves actuated by a bad disposition: "Mente mala, mala fatebantur." Nennius, as Broekhusius remarks, was the first who explained the former part of the Latin deprecation, as Douza did the last. This was a better method surely of making satisfaction than what we moderns have substituted in its place, the pistol and sword.

Ver. 124. The reader by this time must have perceived a frequent recurrence of ideas in Tibul-

lus; yet are both Ovid and Propertius equally reprehensible on that account.

Ver. 139. Bacchus, or (as Sir Isaac Newton has proved) the Egyptian Sesostris, after his return from his Indian conquest, gave the first instance of this ungenerous ceremony, which the Romans afterwards adopted. It is impossible to read the description of those arrogant exhibitions of prosperity, without being struck with indignation: and we can never think highly of the humanity of that people who could behold with pleasure such striking instances of calamity, and of the caprice of fortune, as those solemnities afforded; when the greatest monarchs of the earth were sometimes dragged from their thrones, to attend in chains the insolent parade of an insulting conqueror. But it was natural for the Romans to enjoy that with insolence which they gained by oppression.

Ver. 140. These were at first of wood; but in Cæsar's last triumph they were of silver.

Ver. 144. "Laureati milites (says Festus Pompeius) sequebantur currum triumphantis, ut quasi purgati, a cæde humana intrarent urbem."

Ver. 151. The poet, as Vulpius observes, wishes eternal chastity to Diana, because Orion, one of the giants, had endeavoured, but in vain, to ravish her.

Testis mearum centimanus Gyas
Sententiarum notus, et integræ
Tentator Orion Dianæ
Virginea domitus sagitta.

Lib. iii. Od. 4.

This truth shall hundred-handed Gyas tell,
And warm Orion, who with impious love
Tempting the goddess of the sylvan scene,
Was, by her virgin darts, gigantic victim, slain.

Francis.

ELEGY VI.

MACER campaigns; who now will thee obey,
O love! if Macer dare forego thy sway?
Put on the crest, and grasp the burnish'd shield,
Pursue the base deserter to the field:
Or if to winds he gives the loosen'd sail,
Mount thou the deck, and risk the stormy gale:
To dare desert thy sweetly-pleasing pains,
For stormy seas, or sanguinary plains!
'Tis, Cupid! thine, the wanderer to reclaim,
Regain thy honour, and avenge thy name! 10
If such thou spar'st, a soldier I will be,
The meanest soldier, and abandon thee.
Adieu, ye trifling loves! farewell, ye fair!
The trumpet charms me, I to camps repair;
The martial look, the martial garb assume,
And see the laurel on my forehead bloom!

My vaunts how vain! debarr'd the cruel maid,
The warrior softens, and my laurels fade.
Piqu'd to the soul, how frequent have I swore,
Her gate so servile to approach no more? 20
Unconscious what I did, I still return'd,
Was still deny'd access, and yet I burn'd! [sway,
Ye youths, whom love commands with angry
Attend his wars, like me, and pleas'd obey.
This iron age approves his sway no more:
All fly to camps for gold, and gold adore:
Yet gold clothes kindred states in hostile arms!
Hence blood and death, confusion and alarms!
Mankind for lust of gold, at once defy
The naval combat, and the stormy sky! 30
The soldier hopes, by martial spoils, to gain!
Flocks without number, and a rich domain:

His hopes obtain'd by every horrid crime,
 He seeks for marble in each foreign clime :
 A thousand yoke sustain the pillar'd freight,
 And Rome, surpris'd, beholds th' enormous weight.
 Let such with moles the furious deep enclose,
 Where fish may swim unhurt, though winter
 Let flocks and villas call the spoiler lord ! [blows :
 And be the spoiler by the fair ador'd ! 40
 Let one we know, a whipp'd barbarian slave,
 Live like a king, with kingly pride behave !
 Be ours the joys of economic ease,
 From bloody fields remote, and stormy seas !

In gold, alas ! the venal fair delight !
 Since beauty sighs for spoil, for spoil I'll fight !
 In all my plunder Nemesis shall shine,
 Yours be the profit, be the peril mine :
 To deck your heav'nly charms the silk-worm dies,
 Embroidery labours, and the shuttle flies ! 50
 For you be rifled ocean's pearly store !
 To you Pactolus send his golden ore !
 Ye Indians, blacken'd by the nearer sun,
 Before her steps in splendid liveries run ;
 For you shall wealthy Tyre and Afric vie,
 To yield the purple, and the scarlet dye.

NOTES ON ELEGY VI.

This elegy is more than commonly difficult ; and, what too frequently happens, the commentators, especially Scaliger, have increased these difficulties, by endeavouring to explain them.

Æmilius Macer, a nobleman, even famous in the Augustan age for his gallantry and wit, had been intrusted by the successor of Julius, with the execution of some military enterprise. At his departure from Rome, it is probable, he boasted to our poet, that however deeply he seemed engaged in love, yet was his heart his own, and now only panted for military fame. As Tibullus could not but regard this declaration as a secret satire on his own conduct, he earnestly addresses Cupid to follow Macer to the field ; from which if he did not bring him back, he threatens to desert his service himself, and in the various life of a soldier, to dissipate his tendresse for the fair. In fancy our poet becomes a military man, and bids adieu to love and its trifling pursuits ; but his ardor soon cools ; he owns, though Nemesis was still insensible to his sufferings, that his passion for her was as violent as ever. From this, he takes occasion to advise the young noblemen of Rome, who, to get rid of love, might flatter themselves, that a military life would effectually answer, to lay aside all their martial intentions, and, like him, implicitly serve under the banner of Cupid. His advice, however, does not seem to have been relished by those for whom it was designed : gold, which at that time was chiefly to be obtained by war, having, it would seem, corrupted them. This was one of the many disasters produced by the civil wars, in which such immense fortunes had been amassed, that manumitted slaves then wallowed in ministerial fortunes. With this known truth he concludes his panegyric on wealth ; and therefore the two lines,

Nota loquor, &c.

which in all editions are placed at the end of this elegy, should immediately follow

Negligat hyernas.

For by this change these two lines, which universally puzzled the commentators, have a connection, and may be made sense of. But though the love of riches had so generally infected even the young, Tibullus only begs that he might enjoy the little he had, in all the simplicity of ancient times. Unfortunately, however, for our poet, Nemesis liked opulence ; and, as he was wholly attached to her, he suddenly determines to become rich by war ; neither could Cupid be offended with this, as with his spoils he only meant to adorn his mistress.

Ver. 1. This elegy, and the third and seventh of this book, have been miserably mangled and blended together, in the Variorum edition : for instance, all the verses of this, from "At tu quisque is es," to the end, are in that edition foisted into the third elegy, "rura tenent," &c. although these lines have no manner of connection with that elegy. But, by way of compensation, the Variorum editors have not only laid the foresaid third elegy under a contribution of four lines to this, beginning at "Acer amor fractas," &c. but have also tagged to it the next elegy, beginning "Finiunt multi leto mala."

Joannes Baptista Pius, Achilles Statius and Glandorpius are all of opinion, that Tibullus means here Pompeius Macer, the son of Theophranes of Mitylene, to whom Augustus intrusted, as Suetonius informs us, the management of his library. The arguments they allege in defence of this, are chiefly taken from Ovid, who, in the eighteenth elegy of his second book, speaks thus of Macer :

*Carmen ad iratum dum tu perducis Achillem,
 Primæque juratis induis arma viris
 Nos, Macer, ignavæ Veneris cessamus in umbra.*

And again,

*Tu canis, æterno quidquid restabat Homero
 Ne careant summa Troica bella manu.*

Pont. Ep. lib. ii. cp. 10. ver. 13.

From whence they conclude, that Pompeius Macer was a poet, and wrote the *Paralipomena* of Homer. This opinion is however unsupported by classical authority. But if there is no cause to believe that Theophanes was a poet, we know, that Æmilius Macer was a considerable one; and as he made a distinguished figure in the court of Augustus, it is not unreasonable to conclude, he was the nobleman whom Tibullus mentions in this elegy.

Æmilius Macer then was born at Verona, a city famous for the births of Lucretius, Catullus, and the architect Vitruvius. Ovid informs us, that Macer was his senior, and that he travelled with him through Asia and Sicily. We also know from the same poet, as well as from Pliny, that Macer, besides the pieces already mentioned, wrote likewise a poem on birds, serpents, and on the virtues of plants. Of this performance, which he used often to recite to Ovid, two or three lines only remain. In it he chiefly copied Nicander, a poet of Colophon. Nor were these his only poetical performances: he composed a piece, intitled *Theriaca*, of which Isidorus and others have saved near half a dozen verses. Nonius Marcellus adds, that he wrote a *Theogony*, of which he mentions one verse: but some learned men think, that the line quoted must have belonged rather to his *Ornithology*. Besides these useful works, he published something on bees (probably in verse), as Pliny informs us, lib. xi. Quintilian allows both Macer and Lucretius to have been elegant, but stigmatizes the one as obscure, and the other as creeping. "Utinam" (says Broekhusius) "hodie de Macro et nobis arbitrari liceret! Utinam saltem Iliaca exstarent, quas tanti facit Naso, ut ab his libris, honorificum dederit auctori cognomentum;"

Cum foret et Marfus, magnique Babirius oris,
Iliacusque Macer fideriusque Pedo.

Lib. iv. Pont. Ep. 16.

Macer died in Asia, about the time that Augustus adopted Caius and Lucius, the sons of Agrippa; which, according to the Eusebian Chronicle, happened A. U. C. 737. in the consulate of C. Furius, and Juf. Silanus.

The poem *De Viribus Herbarum*, which at present passes under the name of Æm. Macer, is the work of one Odo, who was as wretched a poet, as he was a bad physician. Vide Lilio Gyrard, J. C. Scaliger, and Gaudent. Merul. Ital. Illustr. We therefore wonder how that elegant scholar and excellent anatomist, Thomas Bartholin, could be so far imposed upon, as to take this miserable stuff for a poem, which was the delight of the Augustan age. See his *Dissert. de Medicis Poeticis*.

Ver. 3. This passage in the original has mightily puzzled the interpreters. Scaliger and Broekhusius explain it, as if the poet lamented the fate of little Cupid, who would now be obliged to attend Macer to the field, and to be his armour-bearer. Vulpius, on the other hand, condemns Scaliger's explanation, and says, that the poet

seems to intimate, that Cupid himself should put on arms. This sense of the passage is what the translator has adopted, as the most poetical.

We learn from Ovid, that Macer was not averse to love, but even mixed strokes of gallantry in his heroic compositions.

Nec tibi (qua tutum vati, Macer arma canenti)
Aureus in medio Marte, tacetur amor.

Et Paris est illic, et adultera nobile crimen;

Et comes extincto Laodamia viro.

Si bene te novi, non bella libentius istis

Dicis, et a vestris in mea castra venis.

Lib. ii. El. 18. ver. 35.

Ver. 14. Read, instead of "facta," in the generality of editions,

& mihi grata tuba est.

Hammond has improved upon this elegy in his second.

Adieu, ye walls, that guard my cruel fair!

No more I'll sit in rosy fetters bound;

My limbs have learnt the weight of arms to bear,

My rousing spirits feel the trumpet's sound.

Few are the maids that now on merit smile;

On sport and war is bent this iron age;

Yet pain and death attend on war and spoil,

Unsated vengeance, and remorseless rage.

To purchase spoil, ev'n love itself is sold:

Her lover's heart is least Næra's care.

And I through war, must seek detested gold;

Not for myself, but for my venal fair!

That while she bends beneath the weight of dress,

The stiffen'd robe may spoil her easy mien;

And art mistaken, make her beauty less,

While still it hides some graces better seen.

But if such toys can win her lovely smile,

Her's be the wealth of Tagus golden sand,

Her's the bright gems that glow in India's soil,

Her's the black sons of Afric's sultry land.

To please her eye, let every loom contend;

For her be rifled ocean's pearly bed.

But where, alas! would idle fancy tend,

And sooth with dreams a youthful poet's head!

Let others buy the cold unloving maid,

In forc'd embraces act the tyrant's part;

While I their selfish luxury upbraid,

And scorn the person where I doubt the heart.

Thus warm'd by pride, I think I love no more,

And hide in threats the weakness of my mind

In vain—Though reason fly the hated door,

Yet love, the coward love, still lags behind.

Ver. 21. This, in the original, is,

pes tamen ipse redit.

And, as Vulpius observes, it appears to have been a colloquial expression, equally idiomatical both to Greeks and Romans.

Horace has a thought of the same nature, in his excellent epode to Pettius; where, complain-

ing of the cruelty of Inachia, whom he had resolved to see no more, he thus expresses his own impotence of will :

Ubi hæc severus te palam laudaveram
Jussus abire domum
Ferebar incerto pede
Ad non amicos, heu mihi postes, et heu
Limina dura, quibus
Lumbos, et infregi latos.

Ep. xi.

When thus, with vaunting air, I solemn said ;
Inspir'd by thy advice, I homeward sped ;
But, ah ! my feet in wonted wandering stray,
And to no friendly doors my steps betray,
There I forget my vows, forget my pride,
And at her threshold lay my tortur'd side.

Francis.

But are we, therefore, to conclude, that Horace was indebted to Tibullus for this thought ? By no means. For, as one of the best critics that ever instructed this island, observes, " Many subjects " fall under the consideration of an author, which " being limited by nature, can admit only of slight " and accidental diversities. All definitions of the " same thing, must be nearly the same ; and descriptions, which are definitions of a more loose " and fanciful kind, must always have, in some " degree, that resemblance to each other, which " they all have to their object. Different poets, " describing the spring and the sea, would mention the zephyrs and the flowers, the billows " and the rocks : reflecting on human life, they " would, without any communication of opinions, " lament the deceitfulness of hope, the fugacity " of pleasure, the fragility of beauty, and the frequency of calamity ; and, for palliatives of these " incurable miseries, they would concur in recommending kindness, temperance, caution, and " fortitude." *Rambler, No. 143.*

Ver. 37. Would the reader know to what immense extravagance the Romans went in this ar-

ticle of sea-fish-ponds, he may consult Varro, *De Re Rust. cap. 17.* where he treats of these " *piscinæ marinæ.*"

Ver. 41. It is reported by historians, that Demetrius, the freed-man of Pompey, by attending that general in his conquests, amassed greater wealth than his master himself. It is probable, however, our poet, in this passage, glances at some of the Cæsarian party.

Ver. 43. *Be ours the joys of economic ease.*] From the original,

At mihi læta trahant Samiæ convivia testæ
Fictaque Cumana lubrica terra rota.

The translator approves of Scaliger's correction, in inserting " *mihi.*" Although by rendering it *ours*, he takes in also " *tibi,*" which is the other pronoun that contends for a place here. The poet particularly celebrates Samos and Cumæ, as marts of the best and cheapest earthen ware. *Vide Pliny, lib xxxiii. cap. 12.*

Ver. 45. Pliny informs us, that gold was not coined at Rome till the year 647, about sixty-two years after silver had been first coined there. Until this period, the Romans, it seems, subsisted on the money of the nations they conquered.

Ver. 50. *Embroidery labours, &c.*] This in the original is,

Illa gerat vestes, &c.

The island Cos was remarkable of old for gold tissues and other luxuries of apparel. The great Hippocrates was born there.

Ver. 55. Authors make a difference between the Tyrian and Lybian dye, though they are sometimes used promiscuously by good classic writers. The Tyrian was the richest dress a lady could wear. The " *pretexta*" of the Roman magistrates was of purple, a colour which they sometimes permitted such foreign princes as depended on them to assume, but never till they had made exorbitant presents to the consuls.

ELEGY VII.

THOUSANDS in death would seek an end of woe,
But hope, deceitful hope ! prevents the blow !
Hope plants the forest, and she sows the plain ;
And feeds, with future granaries, the swain ;
Hope snares the winged vagrants of the sky,
Hope cheats in reedy brooks the scaly fry ;
By hope, the fetter'd slave, the drudge of fate,
Sings, shakes his irons, and forgets his state ;
Hope promis'd you, you haughty still deny ;
Yield to the goddess, O my fair ! comply. 10
Hope whisper'd me, " Give sorrow to the wind !
" The haughty fair-one shall at last be kind."

Yet, yet you treat me with the same disdain :
O let not hope's soft whispers prove in vain !

Untimely fate your sister snatch'd away ;
Spare me, O spare me, by her shade I pray !
So shall my garlands deck her virgin tomb ;
So shall I weep, no hypocrite, her doom !
So may her grave with rising flowers be dress'd,
And the green turf lie lightly on her breast. 20
Ah me ! will nought avail ! the world I'll fly,
And, prostrate at her tomb, a suppliant sigh !
To her attentive ghost, of you complain ;
Tell my long sorrowing, tell of your disdain :

Oft, when alive, in my behalf she spoke :
 Your endless weyness must her shade provoke :
 With ugly dreams she'll haunt your hour of rest,
 And weep before you, an unwelcome guest !
 Ghastly and pale, as when besmear'd with blood,
 Oh fatal fall ! she pass'd the Stygian flood. 30

No more, my strains ! your eyes with tears
 o'erflow,

This moving object renovates your woe :
 You, you are guiltless ! I your maid accuse ;
 You generous are ! she, she has selfish views.
 Nay, were you guilty, I'll no more complain ;
 One tear from you o'er pays a life of pain !

She, Phryne, promis'd to promote my vows :
 She took, but never gave my billet-doux.
 You're gone abroad, she confidently swears,
 Oft when your sweet-ton'd voice salutes mine ears :
 Or, when you promise to reward my pains, 41
 That you're afraid, or indispos'd, she feigns :
 Then madding jealousy inflames my breast ;
 Then fancy represents a rival blest ;
 I wish thee, Phryne ! then a thousand woes ;—
 And if the gods with half my wishes close,
 Phryne ! a wretch of wretches thou shalt be,
 And vainly beg of death to set thee free !

NOTES ON ELEGY VII.

SUICIDE was not only not criminal, but esteem-
 ed heroical by the Romans. We may suppose but
 few destroyed themselves from philosophical mo-
 tives, although the Stoics permitted it. Under
 the emperors, indeed, those especially that dis-
 graced nature, self-murder became too frequent,
 as then only the best men were doomed the vic-
 tims of their barbarity ; for by this means they
 preserved their estates to their posterity. Under
 such circumstances, suicide was in truth less blame-
 able ; but still no circumstances can be offered,
 which wholly abate its iniquity. Be that, how-
 ever, as it will, even those who condemn self-
 murder as unjustifiable, will own that death
 sounds prettily in the mouth of a lover ; and this
 gives some countenance to the reading,

Jam mala finissem leto,

which makes the beginning of this elegy, in some
 editions ; but as our poet everywhere else shows
 the utmost abhorrence at death, as the best MSS.
 read

Finirent multi leto mala, &c.

and as it appears by the line

Spes facilem Nemefin, &c.

that he only was enumerating some of the many
 effects of that catholic cordial hope, the translator
 has adopted the more common reading, and,
 with Broekhusius, has made this a distinct elegy ;
 which, in not a few editions, is preposterously
 tacked to the foregoing poem.

The whole existence of a lover is made up of
 hope and fears : Though always disappointed by
 Nemesis, our poet still hoped ; that his amorous in-
 clinations would at last be indulged : for this pur-
 pose, he entreats her, as was natural, by the things
 she held most dear.—The text informs us, that
 her sister had unfortunately fallen from a window,
 and broken her neck : this person had always
 warmly espoused the interest of Tibullus ; and as
 it was a point of pagan belief, that their ghosts
 continued their attention to their friends on earth,

especially if these paid proper honours to their
 tombs, our poet informs his cruel fair one, that he
 means to repair to her sister's monument, and by
 oblations of flowers, &c. to implore her assistance.
 But, as it was natural for him to imagine, that
 the mentioning so favourite an object would re-
 new all Nemesis's grief for her unfortunate end,
 he breaks off, and artfully throwing the blame of
 what he had suffered on her servant, he finishes
 the elegy with cursing her.

Ver. 1. Although the Romans looked upon
 suicide as heroical ; yet Virgil thus describes the
 evil condition and remorse of those who had laid
 violent hands upon themselves :

*Proxima deinde tenent mæsti loca, qui sibi letum
 Infantes peperere manu, lucemque perosi
 Projecere animas : quam vellent in æthero alto
 Nunc & pauperiem, & duros tolerare labores !
 Fas obstat, tristisque palus inamabilis unda
 Adligat, et novies Styx interfusa coerces.*

In Plato's almost divine dialogue, intituled, *Phæ-
 do*, Socrates has fully evinced the unlawfulness of
 self-murder. This dialogue Cicero seems to have
 copied in his admirable piece, intituled, *Somnium
 Scipionis*. "*Quæso, inquam, pater sanctissime
 atque optime, quoniam hæc est vita, (ut Africa-
 num audio dicere) quid moror in terra ? quin
 hinc ad vos venire propero ? Non est ita, inquit
 ille ; nisi Deus is, cujus hoc templum est omne
 quod conspicias, istis te corporis custodiis libera-
 verit, huc tibi aditus patere non potest. Homi-
 nes enim sunt hac lege generati, qui tuerentur il-
 lum globum, quem in hoc templo medium vides,
 quæ terra dicitur ; hisque animus datus est ex illis
 sempiternis ignibus, quæ sidera, et stellas vocatis :
 quæ globosæ, et rotundæ, circos suos orbesque
 conficiunt celeritate mirabili. Quare et tibi, Publi,
 et piis omnibus retinendus est animus in custodia
 corporis : nec injussu ejus, a quo ille est vobis da-
 tus, ex hominum vita migrandum est, ne munus
 humanum adsignatum a Deo defugisse videamini.*"

Ver. 2. Hope is a poetical subject, to which

many, both ancient and modern, have done great justice. Theognis supposes, that when the other gods left the earth, hope only staid behind. This thought Ovid has adopted:

*Hæc dea, quum fugerent sceleratas numina terras,
In diis invisâ sola remansit humo.*

As hope, as well as fear, is one of the barriers implanted in us by nature, to prevent our rushing out of life, ought it not to have been taken into the estimate of life in Hamlet's Soliloquy?

To be, or not to be;

which, however sensible, has, as a late critic well observes, nothing to do in the place where it is introduced.

This enumeration of the consequences of hope, or what it may be productive of, though not frequent in our poet, is yet common in Ovid, and has indeed a fine effect even in perceptive poems; but in such as are impassioned or heroic, seems essentially improper. Hence Marino and Davenant are reprehensible; neither is Shakspeare himself entirely free from blame on this score.

St. Paul, with no less beauty than emphasis of expression, calls hope our early immortality. The excellent author of the Night Thoughts, thus expresses his sentiments with regard to wishing:

Wishing of all employments, is the worst,
Philosophy's reverse, and health's decay!
Were I as plump as stall'd theology,
Wishing would waste me to this shade again.
Were I as wealthy as a South-Sea dream,
Wishing is an expedient to be poor.
Wishing, that constant hectic of a fool;
Caught at a court; purg'd off by purer air,
And simpler diet; gifts of rural life!

Ver. 9. The goddess, mentioned in the original, is, by some commentators, supposed to be Nemesis: but as that would be more in the affected mode of Ovid, than in the natural way of Tibullus; and as the context, when carefully considered, shows that the poet meant hope, the translator has kept to that interpretation in the version, notwithstanding Otway, in his translation of this elegy, retains the former.

Ver. 22. Vulpius has collected almost a century of quotations, to prove, that the ancients, when deeply affected with sorrow generally sat. "Graviter dolentes, veteri consuetudine, fere semper sedebant." A wonderful discovery this, and well worthy of critical investigation!

Ver. 29. According to ancient superstition, ghosts often appeared in the same dismal circumstances in which they had departed life. Of this we have a striking instance in Virgil:

*Tempus erat, quo prima quies mortalibus ægris
Incipit, et dono divum gratissima serpit.*

In somni, ecce ante oculos mœstissimus Hector
Visus adeste mihi, largosque effundere fletus;
Raptatus bigis, ut quondam, aterque cruento
Pulvere, perque pedes trajectus lora tumentes,
Hei mihi, qualis erat! quantum mutatus ab illo
Hectore, qui redit exuvias indutus Achillei!

Æn. ii. 262.

Instances of the same sort may be found in Ovid, Met. lib. ii. ver. 650. Fast. lib. v. ver. 451. and in Statius, Theb. lib. ii. ver. 120. *Brooks.*

Ver. 31. Baptista Guarini, in a sonnet where he blames his tongue for being unable to express his love, thus addresses his eyes:

*Ma se muta se' tu, sien gli occhi nostri
Loquaci, e caldi; e'n lor le sue profonde.
Piaghe, e l' interno duol discopra il core.
Non e sì chiuso o sì segreto ardore
Ch'un cigno a l'altro no'l riveli o mostri
La dove amor vera eloquenza asconde.*

Son. xlv.

Many other passages might here be added, wherein speaking eyes are mentioned; for this has been the language of lovers in all ages. But, as the excellent Rambler remarks, "There are flowers of fiction so widely scattered, and so easily cropped, that it is scarcely just to tax the use of them, as an act by which any particular writer is despoiled of his garland; for they may be said to be planted by the ancients in the open road of poetry, for the accommodation of their successors, and to be the right of every one that has art to pluck them without injuring their colours or their fragrance."

Ver. 35. *Nay, were you guilty, &c.]* This is nature; but the Arcadian lovers of Italy carry such emotions beyond the bounds of probability.

ogni cosa (says Aminta)

*O tentato per placarla fuor che morte
Mi resta suol che per placarla io mora,
E morro volontier pur ch'io sia certo
Ch'ella o se ne compiacera, o se ne doglia
Ne so de tai due cose qual piu brami.*

A mighty difficulty, in truth!

Ver. 37. If the reader is desirous to know the stratagems practised by the bawds of antiquity, he may peruse Ovid's El. viii. lib. i. and Propertius, lib. iv. el. 5. In this particular, however, the modern sisterhood, if the modest editor of a late justly famous romance describes them aright, greatly surpass their ancient predecessors.

BOOK III.—ELEGY I.

INTRODUCTION.

SOME words in the elegies of this book are of that sort, which are frequently used by the best writers catachrestically, sometimes denoting more lax, sometimes more intimate relations. The difficulty of ascertaining the sense in which Tibullus has used them, has thrown a seeming obscurity on a poet, who will ever have the first place amongst the wits of Greece and Rome, for elegant simplicity; and has caused such illustrious annotators, as Scaliger, Lipsius, and Muretus, to stumble. The great difficulty is contained in the following lines; and if this can be cleared up, all the rest will be easy and intelligible. *El. i. lin. 23.*

Hæc tibi vir quondam, nunc frater, casta Neæra,
Mittit, et accipias munera parva, rogat.
Teque suis jurat carum magis esse medullis,
Sive sibi conjunx sive futura soror.
Sed potius conjunx hujus spem nominis illi
Auferet extincto pallida ditis aqua.

Where it is first inquired, what is meant by "frater," and "soror?" It is readily seen, that they cannot be understood in their primitive sense, because a marriage betwixt brother and sister would never have been tolerated at Rome: the very thoughts of it would have been regarded with abhorrence. These words sometimes mean cousin-germans, and in this sense Muretus here understands them; but this is too cold and unanimated, to be admitted into poetry, or to flow from the pen of Tibullus, when he is expressing the tender feelings of a fond doating lover. It is much more probable, that he designed to represent by them one of those delicate connections, which have their foundation in the will and the affections; that by "frater" he would have us to understand a fond admirer; and by "soror," a beloved mistress, who had entertained a reciprocal kindness and esteem for her lover. This sense of the words is familiar to most languages. Nothing can be more full to this purpose than what we meet with in the Canticles of Solomon,—*"Thou hast ravished my heart, my sister, my spouse,"*—*ch. iv. ver. 9.* and in several other places.

Ovid also has used the words in this sense:

Alloquor Hermione nuper fratremque virumque,
Nunc fratrem, nomen conjugis alter habet.

And the Greeks had so accustomed themselves to this use of them, that we find their Venus has a title given her by Lycophron, which his Scholiast explains by "*την ἀδελφοποιον*, the author of brotherly associations." And assigns this pretty whimsical reason for it: "For a commerce in love matters makes those who were strangers, brothers: and those who would carry on an amorous commerce secretly, say of one they favour, he is my brother, he is my relation."

Having solved, we hope, this difficulty, we shall next consider what is the import of "vir" and "conjunx." They certainly were designed to express some nearer connection, some closer tie, than mere friendship, or whatever else is comprehended in "frater" and "soror." The epithet "casta" given to Neæra, will not permit us to understand them of any loose amour; that title never could belong to a jilt, who had granted favours to one lover, and, upon some caprice, had thrown herself into the arms of another: but divorces were common enough at Rome, so that even a wife might dismiss her husband upon some displeasure taken, at least before actual matrimony without hurting her reputation by it: so that I think husband and wife are the true meaning of "vir" and "conjunx."

This interpretation, however, is not without difficulties; the silence of antiquity, and several other circumstances, make the marriage of Tibullus appear improbable; it has therefore been supposed by Lipsius, that "quondam" was intended to express future, and not past time. It cannot be denied,

that it is sometimes thus used ; but it more commonly signifies the time past, or formerly ; and to understand it otherwise here, would make the construction harsh and ungrammatical. In further confirmation of this, it appears that the following elegies of this book relate to the same persons and the same distress : they were probably the new-year's gift which Lygdamus, by the advice of the Muses, proposes to send to Neæra : now these furnish us with passages which can be understood of nothing else but a marriage-contract, and a subsequent separation : thus, in El. 2. we find,

Sed veniat caræ matris comitata dolore,
Mæreat hæc genero, mæreat illa viro.

And again,

Lygdamus hic situs est, dolor huic & cura Neæra
Conjugis ereptæ causa perire fuit.

In the third elegy,

Oh niveam quæ te poterit mihi reddere lucem.

And again,

Aut, si fata negant reditum tristesque sorores.

In El. 4.

Nec gaudet casta nupta Neæra domo.

One must torture these passages extremely, to make them consistent with any thing else but a previous marriage, or at least a very solemn contract. Was Tibullus then married ? or did he intend at all to marry Neæra ? I am not inclined to think so, as none of the ancient writers has given us the least hint of it. But the poet is not tied down to actual life :

Pictoribus atque poetis
Quidlibet audendi semper fuit æqua potestas.

The sacrifice of Iphigenia at Aulis, is probably a mere fable : and yet what noble, what affecting, what interesting scenes of distress have both the tragedian and painter formed upon it ? And might not Tibullus, to indulge his plaintive humour, and to display the soft feelings of his soul, choose to represent himself in a situation that forms one of the most melting and agonizing distresses, to be found amongst those beds of thorns and roses which love prepares for his capricious votaries ? A beloved wife, grown dearer by more intimate acquaintance, charming without the help of artifice, and rooted in the soul by a thousand repeated endearments, torn from the arms of an enraptured husband, whilst he still doats upon her, and ready to be sacrificed to another ;—what feeling heart but shudders at the thought ?—especially when the delicate affecting colours are laid on by the pencil of Tibullus ? The names certainly are fictitious ; Neæra was as trite a name for a mistress in Rome, as Phyllis or Cloe with our modern sonnetteers. And what confirms me in the opinion, that the distress painted in these elegies is also fictitious, so far as Tibullus is concerned in it, is, that Ovid, in his poem on Tibullus's death, takes notice of no other mistress but Delia and Nemesis ; to one of whom he assigns the last, to the other the first interest in him, without any intermediate favourite.

Sic Nemesis longum, sic Delia nomen habebit.
Altera cura recens, altera primus amor.

Ovid seems to have carefully searched out every curious particular of Tibullus's life, and therefore could not have overlooked so striking a circumstance as the distresses celebrated in these elegies, if they had really happened to Tibullus. He, and his contemporaries of the Augustan age, were probably well informed of the true reason of Tibullus's composing the following book. Some such distress might have happened, and been much talked of in Rome ; and Tibullus might seize upon it as a favourable opportunity for displaying his elegiac genius in its full lustre. Propertius has made the same use of the misfortunes of a noble family, in the twelfth elegy of book 4. It is a common artifice with delicate writers, to sigh and tell a piteous tale, while their hearts are not at all affected.

B.

Poet.

THEY calends, Mars ! are come from whence of old,
The year's beginning our forefathers told :
Now various gifts through every house impart,
The pleasing tokens of the friendly heart.

To my Neæra, tuneful virgins ! say,
What shall I give, what honour shall I pay ?
Dear, e'en if fickle ; dearer, if my friend !
To the lov'd fair, what present shall I send ?

Muses.

Gold wins the venal, verse the lovely maid :
 In your smooth numbers be her charms display'd.
 On polish'd ivory let the sheets be roll'd, 11
 Your name in signature, the edges gold.
 No pumice spare to smooth each parchment scroll,
 In a gay wrapper then secure the whole.
 Thus to adorn your poems be your care ;
 And thus adorn'd, transmit them to the fair.

Poet.

Fair maids of Pindus ! I your counsel praise :
 As you advise me, I'll adorn my lays :
 But by your streams, and by your shades, I pray,
 Yourselfs the volume to the fair convey. 20
 O let it lowly at her feet be laid,
 Ere the gilt wrapper, or the edges fade ;

Then let her tell me, if her flames decline,
 If quite extinguish'd, or if still she's mine.
 But first your graceful salutations paid,
 In terms submissive thus address the maid :
 " Chaste fair ! the bard, who doats upon your
 charms,
 " And once could clasp them in his nuptial arms,
 " This volume sends ; and humbly hopes, that you,
 " With kind indulgence, will the present view. 30
 " You, you ! he prizes more, he vows, than life ;
 " Still a lov'd sister, or again his wife.
 " But oh ! may Hymen bless his virtuous fire,
 " And once more grant you to his fond desire !
 " Fix'd in this hope, he'll reach the dreary shore,
 " Where sense shall fail, and memory be no
 " more."

NOTES ON ELEGY I.

ROMULUS, who divided the year into ten months, dedicated the first to his father Mars : on the first day of this month the vestal virgins lighted anew the sacred fire, fresh laurels were hung up in the senate, and at the doors of the high-priests's house, &c. the comitia began, the revenues were farmed, and servants not only had their wages paid them (and hence these days were called "Mercedoniæ"), but, for one night this month, were attended upon at supper by their masters.

The poet inquires of the muses, what present he should send to Næra, who, as she was still the sole object of his wishes, so he yet hoped to be again possessed of her in marriage.

The muses answer (for with Muretus the translator reads

Gaudeat, ut digna est, versibus illa tuis),

that, as Næra was a very competent judge of poetry, so he ought to present her with his performances in that way. Our author, however self-denied, was yet too much of the poet not to relish their advice ; but as the dignity of those who carry a present, enhances the value thereof, he entreats the muses to take the trouble themselves of delivering into the hands of Næra his poems ; and to assure her, that he shall never forego the pleasing expectation of being one day again united to her in marriage.

Scaliger, in his poetics, calls the beginning of this elegy "Plebeian," on account of its spondees, " & tantus ejusdem vocalis sonus."

His own correction, however, is not much better :

Romani festæ Martis, &c.

It is remarkable that this hypercritic does not find fault with one single line of the two former books,

Ver. 1. Numa Pompilius, in imitation of the Greeks, added January and February to Romulus's calendar, and began the year with January. From the time of Numa to that of Julius Cæsar, the Roman year was lunar, and consisted of three hundred and fifty-five days. But as this fell about eleven days short of the true solar course, table of intercalation or insertion were invented, to adjust time as nearly as possible to the motions of the sun and moon. The pontifex Maximus and college of priests had the care of inserting these intercalary days ; and they, from negligence, superstition, but chiefly from an arbitrary abuse of their power, by which they could make the year either longer or shorter, as suited their own or friends interest, did not punctually insert them ; insomuch that in Julius's time, the winter months became autumnal ; and those of autumn had fallen back into summer. This gave rise, A. U. C. 707. to the Julian correction, or solar year, adjusted to the exact measure of the sun's revolution in the zodiac, and consisting of three hundred and sixty-five days and six hours. This method of computing time continued in Europe till 1582, when Pope Gregory, by sinking ten days between the 4th and 15th of October, reduced the vernal equinox to the 21st of October, the day which it had fallen upon, when the festivals were regulated by the council of Nice, and made the year consist of three hundred and sixty-five days, five hours, and forty-nine minutes. This new style, as it was called, to distinguish it from the Julian, being the most correct calculation of the flow of time, is authorized every where by law, and prevails now in almost all the kingdoms of Europe.

Ver. 3. It has been observed by the writers on antiquities, that a feast called "Matronalia," was celebrated on the calends of March, when solemn

sacrifices were offered up to Juno by the Roman ladies, to whom also presents were then sent by their friends, in grateful remembrance of the interposition of the Sabine women betwixt their fathers and husbands. But it is not this custom which Tibullus alludes to. The beginning of the year in ancient times on the calends of March would have been an idle circumstance here, if the presents Tibullus speaks of, were not what we call new year's gifts, the "*strenæ*" of ancient Rome, which flew about in every corner, and which emperors themselves did not disdain to accept of. Ovid, indeed, and Suetonius, expressly assign the calends of January for these expressions of benevolence: but even two such authorities are not sufficient to convict Tibullus, in the judgment of one conversant with his writings, of either writing idly, or falsifying ancient customs. It should seem, then, that the Romans continued to distribute these presents as earnest of their good wishes for their friends, on the calends of March, according to the institution of Romulus, even after Numa had added two months to the year, and placed them at the head of it; that this remained thus, till the calendar took a more settled form, under Julius Cæsar, by whose directions the beginning of the year being certainly fixed to the calends of January; and the emperors being jealous of their authority, even in trifles, it became the court fashion to confine this distribution of new year's gifts to that time only. No wonder then, that Ovid, who was a court-flatterer, and Suetonius, who wrote when the powers of the emperors had swallowed up all law and custom, should mention that observance only, which the first Cæsar had established; nor that Tibullus should honour that usage which prevailed when his darling liberty flourished, and disdained to take notice of a change which was introduced by a tyrant. We know the obstinacy of many of our own countrymen in favour of the old style; but amongst the Romans it had somewhat of virtue in it; it was a generous indignation against the authority which had robbed their country of every valuable privilege. Suetonius himself seems to confirm this opinion: we find Tiberius, who thought his power undermined by the slightest deviation from the institution of his predecessors, at the pains of making an edict to confine the new year's gifts to the calends of January: "*edicto prohibuit—strenarum commercium, ne ultra calend. Januarias exerceretur.*" The historian indeed assigns a different reason—that Tiberius did it for his own ease, as numbers, who could not get at him the first day, were plaguing him the whole month through: but what occasion for a solemn edict, extended to all the people, for the ease of the emperor, when the bare notice of his pleasure, supported by a few Prætorian guardsmen, would have sufficiently secured it? Might not then the edict remain upon record, and the reason of it be forgot at such distance of time; or be thought improbable by the historian, when the caprices which usually attend the struggles betwixt prerogative and liberty were buried in oblivion?

Ver. 9. The whole beauty of this elegy is lost, by Scaliger and Broekhusius's reading

gaudeat illa meis.

Whatever the wits allege, wherever "*meum*" and "*tuum*" contend for pre-eminence, it is a logomachia of real importance.

Ver. 11. To understand the original, it must be considered, that the ancients had very few "*libri quadrati*," or square books, like ours; as they generally wrote on "*membranæ*," or such large sheets as resembled our parchment: fastening these, therefore, one to another, they rolled them up, when finished, on a long piece of wood, which was tipped at both ends with horn or ivory, and sometimes decorated with paint. These are what the poet means by his "*cornua*." By "*geminæ frontes*" are to be understood the two ends of the wood next the "*cornua*," where the author's name was inscribed on a label.

As the ancients, therefore, only wrote on one side of their "*volumina*," the other was generally stained with yellow or purple, both to preserve them, and make the writing more legible. Add to this, that they wrapped up the folded scroll in a proper envelope. That wherein our poet here was to send his "*volumina*," was to be of a saffron colour, "*lutea membrana*."

The sheets were smoothed with pumice, and hence "*pumex*:" came metaphorically to signify an elaborate performance. The "*stylus*" was an instrument with one end of which they wrote, and with the other erased inaccuracies; hence "*invertere stylum*" signifies, in classical writers, to correct. But when not words only, but whole sentences were to be changed, they used a sponge, and hence, to sponge out, even in our days, means to obliterate. The ink the ancients wrote with, was the juice of the *loligo*.

Ver. 25. In the original it was,

Sed primum nympham larga donate salute,

till Scaliger first changed it into

Sed primum meritam longa, &c.

And afterwards, in his poetics, read

Sed dominam rara primum donate salute,

to avoid the word "*nympha*," which, according to him, always signifies the daughter of a god and a mortal, or "*vice versa*." Might, however, the translator make any farther alteration upon this unhappy passage, he would read

Sed nympham facili primum donate salute.

As *νύμφη*, in Greek, signifies "*nupta*;" and as even some passages might be produced to show, that "*nympha*" sometimes meant a wife, among the Romans.

Ver. 35. The beauty of this passage has not, it is presumed, been sufficiently attended to. The literal translation is, "*The pale water of Pluto shall ravish the hope of this title from him when he is dead*," "*extincto*." Where it should seem, that Tibullus, in this assumed character of a lover

and discarded husband, in order to convince Neæra of his fond attachment to her, assures her, that not only life, but memory itself must fail him, before he can quit the pleasing hope of being again united in marriage to her. Plato's metempsychosis was at that time a fashionable doctrine at Rome: which Virgil has thus represented, book vi. line 748, & seq.

Has omnes, ubi mille rotam volvere per annos,
Lethæum ad flumen Deus evocat agmine magno:
Scilicet immemores supera ut convexa revisant,
Rursus & incipiant in corpora velle reverti.

And as Tibullus, even in the midst of a love tale,

shows himself to be master of all the learning of his times, it is propable, that by "pallida Ditis aqua," is meant the river Lethe; and that the design of the whole passage is to assure Neæra, that he should always, even in death, retain a fond remembrance of her charms; that in the separate state of his soul, he should still indulge the hope of a re-union with her, when they should enter again upon the scene of life: and that he would not suffer this hope to be ravished from him by any thing else but the same waters of oblivion, in which he should lose the memory of every thing he had formerly been acquainted with. *B.*

ELEGY II.

HARD was the first, who ventur'd to divide
The youthful bridegroom, and the tender bride:
More hard the bridegroom, who can bear the day,
When force has torn his tender bride away.
Here too my patience, here my manhood fails;
The brave grow dastards, when fierce grief affails:
Die, die I must! the truth I freely own;
My life too burdensome a load is grown.
Then, when I flit a thin, an empty shade,
When on the mournful pile my corse is laid, 10
With melting grief, with tresses loose and
torn,
Wilt thou, Neæra! for thy husband morn?
A parent's anguish will thy mother show,
For the lost youth, who liv'd, who dy'd for you?
But see the flames o'er all my body stray!
And now my shade ye call, and now ye pray

In black array'd; the flame forgets to soar;
And now pure water on your hands ye pour;
My lov'd remains next gather'd in a heap,
With wine ye sprinkle, and in milk ye steep. 20
The moisture dry'd, within the urn ye lay
My bones, and to the monument convey.
Panchæian odours thither ye will bring,
And all the produce of an eastern spring:
But what than eastern springs I hold more dear,
O wet my ashes with a genuine tear!
Thus, by you both lamented, let me die,
Be thus perform'd my mournful obsequy!
Then shall these lines, by some thron'd way,
relate
The dear occasion of my dismal fate: 30
"Here lies poor Lygdamus; a lovely wife,
"Torn from his arms, cut short his thread of life."

NOTES ON ELEGY II.

LYGDAMUS having by force been deprived of Neæra, he says in this elegy, that he can no longer support life; and dwells, with such a seeming satisfaction, on the rites which he desires may attend his funeral, that we may suppose the loss greatly affected him.

The beginning of this poem discovers a kind of animated indifference, befitting his situation of mind; for here wit, or too much care about language, would have been extremely improper: because, as Cicero somewhere observes, "quædam etiam negligentia est diligens."

Although the translator is afraid, that this elegy will afford but small entertainment to the mere English reader, the scholar will not be surpris'd

to be told, that it cost him more trouble to translate, than most of the other elegies.

Ver. 1. *Hard was the first, &c.* This sentiment is finely expressed by Hammond, El. 9.

He who could first two gentle hearts unbind,
And robe a lover of his weeping fair,
Hard was the man; but harder, in my mind,
The lover still, who died not of despair.

With mean disguise let others nature hide,
And mimic virtue with the paint of art;
I scorn the cheat of reason's foolish pride,
And boast, the graceful weakness of my heart.

Sad is my day, and sad my lingering night,
When, wrapt in silent grief, I weep alone;
Delia is lost! and all my past delight
Is now the source of unavailing moan.

What follows is an improvement on Tibullus:

Where is the wit, that heightened beauty's charms?
Where is the face, that fed my longing eyes?
Where is the shape, that might have blest my
arms?
Where all those hopes, relentless fate denies?

Ver. 3. What says the sagacious Broekhusius?
"Sic mulier mutet mentem non nolens, tralato in
alium amore; an & tunc moriendum misero illi,
spreto, atque rejecto? Quid si stupro alieno pol-
luta fidem fallat?"

Ver. 10. This rite, which is altogether foreign
to English manners, Mr. Hammond has, we fear,
rather injudiciously transferred into his ninth
elegy:

Wilt thou in tears thy lover's corse attend?
With eyes averted light the solemn fire!
Till all around the doleful flames ascend,
Then, slowly sinking, by degrees expire.

If the reader is desirous to know the manner in
which the funeral pile was constructed, he may
consult Boxhornius, *Quæst. Rom.* p. 99. who, by
a figure explains the method the Romans took to
distinguish between the ashes of the burnt body,
and the ashes of the wood and other combustibles,
which were thrown upon the fire: The solution
of this formerly occasioned mighty controversies
amongst the critics; which might have been pre-
vented, had they considered, that burning, or, as
the chemists call it, calcination, does not change
the figure of the bones.

Ver. 12. There is a thought similar to this, in
that beautiful pastoral ballad called *Colin*.

At the funeral of their parents, the sons attend-
ed "velatis capitibus," but the girls went uncov-
ered and with dishevelled hair, wearing white
garments and white fillets. See Plutarch's
Πορναία. Black, however, came afterwards to be
the mourning colour, as it was in the time of our
poet.

Ver. 15. When a person died at Rome, a
branch of cypress was hung over the door of the
house, that the pontiff, and others of the sacred
college, might not pollute themselves by entering
it. The old Commentator on Virgil says, that
the bodies of the better sort were kept seven days,
burnt on the eighth, and buried on the ninth.
By this, the most dreadful of calamities was pre-
vented, that of coming to life on the pile, after it
was set on fire. And that the bodies might not
putrefy by being kept so long, they were washed
with proper drenches, and anointed with antiseptic
unguents; after this they were splendidly
clothed, and some pieces of money put into their
mouths.

The body was attended by the male and female
relations of the deceased; and sometimes, as Ho-
mer mentions, by hired mourners. The attend-
ants were called together by sound of trumpet;

and the body, preceded by the statues of the de-
ceased's ancestors, was carried through the forum,
to the place where it was to be burnt. Trumpets
were blown on at the funerals of the men, during
the procession; as were flutes at those of children,
&c. The laws of the twelve tables limited the
number of musical instruments to twelve. While
the pile was erecting, the praises of the deceased
were sung in melancholy strains, accompanied
with music sad and solemn: and being kindled,
the nearest relations flung cypress and perfumes
upon it both to feed the flames, and abate the
stench, the dirge still proceeding. When the
body was burnt, the chief mourners, after wash-
ing their hands in water, separated the bones
from the ashes; and, pouring new milk, old wine,
and sometimes blood upon them, wrapt them up
in fine lawn, and then inurned them, placing
sometimes in the urn a bottle of tears (hence on
old monuments; "cum lacrymis posui"), but al-
ways some perfume, according to the quality of
the deceased. When inurned, they conveyed
them to a monument, in the building of which,
in the times of the old republic, a certain sum was
not to be exceeded, without forfeiting an equal
sum to the state. These monuments the Greeks
sometimes anointed with rich unguents. The fu-
neral ceremony being finished, the relations were
entertained with a supper: besides which, anti-
quaries make also mention of three other kinds of
mortuary banquets. The fullest, as well as most
ancient account of funeral rites, is that contained
in the 23d Iliad.

The "Venus Infera, or *Επιθυμία*, presided
over funerals. The Roman undertakers lived in
a street called Libitina. If the reader is desirous
to inform himself of the funeral ceremonies of dif-
ferent nations, he may consult Lucian's excellent
discourse *Περὶ πτωχῶν*, and the notes in the Basil
edition, an. 1563, as also Kirchmannus "De fu-
neribus."

Ver. 21. Vopius and others, authorised by all
the MSS. read

carbascis humorem tollere ventis.

And farther support their reading by the authori-
ty of that witty mimographer Publius Syrus,
where the "carbasci venti" signify a transparent
covering of fine linen. Vulpinus also finds great
fault with the common interpretation of this pas-
sage: *Quid enim frigidius excogitari potuit,*
says he, "quam ossa in linteo ventilari solita, ut
exfugeretur humor, quo sparsa erant? *Nostra*
tempore," adds he, no doubt very archly, "*ab-*
oleribus ita guttas excutunt coqui." And thus
in particular he censures Scaliger: "Nullum præ-
terea idoneum auctorem producat, quo senten-
tiam suam tueatur, sed quasi ex tripode ac lauro con-
sulentibus responsa daret, sibi credi jubet." But
notwithstanding all this zeal, Broekhusius under-
stands the passage in the same sense as Vulpinus
does, only he reads "carbascis velis," which he
supports by two passages from Cicero's oration a-
gainst Verres; adding, that though such an ex-
pression as "carbasci venti" might be used on the

stage, or in satire, yet in serious compositions it would be as cold as Varro's "vitrea togæ." The version includes both meanings.

Ver. 22. The monuments of the more wealthy were erected of marble; and in such a one Tibullus desires Neæra to place the ashes of Lygdamus.

There are many inscriptions in Gruterus, and some in Reinetius, which show, that the Romans called a tomb "domus" (as in the original), with the adjective "æterna" annexed to it.

Ver. 29. It is certain that the Romans had often their monuments erected by some public road; and Broekhusius interprets the "celebri fronte" of the original in this sense. Although the transla-

tor has adopted that meaning, he is also of opinion, that the "celebri fronte" may signify the fore part of the monument, which was to be rendered famous by its architecture, and especially by the epitaph which was to be inscribed on it.

Ver. 31. The ancients, as Broekhusius observes, had the cause of their death inscribed on their tombs, sometimes that they might acquire glory hereby, and sometimes to gain compassion. Theocritus affords us an instance of the latter, pretty similar to that in our poet:

Τύλον ερως εκτεινειν οιδουπορε μη παρὰ δεινσης
Αλλα στας τοδὲ λειξον, Απηνια νυχιν ἐταιρον.

ELEGY III.

WHY did I supplicate the powers divine?
Why votive incense burn at every shrine?
Not that I marble palaces might own,
To draw spectators, and to make me known;
Not that my teams might plough new purchas'd
plains,

And bounteous autumn glad my countless swains:
I begg'd with you my youthful days to share,
I begg'd in age to clasp the lovely fair;
And when my stated race of life was o'er,
I begg'd to pass alone the Stygian shore. 10

Can treasur'd gold the tortur'd breast com-
pose?

Or plains, wide cultur'd, sooth the lover's woes?
Can marble-pillar'd domes, the pride of art,
Secure from sorrow the possessor's heart?
Not circling woods, resembling sacred groves,
Not Parian pavements, nor gay-gilt alcoves,
Not all the gems that load an eastern shore,
Not whate'er else the greedy great adore,

Possess'd, can shield the owner's breast from woe,
Since fickle fortune governs all below: 20

Such toys, in little minds, may envy raise;
Still little minds improper objects praise.
Poor let me be; for poverty can please
With you; without you, crowns could give no ease.

Shine forth, bright morn! and every bliss impart,
Restore Neæra to my doating heart!

For if her glad return the gods deny,
If I solicit still in vain the sky,
Nor power, nor all the wealth this globe contains,
Can ever mitigate my heart-felt pains; 30

Let others these enjoy; be peace my lot,
Be mine Neæra, mine a humble cot!
Saturnia, grant thy suppliant's timid prayer!
And aid me, Venus! from thy pearly chair!

Yet, if the sisters, who o'er fate preside,
My vows condemning, still detain my bride,
Cease, breast, to heave! cease, anxious blood to flow!
Come, death! transport me to the realms below.

NOTES ON ELEGY III.

THIS elegy contains a fine picture of a true philosophical lover; such truly know the unsatisfactoriness of riches or ambition, to remove the diseases of the mind. Of this happy complexion was our poet; for a legitimate son of Apollo can scarce stoop to the mean pursuits of sordid interest, but being enthusiastically enamoured of the muses, finds more rapture in their easy converse, than in all the preferments which kings can bestow (see Mr. Hurd's excellent notes on Horace's Epistle to Augustus, p. 109). The genuine poet not only immortalizes himself, but hands down the virtue of others, a fair example to latest po-

sterity, and thus he becomes the undoubted guardian of the temple of fame. But can wealth or grandeur effectuate this? Of difficult acquirement, and precarious in possession, death inevitably be- reaves us of both. No wonder then that our poetical inamorato only requested of the gods success in his addresses to Neæra. In that one wish all his happiness was centred: with her, any station of life could please; without her, no station, however splendid, could afford him the smallest comfort.

Ver. 3. How little these things are capable of making the possessors of them happy, has logn

been known; and yet how keenly busy are the great vulgar and the small in the pursuit of them? Had mankind estimated the value of possessions, or the extensiveness of them, by the felicity they confer, and regulated their own conduct accordingly, how many disastrous wars and other calamities would have been prevented?

Ver. 10. Not so my Lord Lyttleton, in his fine eclogue, intituled, Possession:

When late old age our heads shall silver o'er,
And our slow pulses dance with joy no more;
When time no longer will thy beauties spare,
And only Damon's eye shall think thee fair;
Then may the gentle hand of welcome death,
At one soft stroke, deprive us both of breath:
May we beneath one common stone be laid,
And the same cypress both our ashes shade.
Perhaps some friendly muse, in tender verse,
Shall deign our faithful passion to rehearse;
And future ages, with just envy mov'd,
Be told how Damon and his Delia lov'd.

Ver. 13. Tibullus mentions three kinds of marble; the Phrygian, which was then most in esteem, the Lacedemonian, and the Eubæan. The Romans ran into immense expence in the article of marble pillars; although it appears, that the Julian law endeavoured, by taxes, to restrain that luxury; for they, not content with the native colours of the marble, not only painted, but stained it. In the Memoirs of the Academy of Sciences, there is an account how the latter process may be performed. Pliny tells us, that Mamurra, who commanded Cæsar's artificers (*præfectus fabrorum*) in Gaul, was the first who incrusted the whole inside of his house with marble. This Mamurra, who was a Roman knight, and born at Formiæ, is he whom Catullus lashes in his verses.

Ver. 15. The ancients distinguished, according to Servius, between "*nemus, lucus*" (the words of the original), and "*sylva*;" the first signifying a regular plantation of trees; the second the same, but devoted to religion; and the third a forest (*diffusa et inculta arborum multitudo*). Roman writers, however, often use "*nemus*" and "*sylva*" synonymously.

The inhabitants of Rome were even more expensive in this article than they were with regard to marble itself. Take the following instance: Cheius Dometius having objected to Lucius Crassus, in a public debate, that the portico of his house was supported by Kymettian pillars, was asked by the latter, what price he put upon his own house? And being answered, "*sexagies sestertia*;" Crassus again demanded, how much less it would be worth should he cut down the ten little trees that stood before it; "*trices sestertia*," replied Domitius. To whom Crassus, Whether am I then, who bought ten columns "*centum millibus nummum*," or you who value the

shade of ten shrubs at "*trices sestertium*," the most extravagant man? And yet, adds the sensible miscellany writer, from whom I copy here, all this was nothing when compared to the luxury of after-times, both in their buildings and groves. And, indeed, if it is considered, that a knight's house, in the upper part of Rome, would sell for thirty thousand pounds Sterling, a grove of small extent to such a house, must be vastly expensive in a city, which, according to the most moderate calculation, contained as many people as any city at present in Europe.

Ver. 17. Horace has illustrated this with his usual felicity of expression:

Non enim Gazæ, neque consularis
Summøvet licet miseris tumultus
Mentis, et curas laqueata circum
Tecta volant.

Nor wealth, nor grandeur can controul
The sickly tumults of the soul;
Or bid grim care to stand aloof,
Which hovers round the vaulted roof.

The truth is, virtue is the sole parent of happiness. See Mr. Johnson's admirable poem, intituled, the Vanity of Human Wishes.

Ver. 34. A critic of no small learning, whom the Dutch editor mentions, supposes that our poet in this passage alludes to the statue of Venus, which Phidias made of gold and ivory, for the Elians. In this work of Phidias, the goddess was represented as treading with one of her feet upon a tortoise; by which symbol the unpolite statuary meant to insinuate, that the ladies ought to keep silence, and mind their domestic affairs. Upon this, Broekhusius wisely observes, "*non omnes sapimus horis omnibus*;" and, indeed, if it is considered, that Venus was, by the mythologists, supposed to spring from the sea, and often to ride in a chair of shell, what occasion was there for making Tibullus, who always thought naturally, allude to so remote an object? But thus it is to play the fool with learning! or, as an excellent poet better expresses it, we have here

Much hard study without sense or breeding,
And all the grave impertinence of reading.

Verbal Criticism.

If Venus had her shell of old, a modern Latin poet, Hadrian Marius, has bestowed a barge on love, in a beautiful poem he calls *Cymba Amoris*, on which his brother, Johannes Secundus, thus compliments him:

Ingeniose Mari, ventura in sæcula tecum
Me tua cymbat vehat, non grave pondus ero.
Cymba, renidentem qua mutet Cypria concham,
Quamque columbino præferat ipsa jugo.

Lib. ii. El. i.

ELEGY IV.

LAST night's ill-boding dreams, ye gods avert!
 Nor plague, with portents, a poor lover's heart!
 But why? From prejudice our terrors rise;
 Vain visions have no commerce with the skies:
 Th' event of things the gods alone foresee,
 And Tuscan priests foretel what they decree.
 Dreams flit at midnight round the lover's head,
 And timorous man alarm with idle dread:
 And hence oblations to divert the woe,
 Weak superstitious minds on heaven bestow. 10
 But since whate'er the gods foretel is true,
 And man's oft warn'd, mysterious dreams! by you;
 Dread Juno! make my nightly visions vain,
 Vain make my boding fears, and calm my pain!
 The blessed gods, you know, I ne'er revild,
 And nought iniquous e'er my heart defil'd.
 Now night had lav'd her coursers in the main,
 And left to dewy dawn a doubtful reign;
 Bland sleep, that from the couch of sorrow flies,
 (The wretch's solace) had not clos'd my eyes; 20
 At last, when morn unbarr'd the gates of light,
 A downy slumber shut my labouring fight:
 A youth appear'd, with virgin-laurel crown'd,
 He mov'd majestic, and I heard the sound.
 Such charms, such manly charms, were never seen,
 As fir'd his eyes, and harmoniz'd his mien;
 His hair, in ringlets of an auburn hue,
 Shed Syrian sweets, and o'er his shoulders flew;
 As white as thine, fair Luna, was his skin,
 So vein'd with azure, and as smoothly thin; 30
 So soft a blush vermilion'd o'er his face,
 As when a maid first melts in man's embrace;
 Or when the fair with curious art unite
 The purple amaranth, and lily white.
 A bloom like his, when ting'd by autumn's pride,
 Reddens the apple on the sunny side;
 A Tyrian tunic to his ankles flow'd,
 Which through its fir'd plaits his godlike beau-
 ties show'd.
 A lyre the present Mulciber bestow'd,
 On his left arm with easy grandeur glow'd; 40
 The peerless work of virgin gold was made,
 With ivory, gems, and tortoise interlaid;
 O'er all the vocal strings his fingers stray,
 The vocal strings his fingers glad obey,
 And, harmoniz'd, a sprightly prelude play:
 But when he join'd the music of his tongue,
 These soft, sad elegiac lays he sung:

"All hail, thou care of Heaven! (a virtuous
 bard,
 "The god of wine, the muses, I regard);
 "But neither Bacchus, nor the Thespian nine, 50
 "The sacred will of destiny divine:
 "The secret book of destiny to see,
 "Heaven's awful fire has given alone to me;

TRANS. I

"And I, unerring god, to you explain
 "(Attend and credit) what the fates ordain.
 "She who is still your ever constant care,
 "Dearer to you than sons to mothers are,
 "Whose beauties bloom in every soften'd line,
 "Her sex's envy, and the love of thine: 59
 "Not with more warmth is female fondness
 "mov'd, [lov'd.
 "Not with more warmth are tenderest brides be-
 "For whom you hourly importune the sky,
 "For whom you wish to live, nor fear to die,
 "Whose form, when night has wrapp'd in black
 "the pole,
 "Cheats in soft vision your enamour'd soul;
 "Neæra! whose bright charms your verse dis-
 "plays,
 "Seeks a new lover, and inconstant strays!
 "For thee no more with mutual warmth she
 "burns, [spurns,
 "But thy chaste house, and chaste embrace, she
 "O cruel, perjur'd, false, intriguing sex! 70
 "O born with woes poor wretched man to vex!
 "Whoe'er has learn'd her lover to betray,
 "Her beauty perish, and her name decay!
 "Yet, as the sex will change, avoid despair;
 "A patient homage may subdue the fair.
 "Fierce love taught man to suffer, laugh at pain;
 "Fierce love taught man, with joy, to drag the
 "chain;
 "Fierce love, nor vainly fabulous the tale,
 "Forc'd me, yes forc'd me, to the lonely dale:
 "There I Admetus' snowy heifers drove, 80
 "Nor tun'd my lyre, nor sung, absorb'd in love.
 "The favourite son of Heaven's almighty fire,
 "Preferr'd a straw-pipe to his golden lyre.
 "Though false the fair, though love is wild,
 "obey;
 "Or, youth, you know not love's tyrannic sway.
 "In plaintive strains address the haughty fair;
 "The haughty soften at the voice of prayer.
 "If ever true my Delphian answers prove,
 "Bear this my message to the maid you love.
 "Pride of your sex, and passion of the age! 90
 "No more let other men your love engage;
 "A bard on you the Delian god bestows,
 "This match alone can warrant your repose."
 He sung. When Morpheus from my pillow
 flew,
 And plung'd me in substantial griefs anew.
 Ah! who could think that thou hadst broke thy
 vows,
 That thou, Neæra! sought'st another spouse?
 Such horrid crimes, as all mankind detest,
 Could they, how could they, harbour in thy
 breast?

The ruthless deep, I know, was not thy fire; 100
Nor fierce chimæra, belching floods of fire;
Nor didst thou from the triple monster spring,
Round whom a coil of kindred serpents cling;
Thou art not of the Lybian lions' seed,
Of barking Scylla's, nor Charybdis' breed;

Nor Afric's sands, nor Scythia gave thee birth;
But a compassionate, benignant earth.
No! thou, my fair, deriv'st thy noble race
From parents deck'd with every human grace.
Ye gods! avert the woes that haunt my mind,
And give the cruel phantoms to the wind. 111

NOTES ON ELEGY IV.

THIS is one of the finest poems in Tibullus. Our dreams are commonly the imperfect images of our waking thoughts, especially when the mind is under the influence of some violent passion. Thus, in particular, it fares with the genuine innamorato, and such a one at this time was the lover of Neæra. Swallowed up in his affection for that fair one, and distracted at her affected delays to make him happy, he one night solicited sleep; but the drowsy god long resisted his importunities: at last, however, the lover being fatigued with the want thereof, but more with the succession of unpromising forebodings, dropped into a slumber about the morning, but did not long enjoy this pleasing state of insensibility; for, soon after, Apollo appeared, and informed him, that Neæra was about to desert him for another. As this news was of a most alarming nature, and could not fail to rouse his indignation against the sex; Apollo, by artfully adopting his sentiments on that score, paves the way for his recommending patience as his only remedy. Apollo's speech concludes with a message to Neæra, that if she ever expected happiness, she must think of none else for her husband but her former lover. This was a very dexterous way of reclaiming his mistress; and it may with propriety be observed, that if Apollo did not appear to our poet, he certainly inspired the description which Tibullus gives of that god; as we half pardon Neæra her infidelity, in consideration of this beautiful elegy.

Propertius has a fine vision upon his mistress's proposing to go abroad.

Ver. 6. The Roman haruspices, of whom before (Book ii. El. 6.) were called Tuscan, because their art was founded on the religious practice of Tuscany. The first sixteen lines of this elegy are an introduction to the vision: reason and philosophy seemed to persuade our lover, that dreams were not to be minded; but superstition, and those fears which are so natural to love, won him over to the other side. He therefore entreats Lucina, that as he was not conscious of having acted any otherwise than as became a man of probity, she would be pleased (ut velit) to render all his fears groundless.

Ver. 9. The oblations mentioned in the text are the holy cake (farre pio) and salt (et saliente sale). This the Romans also learn from the Tus-

cans, for whose application to haruspicy, &c. Cicero assigns some extraordinary reasons. "Etrusci autem (says that incomparable writer and good man) quod in religione imbuti, studiosius et crebrius hostias immolabant, extorum cognitioni se maxime dediderunt: quodque propter aeris crafitudinem de cælo apud eos multa fiebant, et quod ob eandem causam multa inusitata partim ex cæli, alia ex terra oriebantur, quædam etiam ex hominum pecudumve conceptu et satù; portentorum exercitatissimi interpretes extiterunt."

Ver. 13. Some interpreters understand Diana to be the Lucina of the original; but the poet certainly meant Juno Lucina, or the goddess of light and of matrimony. Festus and Varro derive the appellation Lucina from "lux, lucis;" but Pliny, with whom Ovid also, in one place of his Fasti, agrees, thinks that Juno was called Lucina from "lucus." Both etymologies, however, at last turn out to be the same. "Nam lucem (says Broekhusius) dici a luce luminum religionis causa ex arboribus suspensorum fatis constat."

Ver. 17. Tibullus is the only poet of antiquity who bestows on night a chariot and four; as Marini is the only one among the moderns who has imitated him. This he does in a prologue, prefixed to a wretched pastoral drama, intituled *Filli de Sciro*, composed by Count Giudubaldo de Bonarelli.

Chiunque haver desia
Di mia condition piena contezza,
Questa bruna quadriga
Miri, e questi aurei fregi: e sopra poi
Qual è quanta i' mi sia.

Our poet, in imitation of Homer, calls the ocean "cæruleus amnis," or a cærulean stream.

Ver. 21. The ancients thought that those visions were truly prophetic which appeared in the morning. "Certiora et colatiora (says Tertullian) de anima somnari affirmant sub extremis noctibus;" or, as Ovid expresses it in his epistle of Hero to Leander,

sub Auroram, jam dormitante lucerna,
Somnia quo cerni tempore vera solent.

Mr. Pope begins his intellectual vision of the Temple of Fame at the same time:

What time the morn mysterious visions brings,
While purer slumbers spread their golden wings.

Ver. 25. This is not a version of the hexameter and pentameter, which make the twenty fifth and twenty-sixth lines of the original in all the editions the translator ever saw: for, as Vulpinus well observes, these lines,

Non illo quidquam formosius ulla priorum
Ætas humanum nec videt illud opus,

cannot be applied to the beauties of Apollo. "Certe (says he) latet malignum ulcus, quod Chironis auxilio indigeat: ego lubens depono, et peritiori manui committo." Broekhusius passes them over without any remark, although he must have seen the absurdity of the passage. But are we to think that Tibullus wrote nonsense? By no means. Place the lines after the thirty-eighth (in the original), and you will find they exactly correspond with that station; and that there is no occasion to change the "videt" in the pentameter, into "fuit," as Achilles Statius proposes.

Ver. 27. The "myrtea coma" which Tibullus bestows on Apollo, Ovid thus explains:

Nec tamen ater erat, nec erat color aureis illis,
Sed quamvis neuter, mistus uterque color.

Nor of a black, nor of a golden hue,
They were, but of a dye between the two.

But as the painters (for thus Athenæus informs us) drew Apollo with black hair, and the poets gave him yellow or golden locks; why does Tibullus make the god's hair auburn? Neæra's own hair, say some critics, was of that colour,

Dic et argutæ properet Neæra
Myrteum nodo cohibere crinem.

Hor. lib. iii. Od. 14.

For so Porphyrio, and Cunningham, upon the authority of several MSS. read it. This, therefore, add they, was a delicate compliment to his mistress. But this solution is more ingenious than solid; for though Horace's Neæra had "myrteus crinis," it by no means follows, that Tibullus's Neæra had hair of that colour; nor indeed is it of any consequence. The emperor Commodus used to powder his hair, of which he was passionately fond, with gold-dust.

Ver. 29. The whiteness of the moon has been a favourite resemblance since the days of Solomon; the sun, however, for some centuries past, appears to have been the more common simile. Tasso, however, has a beautiful address to the moon, which the reader will not be displeased to see.

In bianca e vaga Luna,
C'hai tanti specchi quanti sono i mari
Mira questo candor, ch'è senza pari.
A lei mena i tuoi balli, a lei distilla
Le tue dolci rugiade;
Specchiati con lei con amoroso affetto.

But, besides this general resemblance, there is a farther propriety in Tibullus's comparing Apollo to Diana, as she was his sister.

Ver. 30. As poetry is a great assistant to painting and statuary, those who have excelled in these arts, have always particularly cultivated the muses. Thus Phidias obtained the idea of his Olympian Jove from the Iliad of Homer, and probably was indebted to Pindar's first Pythian ode for placing an eagle on the sceptre of the same god. On the other hand, again, painting has been of use to poetry; thus, in this century, an excellent Italian poem was composed from the drawings of the famous Bolognian painter Spagnoletto.

Ver. 31. This is one of the strokes which seems to me, says the author of the Polymitis, to have been borrowed from some painting in Rome, in which the mixture of colours here mentioned to be blended together, was remarkably well executed. Pliny, in speaking of the best pieces by Echion there, instances in one on this subject; "nova nupta, verecundia notabilis," lib. xxxv. 10. The famous picture of the Aldobrandine palace in Rome is on the same subject; and the air of the new bride in it is remarkably modest. As that is so good, though done when the art of painting was extremely fallen at Rome, it was very probably copied from some celebrated picture there, and possibly from that piece of Echion's. The colours are all so faded in it (as one may well expect, after the course of almost seventeen hundred years), that we can see nothing of the beautiful blush, that was probably on the face of the bride. Dialogue 8.

Ver. 32. The word "deducta," in the original, has a peculiar beauty, being only applied to the modest, in opposition to "producta," a term used for women of the town.

Ver. 33. Charmed with the beauties of his vision, Tibullus here, contrary to custom, multiplies his illustrations: the lily and the amaranth furnished the ancients with favourite allusions; but, as the finest similes, by repetition, become unaffecting, the moderns labour under great difficulties in this respect. It is true, they have exchanged the amaranth for the rose; but that has been now so long employed, that it is grown stale, and the poets of this age may exclaim, with the old grammarians, "percant isti, qui, ante nos, nostra dixerunt." It is a pity that Tibullus, who was so excellent an artist, did not leave more pictures of beauty behind him.

Although Ovid and others paint Apollo in much the same colours as our poet does, we are not, therefore, to suppose that they copied from one another. The figure, features, dress, &c. of the heathen gods, were as well known to the ancients from statues, paintings, &c. of them, formed according to a common standard, as St. Peter is now a-days to any Roman Catholic!

Ver. 36. Broekhusius makes our poet indebted to the great Sicilian shepherd, Idyll. vii. for this simile. But why need we suppose this? It is only such as grows in the poetical common of nature; and what no traveller, however little inspired, could fail to pluck as he passed.

Ver. 37. The word, in the original is "palla," the name of a robe, with which not only Apollo,

but the poets and musicians of old, were vested. Valerius Flaccus clothes his bard Mopsus with a white "palla:" but the more common colour of it was purple, "Tyrio bis murice tineta."

Ver. 39. Who the inventor of the lyre was, is uncertain: some attribute it to Apollo, and others to Mercury. Diodorus informs us, that this instrument, in conformity to the seasons, assumed at first four strings; but soon after, it mounted seven, in imitation of the planets; and hence Pindar's epithet, when he calls it seven-tongued. It was at first made of gold, silver, or ivory, ornamented with precious stones; but, in the Augustan age, the shell of the sea-tortoise coming into very high estimation, the body of the lyre was principally composed of it, yet still adorned with gold, silver, &c. Hence Horace says,

O mutis quoque piscibus

Donatura cygni, si libeat, sonum.

Goddeſs of the ſweet ſounding lute,

Which thy harmonious touch obeys;

Who canſt the ſinny race, though mute,

To Cygnets' dying accents raiſe.

Francis, Book iv. Od. 3.

The lyre was played upon with a plectrum of ivory. See a curious diſſertation on this ſubject, preſented by Mr. Molyneux to the Royal Society.

Ver. 50. In this paſſage Bacchus is deprived of the power of preſcience; and yet we know that many of the ancients regarded him as a prophetic deity. Thus Pausanias tells us, that Bacchus had an oracle in Thrace. But eſpecially (book x. chap. 33.) a cave (αδύτην) at Ophitea, corruptly called Amphiclea, in which were performed his orgies. This cave was acceſſible by one road only; and there was in it no ſtatue of the god. There the inhabitants of the city and neighbourhood were, in their ſleep, informed by the divinity, of remedies appropriated to their diſeaſes; and his prieſt, inſpired by him, acquainted them with future events.

Ver. 70. There is a deſigned harſhneſs in theſe lines, as in the original. Engliſh translators can never be at a loſs for unharmonious combinations; theſe however, like diſcord in muſic, when properly introduced, greatly increaſe the harmony.

The tranſlator cannot help thinking this a very unjuſt deſcription of the fair ſex, as they are commonly more conſtant than men.

Ver. 75. The poſture of a ſuppliant and vanquiſhed perſon is happily expreſſed in the original,

Tu modo cum multa brachia tende prece,

but could not be preſerved in the verſion. Achilles Statius and Douza miſunderſtood this paſſage.

Ver. 79. See the notes to Elegy iii. Book 2.

Ver. 92. The original paſſage was incomprehenſible, till Muretus reſtored it, from an old MS. thus,

Felix. Hoc alium define velle virum.

The ſenſe of which according to him, is, that Neæra muſt think of no other huſband but this, "alium ab hoc." But Scaliger and Douza allege, that the "felix hoc" alludes to the old form of nuptial contracts; as if they had ſaid, "felicitur felix hoc ſit." Salmaſius, however, and Broekhuſius interpret it in this manner: as this marriage is, on the word of Apollo, to be productive of perfect happineſs to you, Neæra; preſume not to wiſh for another lover; "felix hoc conjugio define alium virum velle."

Ver. 106. Theſe were the ſtrongeſt poetical emblems of barbariſm and infidel ferocity. The thought is originally Homer's (Il. xvi. ver. 34.) but adopted by Catullus and Virgil, traſteſtied by Glambattiſta Lalli, often uſed by Ovid, and parodied by Boileau in his admirable Lutrin:

Non ton pere a Paris ne fut pas Boulanger, &c.

In the famous interview of Glaucus and Diomed, Glaucus thus deſcribes chimæra:

Fiſt dire chimæra's conqueſt was enjoin'd;

A mingled monſter, of no mortal kind;

Behind, a dragon's fiery tail was ſpread;

A goat's rough body bore a lion's head;

Her pitchy noiſtrils ſlaky flames expire,

Her gaping throat emits infernal fire.

Pope.

Verſes nothing inferior to the original.

Ver. 108. This was an artful method of ſtill farther intereſting Neæra's family in favour of her lover.

ELEGY V.

WHILE you at Tuſcan baths for pleaſure ſtay,
(Too hot when Sirius darts his ſultry ray,
Though now that purple ſpring adorns the trees,
Not Baia's more medicinal than theſe,)
Me harder fates attend, my youth decays;
Yet ſpare, Perſephone! my blameleſs days;

5

With ſecret wickedneſs unſtung my ſoul;

I never mix'd nor gave the baneful bowl;

I ne'er the holy myſteries proclaim'd;

I fir'd no temple, and no god defam'd;

10

Age has not ſnow'd my jetty locks with white,

Nor bent my body, nor decay'd my ſight;

(When both the consuls fell, ah fatal morn !
Fatal to Roman freedom ! I was born)
Apples unripe, what folly 'tis to pull,
Or crush the cluster e'er the grapes are full !

Ye gloomy gods ! whom Acheron obeys,
Dispel my sickness, and prolong my days !
Ere to the shades my dreary steps I take,
Or ferry o'er th' irremeable lake, 20
Let me (with age when wrinkled all my face)
Tell ancient stories to my listening race ;

Thrice five long days and nights consum'd with fire,
(O sooth its rage !) I gradually expire ;
While you the Naiad of your fountain praise,
Or lave, or spend in gentle sport your days :
Yet, O my friends ! whate'er the fates decree,
Joy guide your steps, and still remember me !
Meantime, to deprecate the fierce disease,
And hasten glad returns of vigorous ease, 30
Milk, mix'd with wine, O promise to bestow,
And fable victims, on the gods below.

NOTES ON ELEGY V.

SOME critics are of opinion, that this elegy was written by Tibullus when very young, and disengaged from any amorous attachment, as in it he makes no mention of any of his former mistresses. And indeed it must be confessed, that their conjectures are not always so well founded ; for had his heart been engaged, his sickness, which makes the subject of the poem, would have supplied him with as many pathetic thoughts as it did when he was left behind in the island of Corfu. But be this as it will, the elegy itself is valuable, for being the only one wherein our poet gives us any hints of his own person, which, as it really was amiable, is no small proof of his modesty.

It is addressed to some of his friends, who were then at the hot baths of Tuscany, where, probably, our poet was to have been of the party, had not a violent fever prevented him. However desirous the commentators may show themselves to discover the names of the poet's friends, that discovery is now impossible ; but if we are not ignorant of this, the poem itself informs us, that Tibullus composed it on the fifteenth day of his disorder, which he entreats Persephone speedily to bring to a happy crisis, as he was then young, and by his conduct had never merited any chastisement from heaven.

Ver. 1. Critics have in vain endeavoured to determine which of the Tuscan baths are here meant. Schoppius believes them to have been the Clusin ; but these were cold, as we learn from Horace, Ep. 15. lib. i. wherein those, at which Tibullus's friends appear to have been, were warm.

Ver. 4. Baia was the most remarkable warm bath in Italy. The name of it came in time to stand for "therme" in general.

Ver. 9. The mysteries here meant, were those of Ceres, the most revered of any in ancient times. As it was piacular to divulge them, the reader must not expect to find them described with the same exactness as the other religious ceremonies of paganism. But what is known of certainty of them, shall here briefly be collected.

The Eleusinian mysteries, for so they were also

called, were divided into the greater and the lesser, and celebrated at Athens, at stated seasons, with great pomp of machinery and solemn shows. These drew together a vast concourse of people from all nations ; and many earnestly desired to be initiated, but that favour was bestowed upon none but those of the first rank and figure. The reverence with which Cicero speaks of them, and the hints he drops of their use and end, seem to confirm Dr. Warburton's conjecture about them, viz. that they were intended to inculcate God's unity and the immortality of the soul. The shows are supposed to have represented Heaven, Hell, Elysium, and whatever concerned a future state. The poets often alluded to them ; and we find Cicero, at the request of Chilias a famous poet, requesting Atticus to send him from Athens a detail of them. This intimates, that these shows were occasionally varied ; and Dr. Middleton conjectures, that the detail here desired from Atticus was intended by the poet as episodes to some of his poetical performances. Is Virgil's sixth *Æneid* a representation of this kind ? The supposition is highly ingenious, and Dr. Warburton has supported it with no less fancy than learning.

So cautious were the Athenians, in Cicero's time, of violating the solemnity of these mysteries, that the famous orator Crassus, coming to Athens two days after the procession was over, could not prevail on the magistrates to re-exhibit the shows, although he was one of the first senators of Rome.

Whoever divulged the Eleusinian mysteries, was expelled the society of human kind, and abhorred as a monster unworthy the common benefits of life. It was esteemed dangerous to converse with him, lest Jupiter, in his wrath, should make no distinction between the innocent and the guilty. Thus Horace,

—vetabo, qui cereris sacrum
Vulgarit arcana, sub isdem
Sit trabibus, fragilemve mecum
Solvat phaselum.

Horat. Lib. iii. Ode 2.

He who can friendship's secrets tell,
Or Ceres' hallow'd rites reveal ;

The wretch with me shall never dwell,
With me shall never hoist the doubtful sail.

Francis.

The Greeks, according to Dacier, not only punished with death those who revealed, but those also to whom the mysteries were imparted. When the Athenians for two years were baffled in their attempts against Sicily, Alcibiades, who not only advised, but conducted that war, was accused by that superstitious people of having divulged the mysteries of Ceres.

Numenius, the celebrated Pythagorean, having published an account of the mysteries, some goddesses, in the wanton dress of courtesans, appeared to him. The philosopher, with surprise, asking the reason, was told by them in an angry tone, "Ab se, ipso adyto pudicitiae abstractas, et passim adeuntibus prostitutas:" That he himself dragged them from the shrine of chastity, and prostituted their charms to every comer. Macrobi. Somn. Scip. cap. 2.

Ver. 10. Nothing tends so much to soften the horrors of death, as the consciousness of a well-spent life. Upon a death-bed, every object appears in its genuine colours; as the mind then often has the nicest perception of right and wrong.

Ver. 13. *When both the consuls fell, ah fatal morn! Fatal to Roman freedom! I was born.* At the end of the year U. C. 709, the famous Mark Antony, under the specious pretext of revenging the murder of Cæsar, left Rome. Decimus Brutus (whose name, next to that of Marcus Brutus, the patrons of liberty will ever reverence for his glorious share in the death of Julius), was to feel the first effects of his bloody rage. Although Gaul had cheerfully declared in favour of Brutus, and had levied a considerable force, yet was that patriot, at the approach of Antony, obliged to throw himself into Modena. As Antony knew the aversion of the better and wiser senators to his conduct; how devoted the veterans were to his political, though young enemy, Octavius; and the levies that were vigorously carrying on by decree of the senate, to support the consuls elect, Hirtius and Panfa; he easily saw that no time was to be lost in the reduction of that city: accordingly he invested it with a formidable body of troops, posted to so great advantage, that even after Octavius and the consul Hirtius arrived with a veteran army, the place too defending itself with no less art than courage, he reduced the besieged to very great straits, and seldom was worsted in his encounters with the consular army. Modena had now stood out near four months, when, on the 15th of April, U. C. 710, Antony having intelligence that the other consul, Panfa, with four legions, was to join the confederate chiefs, he resolved to attack him on his march, with two legions, two Prætorian cohorts, and part of the Evocati. It is scarce to be imagined but the plan would have succeeded, as the enemy was made up of raw levies, had not Hirtius privily in the night detached the martial legion and two Prætorian

cohorts, to cover their march to the camp. By the eagerness of that reinforcement, which run forward to attack Antony, Panfa was obliged to follow after with two of the new legions, and a brisk engagement was fought at Castell-Franco, in which Panfa was mortally wounded, and the victory, by the retreat of his enemies, inclined to Antony. His joy, however, was short, for Hirtius, hearing of the engagement, marched out with twenty veteran cohorts, met Antony, entirely routed and put to flight his whole army, in the very plain so lately the scene of his glory. Antony, though now obliged to lie on the defensive in his strongly fortified camp, still hoped to make himself master of Modena, which was now reduced to the greatest difficulties. Octavius and Hirtius saw this; and, flushed with their late success, were determined at all hazards, to relieve the town. To effectuate this, after two or three days spent in finding out the weakest part of Antony's camp, they attacked the entrenchments with such vigour, that Antony, rather than suffer the town to be snatched at last from him, drew out all his forces, and came to a general battle. Little advantages were gained on either side, both armies fought like Romans, till D. Brutus, taking the opportunity, sallied out of the town at the head of his garrison, and helped greatly to determine the victory on the side of the republic. Hirtius pushed his advantages with great spirit, drove all before him to the middle of the enemy's camp, where he was unfortunately killed, near the general's tent. This probably would have turned the fortune of the day, had not Octavius made good the attempt, by keeping possession of Antony's camp, while that general, after the destruction of his best troops, fled precipitately, with his horse, towards the Alps. The other consul died the day after, of his wounds, at Bologna. This was the greatest loss the republic could possibly sustain at that time; as the death of the two consuls placed Octavius above all controul, left him sole master of their armies, especially the veterans, and first inspired him with the design of succeeding to his uncle's power as well as to his estate. That with inferior martial virtues, the successor of Julius was equally successful; and that after the most bloody proscriptions of the best families of the empire, he reigned quietly, nay gloriously; are particulars which our present purpose calls not upon us to explain: we only beg leave to remark, that if the two lines which gave rise to this note, are genuine, Tibullus must have been born A. U. C. 710, some time between the 14th and 15th of April, and perhaps on the very same day with Ovid. This was the opinion of Petrus Crinitus and Lelio Giraldi, and of every biographer till the time of Josephus Scaliger. That great scholar could not well reconcile that date to some other passages in Tibullus: but the affair remained undetermined, till Janus Douza the younger, attempted to prove, that the "cum cecidit fato," &c. was stolen from Ovid, and inserted in Tibullus. The reasons on which he, and those of his party, ground their opinion, and the

objections which may be urged against them, are as follow :

In the first place, it appears from the seventh elegy of the first book, that our poet not only attended Messala to the war of Aquitaine, but that he was also rewarded with military honours for his behaviour at that time. Now it is known, that the reduction of that province was accomplished A. U. C. 725; of course, if Tibullus was born 710, he must have had those marks of successful bravery conferred on him when he was only fifteen years of age; but the Romans did not put on the "toga virilis" at soonest till the fifteenth year of their age; therefore, say they, Tibullus could not, if no older, serve with Messala. This argument, however, is more specious than solid; for it is certain that some Roman youths had the manly gown conferred on them before their fifteenth year; and experience shows us, that young men at that age often behave with as much intrepidity, as those who are more advanced in life.

Again, Horace, in the ode addressed to Tibullus, has the following lines :

Albi ne delas plus nimio memor, &c.

No more in elegiac strain
Of cruel Glycera complain;
Though she resigns her faithful charms
To a new lover's younger arms.

Francis, Lib. i. Ode 33.

Now, argues Douza, as Horace was but about forty when this ode was wrote, Tibullus could only be about fifteen; and how could one at those years write mournful elegies? or how could Glycera well prefer one younger than himself? To obviate this objection, Dacier explains *junior* by a *new lover*. But there is no occasion for this strained interpretation; for it will afterwards be proved, that younger folks have written, and with applause too, poems of a more difficult nature than elegy; and he must know little of life, who has not observed some women, even in our cold climate, prefer a lover of fourteen even to one of twenty; and Julius Cæsar divorced Cossutia in the sixteenth year of his age. But not to insist on these arguments; the critics may be defied to prove Horace's age, when the thirty-third ode of his first book was written: for though that poet was just forty when some of the odes of the second book were composed, we know that his odes are not placed in the order they were written: hence there is no necessity of alleging, with some critics, that this ode was written to our poet's father.

But, says Vulpus, Horace, when upwards of forty " (octo lustra prætergessum) ", used to consult Tibullus upon his satire, as appears from the following line,

Albi nostrorum sermonum candide judes.

Ep. 4. Lib. i.

Albius, in whom my satires find
A candid critic, and a kind,

Francis.

Now this, adds the Italian editor, is not to be supposed; as Tibullus, at that time, must, if born in 710, have been nineteen years younger than the poet. To this it may be answered, that a person of nineteen, if endowed with good sense, and some practice in poetry, may be capable of correcting the writings of a man of forty: thus Pope, when younger than Tibullus is supposed to be, amended Wycherley's poems, when that gentleman was upwards of fifty; and even wrote the Essay on Criticism at twenty. But, what is of more consequence, the critics are not agreed about the time when the fourth epistle of the first book was written: thus Sanadon says, it was composed about the year 720, when Horace was thirty-one, and Tibullus thirty years old. And the truth is, the precise time of it cannot be determined. Besides, the commentators have proved, that Horace wrote an epistle to Lollius, when that nobleman attended Augustus in the Cantabrian war, A. U. C. 727, and was only sixteen years of age.

Again, says Broekhusius, our Roman knight fell sick at Phæacia, in his voyage with Messala to Syria. Now it is certain, that excellent general went thither with an extraordinary command, A. U. C. 724; therefore Tibullus, if born 710, could only then be fourteen: and yet it appears from the elegy itself (which is much too fine a piece for a boy of these years), that he had been some time in love with Delia. To this argument, this short reply may be made: that it cannot be proved that Messala was upon his Syrian expedition when our poet was left behind sick in Phæacia; and, could that even be established, instances are not wanting to prove, that poems, not inferior to the third elegy of the first book, have been the production of youths not much older. L. Valerius Prudens gained the prize of poetry, and was crowned, in the reign of Domitian, when only thirteen years old; Johannes Secundus was not twenty-five years old when he died; and there is good reason for asserting, that Cardinal Rovera, when only ten years of age, published at Pavia, a collection of his own poems; nay, it is a fact, that Cowley printed a volume of poems, all which were written before his fifteenth year.

Well; but, says Vulpus, it is not to be believed, that Ovid, who was so studious of the memory of Tibullus, and so minutely exact in other things of less moment, would have passed by an event which did such honour to his own birth, had Tibullus and he been born at the same time. To this it may be answered, that he had but a short acquaintance with our poet, as he himself informs us,

—nec avara Tibullo

Tempus amicitiae fata dedere meæ.

It may, however, be objected, say Douza and others, that Domitius Marfus calls Tibullus a youth when he died:

Te quoque Virgilio comitem non æqua, Tibulle,
Mors juvenem compos misit ad Elysios.

Now as Marfus lived at that time, Tibullus must have died when twenty-four or twenty-five years

of age, and therefore must have been born A. U. C. 710.

To this it may be opposed, that by the laws of Servius Tullus, the Romans considered every citizen as a *juvenis* till his forty-sixth year. After that time indeed they called them *seniores*; and therefore, as Tibullus was only forty-five when he died, Marfus might call him *juvenis*. Doubtless he might, according to the Tullian computation; but then, it may be observed, that Marfus does not say that Tibullus died the same year with Virgil, i. e. in his forty-fifth year; but only, that he was the first poet who died after him; and therefore he must either have been out of the class of *juvenis*; or born in 710, and consequently then only twenty-five or twenty-six when he died.

But had our author been so young, Ovid would not have omitted that circumstance, as it would have greatly added to the pathos of his famous elegy on his death; especially since, in that very poem, he mentions the youth of Catullus, who, by the by, was upwards of forty when he died, contrary to the common opinion.

Obvius huic venies, hedera juvenilia cinctus
Tempore, cum Calvo, docte Catulle, tuo.

This argument, indeed, is of moment; but the same poet affords some other arguments of still greater weight to prove that Tibullus could not be born in 710. In the first place, he says, that our poet was eminent for his reputation as a writer, when Augustus Cæsar was prince,

—jam te principe notus erat.

that is, when Cæsar was "princeps senatus," after having had the glorious but undeserved title of "pater patriæ" bestowed on him by Messala and the senate, A. U. C. 727. But how could a youth of seventeen be known as a poet? The answer to this has in part been anticipated; and when we add, that Heinsius reads "natus," it rather is an argument in support of Tibullus's being born in 710. as Octavius Cæsar and Pedius succeeded Hirtius and Pansa in the consulate. It must here, at the same time, be confessed, that Cæsar could not be styled "princeps," far less "princeps senatus," for being made consul: yet could even this be granted, Heinsius's reading is supported by MS. authority.

But the argument to which the least objection can be made, is that which follows, and Ovid furnishes it. It runs thus,

Virgilium vidi tantum; nec avara Tibullo
Tempus amicitiae fata dedere meæ:
Successor fuit hic tibi, Galle; Propertius illi;
Quartus ab his serie temporis ipse fui.

Trist. Lib. iv. el. 10.

That is, I only saw Virgil, and the cruel fates did not long indulge me with the friendship of Tibullus. He (viz. Tibullus), was thy successor, Gallus; Propertius followed Gallus; and, in order of time, I myself was the fourth. Now, as Gallus

was born A. U. C. 681; and Propertius, by his own confession, did not put on the "toga virilis" till after the division of the municipal lands among the veterans, A. U. C. 711, when he was at least fifteen; Tibullus must have been born between the year 681, and the year 696, that is, about the year 690, one year after Horace. But why might he not be five years younger, as well as one year? And indeed, as this corresponds more with Marfus's epigram, it seems as likely that Tibullus was born 695. Some, indeed, object to the quotation from Ovid, as if that poet meant poetical fame, or the order in which the poets he there mentions were known to the world by their writings; and indeed, were it not for the former passage from Ovid, such a suggestion might invalidate the argument upon which Douza chiefly builds his opinion.

But (add Douza, and the rest who espouse his opinion), what if we can prove, from Tibullus himself, that he was not born A. U. C. 710? Had he been so young when sick at Corfu, would he not, in a particular manner, have mentioned it? And would not a youth of twenty-five years, have expressed himself differently in the poem before us from

Et nondum cani nigros læsere capillos
Nec venit tardo curva senecta pede.

Besides, in his panegyric, which we know was written 722 (vide l. 121, &c.) he has the following lines,

—nam cura novatur,
Cum memor ante actos semper dolor admonet
annos.

which could not be proper from a boy of twelve years of age. Nay, that poem itself, though inferior in every respect to his elegiac compositions, is yet too great a work for one so young. And if to this we add, that in this poem he talks of the old warrior of Arupinum, and of his having attended Messala in his Pannonian expedition; and if we consider, that this expedition took place A. U. C. 718, or 719. it must appear that 710 could not be the year of Tibullus's birth, and that, therefore, the

Cum cecedit fato consul uterque pari
is spurious, and foisted in by some librarian from Ovid. Nay, Vulpius, not content with putting a mark of reprobation on that line, even suspects the following one, as it is, according to him, not only languid, but interrupts the sentence, which is complete without it.

However immaterial these remarks may appear to the generality, the translator hopes, that the critical reader will pardon their length, as they may be found of some service to future biographers.

Ver. 15. *Apples unripe, what folly 'tis to pull?*
This sentiment would answer in pastoral; and were it not what every man might have thought, it might be said, that Ovid had almost transcribed it.

Quid plenam fraudas vitem crescentibus uvis?
Pomaque crudeli vellis acerba manu?

El. 14. Lib. 2,

The "tolle cupidinem immitis uvæ" of Horace, is almost the same; but as the lyric bard in the ode where he uses these expressions describes lalage as a young frisking heifer, and her lover as a bull, the metaphor is not so happily exact.

Ver. 17. This and the foregoing thought are thus imitated by Mr. Hammond:

No stealth of time has thinn'd my flowing hair,
Nor age yet bent me with her iron hand;
Ah why so soon the tender blossom tear?
Ere autumn yet the ripen'd fruit demand.

Ye gods who dwell in gloomy shades below,
Now slowly tread your melancholy round;
Now wandering view the baleful rivers flow,
And musing hearken to their solemn sound:

O let me still enjoy the cheerful day,
Till many years unheeded o'er me roll'd,
Pleas'd in my age I trifle life away,
And tell how much I lov'd ere I grew old.

The whole fourth elegy, from which these stanzas are taken, is an improvement upon our author. In the original, the poet joins two adjectives to one noun, which Servius, in his notes on Virgil, blames as a vice in writing; and yet not only instances of this may be produced from the ancient Roman authors, but also from Lucretius, Cicero, Ovid, and Virgil.

Ver. 21. That man should be so solicitous for old age, is really astonishing, when we consider, with a great moral poet,

That life protracted is protracted woe.
Time hovers o'er, impatient to destroy,
And shuts up all the passages of joy:
In vain their gifts the bounteous seasons pour,
The fruit autumnal, and the vernal flower.
With listless eyes the dotard views the store;
He views, and wonders that they please no more.
Now pall the tasteless meats, and joyless wines,
And luxury, with sighs, her slave resigns.
Approach, ye minstrels, try the soothing strain,
And yield the tuneful lenitives of pain;
No sound, alas! would touch th' impervious ear,
Though dancing mountains witness'd Orpheus near:

Nor lute, nor lyre his feeble powers attend,
Nor sweeter music of a virtuous friend;
But everlasting dictates crowd his tongue,
Perversely grave, or positively wrong:
The still returning tale, and lingering jest,
Perplex the fawning niece and pamper'd guest,
While growing hopes scarce awe the gathering
And scarce a legacy can bribe to hear; [sneer,
The watchful guests still hint the last offence,
The daughter's petulance, the son's expence;
Improve his heady rage with treacherous skill,
And mould his passions, till they make his will.
Unnumber'd maladies his joints invade,
Lay siege to life, and press the dire blockade:
But unextinguish'd avarice still remains,
And dreaded losses aggravate his pains;

He turns, with anxious heart and crippled hands,
His bonds of debt, and mortgages of lands;
Or views his coffers with suspicious eyes,
Unlocks his gold, and counts it till he dies.
But grant the virtues of a temperate prime,
Bless with an age exempt from scorn or crime;
An age that melts in unperceiv'd decay,
And glides in modest innocence away:
Whose peaceful days benevolence endears,
Whose nights congratulating conscience cheers;
The general favourite, as the general friend:
Such age there is, and who could wish its end?
Yet ev'n on this her load misfortune flings,
To press the weary minutes' flagging wings:
New sorrow rises as the day returns;
A sister sickens, or a daughter mourns;
Now kindred merit fills the sable bier,
Now lacerated friendship claims a tear.
Year chafes year, decay pursues decay,
Still drops some joy from withering life away;
New forms arise, and different views engage,
Superfluous lags the veteran on the stage,
Till pitying nature signs the last release,
And bids afflicted worth retire to peace.
But few there are whom hours like these await,
Who set unclouded in the gulfs of fate;
From Lydia's monarch should the search descend,
By Solon caution'd to regard his end,
In life's last scene what prodigies surprise,
Fears of the brave, and follies of the wise;
From Marlborough's eyes the streams of dotage
And Swift expires a driv'ler and a show. [flow,

Its great beauty will, it is presumed, excuse the length of this quotation.

Ver. 26. Swimming was much practised by the Romans; an exercise which they, as a military people, found serviceable to them on many accounts, and which Britons, both on that account, and as a naval people, would do well to practise more; for as the poet of the seasons sings,

This is the purest exercise for health,
The kind refresher of the summer heats;
Nor when cold winter keens the brightening flood,
Would I, weak shivering, linger on the brink.
Thus life redoubles, and is oft preserv'd
By the bold swimmer, in the swift illapse
Of accident disastrous. Hence the limbs
Knit into force; and the same Roman arm
That rose victorious o'er the conquer'd earth,
First learn'd, while tender, to subdue the wave.
E'en from the body's purity, the mind
Receives a secret sympathetic aid.

Summer.

Ver. 28. Tibullus was as warm in his friendship as in his love; and certainly, if the love of fame is ever allowable, the wishing to be remembered after death, by one's friends, is highly natural. The

Oblitus meorum, obliviscendus et illis,
The world forgetting, by the world forgot,
of some authors, is too misanthropical; for the love of fame being natural to man, and the source

from whence have sprung most of the good actions which have astonished or benefited humanity, the translator cannot join issue with those who condemn its exertion.

Ver. 31. The old Scholiast on Statius, whose comment Barthius had in his possession, calls blood, honey, and milk, the banquet of the infernal powers, "*inferorum pastus*." But this passage in our poet shows, that wine was also part of their cheer.

Black cattle were the only victims sacrificed to the "*dii inferni*." The ancients, say the critics, generally offered to their gods, those beasts which they were supposed to hold in the greatest abhorrence. When they sacrificed to the infernal powers, they turned their palms downwards.

There are two or three instances in the legendary part of the Roman story, of the ceasing of plagues at Rome, upon immolating on the altars of Pluto and Proserpine. Pluto's altars at Tarentum were chiefly remarkable for miracles of this kind. These sacrifices, which in time gave rise to the secular games, the jubilee of Paganism, were performed in the evening; as those to the celestial powers were in the morning. The priests were sprinkled with water, when offerings were made to the infernal deities. See the old Scholiast on the fourth Isthmian ode of Pindar. And it is certain from Homer (*Iliad ix. lin. 565.*) that those who addressed these powers, fell on their knees when they prayed to them.

ELEGY VI.

Lover.

COME, Bacchus, come! so may the mystic vine
And verdant ivy round thy temples twine!
My pains, the anguish I endure, remove;
Oft hast thou vanquish'd the fierce pangs of love.
Haste, boy, with old Falernian crown the bowl,
In the gay cordial let me drench my soul.
Hence, gloomy care! I give you to the wind;
'The god of fancy frolics in my mind!
My dear companions! favour my design,
Let's drown our senses all, in rosy wine! 10

Companion.

Those may the fair with practis'd guile abuse,
Who, sourly wise, the gay dispute refuse:
The jolly god can cheerfulness impart,
Enlarge the soul, and pour out all the heart.

Lover.

But love the monsters of the wood can tame,
The wildest tygers own the powerful flame:
He bends the stubborn to his awful sway,
And melts insensibility away:
So wide the reign of love!

Companion.

Wine, wine, dear boy!

Can any here in empty goblets joy? 20
No, no, the god can never disapprove,
That those who praise him should a bumper love.
What terrors arm his brow? the goblet drain:
To be too sober is to be profane!
Her son, who mock'd his rites, Agave tore,
And furious scatter'd round the yelling shore!
Such fears be far from us, dread god of wine!
Thy rites we honour, we are wholly thine!
But let the sober wretch thy vengeance prove:

Lover.

Or her whom all my sufferings cannot move! 30
—What pray'd I rashly for? my madding prayer,
Ye winds, disperse, unratified, in air:

For though, my love! I'm blotted from your soul,
Serenely rise your days, serenely roll!

Companion.

The love-sick struggle past, again be gay:
Come crown'd with roses, let's drink down the
day!

Lover.

Ah me! loud-laughing mirth how hard to feign!
When doom'd a victim to love's dreadful pain:
How forc'd the drunken catch, the smiling jest,
When black solicitude annoys the breast! 40

Companion.

Complaints, away! the blithsome god of wine
Abhors to hear his genuine votaries whine.

Lover.

You, Ariadne! on a coast unknown,
The perjur'd Theseus wept, and wept alone;
But learn'd Catullus, in immortal strains,
Has sung his baseness, and has wept your pains.

Companion.

Thrice happy they, who hear experience call,
And shun the precipice where others fall.
When the fair clasps you to her breast, beware,
Nor trust her, by her eyes although she swear; 50
Not though, to drive suspicion from your breast,
Or love's soft queen, or Juno she attest;
No truth the women know; their looks are lies.

Lover.

Yet Jove connives at amorous perjuries.
Hence serious thoughts! then why do I complain?
The fair are licenc'd by the gods to feign.
Yet would the guardian powers of gentle love,
This once indulgent to my wishes prove,

Each day we then should laugh, and talk, and toy,
 And pass each night in Hymeneal joy. 60
 O let my passion fix thy faithless heart!
 For still I love thee, faithless as thou art!
 Bacchus the Naiad loves; then haste, my boy!
 My wine to temper cooler streams employ.
 What though the smiling board Neæra flies,
 And in a rival's arms perfidious lies,

The live-long night, all sleepless, must I whine?
 Not I—

Companion.

Quick, servants! bring us stronger wine.

Lover.

Now Syrian odours scent the festal room, 70
 Let rosy garlands on our foreheads bloom.

NOTES ON ELEGY VI.

We have seen, with what cruelty Neæra had treated her lover, all his endeavours to fix her solely his, having proved hitherto ineffectual. But his misery being now extreme, some remedy must be attempted; and wine, by the joint approbation of antiquity, being esteemed the certain antidote of affliction, his friends strongly recommended his making an experiment of its virtues: he follows their advice, and begins the present elegy with an address to the god of wine, in full confidence of his being able to free him from his amorous inquietude.

This poem, which is one continued struggle between the powers of love and wine, but in which the latter triumphs over the former, the translator has thrown into a dialogue between the lover and one of his boon companions. This gives it a more spirited air, but does not entirely remove all its obscurities; and hence the translator has been led to believe, that it is imperfect; unless with some judicious critics, it is supposed, that as the author was agitated with a diversity of passions at the time of his composing it, so the hyperbaton and disorderly connection was the result of judicious choice, and not the fault of imperfection.

In some editions this elegy is improperly split into two.

Ver. 1. —*so may the mystic vine.*] Why mystic? Because those who were initiated in the mysteries of Ceres and Bacchus carried *thyrsi*, round which were twisted vine branches; or, because those who assisted at the orgies of Bacchus wore vine garlands. See a description of these frantic ceremonies in the sixth book of Ovid's *Metamorphosis*, ver. 587.

Ver. 2. Bacchus wore grapes on his horns. See notes on the first elegy of the second book; and ivy round his temples.

Cur hederæ cinctæ est? hederæ est gratissima
 Baccho:

Hoc quoque cur ita fit, dicere nulla mora est.
 Nytiades Nymphæ, puerum quærente noverca,
 Hanc frondem cunis apposuerunt novis.

Lib. iii. Fast. ver. 769.

But Constantius Cæsar, in the eleventh book of his *Geopon*, says, that Bacchus loved the ivy be-

cause his favourite boy Cissus was metamorphosed into that plant. *Broekb.*

The true reason however seems to have been, that the ancients thought ivy chaplets had a power of preventing intoxication.

Those who conquered in poetical contests, had, of old, a wreath of ivy bestowed upon them. Andreas Alciatus gives the following reason for it:

Haud quaquam arefcens hederæ est arbuscula,
 Cisso

Quæ puero Bacchum dona dedisse ferunt:
 Errabunda, procax, auratis, fulva corymbis,
 Exterius viridis, cætera pallor habet.
 Hinc aptis vates cingunt sua tempora fertis;
 Palefcunt studiis, laus diuturna viret.

Emb. 204.

Ver. 15. The two great Italian pastoral poets have enlarged upon this thought in their tragicomedies.

Van le tigre in amore
 Ama il leon superbo, &c. *Amynt.*

Rugge il leon al bosco
 Ne quel rugito è d'ira
 Così d'amor sospira, &c. *Past. Fido.*

Ver. 21. When the gods appeared in anger to mortals, they were supposed to become much taller than usual. Thus Ceres, when she appeared to Erysychton, who had violated her sacred grove, trod indeed on the ground, but with her head she touched the skies.

Δαμαῖος δ' ἀφ' οὐρανῶν, &c.

Callim. Hymn. in Cerer. ver. 58.

Ver. 23. Penthus, King of Thebes, was torn in pieces by his mother and the other Mænades, for having ridiculed the newly-introduced orgies of Bacchus. See Ovid, *Met. lib. iii.* and Theocritus, *Idyll. 26.* See also the *Βακχαι* of Euripides.

Ver. 29. This is a fine instance of amorous irresolution; and the prayer the poet puts up to Heaven for the happiness of his inconstant fair, makes us compassionate him more, than if he had broke out into the most direful execrations.

Tasso has given us a no less beautiful instance of this passionate figure in his *Gierusalem. Liberat.* Canto xx. where Armida, being abandoned by Rinaldo, breathes fury and revenge: and, pursuing him through the ranks of the battle, aims an arrow at his heart; but scarce had the shaft left the bow, when returning love compelled her to wish it might miss its aim:

Lo stral volo; ma con lo stral, un voto
Subito uscì, che vada il copo a voto.

Swift flies the shaft, as swiftly flies her prayer
That all its vehemence be spent in air.

Spence.

Such sudden changes of passion give a vast energy to poetical compositions. They are frequent in the elegiac poets: but no instance of this kind ever afforded the translator more pleasure than the following of Lotichius, who desiring his deceased mistress's shade often to appear to him, suddenly checks himself:

Quid precor imprudens? non fas ita velle priumve
Otia sint cineri, sit sopor usque tuo.
Et tumulum myrti virides, & amaricus ornet;
Et sedeat custos ad tua busta Venus.

B. iii. *El.* 3.

Ver. 37. This double passion is aptly termed dissimulation, by Mr Spence, in his ingenious *Observations on Pope's Odyssey*. Such figures are viewed in a juster light, when we look upon them as naturally expressive of what we feel within us, than when we regard them only as the artful machineries of writing.

Ver. 43. Catullus is here called learned; and antiquity, with one consent, bestows upon him that distinguished epithet. He certainly understood the Greek language, and translated, with some applause, Callimachus's beautiful poem on Berenice's hair: but his version from Sappho is very indifferent. Yet these perhaps obtained him the reputation of learning; or perhaps it arose from his frequent use of cramp words. Men are often called learned, even now-a-days, for no better reasons. The translator, however, is not of opinion, that he merited that distinction, so much at least as some of his Roman predecessors. Nay, are not the best critics now agreed, that had all his poems perished, the world would have been at no very great loss, except for the piece here alluded to, his *Epithalamium on Peleus and Thetis*, and one or two more?

The most remarkable part of Catullus's character is, the freedom with which, in his writings, he attacked Julius Cæsar, at a time when he was the sovereign master of the world. That great, but wicked Roman, understood the importance of having the men of abilities and learning on his side, and therefore invited the poet to sup with him on the night his *Pasquin* was published. Could the poet satirize after such an act of condescension? Something of the same kind is also told us, of that most consummate of politicians, Philip, who more than paved the way for his son's conquest of the East.

See Dr. Leland's excellently written *Life of that monarch*.

In the poem which Tibullus here had in his eye, there is an exquisite stroke of nature, where Ariadne runs into the sea, as if to reach Theseus, who was sailing off.

Tum tremuli falis adversas percurrere in undus
Mollia nudata tollentem tegmina furæ, &c.

Ovid has written on the same subject: but there is more real beauty in the pathetic exclamations and frantic behaviour of Catallus's Ariadne, than in the witty, but unaffected epistle of Naso.

There appears no connection between this story of Ariadne, and what either goes before or follows it. But if the translator durst venture upon a transposition, he would join

Thrice happy they,

and so on, to

Hence, serious thoughts!

to the forty-second line, and make it part of the advice which our poet's companion gave him. The manner of disposing and connecting these verses, would make the story of Ariadne appear as part of Tibullus's answer, by which he would insinuate, that if the women were deceitful, the men are not much better, as witness the treatment which Theseus, whom they all deemed a hero, gave Ariadne.

Ver. 50. The common editions read

Junonemque suam, perque suam venerem.

But Broekhusius is of opinion that Tibullus wrote

Junonemque suam, per Veneremque suam,

and produces several instances of his using the "que" in that manner. He closes his quotations on that subject with the following sentence, which is in the true spirit of a verbal critic: "Hæc palæmonibus nostris exila videbuntur, neque satis digna in quibus otium ponatur: mihi vero, quæ mea est humilitas, nihil exile habetur, quod faciat ad inlustrationem sermonis Latini."

Ver. 51. Female infidelity has been a common topic of invective with the wits of all ages; and yet, had they looked into their own conduct with the same virulent penetration, they would have found that the lion made a just observation to the man, who vauntingly showed him a picture wherein one of the lion-kind was represented as conquered by a man, when that monarch of the woods said, "We lions are not painters."

Ver. 52. Plato assigns a whimsical reason for Jupiter's good-nature in this affair; the pleasures (says he) are infants, incapable of understanding and judgment, and therefore not liable to punishment for perjury, or breach of promise.

Ver. 59. "Nobis merenti," in the original, as Broekhusius observes, is an elegant Græcism (archaismus), which Terence and the most correct Roman poets have admitted. There are many such Græcisms in both Milton and Shakspeare; the former, no doubt, thought the joining a sin-

gular with a plural an elegance ; but it is a question whether the instances of this kind which occur in the tragic bard are not the effect of chance, or fault of transcribers, &c. This pentameter is the only turn on words to be found in Tibullus. When sparingly admitted, such turns are doubtless beauties. Mr. Dryden makes Virgil the parent of this elegance in composition : that critic, however, is mistaken, as Homer has a turn on the words, Il. 20, where Hector says, that at all events he will attack Achilles :

και ει πυρι χειρας εοικεν
Ει πυρι χειρας εοικε' μενος αιωνι σιδηρω.

Not from yon boaster shall your chief retire,
Not though his heart were steel, his hands were fire :
That fire, that steel, your Hector should withstand,
And brave the vengeful heart, and dreadful hand.

So very attentive was Mr. Pope not to lose any of the beauties of his original. And if Mr. Dryden (*Dedicat. to Juvenal*) had looked, he would have found that Catullus used this charm in writing before Virgil.

Ut flos in septis secretus nascitur hortis,
Ignotus pecori, nullo convulsus aratro,
Quem mulcent auræ, firmat sol, educat imber :
Multi illum pueri, multæ optavere puellæ :
Idem cum tenui carptus defloruit ungui,
Nulli illum pueri, nullæ optavere puellæ.
Sic virgo dum intacta manet, dum cara suis est.
Cum castum amisit polluto corpore florem,
Nec pueris jucunda manet, nec cara puellis.

Carm. Nupt. 60.

It must indeed be owned, that Virgil and Ovid more frequently use turns, both on words and thoughts. Neither is Milton wholly destitute of that beauty, though Mr. Dryden says, he could find none such in his poems, as witness the following charming verses, where Eve addresses our general ancestor :

With thee conversing, I forget all time !
All seasons, and their change, all please alike.
Sweet is the breath of morn, her rising sweet
With charm of earliest birds ; pleasant the sun,
When first on this delightful land he spreads
His orient beams, on herb, tree, fruit, and flower
Glist'ring with dew ; fragrant the fertile earth
After soft showers ; and sweet the coming on
Of grateful evening mild ; then silent night,
With this her solemn bird, and this fair moon,
And these the gems of heaven, her starry train :
But neither breath of morn, when she ascends
With charm of earliest birds ; nor rising sun

On this delightful land ; nor herb, fruit, flower,
Glist'ring with dew : nor fragrance after showers ;
Nor grateful evening mild ; nor silent night,
With this her solemn bird ; nor walk by moon,
Of glittering star-light, without thee is sweet.

This quotation Mr. Addison has inserted in one of the *Tatlers* (No. 114.), and indeed Mr. Mason makes this turn on words characteristical of Milton's manner, in that beautiful poem of his, intitled *Musæus*.

Various this peaceful scene, this mineral roof ;
This 'semblance meet of coral, ore, and shell ;
These pointed crystals fair, 'mid each obscure
Bright glistening ; all these slowly-dripping rills,
That tinkling stray amid the cool cave.
Yet not this various peaceful scene, with this
Its mineral roof, nor this assemblage meet
Of coral, ore, and shell ; nor 'mid th' obscure
These pointed crystals glittering fair ; nor rills
That straying tinkle through the cool cave,
Deal charms more various to the raptur'd sense,
Than thy mellifluous lay.

Ver. 61. Bacchus was brought up by the nymphs ; which, says Vulpius, is a poetical figment, signifying that wine ought to be mixed with water.

Αι Νυμφαι τον Βακχον οτ' εκ πυρος ηλαθ' ο κερως
Νιψαν, υπερ τεφρης αρι κυλισμενον.
Τενικα σην Νυμφαις βρομιος φιλος, ην δε νιν εισης
Μισισθαι διζη πυρ' ετι καιομενον.

Λεξολογια.

E cingere ut Bacchum nymphæ cessere sorores,
Membraque lavarunt fonte perennis aquæ,
Junctus amicitia est Nymphis. Si forte repellas,
Natum de flammis experire Deum.

And Plato, in his poetical language, calls the mixing of wine with water, the taming a mad god with a sober one.

Ver. 68. "Jam dudum" in the original, says Brockhusius, "formula venusta de tempore non longo in re præsentē & scriptoribus elegantibus adamata."

Festus observes, that the boon companions of old used sometimes to tie birds to their garlands, not only to amuse themselves with their songs, but also to be kept awake by their pecking ; so ingenious were they in the article of drinking !

The garlands used at first upon these occasions, were made of fine wool ; and therefore Theocritus calls them εως ακων, the flower of the sheep.

Parsley, roses, ivy, &c. came afterwards to be worn ; for which, as well as for the introduction of essences in drinking, the toppers of antiquity were indebted to the fair sex. Lipsius has given us the "leges convivales" of the ancients,

ELEGY VII.

To you my tongue eternal fealty swore,
My lips the deed with conscious rapture own;
A fickle libertine I rove no more,
You only please, and lovely seem alone.

The numerous beauties that gay Rome can boast,
With you compar'd, are ugliness at best;
On me their bloom and practis'd smiles are lost,
Drive then, my fair! suspicion from your breast.

Ah no! suspicion is the test of love:
I too dread rivals, I'm suspicious grown;
Your charms the most insensate heart must move;
Would you wereauteous in my eyes alone!

I want not man to envy my sweet fate,
I little care that others think me blest;
Of happy conquests let the coxcomb prate!
Vain-glorious vaunts the silent wife detest.

Supremely pleas'd with you, my heavenly fair!
In any trackless desert I could dwell;
From our recess your smiles would banish care,
Your eyes give lustre to the midnight cell.

For various converse I should long no more,
The blithe, the moral, witty, and severe;
Its various arts are her's, whom I adore;
She can depress, exalt, instruct, and cheer.

Should mighty Jove send down from heaven a maid,

With Venus' cestus zon'd, my faith to try,
(So, as I truth declare, me Juno aid!)
For you I'd scorn the charmer of the sky.

But hold! you're mad to vow, unthinking fool!
Her boundless sway you're mad to let her know:
Safe from alarms, she'll treat you as a tool—
Ah, babbling tongue! from thee what mischiefs flow!

Yet let her use me with neglect, disdain;
In all, subservient to her will I'll prove;
Whate'er I feel, her slave I'll still remain,
Who shrinks from sorrow, cannot be in love!

Imperial queen of bliss! with fetters bound,
I'll sit me down before your holy fane;
You kindly heal the constant lover's wound,
Th' inconstant torture with increase of pain.

NOTES ON ELEGY VII.

ALTHOUGH this poem is usually published at the end of the fourth book, yet as some old critics assert, that Tibullus wrote only three books of elegies, and as this piece, in the opinion of Broekhusius, has all the marks of Tibullian legitimacy, the translator has taken the liberty to place it here; not strictly rendered, but more paraphrastically, as, in his opinion, better suited to the genius of the alternate stanza. What induced the translator to turn paraphrast with this elegy, was, that though the critics unanimously ascribed it to Tibullus, yet did he think, that the thoughts had not that simplicity, which constitutes one of the characteristical beauties of our poet. And though Tibullus is mentioned in the poem, no argument can thence be drawn of it being the work of our poet, as in after-times, those who excelled in elegy affected to style themselves Tibullus: and it is known that Nero used to call the poet Nerva by that appellation.

Ver. 11. *Your charms the most insensate heart must move;*

Would you were charming in my eyes alone!

This, exclaims the polite Dutch commentator, is rusticity itself! For what more cruel, to a fine woman, could he wish, than that she should please one man only? And what do the ladies aim at, in all their finery and variety of dress, but to appear amiable even to those whom they neither can, nor wish to love?

Delectant etiam castas præconia formæ.

And what woman did you ever see, however vile and wretched, whose face or person you dared, in her own presence, to condemn with impunity; or who thought herself ugly? Beauty they prefer to life itself, and death they view without dismay, if they carry their charms along with them. Thus far Broekhusius.

D'Ursey, who was the first, that gave the

French an idea of pastoral romance, has copied this thought of our author; and, indeed, it better suited such languid unnatural compositions as the *Astrea*, than the serious sensibility of the elegiac muse.

Ver. 12. Cowley has imitated this; or rather, such conceits were in his way.

How happy here, should I
And one dear she, live, and embracing die;
She who is all the world, and can exclude
From deserts, solitude.

I should have then this only fear,
Lest men, when they my pleasure see,
Should hither throng to live like me,
And so make a city here.

How much more truly does Prior represent the contentment which lovers feel in one another's company?

My conqueror now, my lovely *Abra* held
My freedom in her chains; my heart was fill'd
With her; with her alone, in her alone
It fought its peace and joy; while she was gone,

It sigh'd and griev'd, impatient of her stay;
Return'd, she chas'd those sighs, that grief away;
Her absence made the night, her presence made
the day.

The pastoral writers often ascribe still greater force to the charms of their *Galateas* and *Phyllises*, perhaps very impertinently.

Ver. 25. Thus finely imitated by *Croxal*:

Were I invited to a nectar feast
In heaven, and *Venus* nam'd me for her guest;
Though *Mercury* the messenger should prove,
Or her own son, the mighty god of love;
At the same instant let but honest *Tom*
From *Sylvia's* dear terrestrial lodging come,
With look important say—"desires—at three,
"Alone—your company—to drink some tea."
Though *Tom* were mortal, *Mercury* divine,
Though *Sylvia* gave me water, *Venus* wine; [far
Though heaven was here, and *Bow-street* lay as
As the vast distance of the utmost star;
To *Sylvia's* arms with all my strength I'd fly:
Let who would meet the beauty of the sky.

THE POEMS OF SULPICIA,

ADVERTISEMENT.

SOME of the best modern commentators contend, that the little poems which compose this fourth book, are not the work of *Tibullus*. Their chief arguments are derived from the language and sentiment; in both which, it is said, and with more justice than is common on such occasions, that they bear no resemblance to our poet's productions.

But if the following little pieces are not the composition of *Tibullus*, to whom shall we impute them? Shall we, with *Caspar Barthius*, and *Broekhusius*, ascribe them to *Sulpicia*, the wife of *Calenus*, who flourished in the reign of *Domitian*? This opinion is by no means improbable, for we know from *Martial* and *Sidonius Apollinaris*, that *Sulpicia* was eminent in those days for her poetry.

Omnes *Sulpiciam* legant puellæ,
Uni quæ cupiunt viro placere.
Omnes *Sulpiciam* legant mariti,
Uni qui cupiunt placere nuptæ.
Non hæc *Colchidos* adferit furorem,
Diri prandia nec refert *Thyestæ*;
Scyllam, *Byblida*, nec fuisse credit:
Sed castos docet & pios amores,
Lusus, *delicias*, *facetiasque*.
Cujus carmina qui bene æstimavit,
Nullam dixerit esse nequiores,
Nullam dixerit esse sanctiores.

Tales egregiæ jocos fuisse.
Udo crediderim *Numæ* sub antro.
Hac condiscipula, vel hac magistra
Esse doctior & pudica *Sappho*:
Sed tecum pariter simulque visam
Durus *Sulpiciam* *Phaon* amaret.
Frustra: namque ea nec *Tonantis* uxor,
Nec *Bacchi*, nec *Apollinis* puella,
Erepto sibi viveret *Caleno*.

Mart. Lib. x. Ep. 35.

But to this proof, it is objected by *Vulpius*, that as the following pieces are of a strain different from those celebrated by *Martial*, so they could not be written by the wife of *Calenus*, but are *Tibullus's*; and that the *Sulpicia* they praise, was the daughter of *Servius Sulpicius*, the famous lawyer, some of whose epistles to *Cicero*, are still extant: For, she who is called *Sulpicia* in this book, adds he, certainly lived in the reign of *Augustus*, as *Horace* himself mentions *Cerinthus*, and *Messala* is named in the eighth poem. To this it may be answered, that it cannot be proved, that *Sulpicia* had never been in love before she married *Calenus*; or had never composed any other poems, besides those of the conjugal kind, so much extolled by *Martial*? Nay, have we not our own testimony, that she wrote some thousands of pieces?

Cetera quin etiam, quot denique millia lusi!

And we know from some of Sulpicia's lines, preserved by the old Scholiast on Juvenal, that she sometimes wrote in a manner the very reverse of that which the epigrammatist celebrates: and of course she may still be the author of these poems. Nor does it follow from Horace's having made mention of one Cerinthus (lib. i. sat. 2. line 81.) who was fond of a rich mistress, that therefore this mistress was Sulpicia; unless it could be proved, that Cerinthus never loved any but Sulpicia; and that there never was a person of the name of Cerinthus, but in the age of Augustus. Again, though Messala is mentioned in the eighth poem of this book, it cannot thence be inferred, that this was our poet's patron; unless it could be proved that the name Messala (which is not true) expired with that illustrious Roman. Therefore the following poems may still be the offspring of Martial's Sulpicia.

But against this opinion it is farther urged by Vulpius, that Quintilian (lib. i. cap. 11.) plainly alludes to,

*Illam quidquid agit, quoque vestigia movet
Componit, furtim subsequiturque decor,*

in the following sentence: "*Neque enim gestum oratoris componi ad similitudinem saltationis volo, sed subesse aliquid ex hac exercitatione puerili, unde nos non id agentes, furtem decor ille discitibus traditus prosequatur.*" But that eloquent rhetorician, says Vulpius, would have been ashamed to use the words of a woman, who was then alive; and therefore it is more probable, that he borrowed his illustration from Tibullus, a poet of an established reputation.

We cannot see any reason, however, why Quintilian should be more ashamed to borrow from a cotemporary poetess, if her words suited his purpose, than from a dead poet, let his character be ever so great. Nay, the great rhetorician, we apprehend, would rather have chosen to have expressed himself in the words of a woman, who was honoured with the epithet of learned, which was Sulpicia's case, than to have used the language of Tibullus or any other person, when treating of a subject (viz. Decency of Gesture) wherein the fair sex must be allowed to be the most competent judges. But why might not Quintilian stumble upon "*componit*" and "*furtim decor*" without having ever read this poem? Can any reason be assigned to the contrary? Or, rather, did not his subject naturally lead him to express his sentiments of oratorical gesture in these very words?

Some critics, however, whom the translator has consulted, and who acknowledge the futility of Vulpius's arguments, are yet of opinion, that the first, third, and fifth poems of this book cannot be of Sulpicia's writing, but must be the works of Cerinthus, or some poet; as Sulpicia, they say, could not, with any grace, write the encomium on her own person; nor can the poem on her birthday be, with any more propriety, ascribed to her; and it is evident, they think, that the fifth poem is the composition of a common friend.

Nor, granting this, every difficulty is not yet

surmounted: the twelfth poem, according to some others, cannot be Sulpicia's, for from the following lines:

*Nunc licet, e cœlo, mittatur amica Tibullo;
Mittetur frustra, deficietque Venus.*

it is, they assert, plainly the composition of Tibullus. "*Tibulli carmen arbitror (says Broekhusius) ipsa dictione ita persuadente & numeris ad Albianum characterem artificiose conformatis;*" adding, that it has certainly slipped out of its place, and must belong to the third book, as the old critics inform us, that Tibullus wrote no more than three books of elegies.

Although we have so far admitted this opinion, as to place that poem at the end of the third book, yet that our poet certainly wrote more elegies than we have of his at present, is obvious, both from his works themselves, and from Horace: nor can the translator help being of opinion, that, however similar the metrical composition in the twelfth poem may be to that of Tibullus, yet the mode of thinking is very different from his; and, therefore, if Tibullus is the author, he either in this piece, imitated Ovid, or the piece itself was written by some body else, perhaps in the age of Domitian, who was so fond of Tibullus, as to be willing to usher his own productions into the world under the sanction of his name.

But if the fourth book was composed by Sulpicia, how comes it, objects Vulpius, to be found in all the ancient MSS. of Tibullus? To this it may be answered, that the old librarians used commonly, in order to enhance the price of their MSS. to join to an author, who had not left many works behind him, any writer who composed in what they thought a similar taste. By this means, a satire, which our Sulpicia certainly wrote, was long ascribed by some to Juvenal, and by others to Ausonius, from having been found in the MS. works of those two poets; till some critics of more understanding * proved to the learned, neither Juvenal, nor Ausonius, but Martial's Sulpicia wrote it.

Such are the arguments by which the commentators support their different opinions. The reader must determine for himself. But if the translator might be permitted to pronounce on the subject, he would say, that if any weight might be laid on difference of style, and especially of thought, the following poems cannot be the work of Tibullus:—but whether Martial's Sulpicia, or who else wrote them, is not in his power to determine. But as Sulpicia is the only person to whom the critics attribute them, the translator, not knowing any one else, who can show a preferable claim, has retained her name in the title page.

Notwithstanding, however, it cannot be absolutely ascertained (and how can controversies of this sort be absolutely ascertained?) who was the person to whose happy talent we owe the following poems; every reader of taste will allow, that

* Scaliger, &c.

they abound with striking beauties; and that, upon the whole, those critics do no great injury to Tibullus, who still ascribe them to that poet.

As Sulpicia and Cerinthus perfectly understood one another, we must not expect in their poems those sallies and transitions of passion, that frantic and despondent air, so observable in Tibullus: for

these are the natural emanations of a heated fancy and a distracted heart. But the poems before us abound in what the moderns denominate gallant flattery. Most of them show the poet and happy lover. They give us little anecdotes of their passion, and make us regret we have no more.

POEM I.

GREAT god of war! Sulpicia, lovely maid,
To grace your calends, is in pomp array'd.
If beauty warms you, quit th' etherial height,
E'en Cytherea will indulge the sight:
But while you gaze o'er all her matchless charms,
Beware your hands should meanly drop your arms!
When Cupid would the gods with love surprise.
He lights his torches at her radiant eyes.
A secret grace her every act improves,
And pleasing follows wheresoe'er she moves: 10
If loose her hair upon her bosom plays;
Unnumber'd charms that negligence betrays:
Or if 'tis plaited with a labour'd care,
Alike the labour'd plaits become the fair.
Whether rich Tyrian robes her charms invest,
Or all in snowy white the nymph is drest,
All, all the graces, still supremely fair,
Still charms spectators with a fond despair.
A thousand dresses thus Vertumnus wears,
And beauteous equally in each appears. 20

The richest tints and deepest Tyrian hue,
To thee, O wonderful maid! are solely due:
To thee th' Arabian husbandman should bring
The spicy produce of his eastern spring:
Whatever gems the swarthy Indians boast,
Their shelly treasures, and their golden coast,
Alone thou merit'st! come, ye tuneful choir!
And come, bright Phœbus! with thy plausive
lyre!

This solemn festival harmonious praise,
No theme so much deserves harmonious lays. 30

POEM II.

WHETHER, fierce churning boars! in meads ye
stray,

Or haunt the shady mountain's devious way;
Whet not your tusks, my lov'd Cerinthus spare!
Know, Cupid! I consign him to your care.

What madness 'tis, shagg'd trackless wilds to beat,
And wound, with pointed thorns, your tender
feet:

O! why to savage beasts your charms oppose?
With toils and blood-hounds why their haunts en-
close?

The lust of game decoys you far away;
Ye blood-hounds perish, and ye toils decay! 10

Yet, yet could I with lov'd Cerinthus rove
Through dreary deserts, and the thorny grove:
The cumbrous meshes on my shoulders bear,
And face the monsters with my barbed spear:

TRANS. II.

Could track the bounding stags through tainted
grounds,

Beat up their cover, and unchain the hounds:

But most to spread our artful toils I'd joy,
For while we watch'd them, I could clasp the boy!
Then, as entranc'd in amorous bliss we lay,
Mix'd soul with soul, and melted all away! 20
Snar'd in our nets, the boar might safe retire,
And owe his safety to our mutual fire.

O! without me ne'er taste the joys of love,
But a chaste hunter in my absence prove.
And O! my boars the wanton fair destroy,
Who would Cerinthus to their arms decoy!
Yet, yet I dread!—Be sports your father's care;
But you, all passion! to my arms repair!

POEM III.

COME, Phœbus! with your loosely floating hair,
O sooth her torture, and restore the fair!
Come, quickly come! we supplicant implore,
Such charms your happy skill ne'er sav'd before!
Let not her frame, consumptive pine away,
Her eyes grow languid, and her bloom decay;
Propitious come! and with you bring along
Each pain-subduing herb, and soothing song;
Or real ills, or whate'er ills we fear,
To ocean's farthest verge let torrents bear. 10

O! rack no more, with harsh, unkind delays,
The youth, who ceaseless for her safety prays;
'Twixt love and rage his tortur'd soul is torn;
And now he prays, now treats the gods with scorn.

Take heart, fond youth! you have not vainly
pray'd

Still persevere to love th' enchanting maid:
Sulpicia is your own! for you she sighs,
And flights all other conquests of her eyes:
Dry then your tears; your tears would fitly flow
Did she on others her esteem bestow. 20

O come! what honour will be yours, to save
At once two lovers from the doleful grave?
Then both will emulous exalt your skill;
With grateful tablets, both your temples fill:
Both heap with spicy gums your sacred fire;
Both sing your praises to th' harmonious lyre:
Your brother-gods will prize your healing powers,
Lament their attributes, and envy yours.

POEM IV.

ON my account, to grief a ceaseless prey,
Dost thou a sympathetic anguish prove?

3 F

I would not wish to live another day,
 If my recovery did not charm my love :
 For what were life, and health, and bloom to me,
 Were they displeasing, beauteous youth ! to thee.

POEM V.

With feasts I'll ever grace the sacred morn,
 When my Cerinthus, lovely youth was born.
 At birth, to you th' unerring sisters sung
 Unbounded empire o'er the gay and young :
 But I, chief I ! (if you my love repay),
 With rapture own your ever-pleasing sway.
 This I conjure you, by your charming eyes,
 Where love's soft god in wanton ambush lies !
 This by your genius, and the joys we stole,
 Whose sweet remembrance still enchants my soul !
 Great natal genius ! grant my heart's desire, 11
 So shall I heap with costly gums your fire !
 Whenever fancy paints me to the boy,
 Let his breast pant with an impatient joy :
 But if the libertine for others sigh
 (Which love forbid !) O love ! your aid deny.
 Nor, love ! be partial, let us both confess
 The pleasing pain, or make my passion less.
 But O ! much rather 'tis my soul's desire,
 That both may feel an equal, endless fire. 20
 In secret my Cerinthus begs the same,
 But the youth blushes to confess his flame :
 Assent, thou god ! to whom his heart is known,
 Whether he public ask, or secret own.

POEM VI.

Accept, O natal queen ! with placent air,
 The incense offer'd by the learned fair.
 She's rob'd in cheerful pomp, O power divine !
 She's rob'd to decorate your matron-shrine ;
 Such her pretence ; but well her lover knows
 Whence her gay look, and whence her finery flows.
 Thou, who dost o'er the nuptial bed preside,
 O ! let not envious night their joys divide,
 But make the bridegroom amorous as the bride !
 So shall they tally, matchless lovely pair !
 A youth all transport, and a melting fair ? 10
 Then let no spies their secret haunts explore,
 Teach them thy wiles, O love ! and guard the door.
 Assent, chaste queen ! in purple pomp appear ;
 Thrice wine is pour'd and cakes await you, here.
 Her mother tells her for what boon to pray ;
 Her heart denies it, though her lips obey.
 She burns, that altar as the flames devour ;
 She burns, and flights the safety in her power. 19
 So may the boy, whose chains you proudly wear,
 Through youth the soft indulgent anguish bear ;
 And when old age has chill'd his every vein,
 The dear remembrance may he still retain !

POEM VII.

I.

At last the natal odious morn draws nigh,
 When to your cold, cold villa I must go ;
 There, far, too far from my Cerinthus sigh :
 Oh why, Messala ! will you plague me so ?

II.

Let studious mortals prize the sylvan scene ;
 And ancient maidens hide them in the shade ;
 Green trees perpetually give me the spleen ;
 For crowds, for joy, for Rome, Sulpicia's made !

III.

Your too officious kindness gives me pain.
 How fall the hailstones ! hark ! how howls the
 wind ! 10
 Then know, to grace your birth day should I deign,
 My soul, my all, I leave at Rome behind.

POEM VIII.

At last the fair's determin'd not to go :
 My Lord ! you know the whimsies of the sex.
 Then let us gay carouse, let odours flow ;
 Your mind no longer with her absence vex :
 For O ! consider, time incessant flies ;
 But every day's a birth-day to the wife !

POEM IX.

That I, descended of Patrician race,
 With charms of fortune, and with charms of face,
 And so indifferent grown to you of late,
 So little car'd for, now excites no hate.
 Rare taste, and worthy of a poet's brain.
 To prey on garbage, and a slave adore !
 In such to find out charms a bard must feign
 Beyond what fiction ever feign'd of yore.
 Her friends may think Sulpicia is disgrac'd ;
 No ! no ! she honours your transcendent taste. 10

POEM X.

If from the bottom of my love-sick heart,
 Of last night's coyness I do not repent,
 May I no more your tender anguish hear,
 No longer see you shed th' impassion'd tear.
 You grasp'd my knees, and yet to let you part—
 O night more happy with Cerinthus spent !
 My flame with coyness to conceal I thought,
 But this concealment was too dearly bought.

POEM XI.

FAME says, my mistress loves another swain ;
 Would I were deaf, when fame repeats the wrong !
 All crimes to her imputed, give me pain,
 Not change my love : Fame, stop your fancy
 tongue !

POEM XII.

Let other maids, whose eyes less prosperous
 prove,
 Publish my weakness, and condemn my love.
 Exult, my heart ! at last the queen of joy,
 Won by the music of her votary's strain,
 Leads to the couch of bliss herself the boy ;
 And bids enjoyment thrill in every vein :
 Last night entranc'd in ecstasy we lay,
 And chide the quick, too quick return of day !

But stop, my hand! beware what loose you scrawl,
Lest into curious hands the billet fall. to
No—the remembrance charms!—begone, gri-
Matrons! be yours formality of face. [mace!

Know, with a youth of worth, the night I
spent,
And cannot, cannot, for my soul repent!

NOTES ON SULPICIA'S POEMS.

POEM I.

Ver. 4. One of the critics has observed upon this passage, that Venus must either have had great confidence in her own charms; or have been little solicitous what became of her paramour Mars, to indulge him in this interview.

Ver. 6. When Euryclea, in the *Odyssæy* (lib. xix.) discovers Ulysses (whom she was bathing) by the scar in his leg, her joyful surprise is finely imagined, by her being ready to faint, and her dropping the jar of water. Nor less beautiful is the surprise testified by Paris, when by chance he beheld the fair bosom of Helen:

Dum stupeo visis (nam pocula forte tenebam)

Tortilis e digitis excidit ansa meis.

Ep. Her. lin. 251.

Menage, in his *Bird-Catcher* and *Adonis*, gives a no less fine instance of astonishment; but Milton has surpassed them all, in the picture he has drawn of Adam's consternation and horror, upon being told by Eve that she had eaten of the forbidden fruit, which is a beautiful contrast to the joy which she showed in narrating the fact:

Thus Eve, with count'nance blithe, her story told,
But in her cheek distemper flushing glow'd.
On th' other side, Adam, soon as he heard
The fatal trespass done by Eve, amaz'd,
Astounded stood, and blank; while horror dull
Ran through his veins, and all his joints relax'd;
From his slack hand the garland, wreath'd for Eve,
Down dropt, and all the faded roses shed:
Speechless he stood, and pale; till thus at length
First to himself he inward silence broke.

Book ix. l. 886.

What the author of this poem ascribes to the power of beauty, Pindar ascribes (perhaps no less truly) to the force of harmony.

Χρυσῆα φερέμεν ἄπολλω, &c.

Pyth. Od. I.

which the late Mr. West has thus poetically rendered:

Hail, golden lyre! whose heaven-invented string
To Phœbus and the black-hair'd nine belongs,
Who, in sweet chorus, round their tuneful king,
Mix with thy sounding chords their sacred songs.
The dance, gay queen of pleasure! thee attends;
Thy jocund strains her listening feet inspire:
And each melodious tongue its voice suspends,
Till thou, great leader of the heavenly choir!
With wanton art preluding, giv'st the sign—
Swells the full concert then with harmony divine.

DECADE II.

Then, of their streaming lightnings all disarm'd,
The smouldering thunderbolts of Jove expire:
Then, by the music of thy numbers charm'd,
The birds fierce monarch drops his vengeful ire;
Perch'd on the sceptre of th' Olympian king,
The thrilling darts of harmony he feels;
And indolently hangs his rapid wing,
While gentle sleep his closing eye-lid seals;
And o'er his heaving limbs in loose array,
To every balmy gale, the ruffling feathers play.

But what gave rise to this quotation follows Decade III.

Ev'n Mars, stern god of violence and war,
Sooths with thy lulling strains his furious breast,
And, driving from his heart each bloody care,
His pointed lance consigns to peaceful rest.

Which image, as well as that of the eagle, are thus imitated by two excellent poets of our own days.

O! sovereign of the willing soul
Parent of sweet and solemn-breathing airs,
Enchanting shell! the sullen cares
And frantic passions hear thy soft controul.
On Thracia's hills the lord of war
Has curb'd the fury of his car,
And dropp'd his thirsty lance at thy command.
Perching on the scepter'd hand
Of Jove, thy magic lulls the feather'd king
With ruffled plumes and flagging wing;
Quench'd in dark clouds of slumber lie
The terror of his beak, and lightning of his eye.

Ode by Gray.

What follows, is from Dr. Akenfide's Hymn to the Naiads:

With emulation all the sounding choir,
And bright Apollo, leader of the song,
Their voices through the liquid air exalt,
And sweep their lofty wings: those awful strings,
That charm the mind of gods; that fill the courts
Of wide Olympus with oblivion sweet
Of evils, with immortal rest from cares;
Assuage the terrors of the throne of Jove;
And quench the formidable thunderbolt
Of unrelenting fire, with slacken'd wings,
While now the solemn concert breathes around,
Incumbent o'er the sceptre of his lord
Sleeps the stern eagle, by the number'd notes
Possess'd, and satiate with the melting tone;
Sovereign of birds. The furious god of war,
His darts forgetting, and the rapid wheels

That bear him vengeful o'er th' embattled plain
Relents, and sooths his own fierce heart to ease.

Dodley's Collect. vol. vi.

While such imitations make it doubtful to whom
the palm of preference should be given, all complaints of decay of poetical genius among us, must be imputed, either to ignorance or malice.

Ver. 8. Andreas Schottus makes our authoress indebted to Euripides for this thought; and yet what he quotes from that excellent tragic poet, has little or no reference to the text. The words are,

Ερως ερως, ὁ κατ' ὀφθαλμῶν

Σταχθίς ποδῶν, εισαγωγὴν γλυκυῖαν

Ψυχὰ χάριν, ὡς ἐπιστρέφουσα. Hippol. ver. 525.

Broekhusius has collected most of the passages from the ancient and modern (Latin) poets, where love is either said to lurk in the eye, or bask in the check of a fine woman, but gives justly the preference to the text. Thoughts of this kind, however, are now-a-days too threadbare even to please a chambermaid.

Ver. 9. Cardinal Bembo and Count Castiglione have both imitated this passage. The latter inserted his imitation in a poem he addressed to his wife Elizabeth Gonzaga, on her singing, and is as follows:

*Quidquid agit, certant pariter componere furtim
Et Decor & charitis, & pudor ingenuus.*

Elizabeth had a fine genius for poetry.

Ver. 13. "Coma," *απο τῆ κομμῆς*, "dicuntur Capilli aliqua cura compositi; teste Festo." And Servius adds, that "coma" belongs to women's, as "cæsariis" does to men's hair: but this distinction is too refined; Tibullus himself applies "coma" to the hair of a boy. Vide Book i. El. 10.

Ver. 17. Lord Lansdown has some thoughts analogous to these of our poetess.

When Myra walks, so charming is her mien,
In every motion every grace is seen.

And again,

With charms so numerous Myra can surprise
The gazer knows not by what darts he dies;
So thick the volley, and the wound so sure,
No flight can save, no remedy can cure.

Ovid's Vertumnus is a masterpiece. See *Metamorphosis*, lib. 14.

Ver. 21. This and the remainder of the poem are also imitated by Castiglione; and though he hath well performed, yet Francius, who has also adopted the sentiments of our author, hath surpassed the Count in a poem addressed to that great scholar, but middling poet, Monf. Menage.

Ver. 23. It was so commonly believed, in the time of Augustus, that Arabia, besides spices, contained immense quantities of gold, that the emperor marched thither a considerable army, A. U. C. 729. which perished by sickness. A like fate attend every army, which invades any country on such an account.

POEM II.

Ver. 3. The Cerinthus whom Horace mentions, was a beautiful slave from Chalcis; and under this name, applied only to the handsome, Sulpicia probably veiled her regard for some young person of fashion.

Ver. 4. Mr. Gay, in his fine ballad, intitled William and Susan, has the following pretty if not true thought,

Love will ward off the bullets as they fly,
Lest precious drops should fall from Susan's eye.

Ver. 11. However disagreeable field-sports were to the amiable Sulpicia, yet to have the pleasure of Cerinthus's company, she was willing to undergo all the fatigues and dangers of boar-hunting. Such is the nature of love!

Had Guarini our Sulpicia in his mind, when he made Dorinda thus address Sylvio?

*Te seguiro compagna
Del tuo fido, Melampo assai piu fida:
E quando farai stanco
T' aufchiugero la fronte:
E sovra questo fianco,
Che per ti mai non posa, havrai riposo.*

It is thus that Prior describes the disguises which Henry assumed, in order to obtain the affection of the beautiful Emma:

When Emma hunts, in huntsman's habit drest,
Henry on foot pursues the bounding beast;
In his right hand his beachen pole he bears,
And graceful at his side his horn he wears, &c.

Again,

A falc'ner Henry is, when Emma hawks;
With her of tarsels and of lures he talks;
Upon his wrist the towering merlin stands,
Practis'd to run, and stoop, at her commands, &c.

Again,

A shepherd now along the plain he roves,
And with his jolly pipe delights the groves:
The neighbouring swains around the stranger throng,
Or to admire, or emulate his song, &c.

And lastly,

A frantic gypsy, now, the house he haunts,
And in wild phrases speaks dissembled wants:
With the fond maids in palmistry he deals;
They tell the secret first, which he reveals, &c.

POEM III.

Ver. 1. Would not a long enumeration of the epithets of Apollo have been extremely improper here? and does not his immediate call for assistance show the greatness of the writer's concern?

When Laura was at the point of death, how very coldly does Petrarch place her next to Jupiter, instead of breaking forth into passionate exclamations? and how poorly consolatory is his vision? *Prim. Part. Canzon. 12, 13, 14, &c.*

Ver. 9. Hence Apollo, from the Greeks, had the appellation of *Θεὸς ἀλεξικακός*, (deus malorum depulso), bestowed on him; as the Latins called him *Averruncus*.

Ver. 10. All expiations and "purgamenta" were, by the ancients, performed either on the brink of a river, or on the sea-shore: this practice continued long after the introduction of Christianity, for we are informed by Petrarch, that he saw the women of Cologne, with garlands on their heads, wash their arms in the Rhine, while they muttered some foreign charm. The poet, wondering both at the crowd and the action, inquired the reason, and was told, that it was a very ancient rite, the common people believing that all the calamities of the ensuing year were prevented by the solemn ablution of that day. Vide lib. i. Ep. 4.

Petrarch flourished in the fourteenth century, and was no less eminent for his Latin (inasmuch that he obtained the appellation of the restorer of that language), than for his Italian compositions. In propriety, exactness, elegance, and melody he surpassed all his poetic predecessors; and so much was he esteemed, that a man, for having shot, out of wantonness, at his statue in Padua, and broke its nose, was hanged by the Venetians. Vindelino Spira published the first edition of his Rime, at Venice, A. D. 1470.

Ver. 18. Some editions read "fedula;" and indeed the epithet is more consonant to the interpretation which Broekhusius and the translator have given of the passage. Vulpius explains the "credula turba" to be those, who, either about Sulpicia's bed, or in the temples of the gods, put up petitions for her recovery.

Ver. 27. This is an elegant compliment on the professors of medicine.

POEM V.

Ver. 19. In this manner he prayed, lest any of the auditors should envy him, say the commentators; or lest a fascinating tongue " (lingua fascinatrices)" should prevent the completion of his prayers. None, add they, chose in an audible voice to lay open their real wants to the gods, lest the bystanders should overhear them; and therefore, all those, who desired of the gods what was extravagant, or what was immodest, or in short what they did not choose to own, either muttered their vows, or whispered them in the ear of their deity. And thus the ancients, as Seneca expresses it, told that to God, which they were ashamed a mortal should be made privy to. "Quanta dementia est hominum? turpissima vota Diis insufurrant: si quis admoverit aurem conticescent; et quod scire hominem nolunt, Deo narrant." Ep. 10. See this impiety severely treated by Persius, in his second satire.

POEM VI.

Ver. 2. Sulpicia had a good title to that epithet; for in the following line, she said no more

of her poetical endowments, than she modestly might,

Primaque Romanos docui contendere graiis.

That the Romans should have produced not one poetess before Sulpicia, to put them more upon a level with the Greeks, is matter of no small astonishment; since, as Cato observed, the Romans governed the world, but the women governed the Romans. How many fair poetesses has this island produced? and in particular, how many does Britain at present boast of, whose writings, both in prose and verse, may be compared, much to their advantage, with all the female productions of antiquity?

Besides Sulpicia, the poets mention Perilla and Theophila. Perilla lived in the Augustan age, and is praised by Ovid, Trist. lib. iii. el. 7. The other was a cotemporary of Martial's, who celebrates her, lib. 7. ep. 68. Their works, if ever they published any, are now lost. But we have a Virgilian canto on the life of our Saviour, written in the reign of Theodosius and Honorius, by Proba Falconia. This poetess, who was married to a person of proconsular dignity, is accused by some of having betrayed Rome into the hands of Alaric the Goth; but Cæsar Baronius has fully cleared her from that disloyal imputation.

Juvenal, Boileau, and others, have expressed, in their writings, a vast aversion to learned women; and indeed were all of the sex, who have learning, to be such as they represent them, the translator would heartily join with the satirists: but how can he do it, whilst he has the honour to know some ladies, who possess as great a fund of erudition, as most men are enriched with, and who, nevertheless, are entirely free from all those disagreeable concomitants, with which those poets have loaded their armed women? In short, when we consider in what manner the welfare of society depends upon the fair sex, we cannot but own, that their understandings ought to be cultivated with much assiduity: a fine woman, with a good heart, and an improved head, is the loveliest object in the creation.

Ver. 9. The word *componere*, in the original, is a metaphor taken from gladiators, who were then said *componi*, when they fought together, and were well matched.

VULPIUS.

Ver. 3. — *in purple pomp appear.*] That is, in a palla of purple; which not only Apollo and his votaries, with Osiris, wore, but in which also Bacchus, Mercury, Pallas, Night, the Furies, Discord, and even rivers were habited. "Adeo semper," says Macrobius, "ita se et sciri et coli numina maluerunt, qualiter in vulgus antiquitas fabulata est; quæ et imagines et simulacra formarum talium prorsus alienis, et ætates tam incrementi quam diminutionis ignaris, et amictus ornatusque varios corpus non habentibus adsignavit."

BROEKH.

Ver. 16. Vulpius retains the old reading,

jam sua mente rogat,

and explains it, as if Sulpicia were now "sui juris

et arbitrii," of age, and fit to make vows for herself; but had that ingenious commentator attended to the words "clam et tacita" in the same line, he would have seen that the true reading was that which is retained in the text.

Ver. 17. Menage observes of the original of this passage, that an active should not follow a passive verb; and therefore contends that the "urunt" should be "uruntur:" and yet we know that the contrary practice is warranted by some of the purest writers of the Augustan age; and, if the translator is not mistaken, that learned grammarian himself has, in his Latin poems, fallen into the mode of expression, which he here condemns in Sulpicia.

POEM VII.

Ver. 2. The villa, mentioned in the original, is Eretum, now Monte Ritondo. It was situated upon a high hill, not far from the banks of the Tiber, and was therefore cool, even in the midst of summer. Cluverius places it at the distance of fourteen miles from Rome; but Holstenius, in his Annot. Geogr. on the authority of Antoninus's Itinerary, and Ferrarius removes it four miles farther off.

POEM IX.

Ver. 1. From the original, the commentators conclude, that Sulpicia was the daughter of that famous Servius Sulpicius, who died at Modena, whilst he was engaged in an embassy to Antony, which he had undertaken at the request of the consuls Hirtius and Pansa, and of the senate: but then they seem to forget that Servius was a prænomen common to all the males of the Sulpician family and therefore not distinguishingly characteristic of any one of them. Those who suppose that Tibullus wrote these poems, and believe he was born in 710, make him a poet before his birth; for, says Broekhusius, Sulpicia speaks of her parents as if both were alive. Although the translator is persuaded that the pieces in this book are not Tibullus's, yet he can see nothing in the poem to support this assertion. Sure Sulpicia might call herself the daughter of Servius Sulpicius, notwithstanding her father's death; and the two last lines of the original may be applied to her nearest relations or guardians, with as much propriety as to her parents.
